NOTES ON THE JUNE QUARTER ESTIMATES

MAIN FEATURES

NOTE: Changes in individual quarters are necessarily subject to the uncertainties discussed in the explanatory notes under interpretation of quarterly estimates, and furthermore some may be substantially revised as firmer data come to hand. This applies particularly to the estimates for the two most recent years for gross operating surplus, the income of companies and non-farm unincorporated enterprises, depreciation, and therefore to the estimated magnitude of change in gross non-farm product.

ESTIMATES OF MAIN AGGREGATES AT AVERAGE 1974-75 PRICES, SEASONALLY ADJUSTED

	Percentage Change		Percentage points Contribution to Growth in GDP	
	Mar. qtr 1981 to June qtr 1981	June qtr 1980 to June qtr 1981	Mar. qtr 1981 to June qtr 1981	June qtr 1980 to June qtr 1981
Final consumption expenditure—				
Private	0.6	3.4	0.3	2.0
Government	-4.3	2.4	-0.8	0.4
Gross fixed capital expenditure	1.1	12.7	0.3	2.7
Increase in stocks	0.9	-0.1
Statistical discrepancy	0.5	1.0
Gross national expenditure	1.2	6.1	1.2	5.9
Exports of goods and services	1.1	-5.6	0.2	-1.0
Imports of goods and services	5.8	16.2	-1.0	-2.5
Gross domestic product	0.4	2.3	0.4	2.3
Gross farm product	9.1	-8.5	0.5	-0.5
Gross non-farm product	-0.1	3.1	-0.1	2.9

.. not applicable

— nil or rounded to zero

In current price seasonally adjusted terms, wages, salaries and supplements rose by 2.7 per cent in June quarter 1981, while gross operating surplus of trading enterprise companies fell by 0.5 per cent in the same period.

The following notes are provided to aid analysis of the estimates for recent quarters.

Wages, salaries and supplements

Because of problems in recent years in the reliability of estimates of employment, the method used for estimating wages, salaries and supplements has been modified. The estimates of wages, salaries and supplements for 1979-80 and 1980-81 reflect movements in the number of wage and salary earners shown in the monthly Labour Force Survey. Estimates for previous years are based on the now discontinued civilian employees series published in the *Civilian Employees, Australia* (6213.0).

Government final consumption expenditure

The decline in this aggregate in constant price seasonally adjusted terms in the June quarter is largely attributable to the unusually high level of expenditure

recorded in the December 1980 and March 1981 quarters; a frigate valued at \$149 million (at current prices) was delivered to the Australian Navy in both of those quarters. (See the December quarter 1980 issue of Catalogue No. 5206.0 for an explanation of the treatment in these statistics of defence equipment purchased from overseas.)

The implicit price deflator for government final consumption expenditure rose markedly in June quarter 1981. The major reason for the large rise was an increase of 5.7 per cent in N.S.W. teachers' salaries effective from 7 November 1980 and paid during June quarter 1981.

Private gross fixed capital expenditure-dwellings

Estimates for private gross fixed capital expenditure on dwellings have not been shown explicitly in the tables for the quarters of 1980-81, although they have been included in totals where appropriate. As discussed in the March quarter 1981 issue of *Quarterly Estimates of National Income and Expenditure* (5206.0), a discontinuity between June quarter 1980 and September quarter 1980 estimates of expenditure on dwellings occurred because of the introduction, from September quarter 1980, of a new collection system for building activity statistics. Data from the new collection system on the value of work done is not yet available for the March and June quarters of 1981. In addition, the estimates previously published in *Building Activity, Australia, September and December Quarters, 1980* (8705.0) are currently being reviewed and may be revised substantially. Therefore, significance should not be given to the figures for private gross fixed capital expenditure on dwellings that can be derived from the tables.

Statistical discrepancy

The statistical discrepancy represents the difference between the sum of the estimates of gross domestic product (GDP) and imports of goods and services on the one hand and the sum of the estimates of components of gross national expenditure and exports of goods and services on the other hand. Conceptually these two totals are the same. The inclusion of the statistical discrepancy on the expenditure side of the domestic production account is a convention and does not necessarily imply that the sum of the income components more accurately measures GDP than the sum of the expenditure components.

The aspect of the statistical discrepancy which is of most concern in the quarterly context is the magnitude of change from one quarter to the next. In recent quarters there have been quite significant movements in the seasonally adjusted constant price statistical discrepancy. A useful way of examining the significance of the statistical discrepancy is to compare the change in gross non-farm product as published with the result which would be obtained using the expenditure aggregates excluding the statistical discrepancy. The following table shows such a comparison for the last 5 quarters and indicates that inconsistencies in the recording of transactions in the domestic production account are particularly marked in recent quarters. Users are advised to take these problems into account when interpreting the estimates.

