## NOTES ON THE MARCH QUARTER ESTIMATES

### MAIN FEATURES

**NOTE:** Changes in individual quarters are necessarily subject to the uncertainties discussed in the explanatory notes under interpretation of quarterly estimates, and furthermore some may be substantially revised as firmer data come to hand. This applies particularly to the estimates for the two most recent years for gross operating surplus, the income of companies and non-farm unincorporated enterprises, depreciation, and therefore to the estimated magnitude of change in gross non-farm product.

### ESTIMATES OF MAIN AGGREGATES AT AVERAGE 1979-80 PRICES, SEASONALLY ADJUSTED

.. not applicable

In current price seasonally adjusted terms, wages, salaries and supplements rose by 4.5 per cent in March quarter 1982, while gross operating surplus of trading enterprise companies fell by 13.6 per cent in the same period.

The following notes are provided to aid analysis of the estimates for recent quarters.

#### **Wages, salaries and supplements**

Until September quarter 1981 estimates of wages, salaries and supplements have been compiled mainly using payroll tax data. Up to the September quarter 1979 the employment coverage of these estimates was based on the now discontinued civilian employees series. From the December quarter 1979, estimates have been adjusted to reflect movements in the number of wage and salary earners shown in the monthly Labour Force Survey.

Because of problems that have been experienced in recent years with the coverage of the payroll tax data, it has been replaced from the September quarter 1981 by data from a small interim survey of employment and earnings. An ABS Information Paper entitled *Review of ABS Employment Statistics* (6239.0) explains in more detail the reasons for that decision. The employment coverage of the December quarter 1981 and March

quarter 1982 estimates continues to be adjusted to reflect movements in the number of wage and salary earners shown in the monthly Labour Force Survey.

It is proposed to replace the small interim survey with a quarterly survey of employment and earnings covering approximately 20,000 private employers. When interpreting estimates of wages, salaries and supplements for December quarter 1981 and March quarter 1982 (and for subsequent quarters until the introduction of the proposed survey) the following factors should be borne in mind:

- (a) Wage and salary estimates obtained from the interim quarterly survey of earnings have relatively high sampling errors;
- (b) The coverage of small businesses in the interim survey is smaller than for the proposed survey;

- (c) There is some uncertainty concerning the seasonal element in the interim quarterly wage and salary series. Information was collected from respondents to the interim survey about the incidence of pay days in an attempt to minimise this area of uncertainty.

#### **Gross operating surplus-companies**

The gross operating surplus of companies is obtained by deducting the stock valuation adjustment (SVA) from an estimate of the profits of companies which, for the quarters of the latest year, are calculated using data obtained from the profits survey conducted by the ABS. The magnitude of the fall in gross operating surplus of companies in the March quarter 1982 should be interpreted in the light of the discussion below concerning the SVA.

#### **Stock valuation adjustment**

The size of the stock valuation adjustment (SVA) in March quarter 1982 increased substantially compared with December 1981. The reason for this is that there has been an acceleration in the rate of price increase of most commodities during March quarter. However, it is possible that the size of the SVA could be overstated in March quarter because of the assumptions that necessarily have to be used in compiling estimates of the SVA. The major assumptions used are that:

- (a) book value levels reported by businesses are based on accounting valuations at historical cost assigned by the FIFO (first in, first out) method;
- (b) within most sectors, sales prices can be used to adjust stock levels valued at cost, that is, the selling price of finished goods is established as a fixed mark-up on the costs incurred in the current period;
- (c) the commodities in stock have a fixed turnover period, that is, the ratios 'stock level of materials/value of purchases' and 'stock level of finished goods/value of sales' remain constant;
- (d) the commodity composition of each estimation cell remains fixed; and
- (e) within each estimation cell, the RATE of physical increase (or decrease) in stocks is constant throughout each quarter.

In times of rapid price change and/or marked changes in the rate of price increase, inconsistencies between these assumptions and actual business practice can lead to significant errors in the SVA. The extent of the increase shown in the SVA between December quarter 1981 and March quarter 1982 may be exaggerated. If this were so, the level of gross domestic product in March quarter would be too low. However, because the SVA is deducted from both sides of the domestic production account, errors in its measurement have no impact on the size of the statistical discrepancy.

