DATA NOTES

ABS statistical series are being impacted to varying degrees as a result of The New Tax System (TNTS), introduced in Australia from 1 July 2000. TNTS included the removal of Wholesale Sales Tax and the introduction of a Goods and Services Tax (GST), and as a result, a wide range of ABS data series will reflect significant immediate and subsequent impacts. For further information see Australian Economic Indicators, July 2000 (Cat. no. 1350.0).

**GENERAL** 

This publication provides information on a wide range of economic indicators which are the latest available at the time of publication. In a number of cases, figures appearing in this summary are preliminary and are subject to revision in subsequent issues.

SEASONAL ADJUSTMENT AND TREND ESTIMATION Seasonal adjustment is a means of removing the estimated effects of normal seasonal variation from a series so that the effects of other variations on that series can be more clearly recognised. This means that movements of seasonally adjusted estimates may not be reliable indicators of trend behaviour. Smoothing seasonally adjusted series produces a measure of the underlying trend by reducing the impact of the irregular component of the series. For an explanation of seasonal adjustment derivation, refer to the publication Seasonally Adjusted Indicators (Cat. no. 1308.0).

<sup>(</sup>b) For dates prior to June 1996, differences between the total increase shown and the sum of the natural increase and net estimated migration arise from retrospective adjustments to population estimates (which are made after each Census) to compensate for any intercensal discrepancy. A description of intercensal discrepancy is contained in the ABS Information Paper: Demographic Estimates—Concepts, Sources and Methods (Cat. no. 3228.0).
