VITAL STATISTICS.

The present official system of compulsory registration Registration of Births, Deaths, and of births, deaths, and marriages in Victoria has been force since 1853, and the registers contain all necessary information bearing on the family history of The statutory duties under the Registration Acts are performed by the Government Statist, who has supervision over the local registrars of births and deaths, and the registrars of marriages, and (so far as regards their registration duties) over the clergymen who celebrate marriages. Copies of entries certified by the Government Statist or by an Assistant Government Statist are prima facie evidence in the Courts of Australia of the facts to which they relate. At the Government Statist's Office there is kept for reference a complete collection of all registrations effected since 1st July, 1853, as well as originals or certified copies of all existing church records relating to earlier periods, as far back as 1837. Since the present system was instituted approximately 5,051,850 original entries have been made in the indexes, of which 1,395,800 relate to marriages, 2,468,450 to births, and 1,187,600 to deaths.

Since 1st August, 1932, all registrations of births and deaths occurring within the area of Greater Melbourne have been effected at the office of the Government Statist.

Applicants for searches or certificates of births, deaths, or marriages should, in applying to the Government Statist, furnish particulars of the date and place of the event; also the names of the parties in the case of a marriage, and the name, age (if a death), and parentage in the case of a birth or death. Searches are charged for at the following rates:—2s. 6d. for every search not exceeding a period of five years and for every search extending beyond a period of five years 2s. 6d. for each additional five years or part thereof. A search fee is not charged in any case where an application for a certificate is lodged within three months of the date of registration of the event. There is no extra charge for an extract of an entry, but, for a certificate, a further sum of 5s. is payable. For a search in the early church records, prior to 1st July, 1853, the fee is only 1s., a further sum of 1s. being payable if a certificate be required.

As evidence of the extent of the use made of the information contained in the records, the number of transactions which took place in 1936 was 59,129, and the amount of revenue received was £6,624. Included in the above number were 1,731 free ordinary searches and 297 free certificates.

Law relating to Marriages, Births, and Deaths.

The various Acts relating to the registration of marriages births, and deaths in Victoria were consolidated in 1928.

Marriages may be celebrated by any minister of religion ordinarily officiating as such in one of the religious denominations, and whose name is registered in the office of the Government Statist, also by the Government Statist, an Assistant Government Statist, or a duly appointed registrar of marriages. The Governor in Council may prohibit from celebrating marriages any minister who is proved guilty of any indictable offence, misconduct or impropriety in the celebration of any marriage, or who makes a business of celebrating marriages for the purpose of profit or gain. At least three clear days before the performance of any marriage, written notice of such marriage must be given to the proposed celebrant by the parties about to be married, but such notice may, in respect of a marriage by a minister of religion, be dispensed with in the case of emergency by written permission of any Justice of Marriage of minors is permissible only with the written consent of parents or guardian, or in certain circumstances by permission of a Guardian of Minors who is usually a police magistrate. Marriage with a deceased wife's sister is valid. Marriages of Jews and Quakers are exempted from the law relating to marriages, and are deemed legal and valid if celebrated according to their respective usages. Certificates of such marriages must, however, be lodged with the Government Statist for record purposes. No marriage is invalid by reason of its having been celebrated by an unqualified person if either of the parties believed at the time that such person was qualified, or by reason of any formal defect or irregularity where the identity of the parties to the marriage is not in question.

A person whose husband or wife has been continually absent from such person for the space of seven years or over, and has not been known by such person to be living within that time, may marry without being liable to prosecution for bigamy (see sec. 61 of the Crimes Act); but such a marriage would be void, and the issue thereof illegitimate, if it should be subsequently discovered that the former wife (or husband) was alive at the date of the marriage.

Births of live children must, under a penalty not exceeding £10 for default without reasonable cause, be registered within 60 days. After 60 days and within twelve months, registration may be effected after declaration, on the payment of a fee of 5s., after twelve months and under seven years, only by authority of the Government Statist (fee 20s.), and after seven years by order of a Judge of a County Court or the Supreme Court (fee 30s.). The occupier of every house or place in which an illegitimate child is born or in which an illegitimate child under the age of five years dies is required to give notice of such birth or death to the district registrar within three to seven days, according to the locality of the event. If the mother is the occupier the period of notification is extended to three weeks.

Legitimation of an illegitimate child born in Victoria may be effected by the father at any time after the marriage of the father to the mother provided there was at the time of the birth of the child no legal impediment to the marriage. Should the father be deceased, however, the mother may, on proof of his admission of paternity, effect the legitimation within two years of his death.

The Adoption of Children Act 1928 and the Adoption of Children Act 1936 provide for the legal adoption of children and for the

registration of each adoption by the Government Statist.

Stillbirths are not registered, but registrars issue burial certificates in accordance with the *Cemeteries Act* 1928, and are instructed to keep a memorandum of each case notified.

Deaths must, under a penalty not exceeding £10, be notified to the local registrar within seven days by the occupier of the house in which the death occurred or by the doctor or nurse present at the death, and must be registered within 21 days by a person present at the death or in attendance during last illness of the deceased. Sudden deaths and deaths of boarded-out children under five years of age should, however, be reported to the Coroner, and registered by him or on his authority.

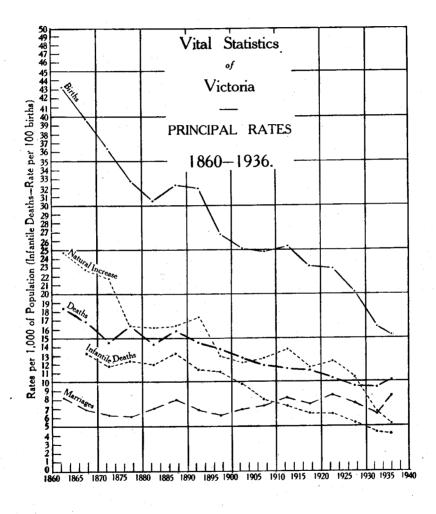

Summary of The principal numbers and rates—male and female—Vital Statistics, relating to Vital Statistics in Victoria are given in the following table:—

SUMMARY OF VITAL STATISTICS, VICTORIA, 1936.

Division.		Mean Population.	N	umber of	. .	Ra per 1, Popul	Deaths under

MARRIAGES.

Number			 	15,915
Rate per 1,000	of popula	ation	 	8.61

MARRIAGES.

Marriages—Marriages in Victoria in 1936 numbered 15,915, corresponding to a rate of 8.61 per 1,000 of the population. Rates for previous years were 8.38 in 1935, 7.57 in 1934, 6.96 in 1933, and 6.49 in 1932. The highest rate since 1857—9.85, was recorded in 1920. This was mainly due to the marriages of a large number of soldiers after their return to civilian life. The lowest rate recorded in the history of the State was 5.66 in 1931. There has been a steady increase in the rate since that year.

The following table shows the number of marriages, the quarters in which they were registered, and the proportion per 1,000 of the population, since 1854:—

MARRIAGES IN EACH QUARTER, VICTORIA, 1855 TO 1936.

	Average		Quarter of	Registration.		Rate
Period.	Annual Number of Marriages.	March.	June.	September.	December.	1,000 of Mean Population

^{*} Not available.

The ordinary marriage rate—per 1,000 of the total population—like birth and death rates similarly estimated, is somewhat unreliable in comparatively newly settled countries like Australia, especially in earlier periods, but it affords a ready and approximate comparison between years not widely separated.

Marriage Rates The following statement shows the marriage rate per in Australasia. 1,000 of the population in each of the Australian States and in New Zealand, for the last five years:—

Year.	Vic- toria.	New South Wales.	Queens- land.	South Aus- tralia.	Western Aus- tralia.	Tas- mania.	Aus- tralia.	New Zealand
				÷.		·		1 :

The proportion of minors marrying has steadily decreased since 1931.