#### **Government final consumption expenditure**

The implicit price deflator (IPD) for this aggregate declined in the March quarter. The major reason for this fall was that the December quarter 1981 IPD was unusually high because of retrospective wage increases paid during that quarter to Commonwealth public servants and university staff. In addition, there were no major wage increases awarded to government employees which were first paid during March quarter 1982.

#### **Gross fixed capital expenditure**

Estimates for December quarter 1981 and March quarter 1982 for private gross fixed capital expenditure on equipment and public enterprises' gross fixed capital expenditure should be interpreted in the light of the discussion in paragraph 3 of the Explanatory notes.

#### **Exports and imports of goods at constant prices**

Because of changes being made to the computer system normally used to derive constant price estimates of exports and imports of goods it was not possible to compile these estimates for March quarter 1982 in the usual degree of detail. The procedure used as an interim measure was to revalue major commodities within each commodity classification division and to deflate the value of the remaining commodities at a very broad level. As a result, the constant price estimates published for exports and imports of goods and services for March quarter 1982 are more prone to subsequent revision than would usually be the case and care should be taken when comparing the estimates for the latest quarter with those for any other period.

#### **Statistical discrepancy**

The statistical discrepancy represents the difference between the sum of the estimates of gross domestic product (GDP) and imports of goods and services on the one hand and the sum of the estimates of components of gross national expenditure and exports of goods and services on the other hand. Conceptually these two totals are the same. The inclusion of the statistical discrepancy on the expenditure side of the domestic production account is a convention and does not necessarily imply that the sum of the income components more accurately measures GDP than the sum of the expenditure components.

The aspect of the statistical discrepancy which is of most concern in the quarterly context is the magnitude of change from one quarter to the next. In some quarters there are quite significant movements in the seasonally adjusted constant price statistical discrepancy. A useful way of examining the significance of the statistical discrepancy is to compare the change in gross non-farm product as published with the result which would be obtained using the expenditure aggregates excluding the statistical discrepancy. The following table shows such a comparison for the last 6 quarters and indicates that inconsistencies in the recording of transactions in the domestic production account are particularly marked in some quarters. Users are advised to take these problems into account when interpreting the estimates.

**PERCENTAGE CHANGES IN GROSS NON-FARM  
PRODUCT AT AVERAGE 1979-80 PRICES,  
SEASONALLY ADJUSTED**

<i>Quarters ended</i>	<i>Income -based(a)</i>	<i>Expenditure -based(b)</i>
<i>1980—</i>		
December	1.7	1.8
<i>1981—</i>		
March	1.0	-0.4
June	0.8	-0.1
September	1.4	2.2
December	-0.7	0.3
<i>1982—</i>		
March	-0.3	-2.0

(a) Gross non-farm product as published. (b) Gross non-farm product less statistical discrepancy.

**Household saving ratio**

Present estimates indicate that, on a seasonally adjusted basis, the proportion of household disposable income devoted to consumption in the March quarter was 86.5 per cent while household saving which is derived as a balancing item represented 13.5 per cent. Both of these ratios are affected by any deficiencies or inconsistencies in the estimation and seasonal adjustment of household income and expenditure.

The household saving ratio in recent quarters is as follows:

<i>Quarters ended</i>	<i>Percentage</i>
<i>1980—</i>	
December	12.8
<i>1981—</i>	
March	10.8
June	12.9
September	13.2
December	14.3
<i>1982—</i>	
March	13.5

**Rewvisions**

In addition to the revisions to components of gross fixed capital expenditure discussed in paragraph 3 of the Explanatory notes, there have been significant changes to a number of aggregates in respect of December quarter 1981: significant downward revisions have been made to wages, salaries and supplements, gross operating surplus of trading enterprise companies, gross operating surplus of public trading enterprises and government final consumption expenditure. As a result of these and other minor revisions gross non-farm product at constant prices, seasonally adjusted, is estimated to have fallen in December quarter 1981 by 0.7 per cent, whereas the previous estimate was an increase of 1.0 per cent.

There were errors in some of the stocks series in the December quarter 1981 issue of this publication and revised long-term estimates are shown in Tables 32-35, 39 and 40.

