## NOTES

FORTHCOMING ISSUES	<p><i>Issue</i></p> <p>December 2005</p> <p>January 2006</p> <p>February 2006</p> <p>March 2006</p> <p>April 2006</p> <p>May 2006</p>	<p><i>Expected release date</i></p> <p>30 November 2005</p> <p>13 January 2006</p> <p>31 January 2006</p> <p>28 February 2006</p> <p>31 March 2006</p> <p>28 April 2006</p>
IN THIS ISSUE	<p>Where available, the statistics in this issue are presented as time series for the last nine years of annual data, the last nine quarters or 15 months of data. To assist analysis most tables include percentage movements, as well as levels, of series.</p> <p>Quarterly and monthly data for most series, and annual data for a limited number of series, are available from the Australian Bureau of Statistics for earlier periods than that shown in this publication. Many series can be obtained on electronic media. Inquiries should be directed to the National Information Service on 1300 135 070.</p>	
CHANGES IN THIS ISSUE	<p>A new base year, 2003-04, has been introduced into the chain volume estimates which has resulted in revisions to growth rates in subsequent periods. In addition, the chain volume estimates have been re-referenced to 2003-04, thereby preserving additivity in the quarters after the reference year. Re-referencing affects the levels of, but not the movements in, chain volume estimates.</p>	
EXTENDED TIME SERIES	<p>For users requiring longer time series, each February issue of <i>Australian Economic Indicators</i> contains, for most series, a greater span of annual, quarterly and monthly data.</p>	
SYMBOLS AND OTHER USAGES	<p>See the Abbreviations sections following the Explanatory Notes.</p>

Australian Statistician

## TECHNICAL NOTE:

# ESTIMATING AND REMOVING THE EFFECTS OF CHINESE NEW YEAR AND RAMADAN TO IMPROVE THE SEASONAL ADJUSTMENT PROCESS

## INTRODUCTION

A time series of original estimates can be decomposed into a trend, seasonal and irregular component. Seasonally adjusted estimates are derived by estimating and removing the systematic calendar related variation from the original estimates. The seasonally adjusted estimates can be smoothed to obtain an estimate of the underlying direction, referred to as trend estimates. The irregular component is what is left after the trend and seasonal components are removed from the original estimates. Seasonally adjusted and trend estimates can be used to illustrate the short term movements and the underlying level in social and economic time series.

The estimation of the seasonal component is an essential part of the seasonal adjustment process. Regular calendar related events that occur at the same time each year are accounted for when estimating seasonality. Some calendar related events can move between months. These type of events are known as moving holidays. The activity due to some moving holidays can change the pattern of activity in surrounding months and is also referred to as a proximity effect. Since moving holidays do not occur in the same month each year the estimation of the seasonal component may be distorted and systematic variation will remain in the seasonally adjusted estimates. If moving holidays are not taken into account misleading seasonally adjusted and trend estimates will be produced. This will impact on the interpretation of the short term movements and underlying level of a time series.

This article shows how the Australian Bureau of Statistics (ABS) estimates and removes the impact of two moving holidays: 1) Chinese New Year and 2) Ramadan within the seasonal adjustment process. An example of model based corrections for these two moving holidays is given with an application to ABS monthly Overseas Arrivals and Departure (OAD) time series (*Overseas Arrivals and Departures, Australia*, cat. no. 3401.0).

## CORRECTING FOR MOVING HOLIDAYS

The ABS seasonal adjustment process corrects for a range of moving holidays. These include Easter, Father's Day, Chinese New Year and Ramadan. Different approaches can be used to correct for moving holidays. Easter and Father's Day are corrected using an iterative approach (See Zhang, McLaren and Leung (2001) for more details). The most appropriate approach is the use of a model. For example, a suitable regression (or intervention) variable can be constructed and the effect estimated in a suitable framework (Regression-ARIMA, Findley et al, 1998). Regression-ARIMA combines regression analysis with time series modelling (ARIMA). For more detail on ARIMA modelling refer to the technical note of the October 2004 edition of Australian Economic Indicators.

