NOTES ON THE SEPTEMBER QUARTER ESTIMATES

MAIN FEATURES

NOTE: Conflicting information is contained in these estimates. Do not attempt to read too much into individual quarterly movements. To adequately interpret the estimates it is often necessary to consider several quarters and several aggregates in conjunction rather than the results of one quarter and of one aggregate taken in isolation. In particular, care should be taken in interpreting the major summary aggregates such as GDP, Gross non-farm product and GNE. These aggregates (in both current and constant price terms) are dependent on the estimates of wages, salaries and supplements and of gross operating surplus of companies, both of which are subject to uncertainties as described in the explanatory notes below.

ESTIMATES OF MAIN AGGREGATES AT AVERAGE 1979-80 PRICES, SEASONALLY ADJUSTED

	Percentage Change		Percentage points Contribution to Growth in GDP	
	June qtr 1982 to Sept. qtr 1982	Sept. qtr 1981 to Sept. qtr 1982	June qtr 1982 to Sept. qtr 1982	Sept. qtr 1981 to Sept. qtr 1982
Final consumption expenditure—				
Private	-0.6	1.8	-0.4	1.1
Government	-2.2	-3.2	-0.4	-0.5
Gross fixed capital expenditure	0.1	-4.5	—	-1.1
Increase in stocks	-0.6	-2.0
Statistical discrepancy	-2.0	0.2
Gross national expenditure	-3.1	-2.3	-3.2	-2.3
Exports of goods and services	4.6	10.1	0.8	1.7
Imports of goods and services	-8.7	-3.2	1.9	0.7
Gross domestic product	-0.6	—	-0.6	—
Gross farm product	-5.1	-1.0	-0.3	-0.1
Gross non-farm product	-0.3	0.1	-0.2	0.1

.. not applicable

In current price seasonally adjusted terms, wages, salaries and supplements rose by 4.1 per cent in September quarter 1982, while gross operating surplus of trading enterprise companies fell by 9.6 per cent after rising by 10.0 per cent in the June quarter 1982.

The following notes are provided to aid analysis of the estimates for recent quarters.

Wages, salaries and supplements

From December quarter 1981 an interim quarterly survey has been the principal source for compiling estimates of wages, salaries and supplements. Prior to that quarter the estimates were mainly based on payroll tax data. The employment coverage of the estimates has continued to be adjusted to reflect movements in the number of wage and salary earners shown in the monthly Labour Force Survey. Caution should be exercised in interpreting individual quarterly movements, particularly in the seasonally adjusted series.

Since the estimates from the interim survey are based on information obtained from a sample of employers, they are subject to sampling variability; that is, they may differ from the figures that would have been produced if all employers had been included in the survey. One measure of the likely difference is given by

the standard error, which indicates the extent to which an estimate might have varied by chance because only a sample of units was included. There are about two chances in three that a sample estimate will differ by less than one standard error from the figure that would have been obtained if all units had been included, and about nineteen chances in twenty that the difference will be less than two standard errors. For example, the estimate of the level of wages, salaries and supplements for the December Quarter of 1981 is \$21,014 million, and the standard error of this estimate is \$386 million. There are about two chances in three that the figure which would have been obtained if all employers were included in the survey is in the range \$20,628 million to \$21,400 million, and nineteen chances in twenty that it is in the range \$20,242 million to \$21,786 million.

The standard errors applicable to the estimates of level and movement to wages, salaries and supplements based on the interim survey are set out below:

	<i>Standard Error (\$ million)</i>	
	<i>Level</i>	<i>Movement</i>
December 1981	386	170
March 1982	353	163
June 1982	443	187
September 1982	437	195

A small pay periodicity survey has been conducted in respect of September quarter 1981 in order to assist in estimating the effects of changes in the seasonal pattern between the payroll tax data underlying the series prior to December quarter 1981 and the Quarterly Survey of Earnings data underlying the series from December quarter 1981. Because of the limited nature of the data that was obtained, extra caution is required in interpreting the seasonally adjusted estimates for recent quarters.

The factors outlined above should be taken into account when considering quarterly differences between the income-based and expenditure-based estimates of changes in gross non-farm product discussed under *Statistical discrepancy* below.

Gross operating surplus-companies

The gross operating surplus of companies is obtained by deducting the stock valuation adjustment (SVA) from an estimate of the profits of companies which, for the quarters of the latest year, are calculated using data obtained from the profits survey conducted by the ABS. During the past few quarters there have been some particularly erratic movements in the estimates of gross operating surplus of companies, caused by volatility in the SVA and the profits survey results. (The March and June quarter 1982 issues of this publication have contained details concerning the assumptions used in estimating the SVA and the way in which the SVA can be subject to quite large quarterly fluctuations.)

Government final consumption expenditure

The implicit price deflator (IPD) for this aggregate rose by only 0.8 per cent in the September quarter 1982. The main reason for the small increase is that the June quarter 1982 IPD was unusually high because of retrospective wage increases paid during that quarter to N.S.W. and Victorian teachers.

