## NOTES ON THE DECEMBER QUARTER ESTIMATES

## MAIN FEATURES

*NOTE: Changes in individual quarters are necessarily subject to the uncertainties discussed in the explanatory notes under interpretation of quarterly estimates, and furthermore some may be substantially revised as firmer data come to hand. This applies particularly to the estimates for the two most recent years for gross operating surplus, the income of companies and non-farm unincorporated enterprises, depreciation, and therefore to the estimated magnitude of change in gross non-farm product.*

## ESTIMATES OF MAIN AGGREGATES AT AVERAGE 1979-80 PRICES, SEASONALLY ADJUSTED

	Percentage Change		Percentage points Contribution to Growth in GDP	
	Sept. qtr 1981 to Dec. qtr 1981	Dec. qtr 1980 to Dec. qtr 1981	Sept. qtr 1981 to Dec. qtr 1981	Dec. qtr 1980 to Dec. qtr 1981
Final consumption expenditure—				
Private	0.5	2.9	0.3	1.7
Government	1.0	3.6	0.2	0.6
Gross fixed capital expenditure	1.6	11.7	0.4	2.7
Increase in stocks	..	..	1.0	1.3
Statistical discrepancy	..	..	-0.1	1.4
Gross national expenditure	1.7	7.7	1.8	7.8
Exports of goods and services	-7.5	-7.9	-1.2	-1.4

Gross domestic product	1.1	5.0	1.1	5.0
Gross farm product	1.7	22.2	0.1	1.2
Gross non-farm product	1.0	4.0	0.9	3.8

.. not applicable

In current price seasonally adjusted terms, wages, salaries and supplements rose by 5.0 per cent in December quarter 1981, while gross operating surplus of trading enterprise companies rose by 1.9 per cent in the same period.

The following notes are provided to aid analysis of the estimates for recent quarters.

**Wages, salaries and supplements**

Until September quarter 1981 estimates of wages, salaries and supplements have been compiled mainly using payroll tax data. Up to the September quarter 1979 the employment coverage of these estimates was based on the now discontinued civilian employees series. From the December quarter 1979, estimates have been adjusted to reflect movements in the number of wage and salary earners shown in the monthly Labour Force Survey.

Because of problems that have been experienced in recent years with the coverage of the payroll tax data, it has been replaced from the September quarter 1981 by data from a small interim survey of employment and earnings. An ABS Information Paper entitled *Review of ABS Employment Statistics (6239.0)* explains in more detail the reasons for that decision. The employment coverage of the December quarter estimate continues to

be adjusted to reflect movements in the number of wage and salary earners shown in the monthly Labour Force Survey.

It is proposed to replace the small interim survey with a quarterly survey of employment and earnings covering approximately 20,000 private employers. When interpreting estimates of wages, salaries and supplements for December quarter 1981 (and for subsequent quarters until the introduction of the proposed survey) the following factors should be borne in mind:

- (a) Wage and salary estimates obtained from the interim quarterly survey of earnings have relatively high sampling errors;
- (b) The coverage of small businesses in the interim survey is smaller than for the proposed survey;

- (c) There is some uncertainty concerning the seasonal element in the interim quarterly wage and salary series. Information was collected from respondents to the interim survey about the incidence of pay days in an attempt to minimise this area of uncertainty.

### Statistical discrepancy

The statistical discrepancy represents the difference between the sum of the estimates of gross domestic product (GDP) and imports of goods and services on the one hand and the sum of the estimates of components of gross national expenditure and exports of goods and services on the other hand. Conceptually these two totals are the same. The inclusion of the statistical discrepancy on the expenditure side of the domestic production account is a convention and does not necessarily imply that the sum of the income components more accurately measures GDP than the sum of the expenditure components.