CORRECTING FOR  
MOVING HOLIDAYS  
*continued*

Regression variables can be constructed for a wide range of moving holidays. They can represent the changed pattern of activity caused by the occurrence of a moving holiday. Most commonly the change in pattern caused by the movement of a holiday can be described using two different regressors; one regressor aims to model the change in activity prior to the date of interest and the other regressor models the change in activity during or after the date of interest. The number of days of changed activity is taken into account during the construction of these regressors. The daily change in activity may be a constant change or linear change over time. Daily data and model diagnostics can assist in determining how the activity changes over time and what type of regressors should be used. A regression-ARIMA model can then be used to estimate the impact of the moving holiday. If the impact is significant then appropriate factors can be calculated which will remove the impact of the moving holiday from the original time series before seasonal adjustment. This will give appropriate seasonally adjusted and trend estimates.

CHINESE NEW  
YEAR

The date of Chinese New Year is determined using the Chinese calendar. This is a lunisolar calendar based on movements of the moon and sun. The Chinese New Year holiday starts on the first full moon of each year falling between January the 21st and February the 21st. This holiday can impact on Australian time series, for example, short-term visitor arrivals to Australia from Hong Kong, China, Malaysia, Thailand, Vietnam and Singapore. Chinese New Year mostly falls in February but can sometimes fall in January. If there is not an appropriate correction for Chinese New Year then when it falls in January or early February the seasonally adjusted estimates for January will typically be higher than normal and the February estimates lower than normal. This will provide users with misleading seasonally adjusted and trend estimates.

Daily data and model based tests can be used to determine the type of activity surrounding the holiday. The number of days of the before-holiday period that fall in January and the number of days of the after-holiday period that fall in January are used to construct two regressors. Regression-ARIMA can then be used to estimate regressor parameters and assess their significance.

RAMADAN

Ramadan is the ninth month of the Islamic calendar. This is a lunar calendar based on cycles of the moon. The end of Ramadan is celebrated with a festival known as Eid al-Fitr which begins approximately eleven days earlier each year on the Gregorian calendar. This means that Ramadan can fall in any month. This holiday can impact on Australian time series. Short-term visitor arrivals to Australia from Indonesia and Malaysia increase at times corresponding to the end of Ramadan when the Eid al-Fitr celebrations occur. If there is not an appropriate correction the months which correspond to the end of Ramadan will typically have larger than normal seasonally adjusted estimates. A

RAMADAN  
*continued*

correction is needed to avoid misleading seasonally adjusted and trend estimates.

Daily data and model based tests can be used to determine the type of activity surrounding the holiday. If the end of Ramadan occurs at the beginning of a month then the proportion of the activity that falls in the preceding month is used to construct a before-holiday regressor. If the end of Ramadan falls at the end of a month the proportion of activity falling in the following month is used to construct an after-holiday regressor. Regression-ARIMA can then be used to estimate regressor parameters and assess their significance.

APPLICATION TO  
OVERSEAS ARRIVAL AND  
DEPARTURE SERIES

Short-term visitor arrivals from Hong Kong and Indonesia are used to demonstrate the application of Chinese New Year and Ramadan moving holiday corrections. Identical methods can also be applied to other time series.

SHORT TERM  
VISITOR ARRIVALS  
FROM HONG KONG

Chinese New Year is celebrated in Hong Kong. This celebration influences short-term visitor arrivals to Australia from this country. Figure 1 shows the seasonally adjusted and trend series for short-term visitor arrivals from Hong Kong with no correction for the effect of the Chinese New Year holiday. The large January and low February seasonally adjusted estimates in 1993, 1995, 1998, 2001, 2003 and 2004 all correspond to years in which the Chinese New Year holiday started in January or early February. The systematic behaviour in the seasonally adjusted estimates would provide users with misleading information. The trend estimates will also be distorted.

