NOTES ON THE ESTIMATES

MAIN FEATURES

NOTE: Changes in individual quarters are necessarily subject to the uncertainties discussed in the Explanatory notes under Interpretation of quarterly estimates, and furthermore some may be substantially revised as firmer data come to hand. This applies particularly to the estimates for the two most recent years for gross operating surplus, the income of companies and non-farm unincorporated enterprises, depreciation, and therefore to the estimated magnitude of change in gross non-farm product.

ESTIMATES OF MAIN AGGREGATES AT AVERAGE 1979-80 PRICES, SEASONALLY ADJUSTED

	Percentage Change		Percentage Points Contribution to Growth in GDP	
	Sept. qtr 1985 to Dec. qtr 1985	Dec. qtr 1984 to Dec. qtr 1985	Sept. qtr 1985 to Dec. qtr 1985	Dec. qtr 1984 to Dec. qtr 1985

.. not applicable

In current price seasonally adjusted terms, wages, salaries and supplements rose by 4.4 per cent in December quarter 1985, following a rise of 1.2 per cent in the previous quarter, while gross operating surplus of trading enterprise companies fell 6.1 per cent after rising by 14.0 per cent in the September quarter 1985.

The following notes are provided to aid analysis of the estimates for recent quarters.

Changes and revisions in this issue

Significant changes affecting the full period covered by this publication have been made to the following aggregates in the domestic production account:

- Gross fixed capital expenditure — private dwellings
- Gross operating surplus — trading enterprise companies
- Gross operating surplus — unincorporated trading enterprises

The capital expenditure estimates have been revised to reflect a more comprehensive adjustment for alterations and additions to dwellings. The gross operating surplus estimates have been adjusted to make adequate allowance for understatement of income as reported for income tax purposes. These revisions are described more fully in paragraphs 4 to 6 of the Explanatory Notes.

There have been revisions, particularly to more recent periods, resulting from both the changes to the presentation of Balance of Payments statistics discussed in

paragraph 3 of the Explanatory Notes and the incorporation of more recent source data. It should be noted that some of the revisions are offsetting as they arise from the gross recording of flows previously recorded on a net basis.

In addition a number of significant revisions have been made to public sector estimates. Some of these revisions represent a reclassification of certain transactions from one aggregate to another, while others have arisen because of the introduction of a new quarterly estimation system. This new system has caused changes to quarterly distributions for many public sector aggregates from 1983-84 and has also led to significant revisions to quarterly estimates for recent periods. There were major revisions to the estimates for public gross fixed capital expenditure for both 1983-84 and 1984-85. The revision for 1983-84 was due to a more detailed examination of the capital accounts of some enterprises while the 1984-85 revisions were principally consequential on those for 1983-84.

Estimates for all aggregates have been revised in accordance with revised annual estimates which will be published shortly in 'Australian National Accounts, National Income

and Expenditure 1984-85, Summary' (5201.0). Seasonally adjusted estimates have also been revised following the normal annual reanalysis of all adjusted series.

A number of significant revisions to aggregates for the September quarter 1985 has resulted in the increase in seasonally adjusted gross non-farm product at constant prices being revised from 0.6 per cent to 2.1 per cent. In particular revisions to estimated prices underlying the SVA and imports, the estimates of indirect taxes less subsidies and gross operating surplus of trading enterprise companies and public trading enterprises contributed to the September quarter revision.

Gross fixed capital expenditure—Sales of public sector assets

The national accounts attribute gross fixed capital expenditure to sectors on the basis of legal ownership. The following table provides information on major sales of fixed assets from the public sector to the private sector. Because the vast majority of these sales are associated with leaseback and similar arrangements this data can be used to partially adjust capital expenditure estimates from sector of legal ownership to sector of effective ownership. However, it should be noted that such an adjustment would not take into account all arrangements under which assets owned by the private sector are effectively controlled by the public sector. Also, it would result in estimates of capital expenditure inconsistent with estimates of gross operating surplus and other aggregates in the sector accounts, for which information is not available to make estimates on other than the present basis.

MAJOR SALES OF FIXED ASSETS FROM THE PUBLIC SECTOR TO THE PRIVATE SECTOR (EXCLUDING DWELLINGS)

	<i>Non-dwelling construction (\$ million)</i>	<i>Equipment (\$ million)</i>	<i>Total (\$ million)</i>
1981-82	81	1,216	1,297
1982-83	98	851	949

Stocks

In seasonally adjusted terms private non-farm stocks at constant prices increased by \$269 million during the December quarter 1985. The smaller build-up compared with that in September quarter resulted in a negative contribution of 0.4 percentage points to growth in gross domestic product (GDP) during the latest quarter.