The aspect of the statistical discrepancy which is of most concern in the quarterly context is the magnitude of change from one quarter to the next. In some quarters there are quite significant movements in the seasonally adjusted constant price statistical discrepancy. A useful way of examining the significance of the statistical discrepancy is to compare the change in gross non-farm product as published with the result which would be obtained using the expenditure aggregates excluding the statistical discrepancy. The following table shows such a comparison for the last 6 quarters and indicates that inconsistencies in the recording of transactions or in the domestic production account are particularly marked in some quarters. Users are advised to take these problems into account when interpreting the estimates.

### PERCENTAGE CHANGES IN GROSS NON-FARM PRODUCT AT AVERAGE 1979-80 PRICES, SEASONALLY ADJUSTED

<i>Quarters ended</i>	<i>Income based(a)</i>	<i>Expenditure based(b)</i>
<i>1980—</i>		
September	2.4	2.8
December	1.7	1.8
<i>1981—</i>		
March	1.0	-0.5
June	0.8	—
September	1.1	1.9
December	1.0	1.1

(a) Gross non-farm product as published. (b) Gross non-farm product less statistical discrepancy.

### Household saving ratio

Present estimates indicate that, on a seasonally adjusted basis, the proportion of household disposable income devoted to consumption in the December quarter was 84.9 per cent while household saving which is derived as a balancing item represented 15.1 per cent. Both of these ratios are affected by any deficiencies or inconsistencies in the estimation and seasonal adjustment of household income and expenditure. The December quarter estimates should be interpreted in the light of the discussion above of the December quarter estimates of wages, salaries and supplements.

The household saving ratio in recent quarters is as follows:

<i>Quarters ended</i>	<i>Percentage</i>
<i>1980—</i>	
September	12.7
December	12.8
<i>1981—</i>	
March	10.7
June	13.0
September	13.1
December	15.1

### Rebase of constant price estimates

In rebasing the estimates from average 1974-75 prices to average 1979-80 prices the opportunity was taken to review the methodology previously used and to draw upon additional data which have become available since the last rebase. The differences between the growth rates exhibited by the estimates at average 1979-80 prices and those at average 1974-75 prices reflect two factors:

- (a) differences between the price relativities in the two years,
- (b) revisions arising from:
  - (i) the use of new methodologies in some components (principally private gross fixed capital expenditure, increase in private non-farm stocks, and exports and imports of goods and services),
  - (ii) the use of some new sources of data in revaluing the current price estimates, and
  - (iii) the revisions that have been made to current price estimates as firmer data have become available.

A value at constant prices may be thought of as being derived by expressing the current price value of each component transaction as the product of a price and a quantity, and by substituting for each actual current price the corresponding price in the chosen base year. Aggregates at constant prices are then obtained by summing constant price values for individual commodities. In the process, quantities of individual commodities are combined using their prices in the base year as weights. Thus the choice of base year influences the movements in the constant price series, and the usefulness of such series is diminished if the relative price weights of the base year differ significantly from the price relationships of other periods included in the series, particularly the latest periods which are the most important for short-term economic analysis. The more remote a base year is from the current period the less likely that its relative prices will reflect the current situation.

There are several criteria for selecting a base year and, unfortunately, they are not always compatible with each other, particularly in times of high inflation. They are:

- (a) the base year should be as recent as possible;
- (b) 'normal' prices and price relationships should prevail in the chosen year;
- (c) if possible, the base year should fit in with international recommendations (by the UN Statistical Office) that base years be those ending in zero and five (e.g. 1970, 1975, 1980).

There is an important practical difficulty involved in selecting a 'normal' year as a base year. It is usually rather difficult to distinguish a 'normal' year until several years have elapsed, by which time the chosen year is somewhat dated and may not adequately reflect current conditions. In addition, during the interim period the old base period would be becoming increasingly less relevant to the current period.

Estimates on a 1974-75 base consistent with the current price series in this publication are available, on request, from September quarter 1966 to December quarter 1981. They can be obtained by calling Mr Peter Willis on (062) 526725 or by writing to:

Quantum Indexes Section  
Australian Bureau of Statistics  
P.O. Box 10  
Belconnen. A.C.T. 2616

In future, the 1974-75 based estimates consistent with the current price series will be maintained only for the period from September quarter 1966 to June quarter 1980.

#### Revisions

The estimates in this publication have been revised in accordance with revised annual estimates which will be published shortly in *Australian National Accounts, National Income and Expenditure, 1980-81, Advance Release* (\$201.0). In addition major revisions to movements in the September quarter 1981 estimates were made to wages, salaries and supplements and private gross fixed capital expenditure on non-dwelling construction.

## EXPLANATORY NOTES

**Introduction**

This publication provides estimates of the components of gross domestic product and national expenditure and supporting tables for the December quarter 1981, together with comparative estimates for the eight previous quarters and the four years 1977-78 to 1980-81. Tables 32-42 provide historical series for the period from September quarter 1969 for the aggregates contained in the domestic production account (at both current and average 1979-80 prices), some selected income aggregates and implicit price deflators.

2. The estimates in this publication have been revised in accordance with revised annual estimates which will be published shortly in *Australian National Accounts, National Income and Expenditure, 1980-81, Advance Release* (5201.0). New series of constant price estimates based on average 1979-80 prices are presented in this publication (see *Rebase of constant price estimates* on page 2). Seasonally adjusted estimates have also been revised following the normal annual reanalyses of all adjusted series.

3. The definitions and concepts used in this publication are identical to those employed in *Australian National Accounts, National Income and Expenditure 1979-80* (5204.0). A discussion of these definitions and concepts, the nature and limitations of implicit price deflators and a description of items in this publication are presented in *Australian National Accounts-Concepts, Sources and Methods* (5216.0)

**Interpretation of quarterly estimates**

4. Estimating for a period of less than one year presents special problems in that it is often difficult to adhere strictly to definitions and concepts used in annual estimates. The measurement of income for a quarterly period is particularly difficult since it is not always possible to match the value of production for a quarter with the cost incurred in that production. This problem occurs, for example, in estimating the income of farm unincorporated enterprises in each quarter, and results in considerable variation of the estimates for this series, and for gross farm product, from quarter to quarter. Difficulties are also experienced in obtaining detailed data for short periods and in preparing consistent estimates from various sources where different accounting procedures and periods are used.

5. These problems inevitably affect the consistency and reliability of the current price estimates, and similarly affect the constant price estimates based on the current price estimates. Accordingly, these factors as well as the approximations and assumptions necessarily made in the revaluation of flows to constant prices should be borne in mind when interpreting or using the estimates, for example, in attempting to draw precise quantitative inferences relating to quarter-to-quarter changes in gross domestic product or its components, or in productivity.

6. Analysis of trends requires allowance for these uncertainties in estimation. The effects are in some measure indicated by the change in the statistical discrepancy for corresponding periods. Uncertainty in trends arises also from the likelihood of revisions as more information becomes available and from the irregularity of short-term movements. The inclusion of the statistical discrepancy on the expenditure side of the accounts is a convention and does not necessarily imply that the sum of the income components more accurately measures GDP than the sum of the expenditure components (plus exports less imports). As household and other saving are estimated as balancing items in their respective accounts, care should be exercised in their interpretation.

7. Estimates of national income and expenditure are necessarily prepared from a wide range of statistical information, some of which is available quickly and some only with a delay of several years. For this reason most figures should be regarded as subject to revision as more complete and more accurate information becomes available. The revisions will be of two main types — those made to the most recent quarters as firmer quarterly or monthly data come to hand and those which are a consequence of revisions to annual totals and are distributed to the quarters approximately in accordance with existing quarterly patterns.

8. No simple measure is available of the accuracy of the national accounting aggregates. However the following example illustrates the *sensitivity* of quarter to quarter growth to the timing of recording a transaction. If, in the latest year, the timing of recording a transaction were delayed by one quarter and if the transaction had an impact on constant price gross domestic product of +\$31 million then the measure of the rate of growth would be affected in three adjoining quarters (centred on the quarter in which the transaction was recorded) by -0.1, +0.2, and -0.1 percentage points respectively. Of course the percentage impact of such a timing delay on relevant sub-aggregates would be greater.