FIGURE 1: SHORT TERM VISITOR ARRIVALS FROM HONG KONG,  
(WITHOUT CHINESE NEW YEAR PROXIMITY CORRECTION)

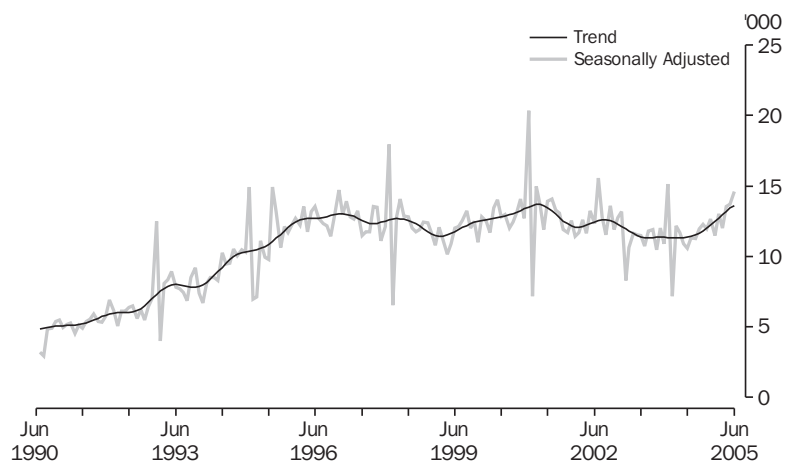

Figure 2 shows the irregular values for January and February ordered by the start date of Chinese New Year. This is referred to as a proximity chart. The irregular component of a time series should display no distinct pattern with a mean of one. When Chinese New Year begins in January or early February, the January irregulars are mostly above one and the February irregulars are less than one. This indicates there are residual effects from Chinese New Year and that the seasonal adjustment process has not removed all systematic variation.

SHORT TERM  
VISITOR ARRIVALS

FIGURE 2: CHINESE NEW YEAR PROXIMITY CHART FOR SHORT TERM VISITOR ARRIVALS FROM HONG KONG, (WITHOUT CHINESE NEW YEAR PROXIMITY CORRECTION)

Using daily data of short-term visitor arrivals from Hong Kong two regressors were constructed to reflect the impact of Chinese New Year. The before Chinese New Year holiday activity showed that there was a linear daily increase in arrivals for seven days leading up to the holiday. The during and after-holiday activity showed a linear daily decrease in arrivals for six days after the start of Chinese New Year.

Table 1 shows the regression-ARIMA results in terms of the daily percentage change in activity. The coefficients of the before and after Chinese new year regressors were both significant. The before Chinese New Year parameter indicated that there was a 13.4% daily increase in arrivals for the seven days leading up to Chinese New Year. For the six days after the Chinese New Year holiday there was a 16% daily decrease in arrivals.

This series was also tested for a Ramadan proximity effect. As expected, Ramadan did not have a significant effect on short-term visitor arrivals from Hong Kong.

TABLE 1: REGRESSION-ARIMA RESULTS FOR SHORT TERM VISITOR ARRIVALS FROM HONG KONG

Regressors	Daily rate	t-value
Before Chinese New Year activity	13.4% increase	5.05
During and after Chinese New Year activity	16% decrease	5.31

Note: If the absolute value of the t-statistic is higher than a critical value of approximately 2.0 then this effect is significant at the 95% level.

Figure 3 shows the seasonally adjusted and trend series once the Chinese New year proximity correction was applied. The large January and low February seasonally adjusted estimates shown in Figure 1 have been corrected. This can also be seen in the proximity chart (Figure 4). The irregulars are randomly scattered about one as opposed to the systematic pattern that was present before the correction was implemented. Figure 5 illustrates the

SHORT TERM  
VISITOR ARRIVALS  
FROM HONG KONG  
*continued*

seasonally adjusted estimates of short-term visitor arrivals from Hong Kong both before and after the correction. There is a significant improvement in the seasonally adjusted estimates after applying an appropriate correction for Chinese New Year.