## EXPLANATORY NOTES

### **Introduction**

This publication provides estimates of the components of gross domestic product and national expenditure and supporting tables for the March quarter 1982, together with comparative estimates for the eight previous quarters and the four years 1977-78 to 1980-81. Tables 32-42 provide historical series for the period from September quarter 1969 for the aggregates contained in the domestic production account (at both current and average 1979-80 prices), some selected income aggregates and implicit price deflators.

2. Apart from the change discussed below in paragraph 3, the definitions and concepts used in this publication are identical to those employed in *Australian National Accounts, National Income and Expenditure 1980-81* (5204.0). A discussion of these definitions and concepts, the nature and limitations of implicit price deflators and a description of items in this publication are presented in *Australian National Accounts, Concepts, Sources and Methods* (5216.0).

### **Changes in this issue**

3. The internationally recommended basis for measuring gross fixed capital expenditure (GFCE) in national accounts is purchases less sales. However, because of inadequate data sources, public gross fixed capital expenditure has been estimated from data on outlays on new fixed capital assets (except for the deduction of the cost of previously rented dwellings sold and the value of fixed assets sold to non-residents). Following a redesign of the public finance processing system, which is now in progress, public GFCE will be measured on the internationally recommended basis. In the meantime, because of the size of some recent sales of public sector capital assets to the private sector, all major sales of fixed capital assets by the public sector to the private sector will be recorded as a reduction in public GFCE and an addition to private GFCE. The adoption of this revised method of estimating GFCE has resulted in revisions to estimates of components of GFCE for recent quarters—the most significant being to December quarter 1981. (These revisions affect series in Tables 1-3, 5-8, 10, 30 and 31 as well as those in corresponding historical tables.) This change in treatment will not affect total GFCE nor will it alter gross domestic product.

### **Interpretation of quarterly estimates**

4. Estimating for a period of less than one year presents special problems in that it is often difficult to adhere strictly to definitions and concepts used in annual estimates. The measurement of income for a quarterly period is particularly difficult since it is not always possible to match the value of production for a quarter with the cost incurred in that production. This problem occurs, for example, in estimating the income of farm unincorporated enterprises in each quarter, and results in considerable variation of the estimates for this series, and for gross farm product, from quarter to quarter. Difficulties are also experienced in obtaining detailed data for short periods and in preparing consistent estimates from various sources where different accounting procedures and periods are used.

5. These problems inevitably affect the consistency and reliability of the current price estimates, and similarly affect the constant price estimates based on the current

price estimates. Accordingly, these factors as well as the approximations and assumptions necessarily made in the revaluation of flows to constant prices should be borne in mind when interpreting or using the estimates, for example, in attempting to draw precise quantitative inferences relating to quarter-to-quarter changes in gross domestic product or its components, or in productivity.

6. Analysis of trends requires allowance for these uncertainties in estimation. The effects are in some measure indicated by the change in the statistical discrepancy for corresponding periods. Uncertainty in trends arises also from the likelihood of revisions as more information becomes available and from the irregularity of short-term movements. The inclusion of the statistical discrepancy on the expenditure side of the accounts is a convention and does not necessarily imply that the sum of the income components more accurately measures GDP than the sum of the expenditure components (plus exports less imports). As household and other saving are estimated as balancing items in their respective accounts, care should be exercised in their interpretation.

7. Estimates of national income and expenditure are necessarily prepared from a wide range of statistical information, some of which is available quickly and some only with a delay of several years. For this reason most figures should be regarded as subject to revision as more complete and more accurate information becomes available. The revisions will be of two main types—those made to the most recent quarters as firmer quarterly or monthly data come to hand and those which are a consequence of revisions to annual totals and are distributed to the quarters approximately in accordance with existing quarterly patterns.

8. No simple measure is available of the accuracy of the national accounting aggregates. However the following example illustrates the *sensitivity* of quarter to quarter growth to the timing of recording a transaction. If, in the latest year, the timing of recording a transaction were delayed by one quarter and if the transaction had an impact on constant price gross domestic product of +\$31 million then the measure of the rate of growth would be affected in three adjoining quarters (centred on the quarter in which the transaction was recorded) by -0.1, +0.2, and -0.1 percentage points respectively. Of course the percentage impact of such a timing delay on relevant sub-aggregates would be greater.

