NOTES ON THE JUNE QUARTER ESTIMATES

MAIN FEATURES

NOTE: Changes in individual quarters are necessarily subject to the uncertainties discussed in the explanatory notes under interpretation of quarterly estimates, and furthermore some may be substantially revised as firmer data come to hand. This applies particularly to the estimates for the two most recent years for gross operating surplus, the income of companies and non-farm unincorporated enterprises, depreciation, and therefore to the estimated magnitude of change in gross non-farm product.

ESTIMATES OF MAIN AGGREGATES AT AVERAGE 1974-75 PRICES, SEASONALLY ADJUSTED

| | Percentage Change | | Percentage points Contribution to Growth in GDP | |
|--|---------------------------------------|--------------------------------------|--|--------------------------------------|
| | March qtr 1980 to June qtr 1980 | June qtr 1979 to June qtr 1980 | March qtr 1980 to June qtr 1980 | June qtr 1979 to June qtr 1980 |
| | | | | |
| Final consumption expenditure | | | | |
| Private | -0.5 | 2.6 | -0.3 | 1.5 |
| Government | 0.5 | 4.8 | 0.1 | 0.8 |

| Gross non-farm product | 1.2 | 4.5 | 1.1 | 4.2 |

n.a. not applicable.

In current price seasonally adjusted terms, wages, salaries and supplements rose by 3.5 per cent in June quarter 1980, while gross operating surplus of trading enterprise companies increased by 8.9 per cent in the same period.

The following notes are provided to aid analysis of the estimates for recent quarters.

Wages, salaries and supplements

Because of apparent understatement of recent growth in employment as recorded in the civilian employees series, a small upward adjustment has been made to estimates of wages, salaries and supplements in 1979-80. As explained in paragraphs 4 to 6 of the explanatory notes in the April issue of *Civilian Employees, Australia* (6213.0) further publication of the civilian employees series will be delayed while investigations are conducted into estimation methods, the source data for the series and consistency with information available from other sources.

The seasonally adjusted estimates of wages, salaries and supplements for the March and June quarters of 1980 show increases of 3.7 per cent and 3.5 per cent respectively. The timing of the six monthly National Wage Case decision which awarded a 4.5 per cent increase from 4 January 1980 and the turnaround in the statistical discrepancy between March and June

quarters indicate that the timing of recording the wage changes may be deficient. The movements in the wages series could also provide some of the explanation for the large changes in the household saving ratio in the March and June quarters (see below).

Stock valuation adjustment

The estimates of the stock valuation adjustment (SVA) have been affected by rapid changes in commodity prices (particularly petroleum products and non-metallic minerals) during recent quarters. The size of the SVA is dependent on stock levels and price changes within each sector and on the assumptions used in its compilation. The major assumptions are:

- . that the book value levels are based on business accounting valuations at historical cost assigned by FIFO (first in, first out) method;

- . that, within most sectors sales prices can be used to adjust stock levels valued at cost, that is the selling price of finished goods is established as a fixed mark-up on the costs incurred in the current period;
- . that the commodities in stock have fixed turnover periods, that is, the ratios 'stock level of materials/value of purchases' and 'stock level of finished goods/value of sales' remain constant;
- . that the commodity composition of each estimation cell remains fixed; and
- . that within each estimation cell, the RATE of physical increase (or decrease) in stocks is constant throughout each quarter.

In times of rapid price change, deficiencies in these assumptions can lead to significant errors in the SVA. There were very marked increases in the prices of most non-metallic minerals during December 1979 and March 1980 quarters, followed by a decline in these prices in June quarter 1980. The extent of the change in the SVA between March 1980 and June 1980 quarters appears to have been exaggerated (the SVA being too high in March and too low in June). If this were so, movements in gross domestic product in these two quarters would be affected as a result. However, because it is deducted from both sides of the domestic production account, errors in the SVA have no impact on the size of the statistical discrepancy.

Statistical discrepancy

The statistical discrepancy represents the difference between the sum of estimates of gross domestic product and imports of goods and services on the one hand and the sum of the estimates of components of gross national expenditure and exports of goods and services on the other hand. Conceptually these two totals are the same. The inclusion of the statistical discrepancy on the expenditure side of the domestic production account is a convention and does not necessarily imply that the sum of the income components more accurately measures GDP than the sum of the expenditure components.

The aspect of the statistical discrepancy which is of most concern in the quarterly context is the magnitude of change from one quarter to the next. There was a turnaround in the seasonally adjusted constant price statistical discrepancy in the June quarter of \$372 million. Another way of examining the significance of the statistical discrepancy is to compare the change in GDP or gross non-farm product as published with the result which would be obtained using the expenditure aggregates excluding the statistical discrepancy. The difference between income and expenditure based estimates of the change in gross non-farm product in the June quarter 1980 (1.2 per cent compared to -1.1 per cent) indicates that inconsistencies in the timing of recording of transactions may be particularly marked in these estimates for the June quarter.