FIGURE 3: SHORT TERM VISITOR ARRIVALS FROM HONG KONG, (WITH CHINESE NEW YEAR PROXIMITY CORRECTION)

FIGURE 4: CHINESE NEW YEAR PROXIMITY CHART FOR SHORT TERM VISITOR ARRIVALS FROM HONG KONG, (WITH CHINESE NEW YEAR PROXIMITY CORRECTION)

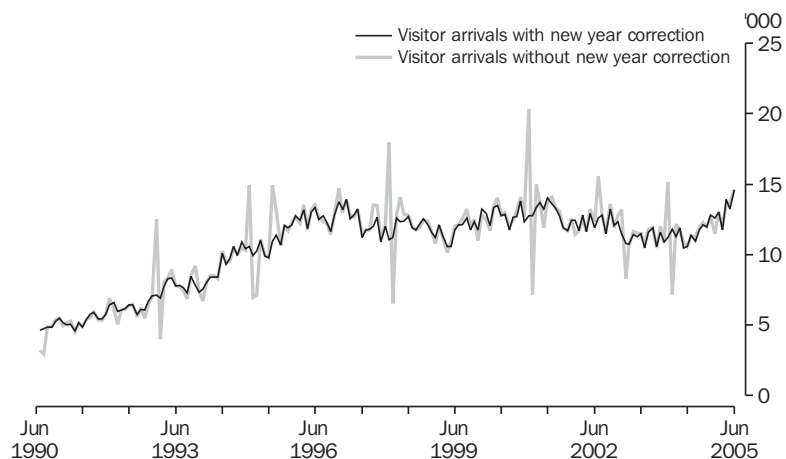

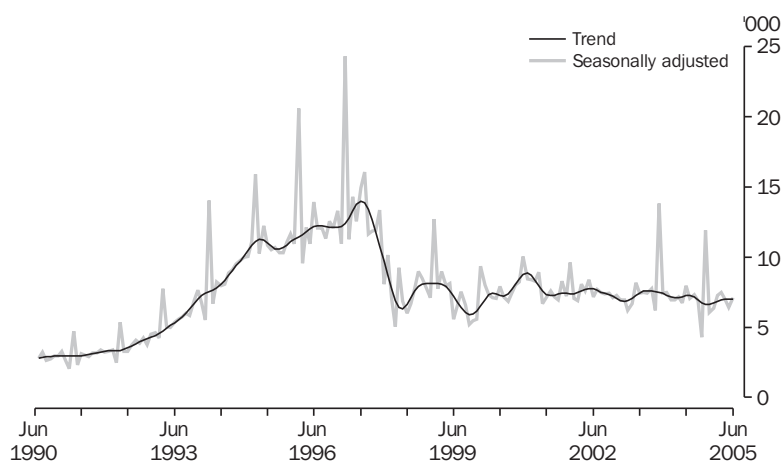

FIGURE 5: SEASONALLY ADJUSTED VISITOR ARRIVALS FROM HONG KONG, (WITH AND WITHOUT THE CHINESE NEW YEAR PROXIMITY CORRECTION)

SHORT-TERM  
VISITOR ARRIVALS  
FROM INDONESIA

Short-term visitor arrivals to Australia from Indonesia significantly increase each year at the end of Ramadan. The seasonally adjusted and trend series for short-term visitor arrivals from Indonesia are given in Figure 6. The large seasonally adjusted estimates correspond to the end of Ramadan. For example, the end of Ramadan fell in November in both 2003 and 2004. For the years 2000, 2001 and 2002 the end of Ramadan fell in December. As December is already seasonally high for this time series the effects of Ramadan is not as evident in those years as the impact has already been removed during the seasonal adjustment process.

FIGURE 6: SHORT TERM VISITOR ARRIVALS FROM INDONESIA, (WITHOUT RAMADAN PROXIMITY CORRECTION)

Daily data of short-term visitor arrivals from Indonesia were used to determine the change in activity before and after the end of Ramadan. For this time series the before-holiday activity started six days before the end of Ramadan and displayed a linear daily increase in arrivals. The after-holiday activity displayed a linear daily decrease for six days after the end of Ramadan. This daily change in activity may vary for different time series. The before and after regressors were both found to be significant (Table 2). The before-holiday parameter indicated that there was a 11% daily increase in arrivals for the six days leading up to the end of Ramadan. For the six days after the end of Ramadan there was a 4% daily decrease in arrivals.

This time series was also tested for a Chinese New Year proximity effect. As expected, there was no significant effect.

TABLE 2: REGRESSION-ARIMA RESULTS FOR SHORT TERM VISITOR ARRIVALS FROM INDONESIA

Regressors	Daily rate	t-value
Before-holiday activity	11% increase	7.73
After-holiday activity	4% decrease	3.03

Note: If the absolute value of the t-statistic is higher than a critical value of approximately 2.0 then this effect is significant at the 95% level.