PERCENTAGE CHANGES IN GROSS NON-FARM PRODUCT AT AVERAGE 1974-75 PRICES, SEASONALLY ADJUSTED

Quarters ended	Income-based(a)	Expenditure-based(b)
1980—		
June	1.4	-0.3
September	1.7	3.9
December	1.2	-0.3
1981—		
March	0.2	-0.9
June	-0.1	-0.6

(a) Gross non-farm product as published. (b) Gross non-farm product less statistical discrepancy.

Household saving ratio

Present estimates indicate that, on a seasonally adjusted basis, the proportion of household disposable income devoted to consumption in the June quarter was 88.6 per cent while household saving which is derived as a balancing item represented 11.4 per cent. Both of these ratios are affected by any deficiencies or inconsistencies in the estimation and seasonal adjustment of household income and expenditure.

The household saving ratio in recent quarters is as follows:

Quarters ended	Percentage
1980—	
March	10.6
June	12.6
September	12.5
December	12.7
1981—	
March	10.8
June	11.4

Revisions

Significant revisions have been made to the travel components of imports and exports of goods and services for most quarters shown in this release, as a result of more accurate information becoming available. These changes have also affected the 'other goods and services' component of private final consumption expenditure and are responsible for most of the revision to this series. The revisions to the travel items are described in the explanatory notes of the publication *Balance of Payments, Australia, June Quarter 1981* (5302.0).

There is also a significant revision to the implicit price deflator for government final consumption expenditure for June quarter 1980, mainly because of the late inclusion in the statistics of a 4.3 per cent interim rise in N.S.W. teachers' salaries effective from 7 December 1979 and paid in June quarter 1980.

Since the release of the March quarter estimates the following series have been seasonally reanalysed:

- 'travel' component of imports of goods and services at both current and constant prices
- 'travel' component of exports of goods and services at both current and constant prices
- 'other goods and services' component of private final consumption expenditure at both current and constant prices
- gross non-farm product at constant prices.

EXPLANATORY NOTES

Introduction

This publication provides estimates of the components of gross domestic product and national expenditure and supporting tables for the June quarter 1981, together with comparative estimates for the eight previous quarters and the four years 1977-78 to 1980-81. Tables 32-42 provide historical series for the period from September quarter 1966 for the aggregates contained in the domestic production account (at both current and average 1974-75 prices), some selected income aggregates and implicit price deflators.

2. The definitions and concepts used in this publication are identical to those employed in *Australian National Accounts, National Income and Expenditure 1979-80* (5204.0).

3. A discussion of the nature and limitations of implicit price deflators and a brief description of items in this publication are given in the Appendices to the publication *Quarterly Estimates of National Income and Expenditure, December Quarter 1977* (5206.0).

Interpretation of quarterly estimates

4. Estimating for a period of less than one year presents special problems in that it is often difficult to adhere strictly to definitions of concepts used in annual estimates. The measurement of income for a quarterly period is particularly difficult since it is not always possible to match the value of production for a quarter with the cost incurred in that production. This problem occurs, for example, in estimating the income of farm unincorporated enterprises in each quarter, and results in considerable variation of the estimates for this series, and for gross farm product, from quarter to quarter. Difficulties are also experienced in obtaining detailed data for short periods and in preparing consistent estimates from various sources where different accounting procedures and periods are used.

5. These problems inevitably affect the consistency and reliability of the current price estimates, and similarly affect the constant price estimates based on the current price estimates. Accordingly these factors as well as the approximations and assumptions necessarily made in the revaluation of flows at constant prices should be borne in mind when interpreting or using the estimates, for example in attempting to draw precise quantitative inferences relating to quarter-to-quarter changes in gross domestic product or its components, or in productivity.

6. Analysis of trends therefore requires allowance for these uncertainties in estimation. The effects are in some measure indicated by the change in the statistical discrepancy for corresponding periods. Uncertainty in trends arises also from the likelihood of revisions as more information becomes available and from the irregularity of short-term movements. The inclusion of the statistical

discrepancy on the expenditure side of the accounts is a convention and does not necessarily imply that the sum of the income components more accurately measures GDP than the sum of the expenditure components (plus exports less imports). As household and other saving are estimated as balancing items in their respective accounts, care should be exercised in their interpretation.

7. Estimates of national income and expenditure are necessarily prepared from a wide range of statistical information, some of which is available quickly and some only with a delay of several years. For this reason most figures should be regarded as subject to revision as more complete and more accurate information becomes available. The revisions will be of two main types — those made to the most recent quarters as firmer quarterly or monthly data come to hand and those which are a consequence of revisions to annual totals and are distributed to the quarters approximately in accordance with existing quarterly patterns.

