DECEMBER QTR KEY POINTS

TREND ESTIMATES

- The pattern of industrial production shows nine consecutive quarters of growth to September quarter 1994. After falling through the remainder of 1994-95, growth resumed from September quarter 1995. In recent quarters, the rate of growth has flattened.
- Growth in the Mining industry continued in December quarter 1996 (up 0.7%). The Electricity, gas and water industry maintained production levels, while the Manufacturing industry fell by 0.3%.
- The manufacturing industry's performance was mixed with four subdivisions
 recording rises in December quarter and five recording falls. The most significant
 falls were by Non-metallic mineral product manufacturing (down 3.7%) and Printing,
 publishing and recorded media (down 2.7%).

SEASONALLY ADJUSTED ESTIMATES

The total industrial production estimate was 0.6% lower than September quarter
 1996. Both the Mining and Electricity, gas and water industries showed increases.

ISSUE (Quarter)

RELEASE DATE

March 1997

11 June 1997

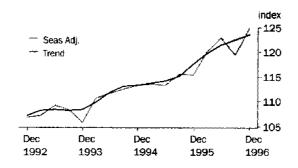

CHANGES IN THIS ISSUE

New benchmarks for 1994-95 have been introduced for the Mining and Manufacturing industries. In addition, constant price estimates of GDP(P) have been revised as a result of revisions to the income based estimates of current price gross product for 1989-90 and the subsequent effects of those revisions on the extrapolated series used in compilation of the indexes.

W. McLennan Australian Statistician

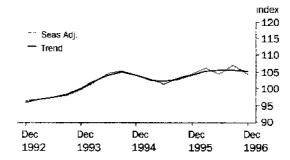

MINING

The rise of 0.7% in the December quarter 1996 trend estimate was the thirtcenth successive rise. Mining production in the December quarter 1996 was 5.0% higher than December quarter 1995 and 8.9% higher than December quarter 1994.

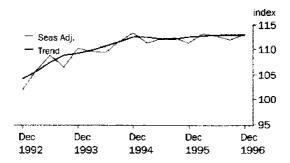

MANUFACTURING

The fall of 0.3% in the December quarter 1996 trend estimate was the second successive fall. These falls followed four successive quarters of growth. Manufacturing production in the December quarter 1996 was 1.0% higher than December quarter 1995 and 1.1% higher than December quarter 1994.

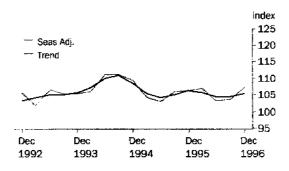

ELECTRICITY, GAS AND WATER

Trend estimates for the Electricity, gas and water industries show stable production levels over recent quarters. Production in the December quarter 1996 was 0.4% higher than both December quarter 1995 and December quarter 1994.

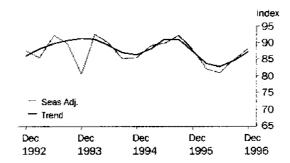

FOOD, BEVERAGE AND TOBACCO

The rise of 0.9% in the December quarter 1996 followed one quarter of no growth and two quarters of falls. Production in the December quarter 1996 was 0.8% lower than December quarter 1995 and 2.9% lower than December quarter 1994.

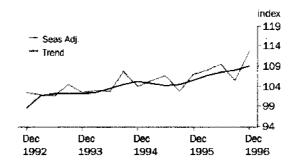

TEXTILE, CLOTHING, FOOTWEAR AND LEATHER

The rise of 3.2% in the December quarter 1996 was the second successive rise following a period of generally falling production. Production in the December quarter 1996 was 0.5% lower than December quarter 1995 but 1.0% higher than December quarter 1994.

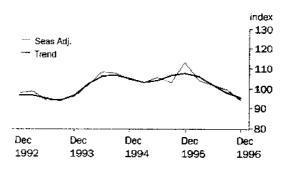

WOOD AND PAPER PRODUCT

The rise of 1.0% in the December quarter 1996 was the sixth successive rise following two quarters of falls in the March and June quarters 1995. Production in the December quarter 1996 was 3.3% higher than December quarter 1995 and 3.8% higher than December quarter 1994.

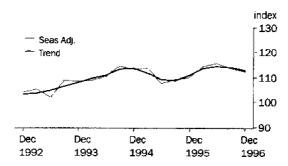

PRINTING, PUBLISHING AND RECORDED MEDIA

The fall of 2.7% in the December quarter 1996 was the fourth successive fall following three quarters of growth. Production in the December quarter 1996 was 11.2% lower than December quarter 1995 and 9.2% lower than December quarter 1994.