Figure 7 shows the seasonally adjusted and trend estimates after the Ramadan proximity correction had been applied. The large seasonally adjusted estimates due to the end of Ramadan have been corrected. Figure 8 displays the seasonally adjusted estimates of short-term visitor arrivals from Indonesia both before and after the correction. There is a significant improvement in the seasonally adjusted estimates after applying an appropriate correction for Ramadan.

FIGURE 7: SHORT TERM VISITOR ARRIVALS FROM INDONESIA,  
(WITH RAMADAN PROXIMITY CORRECTION)

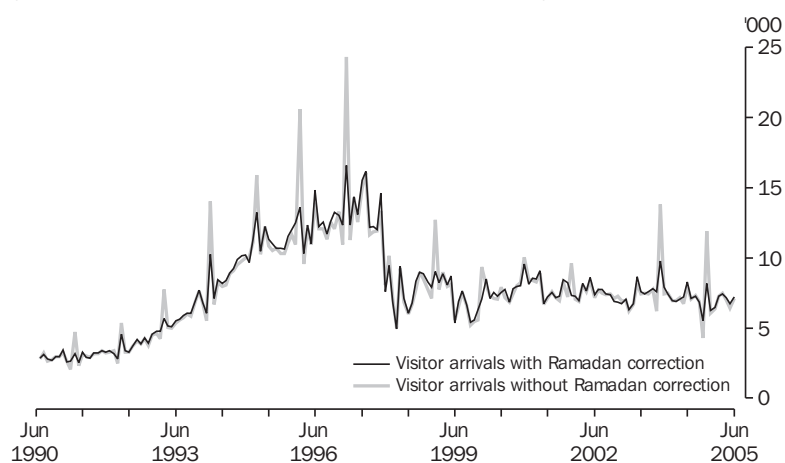

FIGURE 8: SHORT TERM VISITOR ARRIVALS FROM INDONESIA,  
(WITH AND WITHOUT RAMADAN PROXIMITY CORRECTION)

CONCLUSION

The ABS applies corrections for moving holidays that are assessed to have a significant impact on a time series. Removing the effect of moving holidays improves the estimation of the seasonal component which in turn improves the quality of the seasonal adjusted and trend estimates.

This article has described the application of a model based approach to correcting for the Chinese New Year and Ramadan moving holidays. The Chinese New Year proximity correction is currently applied to short-term visitor arrivals from China, Hong Kong, Vietnam, Thailand, Singapore and Malaysia. The Ramadan proximity correction is currently applied to short-term visitor arrivals from Indonesia and Malaysia.

The regression variables and models used for each time series are reviewed on a regular basis to ensure that corrections that are applied are appropriate. This is because the impact of a holiday on a series can change or evolve over time.

(a) Trend data used instead of seasonally adjusted.

(b) Sales is defined as gross non-farm product plus imports of goods and services less changes in private non-farm inventories.

(c) Corporate gross operating surplus include private corporate trading enterprises plus financial enterprises less imputed bank service charge. GNFPfc = Gross non-farm product at factor cost.

(d) Interest paid component contains original data.

(e) By convention, zero productivity growth is assumed for industries in the non-market sector, mainly government and some service industries. Therefore, a better indicator of productivity change is provided by the series showing market sector constant price gross product per hour worked.

TOTAL PUBLIC SECTOR,  
NET LENDING/BORROWING AS A PERCENTAGE OF GDP

A negative percentage of GDP represents a net borrowing position.  
A positive percentage of GDP represents a net lending position.

Source: Government Finance Statistics, cat. no. 5512.0.

Accruals-based Government Finance Statistics, (GFS) are presented in the form of Operating Statements, Cash Flow Statements, Balance Sheets and Statements of Stocks and Flows and the main analytical measures are described below:

*Net Operating Balance (NOB)* – the difference between GFS revenues and expenses. This measure reflects the sustainability of government operations.