Age at The mean ages at marriage, according to conjugal condition, are shown in the following table for each of the last five years:—

MEAN AGE AT MARRIAGE, 1932 TO 1936.

	1	Bride	grooms.	Brides.						
Year.	Bachelors.	Divorced.	Widowers.	All Bride- grooms.	Spinsters.	Divorced,	Widows.	All Brides		
1932	28.02	40.15	47.88	29.50	25.19	35.31	43.19	26.05		
1933	28.09	40.23	48.80	$29 \cdot 45$	25.26	36.09	43.52	26.10		
1934	28 26	40.89	49:61	29.68	25.40	35.21	45.32	$26 \cdot 25$		
1935	28.32	40.84	49.99	$29 \cdot 72$	25.46	36 10	44.88	26 · 35		
1936	28 41	40.30	49.80	$29 \cdot 76$	25.58	35.81	44.97	26:37		

In 1936 the mean age at marriage of bridegrooms of brides under 45 was 28 90 years, while for brides under 45 the age was 25 51 years.

Marriage records for 1936 show that 87.7 per cent. of the bridegrooms and 92.6 per cent. of the brides were Australian born, while 9.5 per cent. of the grooms and 5.9 per cent. of the brides were born in Great Britain and Ireland. Of all persons married 90.2 per cent. were born in Australia, 7 per cent. in New Zealand, 7.7 per cent. in Great Britain and Ireland, 4 per cent. in other British Possessions, and only a small proportion (1.0 per cent.) were natives of foreign countries. The numbers born in Australia and other countries are shown in the subjoined table for the years 1916 and 1936:—

BIRTHPLACES OF PERSONS MARRIED, 1916 AND 1936.

Note. In this table deserted men are included with bachelors and deserted women with spinsters.

The proportions of widowers and widows remarrying per 100 marriages, declined from 7.7 and 5.8 respectively in 1905-09 to 5.4 and 3.3 in 1932-36. During the same period the proportion of re-marriages of divorced men increased from .5 to 2.0, and of divorced women from ·7 to 1·9. The increased proportion of divorced persons remarrying reflects the higher number of decrees for dissolution of marriage granted in recent years. The numbers of such decrees granted and of remarriages of divorced men and women in each decade since 1900 were as follows:-1900-09-decrees granted 1,208, remarriages of divorced men and women, 418 and 554; 1910-19decrees granted 2,258, remarriages 867 and 1,096; and 1920-29decrees granted 4,392, and remarriages 2,125 and 2,116. In 1936, decrees granted numbered 685, and remarriages 331 and 322.

Marriages in religious of religion was 14,517, representing 91·22 per cent. of the total marriages. Civil registrars performed 1,398 marriages, or 8·78 per cent. of the total.

The numbers and proportions of marriages solemnized according to the rites of the principal religious denominations and of those performed by registrars of marriages, for the years 1916, 1926, and 1936, are shown in the following table:—

Marriages of Jews and Quakers are exempted from the law relating to marriages in Victoria, and are deemed legal and valid if celebrated according to their respective usages.

BIRTHS.

The number of births registered in Victoria during the year 1936 was 28,883. This was 999 more than the number registered for the preceding year. The rate per 1,000 of population (15 63) was the highest experienced in Victoria since 1931. The lowest rate recorded was 15 16 in 1935. Stillbirths, which are excluded from both births and deaths, numbered 828, and correspond to a ratio of 28 7 per 1,000 infants born alive in 1936. There were 1,050 male to every 1,000 female births in 1936, as compared with 1,037 in 1935, 1,036 in 1934, 1,042 in 1933, and 1,051 in 1932.

In young communities, birth rates calculated per 1,000 of the population are to some extent unreliable and misleading. In the earlier periods, when, owing to immigration, the population consists for the most part of men and women at the reproductive period of life,

such rates are naturally high. As time proceeds, however, notwithstanding that immigration of reproductive adults may be maintained, the proportion of such adults to the total population must diminish, and with it, consequently, the birth rate. It is clear, however, that other powerful factors are tending to reduce the birth rate.

The following table shows the number of births—male and female—the quarters in which they were registered, and the proportion per 1,000 of the population since 1854:—

BIRTHS IN EACH QUARTER, VICTORIA, 1855 TO 1936.

^{*} Not available,

The following statement shows the birth rate per 1,000 of the population in each of the Australian States and in New Zealand for the last five years:—

	Tear.	Vic- toria.	New South Wales.	Queens- land.	South Aus- tralia.	Western Aus- tralia.	Tas- mania.	Aus- tralia.	New Zealand.
1932		15.18	17.40	18.56	14 · 71	18.31	19.78	16.86	17.09
1933		15.59	16.99	18 · 14	15.32	17.95	19.93	16.78	16.59
1934		15 20	16.52	18.17	14.50	17.66	19.51	16.39	16.47
1935		15.16	16.89	18.31	14 · 14	18.23	19.41	16 55	16.13
1936	•••	15.63	17.31	19·17	15.17	18.84	19.84	17 · 13	16.64

The birth rate in England and Wales was 14.8 in 1936.

Birthplaces of parents of nuptial children.

The birth records of children born in wedlock show that, in Victoria in 1936, 82 out of every 100 children were born to Australian parents, and 96 out of every 100 to one or both parents born in Australia. Of the total fathers, the percentages born in the States or countries mentioned hereafter were as follows: -77 8 in Victoria; 86.8 in Australia; 0.7 in New Zealand; 7 1 in England and Wales; 2 1 in Scotland; 0 8 in Ireland; 0 6 in other British Possessions; and 1.9 in foreign countries. The corresponding percentages for mothers were: - Victoria, 81 0; Australia, 90.7; New Zealand, 0.5; England and Wales, 5.2; Scotland, 1.5; Ireland, 0.5; other British Possessions, 0.4; and foreign countries, 1.2.

The average ages of fathers and mothers of nuptial Ages of children whose births were recorded in 1936 were 32.77 and parents of nuptial 29.12 years respectively, which were 3.87 and 3.61 years respectively above the average ages of bridegrooms marrying brides under 45 years of age, and of such brides, for the year 1936. The proportions of both parents in various age groups are shown in the following table for the year mentioned:

PARENTS OF NUPTIAL CHILDREN IN PERCENTAGE OF AGE GROUPS, 1936.

Father.		Mother.				
Age Group.	Percentage of Total Parents.	Age Group.	Percentage of Total Parents.			
Under 20	. 53	Under 20	4 48			
20 to 24	11.83	90 to 94	24 21			
25 to 29	26 95	05 to 90	30 65			
30 to 34	$27 \cdot 39$	30 to 34	22 23			
35 to 39	17.90	35 to 39	13 32			
40 to 44	$9 \cdot 19$	40 to 44	4 69			
45 to 49	$4 \cdot 20$	45 and over	42			
50 and over	2.01					
Total	100.00	Total	100.00			

It will be seen that, on the experience of 1936, 54.86 per cent. of the mothers were between ages 20 and 30, and 35 55 per cent. between ages 30 and 40. The proportions of fathers at these ages were 38.78 and 45.29 per cent. respectively. Of every 1,000 nuptial births, about 45 were to mothers under 20 years, and about 4 to mothers aged 45 years and upwards.

The following table shows the number of births (allotted municipalities to the place of usual residence of the mother), and the births per 1,000 of the mean population in Greater Melbourne, other principal towns, and the remainder of the State for the five-year periods 1923 to 1927 and 1928 to 1932, and the last three years:—

^{*} Included in Remainder of Metropolis. † Not calculated. Note: - The boundaries of Greater Melbourne were re-defined in 1929.

