**GENERAL** 

This publication provides information on a wide range of economic indicators which are the latest available at the time of publication. In a number of cases, figures appearing in this summary are preliminary and are subject to revision in subsequent issues.

SEASONAL ADJUSTMENT AND TREND ESTIMATION Seasonal adjustment is a means of removing the estimated effects of normal seasonal variation from a series so that the effects of other variations on that series can be more clearly recognised. Seasonal adjustment does not aim to remove the irregular or non-seasonal influences which may be present. This means that movements of seasonally adjusted estimates may not be reliable indicators of trend behaviour. Smoothing seasonally adjusted series produces a measure of the underlying trend by reducing the impact of the irregular component of the series. This smoothing technique does result in revisions to the most recent estimates as additional observations become available. For an explanation of seasonal adjustment derivation, refer to the publication Seasonally Adjusted Indicators (Cat. no. 1308.0).

STANDARD ERRORS OF **ESTIMATES** 

One measure of the variability which occurs as a result of surveying only samples of the total business population is the standard error. There are about two chances in three that a survey estimate is within one standard error of the figure that would have been obtained if all businesses had been included, and about 19 chances in 20 that it is within two standard errors. The standard error can also be expressed as a percentage of the estimate and this is known as the relative standard error (RSE).

Current publications produced by the ABS are listed in the Catalogue of Publications (Cat. no. 1101.0). A Release Advice (Cat. no. 1105.0) is issued on Tuesdays and Fridays which lists publications to be released in the next few days. These publications are available from any ABS office.

<sup>(</sup>b) For dates prior to June 1996, differences between the total increase shown and the sum of the natural increase and net estimated migration arise from retrospective adjustments to population estimates (which are made after each Census) to compensate for any intercensal discrepancy. A description of intercensal discrepancy is contained in the ABS Information Paper: Demographic Estimates—Concepts, Sources and Methods (Cat. no. 3228.0).