*Net Lending/Borrowing (NLB)* – NOB minus the total net acquisition of non-financial assets. It represents the government's call on the financial sector and reflects the economic impact of government operations. A positive result reflects a net lending position and a negative result a net borrowing position.

*Net Worth (NW)* – the economic measure of 'wealth' is calculated as assets less liabilities for the general government (GG) sector and assets less liabilities and shares and other contributed capital for public corporations (financial and non-financial). Net worth of unlisted corporations will always be zero because owners' equity is the difference between assets and liabilities. For listed corporations net worth will be positive or negative depending upon the difference between the value of shares on the balance sheet and the value of traded shares. As the equity of public

corporations held by the General Government, (GG) sector consolidate out at the total public sector level, only equity held external to the public sector will appear.

*Change in Net Worth (CNW)* – this is the change in NW over two adjacent periods. CNW (due to transactions) is also equivalent to the NOB and excludes the impact of revaluations and other changes in volume of assets and liabilities.

*Surplus(+)/Deficit(-)* – is a cash-based measure and is calculated as:

Net cash flows from operating activities  
plus Net cash flows from investments in non-financial assets  
less Distributions paid (public corporations sector only)  
less Acquisitions of assets under finance leases and similar arrangements

The new Surplus(+)/Deficit(-) measure, while conceptually comparable to the previous Deficit(+)/Surplus(-) measure has undergone a sign change – a surplus is now shown as positive and in practice has been compiled on a different methodological basis to that of previous years, hence resulting in a break in series. The Surplus/Deficit is the cash-based equivalent of Net Lending/Borrowing described above.

(a) For all time periods, estimates for sugar, sugar preparations and honey are included in Other non-rural.

(b) The estimates for goods and services are not necessarily consistent with the corresponding quarterly estimates, shown in table 2.1 obtained from *Balance of Payments and International Investment Position, Australia*, (cat. no. 5302.0) due to data revisions to the original monthly data not feeding into the quarterly original series until the next quarterly release of *Balance of Payments and International Investment Position, Australia*, (cat. no. 5302.0).

(c) In addition to the differences outlined in footnote (b), the monthly seasonally adjusted estimates for goods and services are not necessarily consistent with the corresponding quarterly seasonally adjusted estimates, shown in table 2.1 obtained from *Balance of Payments and International Investment Position, Australia*, (cat. no. 5302.0), because of the independent seasonal adjustment of the monthly and quarterly data.

(a) The exports and imports data presented in this table differ from those in tables 2.1 to 2.5 because they are recorded on an international trade basis rather than a balance of payments basis and are compiled from a different edition of the data.

(b) The ten member nations of ASEAN are Brunei, Cambodia, Indonesia, Laos, Malaysia, Myanmar, Philippines, Singapore, Thailand and Viet Nam.

(c) The fifteen Member States of the European Union (EU) are Austria, Belgium, Denmark, Finland, France, Germany, Greece, Ireland, Italy, Luxembourg, Netherlands, Portugal, Spain, Sweden, and the United Kingdom. Figures for Belgium and Luxembourg are presented as combined totals.

(a) The exports and imports data presented in this table differ from those in tables 2.1 to 2.5 because they are recorded by a foreign trade basis rather than a balance of payments basis and are compiled from a different edition of the data.

(b) The fifteen Member States of the European Union (EU) are Austria, Belgium, Denmark, Finland, France, Germany, Greece, Ireland, Italy, Luxembourg, Netherlands, Portugal, Spain, Sweden, and the United Kingdom. Figures for Belgium and Luxembourg are presented as combined totals.

(a) Total population increase is equal to the change in population. Prior to 1992 this is not equal to natural increase (live births less deaths) plus net immigration because of the distribution of the intercensal discrepancy. There is now an intercensal discrepancy for 1986-1991.

(b) Includes Cocos (Keeling) Islands, Christmas Island and Jervis Bay Territory from September quarter 1993.

(a) The indexes in Table 7.4 combine ordinary time and overtime hourly rates and therefore include the effect of any changes in overtime penalty rates but are not affected by changes in penalty payments (which fluctuate depending on the number of hours paid at penalty rates) and allowances (which fluctuate according to how much work is performed under special work conditions e.g. height, dirt and/or heat allowances).