Implicit price deflator – gross non-farm product

The rate of increase in the implicit price deflator (IPD) for gross non-farm product has tended to be somewhat erratic during the past few quarters (increases of 1.5 per cent, 4.5 per cent and 1.8 per cent in December 1979, March 1980, and June 1980 quarters respectively.) The rate of increase in the IPD for gross non-farm product was higher in March quarter 1980 than in either December quarter 1979 or June quarter 1980 because of the timing of recent National Wage Case decisions, and the rapid increase in non-ferrous metal prices in March quarter 1980 and their subsequent fall in June quarter 1980. The IPDs have also been affected by compositional shifts, both within and between aggregates, during these quarters limiting their usefulness as measures of price change. For example, if a fixed-weighted deflator (using the previous quarter's constant price values as weights) is constructed for private final consumption expenditure the percentage changes for the last 3 quarters are 2.0 per cent, 2.7 per cent and 2.3 per cent respectively compared with the actual changes in the corresponding IPD of 1.7 per cent, 3.2 per cent and 2.1 per cent respectively. It is also possible that quarterly movements in the IPDs are being distorted through limitations of the seasonal adjustment processes used. While IPDs can be useful as broad indicators of price change, it is important to understand their limitations (see page 7, paragraph 10 of the explanatory notes). In particular, IPDs should be interpreted in the light of other information which is available on prices, such as the ABS series of wholesale price indexes, and the consumer price index.

Household saving ratio

Present estimates indicate that, on a seasonally adjusted basis, the proportion of household disposable income devoted to consumption in the June quarter was 86.4 per cent while household saving which is derived as a balancing item represented 13.6 per cent. Both of these ratios are affected by any deficiencies or inconsistencies in the estimation and seasonal adjustment of household income and expenditure.

The household saving ratio in recent quarters is as follows:

| | <i>Quarters ended</i> | <i>Percentage</i> |
|------|-----------------------|-------------------|
| 1979 | March | 14.7 |
| | June | 14.6 |
| | September | 13.5 |
| | December | 13.6 |
| 1980 | March | 11.0 |
| | June | 13.6 |

The movements in the household saving ratio in the last two quarters should be interpreted cautiously because of the following factors:

- . For the reason given above it is possible that the movements shown for wages, salaries and supplements may not reflect actual movements.

There appears to be some residual seasonality in the series for income from dwelling rent which rose substantially in the June quarter after showing no growth in the previous three quarters.

Revisions

The only major revisions made since the March quarter publication which affect recent quarterly movements were to exports of goods and services. Up to

and including the March quarter 1980 issue of this publication, the figures for exports f.o.b. were adjusted to take account of differences between the time that wool is sold to non-residents and the time that it is shipped. In a recent review of balance of payments timing adjustments, it was established that the information collected for purposes of this particular timing adjustment was not appropriate for its intended purpose. Commencing with this issue, this adjustment has been discontinued. Revisions have been made to exports f.o.b. from September quarter 1959 on this account.

EXPLANATORY NOTES

Introduction

This publication provides estimates of the components of gross domestic product and national expenditure and supporting tables for the June quarter 1980, together with comparative estimates for the eight previous quarters and the four years 1976-77 to 1979-80. Initial estimates for the June quarter were published on 19 August in *Quarterly Estimates of National Income and Expenditure, June Quarter 1980 (Preliminary)* (5205.0). Those estimates have not been revised but additional details are contained in the following tables. Tables 32-42 provide historical series for the period from September quarter 1966 for the aggregates contained in the domestic production account (at both current and average 1974-75 prices), some selected income aggregates and implicit price deflators.

2. The definitions and concepts used in this publication are identical to those employed in *Australian National Accounts, National Income and Expenditure 1978-79* (5204.0).

3. A discussion of the nature and limitations of implicit price deflators and a brief description of items in this publication are given in the Appendices to the publication *Quarterly Estimates of National Income and Expenditure, December Quarter 1977* (5206.0).

Changes in this issue

4. In this issue some additional tables have been provided and the ordering of some of the previous tables has been altered. The new tables present the following:

- . an analysis of contributions provided by each major aggregate to the percentage change in seasonally adjusted gross domestic product at constant prices;
- . components of private final consumption expenditure at average 1974-75 prices;
- . historical series.

The former section on trends in main aggregates has been replaced by notes on the quarterly estimates which are intended to provide information to aid in the interpretation of the estimates for recent quarters. Details of gross fixed capital expenditure and stocks which were previously shown in separate tables have, in this publication, been incorporated into the relevant summary tables (Tables 5-8). Some of the components of private final consumption expenditure are no longer shown for the most recent quarter.

Interpretation of quarterly estimates

5. Estimating for a period of less than one year presents special problems in that it is often difficult to adhere strictly to definitions of concepts used in annual estimates. The measurement of income for a period is particularly difficult since it is not always possible to match the value of production for a quarter with the

cost incurred in that production. This problem occurs, for example, in estimating the income of farm unincorporated enterprises in each quarter, and results in considerable variation of the estimates for this series, and for gross farm product, from quarter to quarter. Difficulties are also experienced in obtaining detailed data for short periods and in preparing consistent estimates from various sources where different accounting procedures and periods are used.

6. These problems inevitably affect the consistency and reliability of the current price estimates, and similarly affect the constant price estimates based on the current price estimates. Accordingly these factors as well as the approximations and assumptions necessarily made in the revaluation of flows at constant prices should be borne in mind when interpreting or using the estimates, for example in attempting to draw precise quantitative inferences relating to quarter-to-quarter changes in gross domestic product or its components, or in productivity.

7. Analysis of trends therefore requires allowance for these uncertainties in estimation. The effects are in some measure indicated by the change in the statistical discrepancy for corresponding periods. Uncertainty in trends arises also from the likelihood of revisions as more information becomes available and from the irregularity of short-term movements. The inclusion of the statistical discrepancy on the expenditure side of the accounts is a convention and does not necessarily imply that the sum of the income components more accurately measures GDP than the sum of the expenditure components (plus exports less imports). As household and other saving are estimated as balancing items in their respective accounts, care should be exercised in their interpretation.

8. Estimates of national income and expenditure are necessarily prepared from a wide range of statistical information, some of which is available quickly and some only with a delay of several years. For this reason most figures should be regarded as subject to revision as more complete and more accurate information becomes available. The revisions will be of two main types — those made to the most recent quarters as firmer quarterly or monthly data come to hand and those which are a consequence of revisions to annual totals and are distributed to the quarters approximately in accordance with existing quarterly patterns.

9. No simple measure is available of the accuracy of the national accounting aggregates. However the following example illustrates the sensitivity of quarter to quarter growth to the timing of recording a transaction. If, in the latest year, the timing of recording a transaction were delayed by one quarter and if the transaction had an impact on constant price gross domestic product of +\$17 million then the measure of the rate of growth would be affected in three adjoining quarters (centred on the quarter in which the transaction was recorded) by -0.1, +0.2, and -0.1 percentage

points respectively. Of course the percentage impact of such a timing delay on relevant sub-aggregates would be greater.

10. The quarterly implicit price deflators (IPDs) shown in Table 9 are derived by dividing seasonally adjusted current price estimates by the corresponding seasonally adjusted constant price estimates. Movements in the levels of individual implicit price deflators can be greatly affected by changes in the physical composition of the aggregates and their components; moreover the seasonal adjustment process is a further source of possible distortion. Generally, it is considered that IPDs derived from seasonally adjusted data are more reliable than those obtained by using original (i.e., unadjusted) series, because the former are less likely to be affected by compositional change than are the latter. However, there is evidence that some IPDs based on the seasonally adjusted data are distorted by the effects of residual seasonality in the seasonally adjusted current price and/or constant price series. It has not proved possible to remove the seasonality from the affected IPDs without introducing distortions into the component seasonally adjusted current and constant price series. The aggregates particularly affected are public and private gross fixed capital expenditure (including the 3 published components of the latter). In these cases, a more reliable measure of price change can be obtained by using IPDs derived from the original data published in Tables 5 and 7. A discussion of the limitations involved in using IPDs as measures of pure price change, is contained in Appendix C of *Australian National Accounts, National Income and Expenditure, 1976-77*.

Seasonal adjustment

11. As most series are affected to some extent by seasonal factors, allowance should be made for normal seasonal variation. In Tables 6, 8, 9, 13, 16, 18, 21, 22, 33, 35 and 37 to 42 'seasonally adjusted' values are presented for selected series. Series which show substantial irregularities in the original or adjusted series should be treated with some reserve. As different methods of seasonal adjustment tend to produce different results, it is necessary to bear in mind the methods by which they have been derived and the limitations to which those methods are subject.

12. The general methods used in the Bureau for making seasonal adjustments are described in *Seasonally Adjusted Indicators, 1980* (1308.0). However, special methods have been used to adjust some of the components of gross farm product which were not amenable to seasonal adjustment by the usual methods. In the seasonally adjusted estimates, the estimated value of production of wheat, other grain and sugar cane, for any financial year, are distributed equally over the four quarters of the year ended June. One effect of these methods is that changes in the annual production of these commodities first enter into the seasonally adjusted figures in the September quarter. As far as possible the constant price estimates have been adjusted using methods similar to those for the corresponding current price estimates.

Analysis of contributions to growth table

13. Table 3 presents an analysis of the contribution provided by each major aggregate to the percentage change in seasonally adjusted gross domestic product at constant prices. The formula used to calculate the contribution by each aggregate to the growth in GDP is:

$$\frac{A(t) - A(t-1)}{GDP(t-1)} \times 100.0$$

where $A(t)$ = value of aggregate A in quarter under consideration

$A(t-1)$ = value of aggregate A in preceding quarter

$GDP(t-1)$ = value of GDP in preceding quarter

All these values are seasonally adjusted constant price estimates. It should be noted that the figures in this table are additive within each quarter unlike the percentage change tables shown elsewhere in this publication.

Rounding of figures

14. Although percentage changes are given to one decimal place in this publication, this does not imply that they can be regarded as accurate to the last digit shown. The figures after the decimal point are given to avoid distortions which may occur in rounding off the figures to the nearest half or whole number.

15. The procedures used in preparing this publication may occasionally result in rounding differences between figures in this publication and corresponding figures in other publications.