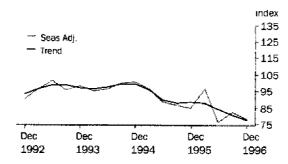

PETROLEUM, COAL, CHEMICAL AND ASSOCIATED PRODUCT

The fall of 1.0% in the December quarter 1996 was the second successive fall following three quarters of rises. Production in the December quarter 1996 was 1.9% higher than December quarter 1995 but 0.6% lower than December quarter 1994.

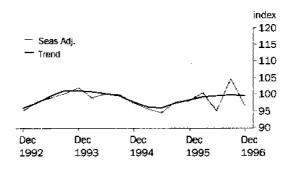

NON-METALLIC MINERAL PRODUCT

The fall of 3.7% in the December quarter 1996 was the fourth successive fall following one rise which was preceded by three quarters of falls. Production in the December quarter 1996 was 12.4% lower than December quarter 1995 and 22.3% lower than December quarter 1994.

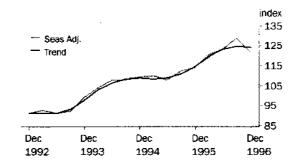

METAL PRODUCT

The fall of 0.4% in the December quarter 1996 followed five successive rises. Production in the December quarter 1996 was 1.1% higher than December quarter 1995 and 1.6% higher than December quarter 1994.

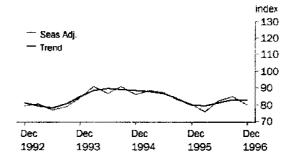

MACHINERY AND EQUIPMENT

The fall of 0.5% in the December quarter 1996 followed six successive quarters of growth. Production in the December quarter 1996 was 8.5% higher than December quarter 1995 and 14.2% higher than December quarter 1994.

OTHER MANUFACTURING

The rise of 0.4% in the December quarter 1996 was the third successive rise following seven quarters of falls. Production in the December quarter 1996 was 4.0% higher than December quarter 1995 but 6.2% lower than December quarter 1994.

INTRODUCTION

- **1** This publication presents in index number form, quarterly estimates of gross product at constant average 1989–90 prices for the non–farm, goods producing sector which, for brevity, is termed the 'total industrial' (see paragraph 3).
- **2** Also presented are indexes for component industries, including individual manufacturing subdivisions.

SCOPE AND COVERAGE

- **3** The scope of 'total industrial' referred to in this publication is defined to include all establishments classified to the Australian and New Zealand Standard Industrial Classification (ANZSIC) Division B (Mining), excluding ANZSIC subdivision 15 (Services to mining); Division C (Manufacturing); and Division D (Electricity, gas and water).
- **4** The base year weights used in constructing the indexes in this publication have been derived from establishment data. However, the quarterly indicator series used for manufacturing are based on data relating to business units which may cover more than one establishment.
- **5** The table below sets out the base year weights associated with the major components of the industrial sector, and each manufacturing subdivision.

	1989–90 Weight
	%
Mining (excluding services to mining)	18.0
Manufacturing	67.5
Food, beverage and tobacco mfg	13.7
Textiles, clothing, footwear and	
leather mfg	3.7
Wood and paper product mfg	3.5
Printing, publishing and recorded	
media	6.4
Petroleum, coal, chemical and	
associated product mfg	6.5
Non-metallic mineral product mfg	3.4
Metal product mfg	11.4
Machinery and equipment mfg	15.6
Other manufacturing	3.3
Electricity, gas and water	14.5
Total Industrial sector	100.0
associated product mfg Non-metallic mineral product mfg Metal product mfg Machinery and equipment mfg Other manufacturing Electricity, gas and water	3.4 11.4 15.6 3.3 14.5

- **6** Quarterly manufacturers' sales and stocks data provides the main indicator series for the manufacturing indexes. As a result, these indexes have three important limitations as measures of manufacturing production:
- changes in quarterly production by manufacturing establishments of non-manufacturing businesses are not reflected in the indexes;
- changes in a part of the quarterly production of non-manufacturing establishments of manufacturing businesses are reflected in the indexes; and
- changes in quarterly production by government bodies such as shipyards are not reflected in the indexes.
- **7** The scope of the data used in the manufacturing indicator series also differs slightly from the general definition of manufacturing gross product. The stocks estimates used include finished goods bought in, but not manufactured, by a business. As far as can be assessed this has not had a significant influence on the estimates.

DERIVATION OF THE ESTIMATES OF GROSS PRODUCT

- 8 The estimates are derived using the gross output method whereby base year (1989-90) estimates of gross product are extrapolated by constant price estimates of gross output. All the quarterly indexes contained in this publication have been benchmarked, where possible, to annual estimates (see paragraph 12 below).
- **9** For further details on the derivation of constant price gross product for individual industries refer to Chapter 18 in Australian National Accounts: Concepts, Sources and Methods (5216.0).