With the moderate increase in private non-farm stocks associated with relatively slight growth in sales (a), the constant price private non-farm stocks to sales (a) ratio in the December quarter 1985 has risen only slightly from the record low recorded in June quarter 1985. The recent history of this ratio is set out below.

<i>Quarters ended</i>	<i>Ratio</i>
<i>1984—</i>	
September	0.666
December	0.666
<i>1985—</i>	
March	0.670
June	0.655
September	0.658
December	0.655

(a) Constant price sales are defined as gross non-farm product plus imports of goods and services (excluding imports of fuel, imports of certain large items of equipment by both the public and private sectors and certain other government imports) less changes in private non-farm stocks. (All these variables are at average 1979-80 prices.)

Statistical discrepancy

The statistical discrepancy represents the difference between the sum of the estimates of gross domestic product (GDP) and imports of goods and services on the one hand and the sum of the estimates of components of gross national expenditure and exports of goods and services on the other hand. Conceptually these two totals are the same. The inclusion of the statistical discrepancy on the expenditure side of the domestic production account is a convention and does not necessarily imply that the sum of the income components more accurately measures GDP than the sum of the expenditure components.

The aspect of the statistical discrepancy which is of most concern in the quarterly context is the magnitude of change from one quarter to the next. In some quarters there are quite significant movements in the seasonally adjusted constant price statistical discrepancy. A useful way of examining the significance of the statistical discrepancy is to compare the change in gross non-farm product as published with the result which would be obtained using the expenditure aggregates excluding the statistical discrepancy. The following table shows such a comparison for the last 8 quarters together with an annual comparison for the last two financial years.

**PERCENTAGE CHANGES IN GROSS NON-FARM
PRODUCT AT AVERAGE 1979-80 PRICES,
SEASONALLY ADJUSTED**

	<i>Income -based(a)</i>	<i>Expenditure -based(b)</i>
1983-84	3.5	2.7
1984-85	4.6	4.3
<i>1984—</i>		
March	3.4	1.4
June	1.4	1.1
September	-0.6	-0.3
December	2.0	1.9
<i>1985—</i>		
March	—	2.0
June	2.9	2.4
September	2.1	1.4
December	0.4	-0.7

(a) Gross non-farm product as published. (b) Gross non-farm product less statistical discrepancy.

Household saving ratio

Present estimates indicate that, on a seasonally adjusted basis, the proportion of household disposable income devoted to consumption in the December quarter was 86.1 per cent while household saving, which is derived as a balancing item, represented 13.9 per cent. Both of these ratios are affected by any deficiencies or inconsistencies in the estimation and seasonal adjustment of household income and expenditure.

The household saving ratio in recent quarters is as follows:

<i>Quarters ended</i>	<i>Percentage</i>
<i>1984—</i>	
September	13.9
December	15.2
<i>1985—</i>	
March	15.5
June	12.2
September	12.4
December	13.9

EXPLANATORY NOTES

Introduction

This publication provides estimates of the components of gross domestic product and national expenditure and supporting tables for the December quarter 1985, together with comparative estimates for the eight previous quarters and the four years 1981-82 to 1984-85. In addition, seasonally adjusted estimates of the major aggregates and some selected series are provided for the December quarter 1985, together with comparative estimates for the twelve previous quarters. Tables 32-42 provide time series, in both original and seasonally adjusted terms, for the period from September quarter 1969 for the aggregates contained in the domestic production account (at both current and average 1979-80 prices), some selected income aggregates and implicit price deflators.

Concepts, definitions, sources and methods

2. A basic guide to the Australian national accounts entitled *Australian National Accounts, Concepts, Sources and Methods* (5216.0) is available. It outlines major concepts and definitions, describes sources of data and methods used to derive annual and quarterly estimates for major aggregates at current and constant prices and discusses the accuracy and reliability of the national accounts. The concepts, definitions, sources and methods applicable to the estimates contained in this publication are as described in 5216.0 but with the changes outlined below in 'Changes in this issue' and in Appendix A, *Australian National Accounts, National Income and Expenditure, 1983-84* (5204.0).