9. The quarterly implicit price deflators (IPDs) shown in Tables 9 and 42 are derived by dividing seasonally adjusted current price estimates by the corresponding seasonally adjusted constant price estimates. Movements in the levels of individual implicit price deflators can be greatly affected by changes in the physical composition of the aggregates and their components. Generally, it is considered that IPDs derived from seasonally adjusted data are more reliable than those obtained by using original (i.e. unadjusted) series, because the former are less likely to be affected by compositional change than are the latter. However the seasonal adjustment process is itself a source of possible distortion, especially to the extent that it is not possible to identify, in a fully consistent way, the seasonality of the current price estimates and of the constant price estimates. A discussion of the limitations involved in using IPDs as measures of pure price change is contained in Appendix B of *Australian National Accounts-Concepts, Sources and Methods* (5216.0).

### Seasonal adjustment

10. As most series are affected to some extent by seasonal factors, allowance should be made for normal seasonal variation. In Tables 6, 8, 9, 13, 17, 19, 22, 23, 33, 35 and 37 to 42, *seasonally adjusted* values are presented for selected series. Series which show substantial irregularities in the original or adjusted series should be treated with some reserve. As different methods of seasonal adjustment tend to produce different results, it is necessary to bear in mind the methods by which they have been derived and the limitations to which those methods are subject. It should also be noted that the methods of seasonal adjustment used by the ABS do not force the sum of the seasonally adjusted estimates for each quarter of a financial year to equal the original annual total.

11. The general methods used in the ABS for making seasonal adjustments are described in *Seasonally Adjusted Indicators, Australia, 1981* (1308.0). However, special methods have been used to adjust some of the components of gross farm product which were not amenable to seasonal adjustment by the usual methods. To obtain the seasonally adjusted estimates, the estimated values of production of wheat, other grain and sugar cane, for any financial year, are distributed equally over the four quarters of the year ended June. One effect of these methods is that changes in the annual production of these commodities first enter into the seasonally adjusted figures in the September quarter. As far as possible the constant price estimates have been adjusted using methods similar to those for the corresponding current price estimates.

### Analysis of contributions to growth table

12. Table 3 presents an analysis of the contribution provided by each major aggregate to the percentage change in seasonally adjusted gross domestic product at constant prices. The formula used to calculate the contribution by each aggregate to the growth in GDP is:

$$\frac{A(t) - A(t-1)}{GDP(t-1)} \times 100.0$$

where A(t) = value of aggregate A in quarter under consideration

A(t-1) = value of aggregate A in preceding quarter

GDP(t-1) = value of GDP in preceding quarter

All these values are seasonally adjusted constant price estimates. It should be noted that the figures in this table are additive within each quarter unlike the percentage change tables shown elsewhere in this publication.

### Rounding of figures

13. Although percentage changes are given to one decimal place in this publication, this does not imply that they can be regarded as accurate to the last digit shown. The figures after the decimal point are given to avoid distortions which may occur in rounding off the figures to the nearest half or whole number.

14. The procedures used in preparing this publication may occasionally result in rounding differences between figures in this publication and corresponding figures in other publications.

15. Where figures have been rounded, discrepancies may occur between sums of the component items and totals.

### Related publications

16. In addition to those mentioned above other ABS publications which may be of interest include:

*Quarterly Estimates of National Income and Expenditure, Australia, (Preliminary)* (5205.0)—issued for June Quarter only

*Historical Series of Quarterly Estimates of National Income and Expenditure, Australia,* (5207.0)—issued for December Quarter only

*Australian National Accounts, Gross Product by Industry at Current and Constant Prices, 1979-80* (5211.0)

Budget Paper: *National Income and Expenditure, 1980-81* (5213.0)

17. Current publications produced by the ABS are listed in the *Catalogue of Publications, Australia* (1101.0). The ABS also issues, on Tuesdays and Fridays, a *Publications Advice* (1105.0) which lists publications to be released in the next few days. The Catalogue and Publications Advice are available from any ABS office.