Multiple births. The number of cases of multiple births and the proportion per 1,000 of the total cases of births in Victoria in the last five years were as follows:—

CASES OF TWINS AND TRIPLETS.

Year.		Cases of Twins.	Cases of Triplets.	Total Multiple Cases.	Multiple Cases, per 1,000 of Total Cases.
			i		
1932		250	2	252	9 26
1933		313	2	315	11 22
1934		328	3	331	12.04
1935		297		297	10.76
1936		298	4	302	10.57

On the average of the five years 1932-36 the proportion of mothers giving birth to twins was one in every 94, of mothers giving birth to triplets one in every 12,635, and of mothers of all multiple births one in every 93 mothers.

The Adoption of Children Act 1928 makes provision for Adoption of the legal adoption of children under 21 years of age who have never married. The Adoption of Children Act 1936 provides that for the purpose of legal adoption an infant includes any person over the age of 21 years who has been brought up, maintained, and educated by any person, or two spouses jointly, as his, her or their child under any de facto adoption. This Act further provides that the Court may make an order authorizing two spouses jointly to adopt an infant notwithstanding that one of the spouses is the natural parent of the infant. An adopted child has the right of succession whether under an intestacy or disposition to the real and personal property of an adopter, but not of its natural parent or parents; it has no rights of succession to the property of adopting parents' relatives but has rights in estate of natural parents' relatives Marriage is prohibited between an adopter and an adopted child.

The first registration under the Act of 1928 was effected on 14th October, 1929, and, between that date and the end of the year 1936, the adoptions of 788 male and 1,319 female children have been registered. During 1936 adoptions registered comprised 124 male and 197 female children.

The first provision for the legitimation of children born out of wedlock was made by the Registration of Births, legitimized. Deaths, and Marriages Act 1903. This Act was repealed in 1912, and an Act passed which provided for the legitimation of such children at any time after the marriage of the parents, on the application of the father, provided there was no lawful impediment to the marriage of the parents at the time of the birth. An amending Act passed in 1916 allowed legitimation to be effected on the application of the mother if the father were absent on war service or had died not more than two years prior to the date of her application. Up to the end of 1936 advantage was taken of these Acts to legitimate 3,663 children, of whom 279 were registered in the years 1903 to 1909, 1,347 in 1910 to 1919, 1,374 in 1920 to 1929, 101 in 1930, 85 in 1931, 77 in 1932, 93 in 1933, 79 in 1934, 100 in 1935, and 128 in 1936.

Legitimation Acts are in force in all the States and New Zealand, but there are marked differences in the numbers of legitimations resulting therefrom. In proportion to every 100 children born out of wedlock in 1936, the numbers of legitimations in the various States and New Zealand during that year were as follows:—Victoria, 10·1; New South Wales, 18·9; Queensland, 16·5; South Australia, 12·5; Western Australia, 24·5; Tasmania, 21·2; and New Zealand, 36·6.

Ex-nuntial Births in Victoria. The following table shows the number of ex-nuptial births and their percentage to total births, in Victoria, since 1909:—

There has been an appreciable decrease in the proportion of exnuptial births to total births in Victoria since 1913, the percentage having fallen from 6.03 in that year to 4.40 in 1936.

The percentages in the various States and New Zealand in 1936 were as follows:—Victoria, 4·40 per cent.; New South Wales, 4·53 per cent.; Queensland, 4·81 per cent.; South Australia, 3·05 per cent.; Western Australia, 3·95 per cent.; Tasmania, 4·74 per cent.; Australia, 4·42 per cent.; and New Zealand, 4·53 per cent.

Ex-nuptiality in town and country.

A larger proportion of ex-nuptiality prevails among residents of Greater Melbourne and of the principal towns than in the rural districts of Victoria. During the year 1936, the proportion of ex-nuptial births to total births was 5.32 per cent. in Greater Melbourne, 4.29 per cent. in the principal towns, and 3.35 per cent. in the rural districts.

DEATHS.

The following table shows the number of deaths—male and female—the quarters in which they were registered, and the proportion per 1,000 of the population since 1854:—

DEATHS IN EACH QUARTER, VICTORIA, 1855 TO 1936.

	Average Annual	Sex.			on.	Rate per 1,000

[·] Not available.

The death rate gradually declined from 18.44 in 1860-64 to 9.50 in 1930-34. The lowest death rate (8.93) in the history of the State was recorded in 1930. It remained low for the following three years, but in 1934 it rose to its maximum since 1923. There has been little fluctuation in the death rate during the last three years.

The number of deaths in 1936 was 18,778, which was 1,098 more

than the average of the preceding five years.

In 1936 there were 1,138 male to every 1,000 female deaths, the average for the last five years being 1,143. The corresponding proportion of male to female births in the quinquennium was 1,043. The natural increase for the five-year period was 50,308 (males, 23,644; females, 26,664).

A reliable estimate of the improvement in the health of the community is obtained by comparing the death rates for groups of ages at different periods. Such rates for Victoria are given in the subjoined table for the periods 1891-1900, 1902-11, 1912-21, and 1922-33:—

DEATH RATES IN CERTAIN AGE GROUPS IN VICTORIA.

	Avera	ge Annual Deaths	per 1,000 at each	age.

55 to 64	23 · 64	18.80	17.46	16.06
85 to 74	45.87	46.71	42 01	38.68
5 and upwards	124 · 33	131 · 77	136 · 61	114.31
All Ages	12:36	10.66	10.35	9 · 10

The figures show that at all ages lower death rates were experienced for both males and females during the period 1922-33 than in the previous periods.

The following statement shows the death rate per Death Rates in 1,000 of the population in each of the Australian States

and in New Zealand for the last five years:-

Year.	Vic- toria.	New South Wales.	Queens- land.	South Aus- tralia.	Western Aus- tralia.	Tas- mania.	Aus- tralia.	New Zealand.
1932	9 · 29	8.27	8.35	8:58	8.54	8.90	8.63	8 02
1933	9.59	8 58	8.84	8.44	8.64	9.60	$8 \cdot 92$	7.98
1934	10.18	8.95	8 · 57	9.26	9 · 23	10.23	$9 \cdot 32$	8.48
1935	10.03	9.28	9.16	8 · 83	9 · 25	10 · 25	9.46	8 · 22
1936	10.16	9.14	8.78	9.30	9.40	10.34	9.43	8.75

The death rate in England and Wales was 12 1 in 1936.

The differences in the age and sex constitutions of the populations of the six States have been taken into account in computing their respective indexes of mortality. The results for each are based upon a standard population, distributed according to sex, into eleven age groups. Mortality indexes for each State for the years 1933 to 1936, as compiled by the Commonwealth Statistician, are as follows:—

INDEX OF MORTALITY FOR AUSTRALIA, 1933 TO 1936.

	Index of Mortality for-											
Year.	Victoria.	New South Wales.	Queens- land	South Australia.	We st ern Australia	Tasmania.	Australia.					
1933	8.74	8 · 52	9.10	7.66	8 74	8 86	8 62					
1934	9 30	8.96	8.84	8.39	9 45	9.43	9.04					
1935	9.08	9 18	9:39	7 · 97	9:47	9 54	9 10					
1936	$9\cdot 23$	9-12	9.02	8.36	9.62	9.60	9.12					

The following table, computed on the basis of allotment Openth rates in of all deaths to the place of usual residence, shows the Municipalities number of deaths, and the deaths per 1,000 of the mean population in Greater Melbourne, other principal towns and the remainder of the State for the five-year periods 1923 to 1927 and 1928 to 1932, and the last three years.