BENCHMARKING

- **10** Deriving quarterly estimates presents special problems in that it is often difficult to adhere strictly to the definitions and concepts used in annual estimates. Frequently, it is not possible to use the same data sources as used for annual estimates, and alternative quarterly data sources are generally much less detailed.
- **11** For example, annual estimates of gross product for the Mining industry (as published in Australian National Accounts: National Income, Expenditure and Product (5204.0)) are compiled (using the double deflation method) from detailed output and input data from the annual census of mining establishments. On the other hand, the quarterly series draw on the quantities of minerals mined (gross output), reported in surveys of mining establishments.
- 12 In such cases, where the quarterly estimates are inferior to the annual, the quarterly estimates are adjusted to agree with the annual estimates in such a way that preserves, as far as practical, the movements of the quarterly series. This is commonly referred to as benchmarking.

DATA SOURCES FOR QUARTERLY **OUTPUT SERIES**

- MINING (EXCLUDING 13 Quarterly constant price output estimates are derived for major ANZSIC classes SERVICES TO MINING) by quantity revaluation (i.e. quantities produced each quarter multiplied by associated base year (1989-90) average prices). Estimates of quantities produced are obtained from data contained in Quarterly Mineral Statistics (Australian Bureau of Agricultural and Resource Economics) and The Australian Mining Industry (8414.0).
 - **14** Constant price estimates of value added are derived by the gross output method (see paragraph 8) for each ANZSIC class. Total quarterly estimates of value added are then benchmarked (see paragraph 12) to annual gross product estimates obtained from the mining census.

- MANUFACTURING 15 Quarterly constant price estimates of gross output for each manufacturing industry subdivision (excluding petroleum refining) are derived by summing constant price estimates of manufacturers' sales of manufactured goods, other operating revenue (where significant) and changes in the level of stocks of finished goods and work-in-progress.
 - **16** Constant price estimates of all components of manufacturing output except petroleum refining are derived by price deflation, i.e. current price components (obtained from the quarterly Survey of Stocks and Manufacturers' Sales) are deflated by fixed weighted producer price indexes (published in *Price Indexes of* Articles Produced by Manufacturing Industry, Australia (6412.0)).
 - 17 Quarterly petroleum refining estimates are based on quarterly quantity data published in Major Energy Statistics (released by the Department of Primary Industries and Energy).

MANUFACTURING (continued) 18 Quarterly constant price estimates of output are used to derive constant price estimates of gross product at factor cost by the gross output method. The latter estimates are then benchmarked to corresponding annual estimates of gross product at market prices (based on annual Manufacturing Survey data).

- **ELECTRICITY** 19 Quarterly quantities of electricity produced, as published in *Manufacturing* Production, Australia (8301.0), are benchmarked to annual gross product estimates based on the quantity of electricity sold (published by the Electricity Supply Association of Australia in The Electricity Industry of Australia).
 - GAS 20 Quarterly quantities of gas available through mains, as published in Manufacturing Production, Australia (8301.0), are benchmarked to gross product estimates derived from ABS economic census data relating to the performance of the gas production and distribution industry.

- WATER AND SEWERAGE 21 Quarterly constant price output estimates are derived by quantity revaluation, i.e. quantities of water sold (to final consumers and for irrigation) and sewerage connections, are multiplied by average 1989-90 prices for each type of service.
 - **22** The quantity data are supplied by a selection of State and Local government authorities. Quarterly output estimates are then benchmarked to annual constant price gross product estimates.

SAMPLE REVISION

- 23 Each year the sample used for the survey of stocks and manufacturers' sales is revised. Differences between the old and revised samples have in general been apportioned back over the preceeding quarters of each year, and incorporated in the estimates included in this publication.
- 24 For more information on the sample revision, refer to Stocks, Selected Industry Sales and Expected Sales, Australia (5629.0).