Changes in this issue

3. Changes have been made in the presentation of these accounts in line with classificatory and presentational changes introduced in the December quarter 1985 issue of *Balance of Payments, Australia* (5302.0). The major changes which affect the presentation of data in the national accounts include:

- (a) Identification of payments and receipts of labour income between the resident and non-resident sectors. (This change is a consequence of a more rigorous separation of services, income and unrequited transfers.) It should be noted that there is now a minor definitional difference between wages, salaries and supplements as published in the domestic production account (payments by Australian resident producers) and as published in the households income and outlay account (receipts by Australian resident individuals).
- (b) Extraordinary insurance claims from overseas are now shown as a separate category of income from overseas rather than as an element of unrequited transfers from overseas. Claims associated with the Brisbane floods of 1974 have now been treated as 'extraordinary'.
- (c) A more systematic approach has been taken to the classification of capital transactions.

For a more detailed discussion of the changes introduced to the balance of payments statistics, reference should be made to the ABS Information Paper *Changes in the presentation of Australian Balance of Payments Statistics* (5340.0) published on 23 December 1985.

4. The series for gross fixed capital expenditure on private dwellings has been increased substantially because of the inclusion of an allowance for the value of alterations and additions which either do not require a permit or for which the owner does not obtain the requisite permit. Estimates for this expenditure have been benchmarked to results from the 1984 Household Expenditure Survey (HES) and are consistent with similar data collected in the 1974-75 HES. (The 1974-75 HES provided evidence of substantial understatement of expenditure on alterations and additions to dwellings but, on its own, did not provide sufficient information to enable an adjustment to the entire time series for gross fixed capital expenditure —private dwellings.)

5. Significant adjustments have been made to the income aggregates for gross operating surplus of trading enterprise companies and unincorporated enterprises in order to make adequate allowance for understatement of income as reported for income taxation purposes. These adjustments have been based predominantly on the information provided by the Commissioner of Taxation in the Taxation Draft White Paper released in June 1985.

6. An adjustment has been included in the gross operating surplus for the construction industry to allow for the value added in the construction of dwellings by owner-builders. A consequential adjustment to gross fixed capital expenditure on private dwellings was not required since new dwellings constructed by owner-builders have always been included at their market value.

Interpretation of quarterly estimates

7. Estimating for a period of less than one year presents special problems in that it is often difficult to adhere strictly to definitions and concepts used in annual estimates. The measurement of income for a quarterly period is particularly difficult since it is not always possible to match the value of production for a quarter with the cost incurred in that production. This problem occurs, for example, in estimating the income of farm unincorporated enterprises in each quarter, and results in considerable variation in the estimates for this series, and for gross farm product, from quarter to quarter. Difficulties are also experienced in obtaining detailed data for short periods and in preparing consistent estimates from various sources where different accounting procedures and periods are used.

8. These problems inevitably affect the consistency and reliability of the current price estimates, and similarly affect the constant price estimates based on the current price estimates. Accordingly, these factors as well as the approximations and assumptions necessarily made in the revaluation of flows to constant prices should be borne in mind when interpreting or using the estimates, for example, in attempting to draw precise quantitative inferences relating to quarter-to-quarter changes in gross domestic product or its components, or in productivity.

9. Analysis of trends requires allowance for these uncertainties in estimation. The effects are in some measure indicated by the change in the statistical discrepancy for corresponding periods. Uncertainty in trends arises also from the likelihood of revisions as more information becomes available and from the irregularity of short-term movements. The inclusion of the statistical discrepancy on the expenditure side of the accounts is a

convention and does not necessarily imply that the sum of the income components more accurately measures GDP than the sum of the expenditure components (plus exports less imports). As household and other saving are estimated as balancing items in their respective accounts, care should be exercised in their interpretation.

10. Estimates of national income and expenditure are necessarily prepared from a wide range of statistical information, some of which is available quickly and some only with a delay of several years. For this reason most figures should be regarded as subject to revision as more complete and more accurate information becomes available. The revisions will be of two main types—those made to the most recent quarters as firmer quarterly or monthly data come to hand and those which are a consequence of revisions to annual totals and are distributed to the quarters approximately in accordance with existing quarterly patterns.