(a) Average non-farm wages, salaries and supplements per wage and salary earner. Seasonally adjusted data.

(b) Base for index: 1986-87 = 100.0.

(c) Deflated by the Gross National Expenditure deflator.

(d) Non-farm wages, salaries and supplements, plus payroll tax less employment subsidies plus fringe benefits tax per hours worked by non-farm wage and salary earners.

(e) Ratio of derived private non-farm corporate wages, salaries and supplements plus payroll tax less employment subsidies, plus fringe benefits tax paid by the private non-farm corporate sector to derived private non-farm corporate sector gross product at factor cost plus payroll tax less employment subsidies plus fringe benefits tax.

(f) Nominal unit labour costs (see footnote (g)) deflated by the derived implicit price deflator for gross non-farm product.

(g) Ratio of nominal hourly labour costs to average hourly labour productivity (real gross non-farm product per hour worked by all employed persons).

- (a) Excludes Commonwealth and State Government and interbank deposits but includes deposits of the non-bank sector with the Reserve Bank.  
(b) Currency plus bank deposits (including certificate of deposit with trading banks) of the private non-bank sector.  
(c) Borrowings (other than from banks and related corporations) by permanent building societies, credit co-operatives, finance companies, authorised money market dealers, pastoral finance companies, money market corporations, general financiers and cash management trusts; less borrowings by authorised money market dealers from those non-bank intermediaries. Breaks occur from time to time due to changes in number of reporting corporations.  
(d) M3 plus borrowing from private sector by non-bank financial intermediaries less the latter's holding of currency and bank deposits.  
(e) Holdings of notes and coin by private sector, plus deposits of banks with the Reserve Bank and Reserve Bank Liabilities to the private non-bank sector.  
(f) Loans and advances of those financial intermediaries whose deposit liabilities are included in broad money.  
(g) Bills outstanding under acceptance and endorsement commitments by banks.  
(h) Credit is equal to bank bills outstanding plus loans and advances by financial intermediaries whose liabilities are included in broad money.

(a) Rates are for the last trading day of the reference period.

(b) On January 1, 1999 eleven European Union nations launched the Euro, a single currency giving control of interest rate and exchange rate policy to the European Central Bank. The Euro was immediately available for electronic financial and business transactions, but Euro coins and notes were not issued to the general public until January 2002. The participating nations are Austria, Belgium, Finland, France, Germany, Ireland, Italy, Luxembourg, the Netherlands, Portugal and Spain. Greece adopted the Euro on 1 January 2001 and Britain, Denmark and Sweden chose not to adopt the Euro.

(a) Excludes Jervis Bay Territory from September quarter 1993.

(b) Includes Cocos (Keeling) Islands, Christmas Island and Jervis Bay Territory from September quarter 1993.

(c) Special arrangements were put in place to estimate net overseas migration for September and December Quarters 2000, and thereby enable production of state and territory population estimates. For more details see the December 2000 issue of Australian Demographic Statistics, cat. no. 3101.0.

(a) Extreme care should be exercised in using the seasonally adjusted and trend series for turnover of retail establishments for the Northern Territory. The highly erratic nature of these data makes reliable estimation of the seasonal pattern and of the trend very difficult.

(a) Original sales data are provided by the Federal Chamber of Automotive Industries and sourced from VFACTS.

(b) Extreme care should be exercised in using the seasonally adjusted series for the number of new motor vehicle sales in Tasmania, the Northern Territory and the Australian Capital Territory. The highly erratic nature of these data makes reliable estimation of the seasonal pattern very difficult.

## NOTES

Consumer price index (CPI). Due to the many differences in the structure of the housing sector in different countries and in the way that housing is treated in their CPIs, a simple comparison of All items (or headline) CPIs is often inappropriate. To provide a better basis for international comparisons, the Fourteenth International Conference of Labour Statisticians adopted a resolution which called for countries to “provide for dissemination at the international level of an index which excludes shelter, in addition to the all-items index.”