Statistical discrepancy

The statistical discrepancy represents the difference between the sum of the estimates of gross domestic product (GDP) and imports of goods and services on the one hand and the sum of the estimates of components of gross national expenditure and exports of goods and services on the other hand. Conceptually these two totals are the same. The inclusion of the statistical discrepancy on the expenditure side of the domestic production

account is a convention and does not necessarily imply that the sum of the income components more accurately measures GDP than the sum of the expenditure components.

The aspect of the statistical discrepancy which is of most concern in the quarterly context is the magnitude of change from one quarter to the next. In some quarters there are quite significant movements in the seasonally adjusted constant price statistical discrepancy. A useful way of examining the significance of the statistical discrepancy is to compare the change in gross non-farm product as published with the result which would be obtained using the expenditure aggregates excluding the statistical discrepancy. The following table shows such a comparison for the last 6 quarters and indicates that inconsistencies in the recording of transactions in the domestic production account are particularly marked in some quarters. Users are advised to take these problems into account when interpreting the estimates.

PERCENTAGE CHANGES IN GROSS NON-FARM PRODUCT AT AVERAGE 1979-80 PRICES, SEASONALLY ADJUSTED

<i>Quarters ended</i>	<i>Income based(a)</i>	<i>Expenditure based(b)</i>
<i>1981—</i>		
June	0.8	—
September	1.1	2.2
December	-0.8	0.6
<i>1982—</i>		
March	0.2	-1.0
June	1.0	-1.7
September	-0.3	1.9

(a) Gross non-farm product as published. (b) Gross non-farm product less statistical discrepancy.

Household saving ratio

Present estimates indicate that, on a seasonally adjusted basis, the proportion of household disposable income devoted to consumption in the September quarter was 87.0 per cent while household saving which is derived as a balancing item represented 13.0 per cent. Both of these ratios are affected by any deficiencies or inconsistencies in the estimation and seasonal adjustment of household income and expenditure.

The household saving ratio in recent quarters is as follows:

<i>Quarters ended</i>	<i>Percentage</i>
<i>1981—</i>	
June	13.3
September	12.6
December	13.0
<i>1982—</i>	
March	12.2
June	12.5
September	13.0

Revisions

Since the June quarter issue of this publication the major revisions to quarterly estimates have been to private final consumption expenditure which in constant price, seasonally adjusted terms is now estimated to have increased by 0.9 per cent in June quarter 1982 compared

with the previous estimate of 0.2 per cent, and to private non-farm stocks which are now estimated to have fallen in constant price, seasonally adjusted terms by \$128 million in June quarter 1982 compared with the previous estimate of an increase of \$47 million.

EXPLANATORY NOTES

Introduction

This publication provides estimates of the components of gross domestic product and national expenditure and supporting tables for the September quarter 1982, together with comparative estimates for the eight previous quarters and the four years 1978-79 to 1981-82. Tables 32-42 provide historical series for the period from September quarter 1969 for the aggregates contained in the domestic production account (at both current and average 1979-80 prices), some selected income aggregates and implicit price deflators.

2. Apart from the change discussed in paragraph 3 of the Explanatory notes to the March quarter 1982 issue of this publication, the definitions and concepts used are identical to those employed in *Australian National Accounts, National Income and Expenditure 1980-81* (5204.0). A discussion of these definitions and concepts, the nature and limitations of implicit price deflators and a description of items in this publication are presented in *Australian National Accounts, Concepts, Sources and Methods* (5216.0).

Interpretation of quarterly estimates

3. Estimating for a period of less than one year presents special problems in that it is often difficult to adhere strictly to definitions and concepts used in annual estimates. The measurement of income for a quarterly period is particularly difficult since it is not always possible to match the value of production for a quarter with the cost incurred in that production. This problem occurs, for example, in estimating the income of farm unincorporated enterprises in each quarter, and results in considerable variation of the estimates for this series, and for gross farm product, from quarter to quarter. Difficulties are also experienced in obtaining detailed data for short periods and in preparing consistent estimates from various sources where different accounting procedures and periods are used.

4. These problems inevitably affect the consistency and reliability of the current price estimates, and similarly affect the constant price estimates based on the current price estimates. Accordingly, these factors as well as the approximations and assumptions necessarily made in the revaluation of flows to constant prices should be borne in mind when interpreting or using the estimates, for example, in attempting to draw precise quantitative inferences relating to quarter-to-quarter changes in gross domestic product or its components, or in productivity.

5. Analysis of trends requires allowance for these uncertainties in estimation. The effects are in some measure indicated by the change in the statistical discrepancy for corresponding periods. Uncertainty in trends arises also from the likelihood of revisions as more information becomes available and from the irregularity of short-term movements. The inclusion of the statistical discrepancy on the expenditure side of the accounts is a convention and does not necessarily imply that the sum of the income components more accurately measures GDP than the sum of the expenditure components (plus exports less imports). As household and other saving are estimated as balancing items in their respective accounts, care should be exercised in their interpretation.

6. Estimates of national income and expenditure are necessarily prepared from a wide range of statistical information, some of which is available quickly and some only with a delay of several years. For this reason most figures should be regarded as subject to revision as more complete and more accurate information becomes available. The revisions will be of two main types—those made to the most recent quarters as firmer quarterly or monthly data come to hand and those which are a consequence of revisions to annual totals and are distributed to the quarters approximately in accordance with existing quarterly patterns.

7. No simple measure is available of the accuracy of the major summary national accounting aggregates. However the following example illustrates the *sensitivity* of quarter to quarter growth to the timing of recording a transaction. If, in the latest year, the timing of recording a transaction were delayed by one quarter and if the transaction had an impact on constant price gross domestic product of +\$31 million then the measure of the rate of growth would be affected in three adjoining quarters (centred on the quarter in which the transaction was recorded) by -0.1, +0.2, and -0.1 percentage points respectively. Of course the percentage impact of such a timing delay on relevant sub-aggregates would be greater.

8. The quarterly implicit price deflators (IPDs) shown in Tables 9 and 42 are derived by dividing seasonally adjusted current price estimates by the corresponding seasonally adjusted constant price estimates. Movements in the levels of individual implicit price deflators can be greatly affected by changes in the physical composition of the aggregates and their components. Generally, it is considered that IPDs derived from seasonally adjusted data are more reliable than those obtained by using original (i.e. unadjusted) series, because the former are less likely to be affected by compositional change than are the latter. However the seasonal adjustment process is itself a source of possible distortion, especially to the extent that it is not possible to identify, in a fully consistent way, the seasonality of the current price estimates and of the constant price estimates. A discussion of the limitations involved in using IPDs as measures of pure price change is contained in Appendix B of *Australian National Accounts, Concepts, Sources and Methods* (5216.0).

Seasonal adjustment

9. As most series are affected to some extent by seasonal factors, allowance should be made for normal seasonal variation. In Tables 6, 8, 9, 13, 17, 19, 22, 23, 33, 35 and 37 to 42, *seasonally adjusted* values are presented for selected series. Series which show substantial irregularities in the original or adjusted series should be treated with some reserve. As different methods of seasonal adjustment tend to produce different results, it is necessary to bear in mind the methods by which they have been derived and the limitations to which those methods are subject. It should also be noted that the methods of seasonal adjustment used by the ABS do not force the sum of the seasonally adjusted estimates for each quarter of a financial year to equal the original annual total.

10. The general methods used in the ABS for making seasonal adjustments are described in *Seasonally Adjusted Indicators, Australia, 1982* (1308.0). However, special methods have been used to adjust some of the components of gross farm product which were not amenable to seasonal adjustment by the usual methods. To obtain the seasonally adjusted estimates, the estimated values of production of wheat, other grain and sugar cane, for any financial year, are distributed equally over the four quarters of the year ended June. One effect of these methods is that changes in the annual production of these commodities first enter into the seasonally adjusted figures in the September quarter. As far as possible the constant price estimates have been adjusted using methods similar to those for the corresponding current price estimates.

Analysis of contributions to growth table

11. Table 3 presents an analysis of the contribution provided by each major aggregate to the percentage change in seasonally adjusted gross domestic product at constant prices. The formula used to calculate the contribution by each aggregate to the growth in GDP is:

$$\frac{A(t)-A(t-1)}{GDP(t-1)} \times 100.0$$

where A(t) = value of aggregate A in quarter under consideration

A(t-1) = value of aggregate A in preceding quarter

GDP (t-1) = value of GDP in preceding quarter

All these values are seasonally adjusted constant price estimates. It should be noted that the figures in this table are additive within each quarter unlike the percentage change tables shown elsewhere in this publication.

Rounding of figures

12. Although percentage changes are given to one decimal place in this publication, this does not imply that they can be regarded as accurate to the last digit shown. The figures after the decimal point are given to avoid distortions which may occur in rounding off the figures to the nearest half or whole number.

13. The procedures used in preparing this publication may occasionally result in rounding differences between figures in this publication and corresponding figures in other publications.

14. Where figures have been rounded, discrepancies may occur between sums of the component items and totals.

Related publications

15. In addition to those mentioned above other ABS publications which may be of interest include:

Historical Series of Quarterly Estimates of National Income and Expenditure, Australia, (5207.0)—issued for December Quarter only

Australian National Accounts, Gross Product by Industry at Current and Constant Prices, 1980-81 (Preliminary) (5210.0)

Australian National Accounts, Gross Product by Industry, 1980-81 (5211.0)

Budget Paper: National Income and Expenditure, 1981-82 (5213.0)

16. Current publications produced by the ABS are listed in the *Catalogue of Publications, Australia* (1101.0). The ABS also issues, on Tuesdays and Fridays, a *Publications Advice* (1105.0) which lists publications to be released in the next few days. The Catalogue and Publications Advice are available from any ABS office.