PERCENTAGE OF DEATHS OF RESIDENTS OF GREATER MELBOURNE, REST OF STATE, AND VICTORIA, OCCURRING IN PUBLIC HOSPITALS IN CERTAIN PERIODS SINCE 1910.

	 1910-14.	1920-24.	1925-29.	1930-34.	1935.	1936.
Greater Melbourne Rest of State Victoria	 $24 \cdot 3^{\circ} \ 17 \cdot 0 \ 20 \cdot 4$	$27 \cdot 0 \\ -21 \cdot 2 \\ 24 \cdot 3$	$ \begin{array}{r} 29.5 \\ 23.7 \\ 27.0 \end{array} $	$27 \cdot 7$ $26 \cdot 3$ $27 \cdot 1$	$27 \cdot 5 \\ 27 \cdot 3 \\ 27 \cdot 4$	$28 \cdot 4 \\ 24 \cdot 2 \\ 26 \cdot 6$

The proportion of residents of Greater Melbourne dying in public hospitals increased slightly between 1910-14 and 1925-29, but since the latter period has shown a tendency to decrease. In the rest of the State the proportion, which in 1910-14 was 30 per cent. below that of Greater Melbourne, increased constantly in each period until in 1930-34 it was slightly below the proportion for the metropolis. In

1935 the proportions for Greater Melbourne and the rest of the State were 27.5 and 27.3 respectively. In 1936 the proportion for Greater Melbourne rose to 28.4 while that for the rest of the State dropped to 24.2.

The percentage of deaths occurring in the other public institutions of the State was 5.94 in 1936 and 6.37 in 1935. The rate in the metropolis is considerably higher than the rate for the rest of the State.

In 1936 the number of deaths in public institutions was 6,110, of

which 3,765 were of residents of Greater Melbourne.

Ocaths in Metropolitan public Metropolitan public institutions.

The number of deaths in each metropolitan public institution in 1936 is given in the subjoined table:—

Of the 4,326 deaths in the above institutions, 2,483 were males and 1,843 were females.

In Greater Melbourne, in the decade 1927-36. there was an average of 10·12 deaths per 1,000 of the population, as compared with 15·76 in the decennium 1892-1901. The reduction in the rate represents a saving of approximately 56,000 lives in the last ten years. That the sanitary conditions of the metropolis have greatly improved is evidenced by a comparison of the death rates from tubercular and certain other diseases for the period 1927-36 with those for the decennium 1892-1901. The following are the rates:—

		Deaths p	Average Annual er 1,000,000 of P	opulation.
Cause of Death.		1892–1901.	1927–36.	Decrease in 1927–36.
Pulmonary Tuberculosis		1,654	538	1,116
Other Tubercular Diseases		446	88	358
Typhoid Fever	••	293	8	285
Scarlet Fever		33	12	21
Measles		215	13	202
Diphtheria	••	196	64	132
Total		2,837	723	2,114

The figures show that the mortality from the six diseases mentioned declined by 75 per cent. in 1927-36—the decline representing a rate of 2,114 per million of the population.

The mortality from all causes showed a net decline of 5,640 per million of the population during the period mentioned.

The mortality of children under one year in proportion to births reveals a constant decline since 1890—the deaths per 1,000 children born having fallen from 133 in 1885–89 to 42 in 1932–36—a reduction of 68 per cent. In other words, where 100 infants died in the earlier years, only 32 died in the last five years.

The reduction has been contributed to by various health acts and educative measures, including the notification of infectious diseases, the regulation of the manufacture, sale, and distribution of foodstuffs and patent medicines, and the ensuring of a pure milk and water supply. The passing of the Midwives Act in 1915 and the inauguration of the

Infant Welfare movement in 1917, coincide with, and, in a large degree, account for the reduction of the rate in the later years. Particulars of the latter movement will be found in Part "Social Condition" of this volume.

The infantile death rates for Greater Melbourne, the remainder of the State, and the whole State, for different periods since 1879, are shown in the following table:—

INFANTILE MORTALITY IN VICTORIA, 1880 TO 1936.

In computing birth and death rates the system was introduced in 1923 of allotting all births and deaths to the place of usual residence of the parties. In the cases of births and infantile deaths the mother's residence is considered to be that of the child. This accounts for the slight increase in the rate for the remainder of the State in the period 1920–24, and a corresponding decrease in the rate for the Metropolis.

During the last decade the infantile death rate declined from 56·1 in 1927 to 42·3 in 1936. The most pronounced fall in the period occurred in 1929, the rate decreasing from 55·6 in the previous year to 47·2. Following 1929 the rate continued to decline each year until in 1933 the record low rate of 40·4 was recorded. In 1934 the rate increased sharply to 44·6 but dropped in the following year to 41·2.

Infantile deaths in and the deaths per 1,000 births in Greater Melbourne, other principal towns, and the remainder of the State for the five-year periods 1923–27 and 1928–32, and the last three years were as follows:—

[†] Not calculated.

The prejudicial effect of city surroundings on infant life is evidenced by the higher rate of infantile mortality in urban than in country districts. During the years 1932–36 the deaths of children under 1 year of age to every 1,000 births were 45 in Melbourne, 45 in Ballarat, 42 in Bendigo, and 53 in Geelong, as against 39 in the remainder of the State.

An investigation into the experience in regard to infantile mortality over a period of years discloses that the decrease infantile Mortality at in the infantile death rate, since the earlier periods, has been different ages. shared proportionately by each sex, and also by each age period, except that of "under one week." The rate per 1,000 births of infants "under one week," which in 1936 comprised 50 per cent. of the total infantile mortality, has varied from 21.5 in the quinquennium 1910-14 (the earliest years for which the information is available) to 23.7 in 1920-24 and 21.1 in 1936. Between 1910-14 and 1932-36 the mortality of infants "one week and under one month" decreased by 52 per cent. and that of infants "one month and under one year" by 64 per cent. Victoria lost, between the ages of one month and one year, sixty-four out of every 1,000 children

On the average of the years 1932-36, the total rate for males was higher than that for females by 27.3 per cent.

born in 1900-04, thirty-three in 1915-19, and fifteen in 1932-36.

The tables which follow show the proportion of deaths of infants at various ages under one year for certain periods since 1899, and male and female death rates at each age period for the year 1936:—

An examination of the principal causes of infantile mortality over a period of years and at various ages reveals the direction in which an improvement has been achieved, and discloses those causes and factors to which future investigations need be directed if the decline in the rate is to be maintained. In the following tables the mortality under one year of age from the principal causes is given for various periods since 1890, and in age groups for 1936.

The mortality of infants under one year from pre-natal causes (malformations, congenital debility, prematurity, injury at birth etc.) was 27.5 per 1,000 births in 1932-36 and represented 65 per cent. of all infants who died. Variations in classification in the earlier

years prevent exact comparison but no appreciable decline is evident. The rate in 1936 was 26.2, of which 76 per cent. occurred in the first week of life.

The mortality from the chief preventable diseases—infectious, respiratory, and diarrheal—has declined from 40·1 per 1,000 births in 1901-10 to 27·9 in 1911-20 and 11·5 in 1932-36. Of these causes, deaths from diarrheal diseases declined from 24·6 per 1,000 births in 1901-10 to 2·3 in 1932-36, the main respiratory diseases from 8·1 to 6·3 and the infectious from 7·3 to 2·8. It will thus be seen that since the beginning of this century mortality of infants from diarrheal diseases has been reduced by 91 per cent.; the main respiratory diseases by 22 per cent.; and the infectious by 62 per cent. Of recent years respiratory diseases have displaced diarrheal as the most fatal of the preventable infantile diseases. With few exceptions the mortality rate of males from infantile diseases is consistently higher than that of females.

The following table shows the number of deaths from the principal causes, and the death rate of infants under one month for Greater Melbourne and the whole State, for the years 1932 to 1936:—

DEATHS OF INFANTS UNDER ONE MONTH, 1932 TO 1936.

A survey of the mortality from pre-natal causes is not and Infantile complete without taking into account the loss due to still-births. In Victoria stillbirths are not registered, but cases are notified to registrars in accordance with the provisions of the Cemeteries Act and the (Commonwealth) Maternity Allowance Act. Rates based on these notifications should be regarded as minimum rates, as they possibly understate the full extent of the loss.

The following table contains information relating to stillbirths and infantile mortality in Victoria for the years 1927 to 1936.

	Percentage of Still- births to—				Deaths of Infants under One Year per 1,000 Birtins.							
Year			Exc	lusive of Stillb	irths.	-						
1 car	Living Births.	All Births.	Under One Month.	One Month and under Twelve Months.	Total under One Year.	*Inclusive of Stillbirths.						
1927		3.0	2.9	31.3	24.8	56.1	83 · 8					
1928		$2 \cdot 8$	2.7	$29 \cdot 5$	26 · 1	55.6	80.9					
1929		$3 \cdot 1$	3.0	$30 \cdot 4$	16.8	$47 \cdot 2$	76.0					
1930		$3 \cdot 0$	2.9	$28 \cdot 0$	18.5	46.5	74 2					
1931		$2 \cdot 8$	$2 \cdot 7$	28.6	15.9	44.5	70.4					
1932		$2 \cdot 9$	2.8	$27 \cdot 2$	15.8	43.0	69 9

1934		3.1	3.0	$27 \cdot 7$	16.9	44.6	73.6					
1935		$3 \cdot 0$	2.9	$27 \cdot 6$	13.6	$41 \cdot 2$	69.5					
1936		$2 \cdot 9$	2.8	26 6	15.7	42 3	69.0					

^{*} In the computation of the rates for the numbers inclusive of stillbirths, the latter are taken into account in both births and deaths.

It will be seen that, as with other mortality due to pre-natal influences, the rate of stillbirths shows little tendency to decrease.

On the average of the last ten years, 93 in every 1,000 ex-nuptial infants died within a year, as against 44 in every 1,000 nuptial children. It is thus seen that the proportion of ex-nuptial children dying before the age of 1 year is 2·1 times that of nuptial children. In the year 1936 the mortality rate of nuptial infants was 40·2 per 1,000 births. The children born out of wedlock during the same year numbered 1,272, and the deaths of ex-nuptial infants were 111, the death rate being thus 87·3 per 1,000 births. With the view of ascertaining the chief reasons for the marked disproportion in the mortality rates of the two classes the following table has been constructed, showing the

deaths from certain causes per 1,000 nuptial and ex-nuptial births, for the periods 1904-08, 1914-18, 1924-28 and the year 1936:

DEATH RATES OF NUPTIAL AND EX-NUPTIAL INFANTS FROM CERTAIN CAUSES.

	Deaths under One Year per 1,000 Births.										
Cause of Deatn.		Nupt	ial.	Ex-nuptial.							
	1904-08.	1914–18.	1924-28.	1936.	1904–08.	1914–18.	1924–28.	1936.

Total, all Causes	75.3	62.8	54.2	40.5	202.0	162.6	112.3	87:3			

[•] Not including "Injury at Birth" and "Other Diseases peculiar to Early Infancy."

The rates for the last five years show that of every 1,000 children born out of wedlock 9.2 died from diarrhead diseases within a year, as compared with 2.0 deaths per 1,000 nuptial infants from the same cause. Owing to a larger proportion of the former children being deprived of breast food a higher mortality from these diseases might be expected among them than among nuptial infants, but the striking differences in the death rates from this cause and from the chief respiratory diseases indicate considerable neglect in the rearing of ex-nuptial infants. The rates from bronchitis, broncho-pneumonia, and pneumonia were 18.1 and 5.7 per 1,000 births respectively.

In 1936 pre-natal causes (malformations, congenital debility, prematurity, injury at birth, etc.) accounted for 37, or 33 per cent.

of the total deaths of ex-nuptial infants.

Infantile mortality in Australasia. The following statement shows the infantile death rate per 1,000 births in each of the Australian States and in New Zealand, for the last five years.

Year.	Vic- toria.	New South Wales.	Queens- land.	South Aus- tralia.	Western Aus- tralia.	Tas- mania.	Aus- tralia.	New Zealand.
1932	43.00	40.98	40.19	36.62	44.57	41.19	41.30	31 · 22
1933	40.43	39.35	42.74	32 · 13	36 · 83	41.07	$39\cdot 52$	31 · 64
1934	44 · 63	46.36	40 · 61	35.58	40.89	42.28	43 · 59	32.11
1935	41 · 17	39 · 44	37 · 26	34 · 95	40.15	51 · 84	39.78	32.26
1936	42.31	43 · 47	36.20	31 · 09	42.22	49.55	41 · 16	30.96

In the year 1936 the infantile mortality rates recorded for the Australian States showed that South Australia had the lowest rate and Tasmania the highest.

The infantile death rate in England and Wales was 59 in 1936.

The infantile deaths per 1,000 births in the Australasian capitals in 1936 were as follows:—Melbourne, 44·1; Sydney, 41·7; Brisbane, 37·9; Adelaide, 28·6; Perth, 44·2; Hobart, 50·5; and Wellington, 31·9.

Deaths of children under 5 years of age number 6.

In 1936 the deaths of male children under 5 years of age number 6.

numbered 895, and the deaths of female children under that age, 714—the former being in the proportion of 8.95 per cent., and the latter of 8.13 per cent., to the total number of deaths of the respective sexes at all ages.

Ages at the last three years are shown in the following table:—

AGES AT DEATH IN VICTORIA, 1934 TO 1936.

Note.—Ages of very old people are frequently overstated; where particulars are available these are verified from official records.

Of the 55,882 persons who died in Victoria during the last three years 7,384 (or approximately 13 per cent.) were aged 80 years and upwards, and 28—six males and twenty-two females—were stated as having attained or passed the age of 100 years. In 1886 the number of deaths of persons aged 80 years and over represented about 3 per cent. of the total deaths in that year.

The changes that have occurred in the age distribution of the population over the last 50 years are reflected in the above figures.

Causes of Death. The following tables show the causes of death in Victoria according to the international abridged classification for the period 1922-26 and for the last three years:—

CAUSES OF DEATH, VICTORIA, 1922-26, 1934, 1935, and 1936.

No deaths from No. 2 Typhus Fever, No. 3 Small Pox, and No. 9 Plague. Detailed classification numbers in brackets.

Typhoid fever numbered 10, being equivalent to a rate of 5 per million of population, as compared with rates of 9 in 1935, 6 in 1934, 9 in 1933, 7 in 1932, 31 in 1920-24, 108 in 1905-09, and 301 in 1895-99. Cases of typhoid fever reported in 1936 numbered 60, or 32 per million of population, as against 259 in 1920-24, and 2,884 in 1895-99.

The figures show that the mortality from typhoid has been reduced

to very small proportions.

Small-pox - Persons suffering from small-pox have arrived at Victorian ports on many occasions, but, as they were at once quarantined, the disease never spread among the people of the State. During the years 1853 to 1936 only 31 deaths occurred from this cause, and of that number only 8 took place in the last fifty-two years of the period. The last death from small-pox in Victoria occurred in 1921.

Although the mortality from measles has varied very considerably from period to period, there has been no very severe epidemic outbreak since 1898, when 671 deaths resulted from the disease. In 1936 there was 1 death attributed to this cause, representing an approximate rate of 1 per million of the population, as compared with rates of 11 in 1935, 14 in 1934, 7 in 1933, and 9 in 1932.

The disease chiefly affects children. On the average of the five years 1932 to 1936, 42 per cent. of those who died from the disease were under 2 years of age and 64 per cent. were under 5 years.

Scarlet fever. In 1936 the deaths from scarlet fever numbered 14, which corresponded to a rate of 8 per million of the population, as compared with rates of 3 in 1935, 10 in 1934, 7 in 1933, 21 in 1932, and 34 in 1890-92. During 1936 there were 2,122 cases reported, as against 1,458 in 1935, 1,834 in 1934, 2,493 in 1933, and 4,152 in 1932. For the five years mentioned the deaths were less than one per cent. of the cases. Seventy per cent. of these deaths were of children under 10 years of age. According to the experience of the last ten years the chance of dying from the disease is 41 per cent. greater for females than for males.

Whooping cough was responsible for 50 deaths in 1936, which equalled a rate of 27 per million of the population at all ages, as compared with rates of 27 in 1935, 46 in 1934, 21 in 1933, and 15 in 1932. The infantile death rate is more affected than the general rate by this ailment, as it is practically confined to children. In the year under review 32 of the deaths were of infants under 1 year, and all except two of the deaths were of children less than 5 years of age. On the average of the last ten years the mortality rate from the disease was 52 per cent. higher among females than males.

The continued prevalence of diphtheria throughout the State since 1910, is one of the few instances in which morbidity statistics have not revealed material improvement. On the other hand a very great reduction has taken place since 1890, in the proportion of cases which ended fatally.

On the average of the five years 1932 to 1936, 51 per cent. of those who died were under 5 years, and 87 per cent. were under 10 years of age.

The appended table shows for Victoria and Greater Melbourne the reported cases of and deaths from diphtheria, and their proportions to the population, also the ratios of deaths to cases for different periods since 1894:—

Prevalence of diphtheria which occurred in the metro-politan area, the three principal extra-metropolitan cities, and their proportions to the respective populations, for the period 1910-19 and the years 1934, 1935, and 1936 are given in the subjoined table:—

CASES OF DIPHTHERIA.

maq Area z (Albanica)	Rep	orted C	ases of	Diphthe	Annual Cases per 10,000 of Population.				
	1982.	1933.	1934.	1935.	1936.	1910–19.	1934.	1935.	1936.

Remainder of State	2,242	2,152	2,420	1,327	1,491	25.7	33 · 3	18.2	20.

The deaths from influenza in 1936 numbered 83. This corresponded to a rate of 45 per million of the population as compared with rates of 120 in 1935, 171 in 1934, 107 in 1933, 49 in 1932, 2,407 in 1919, 71 in 1913–17, 109 in 1908–12, and 381 in 1890–92.

The rate of mortality was low in 1936, being 64 per cent. below

the average of the previous quinquennium.

Of the deaths recorded in 1936, 49 per cent. were associated with

specified respiratory complications.

With the exception of the 1919 epidemic, when 72 per cent. of the deaths were of persons between 20 and 50 years of age, influenza has always proved more fatal to elderly people than to those at middle or young ages. In 1936, 57 per cent. were of persons over 50 years of age.

Tuberculosis (all forms)

The number of deaths ascribed to tuberculosis during 1936 was 870, the rate per million of population being 471.

This equalled the record low rate recorded in 1933. Tuberculosis of the respiratory system was responsible for 88 per cent. of the deaths from this cause in 1936.

Death rates from tuberculosis of the respiratory system from tuberculosis of in 1936 numbered 762—394 being of males and 368 of the respiratory system.

The deaths from tuberculosis of the respiratory system in 1936 numbered 762—394 being of males and 368 of the respiratory system.

From tuberculosis of the respiratory system in 1936 of males and 368 of the respiratory system.

The deaths from tuberculosis of the respiratory system in 1936 of males and 368 of the respiratory system in 1936 of males and 368 of the respiratory system in 1936 of males and 368 of the respiratory system in 1936 of males and 368 of the respiratory system in 1936 of males and 368 of the respiratory system in 1936 of males and 368 of the respiratory system in 1936 of males and 368 of the respiratory system in 1936 of males and 368 of the respiratory system in 1934, 405 in 1935, 411 in 1934, 405 in 1933, 450 in 1932, 660 in 1918–22, 855 in 1908–12, and 1,365 in 1890–92. The deaths from this cause in Scotland, Northern

Ireland, and the Irish Free State in 1936 were 554, 772, and 894 per million of their respective populations. In 1935 the rate per million of population in England and Wales was 605. The rates of mortality for Victoria at the last six census periods per 10,000 of each sex, in age groups, are shown in the following table:—

DEATH RATES IN VICTORIA FROM TUBERCULOSIS OF THE RESPIRATORY SYSTEM IN AGE GROUPS.

A comparison of the mortality from tuberculosis of the respiratory system at the census periods 1920–22 and 1932–34 shows that lower death rates obtained in each age group in 1932–34 than in 1920–22, and that the improvement was greater among males than females.

The ages and sexes of those who died from tuberculosis of the respiratory system in each of the last five years various ages.

The ages and sexes of those who died from tuberculosis the respiratory system in each of the last five years various ages.

For the year 1936, the average age of those who died from tuberculosis of the respiratory system was 46.2 years for males and 36.6 years for females.

In 1936 there were in Victoria 108 deaths from tubercular Tubercular diseases (excluding tuberculosis of the respiratory system), diseases (tuberculosis which corresponded to a rate of 59 per million of the of the respiratory population, as compared with rates of 64 in 1935, 74 in excepted). 1934, 66 in 1933, 76 in 1932, 134 in 1918-22, 182 in 1908-12. The deaths from similar causes in Scotland, and 379 in 1890–92. Northern Ireland, and the Irish Free State in 1936 numbered 183, 244, and 239 per million of their respective populations. In 1935 the rates per million of population in England and Wales was 113.

In earlier periods, the death rate from tuberculosis was considerably higher in the Metropolis and the mining centres of Ballarat and Bendigo—Bendigo in particular—than in the rural portions of the State. During recent years the rates for Greater Melbourne and Ballarat have declined considerably.

[†] Not calculated.

Other Infectious and Parasitic Diseases.

Deaths in 1936, from diseases included under this heading (cause No. 14, on page 73) were dysentery 2, erysipelas 28, acute poliomyelitis 4, lethargic encephalitis 9, cerebro-spinal meningitis 4, tetanus 18, septicaemia 39, hydatid cysts 16, and other diseases 18.

Acute poliomyelitis was responsible for 4 deaths in 1936, 7 in 1935, 9 in 1934, 7 in 1933, 4 in 1932, 16 in 1931, 12 in 1930, 17 in 1929, 32 in 1928, and 8 in 1927. Of these 116 deaths, 68 were of males and 48 were of females; 6 were under 1 year of age, 26 were between 1 and 5 years, 27 between 5 and 10 years, and 57 over 10 years.

In 1936, there were 10 male and 6 female deaths from hydatids, of which 6 deaths of males and 4 deaths of females were attributed to hydatid tumour of the liver. The deaths from hydatids in 1936 were equivalent to a rate of 9 per million of the population, as compared with rates of 10 in 1935, 13 in 1934, 12 in 1933, 9 in 1932, 16 in 1918–22, 22 in 1908–12, and 51 in 1890–92.

Deaths from cancer in 1936 numbered 2,288, and represented a death rate of 1,238 per million of the whole population, as compared with rates of 1,229 in 1935, 1,190 in 1934, 1,180 in 1933, 1,178 in 1932, 934 in 1918–22, 833 in 1908–12, and 584 in 1890–92. The deaths from this cause in Scotland, Northern Ireland, and the Irish Free State in 1936 were 1591, 1286, and 1,154 per million of their respective populations. For the year 1935 in England and Wales the rate per million of population was 1,656.

Cancer death rates, computed in relation to the general population in earlier and later periods, are not comparable owing to the changed age distribution of the people. Satisfactory comparisons are obtained by comparing the deaths with the number of persons in the community of the same sex, in age groups. This has been done for four census periods, when the numbers of the

people in age groups were accurately known, and the results are given in the appended table:—

DEATH RATES FROM CANCER IN AGE GROUPS.

	Average Ar	nual Deaths from	Cancer per 10,000	of each Sex.

Deaths from cancer occur at all age periods, but the rates in the foregoing table show that it is essentially a disease of later life, increasing rapidly in the groups past middle age, and reaching a maximum mortality rate in the oldest age group.

The numbers dying from cancer in different age groups various ages in each of the last five years are given below:—

DEATHS FROM CANCER AT VARIOUS AGES.

				Males.				. 1	Females	3.	2.5
Age Group.		1932.	1933.	1934.	1935.	1936.	1932.	1933.	1934.	1935.	1936.

Ninety-two per cent. of the deaths from cancer in 1936 were at ages 45 years and upwards.

The widely different social and economic effects produced by the prevalence of and deaths from the two important diseases, cancer and tuberculosis of the respiratory system, are evidenced by the ages of their victims. For the year 1936 the average age of those who died from the former was 65.7 years for males and 63.0 years for females, while the corresponding averages for the latter were 46.2 years for males and 36.6 years for females.

Seat of Cancer. The following table shows the seat of cancer in persons who died from this disease in 1936:—

SEAT OF CANCER, 1936.

Seat of Disease.			Males.	Females.	Total.
	;		 		
Buccal cavity and pharynx			94	11	105
Oesophagus			54	16	70
Stomach, duodenum, liver and biliary	ducts		348	262	610
Pancreas			39	36	75
Intestines, peritoneum and rectum		• • .	211	217	428
Respiratory organs			72	25	97

Other and unspecified organs	• •	••	67	103	170
Total Deaths		••	1,112	1,176	2,288

Forty-nine per cent. of the persons who died from cancer were affected in the digestive tract or peritoneum. Of the females who died from the disease 41 per cent. were affected in the genital organs or breast.

Diabetes. The rate of mortality from diabetes has increased, the average of the last five years being 56 per cent. higher than that for the period 1908-12.

During 1936 diabetes was responsible for 107 male and 204 female deaths, representing a rate of 168 per million of the population, as compared with rates of 168 in 1935, 174 in 1934, 163 in 1933, 164 in 1932, 130 in 1918–22, and 107 in 1908–12.

The deaths from diabetes per 10,000 of each sex in age groups for the periods 1900-02, 1910-12, 1920-22, and 1932-34, are shown in the following table:—

DEATH RATES FROM DIABETES.

All Ages	60	1.26	1.45	2.08					

In 1932-34 the rate for females was 66 per cent. higher than that for males.

Deaths in 1936 from diseases included under this Other General heading (cause No. 20 on page 73) were acute rheumatic fever 99, exopthalmic goitre 42, other diseases of the thyroid and parathyroid glands 14, pernicious anaemia 75, other anaemias 11, leucaemia 48, Hodgkin's disease 29, and other diseases 48.

In 1936, 386 male and 594 female deaths were ascribed Haemorrhage, to these causes, the total—980—corresponding to a rate of Embolism, &c. 531 per million of the population as compared with rates of 513 in 1935, 537 in 1934, 545 in 1933, and 522 in 1932. Of the 980 deaths in 1936, 579 were due to cerebral haemorrhage, 31 to apoplexy 24 to cerebral embolism, 259 to cerebral thrombosis, 5 to softening) of the brain, and 82 to hemiplegia and unspecified paralysis.

Other Diseases of the spinal cord, 53 from epilepsy, 30 from other diseases of the ear and mastoid process, and 139 from other diseases.

During 1936 there were 3,812 deaths ascribed to diseases of the heart, including 16 due to pericarditis, 596 to endocarditis, 2,038 to disease of the myocardium, 568 to diseases of coronary arteries, 169 to angina pectoris, 39 to angina pectoris with record of coronary disease, and 386 to other diseases of the heart. The total causes in 1936 represented a rate of 2,063 per million of the population, the rates for previous years being 2,145 in 1935, 2,012 in 1934, 1,880 in 1933, 1,757 in 1932, 1,347 in 1922–26, and 1,441 in 1908–12. On the average of the three years 1932 to 1934 the deaths from all forms of heart diseases per 10,000 of each sex, in age groups, were as follows:—

DEATH RATES FROM HEART DISEASE AT VARIOUS AGES, 1932-34.

Sex.			Deaths per 10,000 Persons aged—											
		0-14.	15-19.	20-24.	25-34.	35-44.	45-54.	55-64.	65-74.	75 and upwards.	All Ages			
Males Females	· ::	·51 ·40	1·03 1·21	1.03 1.04	1·76 1·76	5·21 4·27	16·97 10·73	54·44 35·43	145·47 97·32	316·23 278·94	20·71 16·97			

The figures indicate that the mortality rate from heart disease increases greatly as age advances. Of the deaths of persons aged 70 and upwards, approximately 1 in 4 is due to some form of this disease.

In 1936 the number of deaths from arteriosclerosis with Arteriosclerosis record of cerebral vascular lesion (cerebral haemorrhage etc.) was 559, and without such record 545. Of the total deaths, 691 or 63 per cent. were persons aged 70 years and over.

In 1936 the deaths from respiratory diseases numbered 1,806, which represented a rate of 977 per million of the population, as compared with rates of 1,050 in 1935, 1,125 in 1934, 998 in 1933, and 917 in 1932. Of the deaths in the year under review, 47 were due to acute bronchitis, 189 to chronic bronchitis, 670 to broncho-pneumonia, 250 to lobar pneumonia, 321 to pneumonia unspecified, 81 to pleurisy, 36 to asthma, 110 to pulmonary congestion, embolism, etc., 73 to chronic interstitial pneumonia, and 29 to other diseases. Further details will be found under causes Nos. 26 to 28 on pages 73 and 74.

The greatest mortality from the respiratory diseases occurs during the months of June, July, and August.

In 1936 there were 586 male and 471 female deaths from digestive ailments, representing a proportion of 572 per million of the population, as against rates of 534 in 1935, 580 in 1934, 541 in 1933, 538 in 1932, 807 in 1922–26, and 2,382 in 1890–92. Deaths from the principal diseases in 1936 were, 158 from ulcers of the stomach and duodenum, 199 from diarrhoeal diseases, 143 from appendicitis, 39 from hernia, 120 from intestinal obstruction, 86 from cirrhosis of the liver, 61 from biliary calculi, 75 from other diseases of the gall bladder and biliary passages, and 176 from other diseases. Further rates and details are given under causes Nos. 29 to 32 on pages 73 and 74.

The 199 deaths from diarrhoeal diseases in 1936 correspond to a rate of 108 per million of the population as compared with rates of 94 in 1935, 152 in 1934, 109 in 1933, 136 in 1932, 380 in 1922–26, 833 in 1908–12, and 1,342 in 1890–92. The age incidence of these diseases shows that they are heaviest at the extremes of life. In earlier years these diseases constituted one of the most fatal menaces to infant life. The decline in the mortality therefrom has however been progressive and since 1928 the rate has reached small proportions. Of the deaths at all ages in 1936, 71 were of infants under one year of age, 16 were between the ages of one and two years, and 11 between two and five years, while 49 were of persons aged 65 years and over. Infantile diarrhoea is further dealt with in the section "Infantile Mortality."