9. The quarterly implicit price deflators (IPDs) shown in Tables 9 and 42 are derived by dividing seasonally adjusted current price estimates by the corresponding seasonally adjusted constant price estimates. Movements in the levels of individual implicit price deflators can be greatly affected by changes in the physical composition of the aggregates and their components. Generally, it is considered that IPDs derived from seasonally adjusted data are more reliable than those obtained by using original (i.e. unadjusted) series, because the former are less likely to be affected by compositional change than are the latter. However the seasonal adjustment process is itself a source of possible distortion, especially to the extent that it is not possible to identify, in a fully consistent way, the seasonality of the current price estimates and of the constant price estimates. A discussion of the limitations involved in using IPDs as measures of pure price change is contained in Appendix B of *Australian National Accounts, Concepts, Sources and Methods* (5216.0).

### **Seasonal adjustment**

10. As most series are affected to some extent by seasonal factors, allowance should be made for normal seasonal variation. In Tables 6, 8, 9, 13, 17, 19, 22, 23, 33, 35 and 37 to 42, *seasonally adjusted* values are presented for selected series. Series which show substantial irregularities in the original or adjusted series should be treated with some reserve. As different methods of seasonal adjustment tend to produce different results, it is necessary to bear in mind the methods by which they have been derived and the limitations to which those methods are subject. It should also be noted that the methods of seasonal adjustment used by the ABS do not force the sum of the seasonally adjusted estimates for each quarter of a financial year to equal the original annual total.

11. The general methods used in the ABS for making seasonal adjustments are described in *Seasonally Adjusted Indicators, Australia, 1981* (1308.0). However, special methods have been used to adjust some of the components of gross farm product which were not amenable to seasonal adjustment by the usual methods. To obtain the seasonally adjusted estimates, the estimated values of production of wheat, other grain and sugar cane, for any financial year, are distributed equally over the four quarters of the year ended June. One effect of these methods is that changes in the annual production of these commodities first enter into the seasonally adjusted figures in the September quarter. As far as possible the constant price estimates have been adjusted using methods similar to those for the corresponding current price estimates.

### **Analysis of contributions to growth table**

12. Table 3 presents an analysis of the contribution provided by each major aggregate to the percentage change in seasonally adjusted gross domestic product at constant prices. The formula used to calculate the contribution by each aggregate to the growth in GDP is:

$$\frac{A(t) - A(t-1)}{GDP(t-1)} \times 100.0$$

where  $A(t)$  = value of aggregate A in quarter under consideration

$A(t-1)$  = value of aggregate A in preceding quarter

GDP ( $t-1$ ) = value of GDP in preceding quarter

All these values are seasonally adjusted constant price estimates. It should be noted that the figures in this table are additive within each quarter unlike the percentage change tables shown elsewhere in this publication.

### **Rounding of figures**

13. Although percentage changes are given to one decimal place in this publication, this does not imply that they can be regarded as accurate to the last digit shown. The figures after the decimal point are given to avoid distortions which may occur in rounding off the figures to the nearest half or whole number.

14. The procedures used in preparing this publication may occasionally result in rounding differences between figures in this publication and corresponding figures in other publications.

15. Where figures have been rounded, discrepancies may occur between sums of the component items and totals.

### **Related publications**

16. In addition to those mentioned above other ABS publications which may be of interest include:

*Quarterly Estimates of National Income and Expenditure, Australia, (Preliminary)* (5205.0)—issued for June Quarter only

*Historical Series of Quarterly Estimates of National Income and Expenditure, Australia*, (5207.0)—issued for December Quarter only

*Australian National Accounts, Gross Product by Industry at Current and Constant Prices, 1979-80* (5211.0)

*Budget Paper: National Income and Expenditure, 1980-81* (5213.0)

17. Current publications produced by the ABS are listed in the *Catalogue of Publications, Australia* (1101.0). The ABS also issues, on Tuesdays and Fridays, a *Publications Advice* (1105.0) which lists publications to be released in the next few days. The Catalogue and Publications Advice are available from any ABS office.