11. No simple measure is available of the accuracy of the major summary national accounting aggregates. However the following example illustrates the *sensitivity* of quarter to quarter growth to the timing of recording a transaction. If, in the latest year, the timing of recording a transaction were delayed by one quarter and if the transaction had an impact on constant price gross domestic product of +\$35 million then the measure of the rate of growth would be affected in three adjoining quarters (centred on the quarter in which the transaction was recorded) by -0.1, +0.2, and -0.1 percentage points respectively. Of course the percentage impact of such a timing delay on relevant sub-aggregates would be greater.

12. The quarterly implicit price deflators (IPDs) shown in Table 9 are derived by dividing seasonally adjusted current price estimates by the corresponding seasonally adjusted constant price estimates. Movements in the levels of individual implicit price deflators can be greatly affected by changes in the physical composition of the aggregates and their components. Generally, it is considered that IPDs derived from seasonally adjusted data are more reliable than those obtained by using original (i.e. unadjusted) series, because the former are less likely to be affected by compositional change than are the latter. However the seasonal adjustment process is itself a source of possible distortion, especially to the extent that it is not possible to identify, in a fully consistent way, the seasonality of the current price estimates and of the constant price estimates. A discussion of the limitations involved in using IPDs as measures of pure price change is contained in Appendix B of *Australian National Accounts, Concepts, Sources and Methods* (5216.0).

Seasonal adjustment

13. As most series are affected to some extent by seasonal factors, allowance should be made for normal seasonal variation. In Tables 6, 8, 9, 13, 17, 19, 22, 23, 33, 35 and 37 to 42, *seasonally adjusted* values are presented for selected series. Series which show substantial irregularities in the original or adjusted series should be treated with some reserve. As different methods of seasonal adjustment tend to produce different results, it is necessary to bear in mind the methods by which they have been derived and the limitations to which those methods are subject. It should also be noted that the methods of seasonal adjustment used by the ABS do not force the sum of the seasonally adjusted estimates for each quarter of a financial year to equal the original annual total.

14. The general methods used in the ABS for making seasonal adjustments are described in *Seasonally Adjusted Indicators, Australia, 1983* (1308.0). However, special methods have been used to adjust some of the components of gross farm product which were not amenable to seasonal adjustment by the usual methods. To obtain the seasonally adjusted estimates, the estimated values of production of wheat, other grain and sugar cane, for any financial year, are distributed equally over the four quarters of the year ended June. One effect of these methods is that changes in the annual production of these commodities first enter into the seasonally adjusted figures in the September quarter.

15. Where there is no apparent seasonality in their implicit price deflators, constant price estimates are seasonally adjusted using the same factors as are used for adjusting the corresponding current price estimates. As far as possible the remaining constant price estimates have been adjusted using methods similar to those for the corresponding current price estimates.

Analysis of contributions to growth table

16. Table 3 presents an analysis of the contribution provided by each major aggregate to the percentage change in seasonally adjusted gross domestic product at constant prices. The formula used to calculate the contribution of each aggregate to the growth in GDP is:

$$\frac{A(t)-A(t-1)}{\text{GDP } (t-1)} \times 100.0$$

where $A(t)$ = value of aggregate A in quarter under consideration

$A(t-1)$ = value of aggregate A in preceding quarter

$\text{GDP } (t-1)$ = value of GDP in preceding quarter

All these values are seasonally adjusted constant price estimates. It should be noted that the figures in this table are additive within each quarter, unlike the percentage change tables shown elsewhere in this publication.

Rounding of figures

17. Although percentage changes are given to one decimal place in this publication, this does not imply that they can be regarded as accurate to the last digit shown. The figures after the decimal point are given to avoid distortions which may occur in rounding off the figures to the nearest half or whole number.

18. The procedures used in preparing this publication may occasionally result in rounding differences between figures in this publication and corresponding figures in other publications.

19. Where figures have been rounded, discrepancies may occur between sums of the component items and totals.

Related publications

20. In addition to those mentioned above other ABS publications which may be of interest include:

Historical Series of Estimates of National Income and Expenditure, Australia (5207.0) (\$1.10, \$1.90 incl. postage) —issued for December Quarter only.

Australian National Accounts, Gross Product by Industry, 1982-83 and 1983-84 (5211.0)

Budget Paper: National Income and Expenditure, 1984-85 (5213.0)

21. Current publications produced by the ABS are listed in the *Catalogue of Publications, Australia* (1101.0). The ABS also issues, on Tuesdays and Fridays, a *Publications Advice* (1105.0) which lists publications to be released in the next few days. The Catalogue and Publications Advice are available from any ABS office.