RELIABILITY OF ESTIMATES

- **25** Because the measures used in the derivation of the manufacturing indexes are based on a sample survey, the indexes themselves are subject to sampling variability.
- 26 In terms of original estimates the standard errors in percentage terms approximate the errors reported in Stocks, Selected Industry Sales and Expected Sales, Australia (5629.0). However, for constant price estimates the standard errors may be up to 10 per cent higher than those for the corresponding current price estimates because of the sampling variability contained in the prices data used to deflate the current price estimates. Seasonally adjusting the estimates has an insignificant effect on standard errors.
- 27 The imprecision due to sampling variability, which is measured by the standard error, should not be confused with inaccuracies that may occur because of imperfections in reporting by respondents and errors made in collecting and processing data. Inaccuracies of this kind are known as non-sampling errors and may occur in any collection, whether it be a sample or a full count.
- 28 In addition to the non-sampling errors which may occur in current prices estimates, there may be non-sampling errors introduced by the process of compiling constant price estimates. These further errors may arise from the introduction of additional data and from the assumptions and approximations which are necessary in compiling constant price estimates.
- 29 Every effort is made to minimise non-sampling errors by careful design of forms, editing of data and efficient operating procedures.

SEASONAL ADJUSTMENT

- **30** Seasonal adjustment is a means of removing the estimated effects of normal seasonal variation from the series so that the effects of other influences on the series may be more clearly recognized.
- **31** Seasonal adjustment procedures do not aim to remove the irregular or non-seasonal influences which may be present in any particular quarter, such as the effect of a major industrial dispute or major plant breakdowns.
- **32** Irregular factors of this nature can make it difficult to interpret the movement of the series even after adjustment for seasonal variation.
- **33** Seasonal adjustment may be carried out by various methods and the results may vary slightly according to the procedure adopted. Accordingly, seasonally adjusted statistics should not be regarded as in any way definitive.
- **34** In interpreting particular seasonally adjusted statistics it is important to note the methods by which they have been derived and the limitations to which the methods used are subject. Details of the various seasonal adjustment methods used are available on request.

TREND ESTIMATES

- **35** The seasonally adjusted series can be smoothed to reduce the impact of the irregular component in the adjusted series. There are a number of ways of accomplishing this, depending on the intended uses of the smoothed series.
- **36** If importance is attached to measuring the underlying change in the most recent periods, moving averages employing appropriate weighting patterns should be adopted; the choice of averaging technique will determine the degree of smoothness of the derived series.
- **37** For example, a 9-term moving average will even out more of the short term fluctuation in a series (and therefore appear 'smoother') than will a 5-term moving average. However, the longer the term of the moving average the longer the series affected by revisions resulting from more recent data becoming available.
- **38** Such smoothed seasonally adjusted estimates are referred to as 'trend estimates' in this publication.
- **39** Trend estimates included in this issue are derived using a 7-term Henderson moving average. (The weights of the 7-term average are available upon request.) As a moving average approaches the end of a time series and begins to run out of observations, asymmetric averages have been used. Unlike the asymmetric weights of the standard 7-term Henderson moving averages, the weights employed here have been tailored to suit the particular characteristics of individual manufacturing subdivisions.
- **40** Users may wish to refer to the ABS Information Paper A Guide to Interpreting Time Series Monitoring Trends An Overview (1348.0) for more detailed information on smoothing seasonally adjusted time series data.

RELATED PUBLICATIONS

- **41** Users may also wish to refer to the following publications:
- Australian National Accounts: National Income, Expenditure and Product (5204.0) — issued annually
- Australian National Accounts: National Income, Expenditure and Product (5206.0) — issued quarterly
- Australian National Accounts: Concepts, Sources and Methods (5216.0)
- Manufacturing Industry, Australia (8221.0) issued annually
- The Australian Mining Industry (8414.0) issued annually
- Price Indexes of Articles Produced by Manufacturing Industry, Australia (6412.0) — issued monthly
- Manufacturing Production, Australia (8301.0) issued monthly
- Stocks, Selected Industry Sales and Expected Sales, Australia (5629.0) issued quarterly

42 Current publications produced by the ABS are listed in the *Catalogue of Publications and Products, Australia* (1101.0). The ABS also issues on Tuesdays and Fridays, a *Release Advice* (1105.0) which lists publications to be released in the next few days. The Catalogue and Release Advice are available from any ABS office.

SYMBOLS AND OTHER USAGES

ANZSIC Australian and New Zealand Standard Industrial Classification

FOR MORE INFORMATION...

The ABS publishes a wide range of information on Australia's economic and social conditions. A catalogue of publications and products is available from any of our offices (see below).

INFORMATION CONSULTANCY SERVICES

Information tailored to special needs of clients can be obtained from the Information Consultancy Service available at ABS Offices (see below).

ABS PRODUCTS

A large number of ABS products is available from the ABS Bookshops (see below). The ABS also provides a subscription service – you can telephone the ABS Subscription Service Australia wide toil free on 1800 0206 08.

ELECTRONIC SERVICES

A large range of data is available via on-line services, diskette, magnetic tape, tape cartridge and CD ROM. For more details about our electronic data services, contact any ABS office (see below) or email us at:
