## NOTES ON THE ESTIMATES

## MAIN FEATURES

*NOTE: Changes in individual quarters are necessarily subject to the uncertainties discussed in the Explanatory notes under interpretation of quarterly estimates, and furthermore some may be substantially revised as firmer data come to hand. This applies particularly to the estimates for the two most recent years for gross operating surplus, the income of companies and non-farm unincorporated enterprises, depreciation, and therefore to the estimated magnitude of change in gross non-farm product.*

## ESTIMATES OF MAIN AGGREGATES AT AVERAGE 1979-80 PRICES, SEASONALLY ADJUSTED

	Percentage Change		Percentage Points Contribution to Growth in GDP	
	June qtr 1984 to Sept. qtr 1984	Sept. qtr 1983 to Sept. qtr 1984	June qtr 1984 to Sept. qtr 1984	Sept. qtr 1983 to Sept. qtr 1984
Final consumption expenditure—				
Private	0.6	2.2	0.4	1.4
Government	5.3	8.8	0.9	1.5

.. not applicable

In current price seasonally adjusted terms, wages, salaries and supplements rose by 0.9 per cent in September quarter 1984, following a rise of 5.9 per cent in the previous quarter, while gross operating surplus of trading enterprise companies fell 6.4 per cent after falling by 2.3 per cent in the June quarter 1984.

The following notes are provided to aid analysis of the estimates for recent quarters.

**Gross farm product**

The fall of almost 13 per cent in seasonally adjusted gross farm product at constant prices in September quarter 1984 is mainly attributable to an expected decline in the volume of wheat and other grains to be harvested during 1984-85 compared with the record crop produced in 1983-84. (See paragraph 10 of the Explanatory notes for an explanation of the methods used to seasonally adjust the production series for these commodities.)

**Government final consumption expenditure**

The current price value of this aggregate is estimated using data from public authority accounts, which record cash flows. The estimates therefore reflect the effects of pre-payment of salaries over holiday periods, back pay associated with award changes, etc. It is not always possible to identify all these effects when compiling the deflators used to derive constant price estimates. Therefore, quarter-to-quarter movements in the constant price seasonally adjusted estimates for this aggregate should be treated with caution. The September quarter 1984

estimate is also affected significantly by the inclusion of the full value (\$280 million in current prices) of a frigate delivered to the Australian Navy in July 1984.

**Gross fixed capital expenditure — Sales of public sector assets**

The national accounts attribute gross fixed capital expenditure to sectors on the basis of legal ownership, a basis consistent with existing Australian accounting practices.

The following table provides information on major sales of fixed assets from the public sector to the private sector. Because the vast majority of these sales are associated with leaseback or similar arrangements this data can be used to partially adjust capital expenditure estimates from sector of legal ownership to sector of effective ownership. However, it should be noted that such an adjustment would not take into account all arrangements under which assets owned by the private sector are effectively controlled by the public sector.

Also, it would result in estimates of capital expenditure inconsistent with estimates of gross operating surplus and other aggregates in the sector accounts, for which information is not available to make estimates on other than the present basis.

#### MAJOR SALES OF FIXED ASSETS FROM THE PUBLIC SECTOR TO THE PRIVATE SECTOR (EXCLUDING DWELLINGS)

	<i>Non dwelling construction (\$ million)</i>	<i>Equipment (\$ million)</i>	<i>Total (\$ million)</i>
1980-81	—	185	185
1981-82	81	1216	1297
1982-83	98	851	949
1983-84	151	1120	1271
<i>1982—</i>			
September	n.p.	n.p.	117
December	n.p.	n.p.	208
<i>1983—</i>			
March	n.p.	n.p.	367
June	n.p.	n.p.	257
September	n.p.	n.p.	104
December	n.p.	n.p.	523
<i>1984—</i>			
March	n.p.	n.p.	110
June	n.p.	n.p.	534

It should be noted that, although some quarterly data have been provided above, it is not possible to release this series on an *ongoing* quarterly basis. Because of the magnitude of some individual transactions and a priority to make at least annual figures available, confidentiality of individual quarterly estimates cannot be determined until the completion of each financial year.

In September quarter 1984 the value of major sales of fixed assets from the public sector to the private sector was significantly lower than the very high level recorded in June quarter 1984. As shown in the table above, the value of such sales has tended to fluctuate significantly from quarter to quarter. It is therefore necessary to interpret the quarterly movements in the following aggregates very carefully:

- Gross fixed capital expenditure—public enterprises
- Private gross fixed capital expenditure—equipment
- Private gross fixed capital expenditure—non-dwelling construction

#### Gross fixed capital expenditure—general government

In seasonally adjusted, constant price terms there has been a decrease in the level of capital expenditure undertaken by general government during the September quarter. The estimate has fallen from the exceptionally high level of \$1,120m in June quarter to \$1,023m in September quarter (a drop of 8.7%). On the basis of preliminary survey figures, the change is broadly based, rather than being attributable to any single factor.

#### Private gross fixed capital expenditure—equipment

The implicit price deflator (IPD) for this aggregate rose by only 0.1 per cent in the September quarter 1984. While the decline in the value of the \$A during recent months has exerted upward pressure on the prices of imported items of capital equipment, this influence has been cancelled out by the effect on the IPD of a compositional shift between the imported and domestically produced components of this aggregate. The imported share of capital equipment increased sharply between the June and September quarters of 1984, and there was a lower level of sale/leaseback transactions by the public sector. This latter factor is the reason for the difference between 0.1 per cent increase in the national accounts IPD and the 0.9 per cent increase underlying estimates published in the September quarter 1984 issue of 'New fixed capital expenditure by private enterprises in selected industries, Australia' (5625.0).

#### Exports and imports of goods and services

In September quarter 1984 the implicit price deflator (IPD) for exports of goods and services rose by 5.5 per cent, the first increase since September quarter 1983. The large increase is mainly attributable to rises in prices of non-rural exports, although some of the increase also reflects changes in the composition of exports since June quarter 1984.

The IPD for imports of goods and services rose by 5.0 per cent in September quarter 1984, reflecting mainly the impact on September quarter import prices of the decline in the value of the Australian dollar relative to other currencies (particularly the US dollar) over the first half of 1984.

#### Stock valuation adjustment

The size of the stock valuation adjustment (SVA) in September quarter 1984 is somewhat greater than its average level during the last year. This should not be taken as indicating that price increases have speeded up. A larger SVA in a period in which inflation is moderating could be due to a breakdown in one or more of the assumptions underlying the SVA methodology; and/or differences between the overall price index underlying the SVA methodology and the most widely-used 'official' measures of inflation in terms of the scope and composition of component price series.

The major assumptions underlying the SVA are that:

- (a) book value levels reported by businesses are based on accounting valuations at historical cost assigned by the FIFO (first in, first out) method;
- (b) within most sectors, sales prices can be used to adjust stock levels valued at cost, that is, the selling price of finished goods is established as a fixed mark-up on the costs incurred in the current period;
- (c) the commodities in stock have a fixed turnover period, that is, the ratios 'stock level of materials/value of purchases' and 'stock level of finished goods/value of sales' remain constant;
- (d) the commodity composition of each estimation cell remains fixed; and
- (e) within each estimation cell, the RATE of physical increase (or decrease) in stocks is constant throughout each quarter.

In compiling component price indexes (using the assumptions outlined above) extensive use is made of detailed price data from three ABS collections: Consumer Price Index (CPI), Articles Produced by Manufacturing Industry (APMI); and Materials Used by Manufacturing Industry (MUMI). The weights used to combine the component indexes for stock revaluation purposes are derived from relative levels of stockholdings of the relevant commodities. In contrast, the weighting patterns used in CPI, APMI, and MUMI are derived respectively from: patterns of household expenditure; outputs of the manufacturing sector; and (net) intermediate consumption of the manufacturing sector. Substantial differences in weighting patterns can lead to quite significant differences in movement between two series with the same component data. For example, while movements in the CPI and MUMI can be noticeably influenced by fluctuations in the prices of fresh fruit and vegetables and live animals, neither of these commodities has any significant weight in the calculation of the SVA.

### Stocks

In seasonally adjusted terms, private non-farm stocks at constant prices recorded a larger increase than in June quarter 1984, continuing the restocking which began in March quarter 1984. The increase in stocks contributed 0.2 percentage points to growth in gross domestic product (GDP) in September quarter 1984.

The constant price private non-farm stocks to sales (a) ratio increased marginally over the record low level recorded in June quarter 1984. The private non-farm stocks to sales ratio in recent quarters is as follows:

<i>Quarters ended</i>	<i>Ratio</i>
1983—	
June	0.742
September	0.718
December	0.694
1984—	
March	0.696
June	0.684
September	0.690

(a) Constant price sales are defined as gross non-farm product *plus* imports of goods and services (excluding petroleum, civil aircraft and government imports) *less* changes in private non-farm stocks. (All these variables are at average 1979-80 prices.)

### Statistical discrepancy

The statistical discrepancy represents the difference between the sum of the estimates of gross domestic product (GDP) and imports of goods and services on the one hand and the sum of the estimates of components of gross national expenditure and exports of goods and services on the other hand. Conceptually these two totals are the same. The inclusion of the statistical discrepancy on the expenditure side of the domestic production account is a convention and does not necessarily imply that the sum of the income components more accurately measures GDP than the sum of the expenditure components.

The aspect of the statistical discrepancy which is of most concern in the quarterly context is the magnitude of change from one quarter to the next. In some quarters there are quite significant movements in the seasonally adjusted constant price statistical discrepancy. A useful way of examining the significance of the statistical discrepancy is to compare the change in gross non-farm product as published with the result which would be obtained using the expenditure aggregates excluding the statistical discrepancy. The following table shows such a comparison for the last 6 quarters.

### PERCENTAGE CHANGES IN GROSS NON-FARM PRODUCT AT AVERAGE 1979-80 PRICES, SEASONALLY ADJUSTED

<i>Quarters ended</i>	<i>Income based(a)</i>	<i>Expenditure based(b)</i>
1983—		
June	-1.2	-1.8
September	2.3	2.8
December	1.0	0.5
1984—		
March	2.6	2.4
June	1.8	-0.2
September	—	1.7

(a) Gross non-farm product as published. (b) Gross non-farm product *less* statistical discrepancy.

### Household saving ratio

Present estimates indicate that, on a seasonally adjusted basis, the proportion of household disposable income devoted to consumption in the September quarter was 87.0 per cent while household saving, which is derived as a balancing item, represented 13.0 per cent. Both of these ratios are affected by any deficiencies or inconsistencies in the estimation and seasonal adjustment of household income and expenditure.

The household saving ratio in recent quarters is as follows:

<i>Quarters ended</i>	<i>Percentage</i>
1983—	
June	12.6
September	13.3
December	13.9
1984—	
March	13.7
June	14.9
September	13.0

### Revisions

Since the release of the June quarter issue of this publication the major revisions to estimates for 1983-84 have been to the following aggregates; private gross fixed capital expenditure—equipment, private final consumption expenditure, and wages, salaries and supplements. The net effect of these revisions has been to reduce the statistical discrepancy in each quarter of 1983-84 and to lower the annual discrepancy by almost \$1 billion. In addition, there was a major downward revision to constant price farm and public authority stocks in December quarter 1983. It has affected the movements in gross domestic product and gross non-farm product at constant prices between September and December quarters 1983 and between December quarter 1983 and March quarter 1984.

## EXPLANATORY NOTES

### Introduction

This publication provides estimates of the components of gross domestic product and national expenditure and supporting tables for the September quarter 1984, together with comparative estimates for the eight previous quarters and the four years 1980-81 to 1983-84. In addition, seasonally adjusted estimates of the major aggregates and some selected series are provided for the June quarter 1984, together with comparative estimates for the twelve previous quarters. Tables 32-42 provide time series, in both original and seasonally adjusted terms, for the period from September quarter 1969 for the aggregates contained in the domestic production account (at both current and average 1979-80 prices), some selected income aggregates and implicit price deflators.

### Concepts, definitions, sources and methods

2. A basic guide to the Australian national accounts entitled *Australian National Accounts, Concepts, Sources and Methods* (5216.0) is available. It outlines major concepts and definitions, describes sources of data and methods used to derive annual and quarterly estimates for major aggregates at current and constant prices and discusses the accuracy and reliability of the national accounts. The concepts, definitions, sources and methods applicable to the estimates contained in this publication are as described in 5216.0 but with the changes outlined in Appendix A, *Australian National Accounts, National Income and Expenditure, 1982-83* (5204.0).

### Interpretation of quarterly estimates

3. Estimating for a period of less than one year presents special problems in that it is often difficult to adhere strictly to definitions and concepts used in annual estimates. The measurement of income for a quarterly period is particularly difficult since it is not always possible to match the value of production for a quarter with the cost incurred in that production. This problem occurs, for example, in estimating the income of farm unincorporated enterprises in each quarter, and results in considerable variation of the estimates for this series, and for gross farm product, from quarter to quarter. Difficulties are also experienced in obtaining detailed data for short periods and in preparing consistent estimates from various sources where different accounting procedures and periods are used.

4. These problems inevitably affect the consistency and reliability of the current price estimates, and similarly affect the constant price estimates based on the current price estimates. Accordingly, these factors as well as the approximations and assumptions necessarily made in the revaluation of flows to constant prices should be borne in mind when interpreting or using the estimates for example, in attempting to draw precise quantitative inferences relating to quarter-to-quarter changes in gross domestic product or its components, or in productivity.

5. Analysis of trends requires allowance for these uncertainties in estimation. The effects are in some measure indicated by the change in the statistical discrepancy for corresponding periods. Uncertainty in trends arises also from the likelihood of revisions as more information becomes available and from the irregularity of short-term movements. The inclusion of the statistical

discrepancy on the expenditure side of the accounts is a convention and does not necessarily imply that the sum of the income components more accurately measures GDP than the sum of the expenditure components (plus exports less imports). As household and other saving are estimated as balancing items in their respective accounts, care should be exercised in their interpretation.

6. Estimates of national income and expenditure are necessarily prepared from a wide range of statistical information, some of which is available quickly and some only with a delay of several years. For this reason most figures should be regarded as subject to revision as more complete and more accurate information becomes available. The revisions will be of two main types—those made to the most recent quarters as firmer quarterly or monthly data come to hand and those which are a consequence of revisions to annual totals and are distributed to the quarters approximately in accordance with existing quarterly patterns.

7. No simple measure is available of the accuracy of the major summary national accounting aggregates. However the following example illustrates the *sensitivity* of quarter to quarter growth to the timing of recording a transaction. If, in the latest year, the timing of recording a transaction were delayed by one quarter and if the transaction had an impact on constant price gross domestic product of +\$33 million then the measure of the rate of growth would be affected in three adjoining quarters (centred on the quarter in which the transaction was recorded) by -0.1, +0.2, and -0.1 percentage points respectively. Of course the percentage impact of such a timing delay on relevant sub-aggregates would be greater.

8. The quarterly implicit price deflators (IPDs) shown in Tables 9 and 42 are derived by dividing seasonally adjusted current price estimates by the corresponding seasonally adjusted constant price estimates. Movements in the levels of individual implicit price deflators can be greatly affected by changes in the physical composition of the aggregates and their components. Generally, it is considered that IPDs derived from seasonally adjusted data are more reliable than those obtained by using original (i.e. unadjusted) series, because the former are less likely to be affected by compositional change than are the latter. However the seasonal adjustment process is itself a source of possible distortion, especially to the extent that it is not possible to identify, in a fully consistent way, the seasonality of the current price estimates and of the constant price estimates. A discussion of the limitations involved in using IPDs as measures of pure price change is contained in Appendix B of *Australian National Accounts, Concepts, Sources and Methods* (5216.0).

### Seasonal adjustment

9. As most series are affected to some extent by seasonal factors, allowance should be made for normal seasonal variation. In Tables 6, 8, 9, 13, 17, 19, 22, 23, 33, 35 and 37 to 42, *seasonally adjusted* values are presented for selected series. Series which show substantial irregularities in the original or adjusted series should be treated with some reserve. As different methods of seasonal adjustment tend to produce different results, it is necessary

to bear in mind the methods by which they have been derived and the limitations to which those methods are subject. It should also be noted that the methods of seasonal adjustment used by the ABS do not force the sum of the seasonally adjusted estimates for each quarter of a financial year to equal the original annual total.

10. The general methods used in the ABS for making seasonal adjustments are described in *Seasonally Adjusted Indicators, Australia, 1983* (1308.0). However, special methods have been used to adjust some of the components of gross farm product which were not amenable to seasonal adjustment by the usual methods. To obtain the seasonally adjusted estimates, the estimated values of production of wheat, other grain and sugar cane, for any financial year, are distributed equally over the four quarters of the year ended June. One effect of these methods is that changes in the annual production of these commodities first enter into the seasonally adjusted figures in the September quarter.

11. Where there is no apparent seasonality in their implicit price deflators, constant price estimates are seasonally adjusted using the same factors as are used for adjusting the corresponding current price estimates. As far as possible the remaining constant price estimates have been adjusted using methods similar to those for the corresponding current price estimates.

#### Analysis of contributions to growth table

12. Table 3 presents an analysis of the contribution provided by each major aggregate to the percentage change in seasonally adjusted gross domestic product at constant prices. The formula used to calculate the contribution by each aggregate to the growth in GDP is:

$$\frac{A(t) - A(t-1)}{GDP(t-1)} \times 100.0$$

where A(t) = value of aggregate A in quarter under consideration

A(t-1) = value of aggregate A in preceding quarter

GDP(t-1) = value of GDP in preceding quarter

All these values are seasonally adjusted constant price estimates. It should be noted that the figures in this table are additive within each quarter unlike the percentage change tables shown elsewhere in this publication.

#### Rounding of figures

13. Although percentage changes are given to one decimal place in this publication, this does not imply that they can be regarded as accurate to the last digit shown. The figures after the decimal point are given to avoid distortions which may occur in rounding off the figures to the nearest half or whole number.

14. The procedures used in preparing this publication may occasionally result in rounding differences between figures in this publication and corresponding figures in other publications.

15. Where figures have been rounded, discrepancies may occur between sums of the component items and totals.

#### Related publications

16. In addition to those mentioned above other ABS publications which may be of interest include:

*Historical Series of Estimates of National Income and Expenditure, Australia*, (5207.0)—issued for December Quarter only

*Australian National Accounts, Gross Product by Industry, 1981-82* (5211.0)

Budget Paper: *National Income and Expenditure, 1983-84* (5213.0)

17. Current publications produced by the ABS are listed in the *Catalogue of Publications, Australia* (1101.0). The ABS also issues, on Tuesdays and Fridays, a *Publications Advice* (1105.0) which lists publications to be released in the next few days. The Catalogue and Publications Advice are available from any ABS office.