8. No simple measure is available of the accuracy of the national accounting aggregates. However the following example illustrates the *sensitivity* of quarter to quarter growth to the timing of recording a transaction. If, in the latest year, the timing of recording a transaction were delayed by one quarter and if the transaction had an impact on constant price gross domestic product of +\$18 million then the measure of the rate of growth would be affected in three adjoining quarters (centred on the quarter in which the transaction was recorded) by -0.1, +0.2, and -0.1 percentage points respectively. Of course the percentage impact of such a timing delay on relevant sub-aggregates would be greater.

9. The quarterly implicit price deflators (IPDs) shown in Tables 9 and 42 are derived by dividing seasonally adjusted current price estimates by the corresponding seasonally adjusted constant price estimates. Movements in the levels of individual implicit price deflators can be greatly affected by changes in the physical composition of the aggregates and their components; moreover the seasonal adjustment process is a further source of possible distortion. Generally, it is considered that IPDs derived from seasonally adjusted data are more reliable than those obtained by using original (i.e., unadjusted) series, because the former are less likely to be affected by compositional change than are the latter. However, there is evidence that some IPDs based on the seasonally adjusted data are distorted by the effects of residual seasonality in the seasonally adjusted current price and/or constant price series. It has not proved possible to remove the seasonality from the affected IPDs without introducing distortions into the component seasonally adjusted current and constant price series. The aggregates particularly affected are public and private gross fixed capital expenditure (including the 3 published components of the latter). In these cases, a more reliable measure of price change can be obtained by using IPDs derived from the original data published in Tables 5 and 7. A discussion of the limitations involved in using IPDs as measures of pure price change, is contained in Appendix C of *Australian National Accounts, National Income and Expenditure, 1976-77* (5204.0).

Seasonal adjustment

10. As most series are affected to some extent by seasonal factors, allowance should be made for normal seasonal variation. In Tables 6, 8, 9, 13, 17, 19, 22, 23, 33, 35 and 37 to 42 *seasonally adjusted* values are presented for selected series. Series which show substantial irregularities in the original or adjusted series should be treated with some reserve. As different methods of seasonal adjustment tend to produce different results, it is necessary to bear in mind the methods by which they have been derived and the limitations to which those methods are subject. It should also be noted that the methods of seasonal adjustment used by the ABS do not force the sum of the seasonally adjusted estimates for each quarter of a financial year to equal the original annual total.

11. The general methods used in the ABS for making seasonal adjustments are described in *Seasonally Adjusted Indicators, Australia, 1981* (1308.0). However, special methods have been used to adjust some of the components of gross farm product which were not amenable to seasonal adjustment by the usual methods. In the seasonally adjusted estimates, the estimated values of production of wheat, other grain and sugar cane, for any financial year, are distributed equally over the four quarters of the year ended June. One effect of these methods is that changes in the annual production of these commodities first enter into the seasonally adjusted figures in the September quarter. As far as possible the constant price estimates have been adjusted using methods similar to those for the corresponding current price estimates.

Analysis of contributions to growth table

12. Table 3 presents an analysis of the contribution provided by each major aggregate to the percentage change in seasonally adjusted gross domestic product at constant prices. The formula used to calculate the contribution by each aggregate to the growth in GDP is:

$$\frac{A(t) - A(t-1)}{GDP(t-1)} \times 100.0$$

where A(t) = value of aggregate A in quarter under consideration

A(t-1) = value of aggregate A in preceding quarter

GDP(t-1) = value of GDP in preceding quarter

All these values are seasonally adjusted constant price estimates. It should be noted that the figures in this table are additive within each quarter unlike the percentage change tables shown elsewhere in this publication.

Rounding of figures

13. Although percentage changes are given to one decimal place in this publication, this does not imply that they can be regarded as accurate to the last digit shown. The figures after the decimal point are given to avoid distortions which may occur in rounding off the figures to the nearest half or whole number.

14. The procedures used in preparing this publication may occasionally result in rounding differences between figures in this publication and corresponding figures in other publications.

Related publications

15. Other ABS publications which may be of interest include :

Quarterly Estimates of National Income and Expenditure, Australia, (Preliminary) (5205.0)—issued for June quarter only

Historical Series of Quarterly Estimates of National Income and Expenditure, Australia, (5207.0)—issued for December quarter only

Australian National Accounts, National Income and Expenditures, 1979-80 (5204.0)

Budget Paper : *National Income and Expenditure, 1980-81* (5213.0)

Australian National Accounts, Outline of Principal Sources and Methods (5212.0)

16. Current publications produced by the ABS are listed in the *Catalogue of Publications, Australia* (1101.0) which is available free of charge from any ABS office.

Symbols and other usages

17. Where figures have been rounded, discrepancies may occur between sums of the component items and totals.