In 1936 there were 1,408 deaths attributed to diseases Diseases of the of the genito-urinary system, which corresponded to a rate genito-urinary system. of 762 per million of the population, as against rates of 754 in 1935, 786 in 1934, 755 in 1933, 704 in 1932, 670 in 1918–22, and 700 in 1909–12. In 1936 acute and chronic nephritis were responsible for 1,059 deaths, other diseases of the kidney, etc., for 91, diseases of the prostate for 178, and other genito-urinary diseases for 80.

Deaths in childbirth.

The death rate of women in childbirth is usually ascertained by comparing the number of deaths of parturient women with the total number of live births. In the following table 12673.—6

are given the proportions of deaths from puerperal septicaemia and all other puerperal causes for each of the last ten years and the averages of previous periods back to 1871. For reasons set forth in the 1931–32 issue of the *Year-Book* the rates given for years prior to 1926 are not strictly comparable with rates for subsequent years.

DEATHS OF MOTHERS (MARRIED AND SINGLE) TO EVERY 10,000 CHILDREN BORN ALIVE, 1871 TO 1936.

The death rate of women from puerperal causes as shown in the above table declined steadily during each period from 1871-80 to 1921-25, but the average rate for the following years showed a considerable increase.

The following tables give information in age groups tor the year 1936 relating to the causes of death of women causes. in childbirth, and the total number of children born to married mothers:—

DEATHS FROM PUERPERAL CAUSES, VICTORIA, 1936.

	Ages at Death.

^{*} Illegal operation 2; self-induced 16; open verdict 31.

Of the 338 children born to the 157 married women who died, 324 were living at the time of their mother's death, or an average of 2.1 children per mother, as compared with 2.3 in 1935, 2.5 in 1934, 2.6 in 1933, and 2.6 in 1932.

First confinements were responsible for 57, or 36 3 per cent. of the total deaths of married mothers, as compared with 25 6 per cent. in 1935, 32 9 per cent. in 1934, 28 6 per cent. in 1933, and 32 4 per cent. in 1932.

Ages at Death of women in childbirth varies considerably at different ages, and is higher at older than at younger ages. The number of deaths of women in childbirth and the death rates in various age groups in Victoria, for the period 1926-30 and the years 1934, 1935, and 1936 are shown in the following table:—

DEATH RATES OF WOMEN IN CHILDBIRTH, IN AGE GROUPS, 1926 TO 1936.

	Mothers.										
Age Group.		Dea	ths.		Deaths per 10,000 children born alive.						
	1926-30.	1934.	19 3 5.	1936.	1926-30.	1934.	1935.	1 9 36.

			1								
Total	985	170	131	181	57.4	61 · 1	47.0	62.7			

The experience of the years 1926-30 showed that, for the age period 35 years and upwards, the deaths of mothers in childbirth were 96 per 10,000 live births, as compared with 47 per 10,000 for those under 35 years of age.

During the year 1936, the deaths of 613 men and 644 women were ascribed to senile decay, as compared with 480 men and 530 women in 1935. Prior to 1927, deaths from ill-defined causes, i.e., heart failure, debility, etc., of those persons over 65 years of age, were shown as being due to senile decay. In 1927, however, in accordance with the rule laid down in the International List of Causes of Death, only deaths of persons over 70 years of age from such causes

were included therein. The deaths at ages 70 and over from all causes during 1936 numbered 7,568—3,832 of men and 3,736 of women, or 40.3 per cent. of the total deaths.

Accidental violence.

In 1936, 762 male and 228 female deaths were attributed to accidents and negligence, which represented a rate of 536 per million of the population. This proportion was above the average rate—471—for the previous five years, and 34 per cent. below the rate—811—for 1890–92. In 1931 a distinction was made for the first time between deaths recorded as "open verdiet" and those returned definitely as "accidental." The numbers of deaths from various accidents in the last five years are given in the appended table:—

DEATHS FROM ACCIDENTAL VIOLENCE, 1932 TO 1936.

Grand Total	769	833	934	974	990	762	228			

On the average of the last five years the female mortality rate from accidents was about 30 per cent. of the rate for males.

Transport Accidents. In 1936, deaths from transport accidents numbered 508, as against 440 in 1935, 385 in 1934, 350 in 1933, 350 in 1932, 373 in 1931, 406 in 1930, 394 in 1929, 382 in 1928, and 301 in 1927.

During the year 1936, deaths connected with methods of transport represented 51 per cent. of the total deaths from accidents.

In the following table details are given of deaths due to collisions between various types of conveyances, pedestrians killed, and other fatal accidents in which transport was concerned, for the year 1936:—

^{*} Includes all rail accidents to railway employees (collisions excepted) and accidents to persons boarding or leaving vehicles.

[†] Includes 7 railway employees.

Accidental The number of motor vehicles (including motor cycles) registered in Victoria and the deaths in which they were motor vehicles. involved, for the years 1927 to 1936, were as follows:—

DEATHS INVOLVING MOTOR VEHICLES, 1927 TO 1936.

	Year.		Number of Motor	Deaths Involving Motor Vehicles.						
			Vehicles (30th June.)	Number.	Per 10,000 Motor Vehicles.	Per 1,000,000 of Population				
1927			134,135	214	16.0	124				
1928			150,343	297	19.8	170				
1929			168,578	2 94	17.4	166				
1930	• •		179,887	307	17.1	172				
1931			168,231	296	17.6	165				
1932			167,952	262	15.6	145				
1933		• • •	179,602	255	14.2	140				
1934			188,256	294	15.6	161				
1935	• •		200,759	338	16.8	. 184				
1936			219,925	395	18.0	214				

It will be observed that, while registrations of motor vehicles increased greatly during the years mentioned, the mortality per 10,000 vehicles fluctuated only slightly with a tendency to decline, the average rate for the period 1932–36 being 16·1 as compared with a rate of 17·6 in 1927–31.

The mortality per million of population was 214 in 1936, 161 in 1934, and 82 in 1924. The mortality rate in 1936 was the highest on record.

On the average of the five years, 1932 to 1936, motor cars, etc., were involved in 16.6 deaths per 10,000 cars registered, and motor cycles in 25.4 deaths per 10,000 motor cycles registered.

In the year 1936, 155 males and 43 females took their lives. The deaths represented a rate of 107 per million of the population, as compared with rates of 90 in 1935, 93 in 1934, 103 in 1933, 96 in 1932, 87 in 1918–22, 102 in 1908–12, and 109 in 1890–92. Of the 155 male deaths in 1936 from suicide, 60 or 39 per cent. were connected with firearms. A much lower rate from suicide obtains among females than males, the rate for the former being 29 per cent. of that for the latter on the average of the last five years.

Homicide. The deaths ascribed to homicide in 1936 numbered 18, of which 13 were of males and 5 of females. These represented a rate of 10 per million of the population, as against rates of 13 in 1935, 14 in 1934, 16 in 1933, 9 in 1932, 14 in 1918–22, and 19 in 1908–12. Since 1930 deaths from criminal abortion have been excluded from these figures and included with deaths from puerperal causes.

NATURAL INCREASE

Natural The average annual natural increase, i.e., the excess of births over deaths, per 1,000 of the mean population, in the various Australian States, the Commonwealth of Australia, and New Zealand, for different periods since 1909, as well as detailed particulars for Victoria since 1879, are shown in the following tables:—

NATURAL INCREASE PER 1,000 OF THE MEAN POPULATION.

AUSTRALASIA.

Period.	Victoria.	New South Wales.	Queens- land.	South Australia.	Western Australia.	Tasmania.	Australia.	New Zealand.