Table 10.8 presents indexes for selected countries on a basis consistent with the above resolution and comparable to the Australian series *All groups excluding housing*. The series in this table are presented on a reference base consistent with that used for publication of the Australian CPI (i.e. 1989–90 = 100.0) and as such are not directly comparable with those for All items published in table 10.7 (presented on a reference base of 1995 = 100.0).

## EXPLANATORY NOTES

Explanatory Notes in the form found in other ABS publications are not included in *Australian Economic Indicators*. Readers are directed to the Explanatory Notes contained in related ABS publications.

## INTRODUCTION

*Australian Economic Indicators* presents a statistical summary of the Australian economy, together with international comparisons of selected economic indicators. Except for the special February issue, it also includes commentaries, articles and technical notes. *Australian Economic Indicators* has been developed primarily as a reference document, providing a broad basis for economic analysis and research.

The tables contain mainly ABS data, although data from other sources are included. For ABS sourced data, the publication name and catalogue number are included in the footnotes of the tables. If the data are from other sources, the source organisation's name is included in the footnotes.

## MOST RECENT DATA

The statistics shown are the latest available as at 14 October 2005.

## RELATED PUBLICATIONS

A list of related publications is included in each chapter under the table of contents. These include publications which are the source of the data in the tables and other related publications.

Other useful sources of detailed information are the 'Concepts, Sources and Methods' and classification publications. These are released irregularly, each relating to a specific publication, collection or standard classification. The publications most relevant to *Australian Economic Indicators* include:

- *Australian and New Zealand Standard Industrial Classification (ANZSIC)*, cat. no. 1292.0
- *Classification Manual for Government Financial Statistics, Australia*, cat. no. 5514.0
- *Australian National Accounts: Concepts, Sources and Methods*, cat. no. 5216.0
- *Balance of Payments and International Investment Position, Australia: Concepts, Sources and Methods*, cat. no. 5331.0
- *Labour Statistics: Concepts, Sources and Methods*, cat. no. 6102.0.55.001
- *Labour Price Index: Concepts, Sources and Methods*, cat. no. 6351.0.55.001
- *Australian Consumer Price Index: Concepts, Sources and Methods*, cat. no. 6461.0.

## SEASONALLY ADJUSTED AND TREND ESTIMATES

Series in this publication include original, seasonally adjusted and trend series. Special care should always be taken in interpreting data for the most recent months and quarters. Some of the original and all of the seasonally adjusted and trend series are subject to revision.

SEASONALLY ADJUSTED  
AND TREND ESTIMATES  
*continued*

It is not uncommon for movements in original time series data and those provided from seasonally adjusted and trend series to differ significantly. Movements in a time series of original data may reflect several factors, including:

- longer-term changes in the item being measured (i.e. trend movements)
- short-term irregular changes
- regular seasonal influences
- normal 'trading', 'working' or 'pay' day patterns
- systematic holiday effects.

Seasonal adjustment and trend estimates help the user to identify the effect of these influences on the time series. Seasonal adjustment removes the effect of the last three listed influences from the data, leaving only the trend and short-term irregular movements. Trend estimates are then obtained by removing the effects of the short-term irregularities, which in many series can be a major contributor to movements in the original data. By comparing the historical trend series with the seasonally adjusted series, the user can identify the short-term irregularities which have influenced the original series.

Trend estimates produced by the ABS are based on Henderson Moving Averages, and are therefore subject to revision especially for the latest few months or quarters.

The general methods used in the ABS for making seasonal adjustments are described in *Seasonally Adjusted Indicators, Australia 1983* (cat. no. 1308.0). The method used to estimate trends is described in *Information Paper: A Guide to Smoothing Time Series – Estimates of Trend* (cat. no. 1316.0).

Concurrent seasonal  
adjustment and trend  
estimates

The ABS has introduced the use of concurrent seasonal adjustment to derive the combined adjustment factors for the Retail Series. This means that data from the current month are used in estimating seasonal and trading day factors for the current and previous months. Concurrent adjustment can result in revisions each month to estimates for earlier periods. However, in most instances, the only noticeable revisions will be to the combined adjustment factors for the current month, the previous month and the same month a year ago. As a result of the concurrent seasonal adjustment the trend estimates are also concurrently estimated.

CHAIN VOLUME  
MEASURES

The chain volume measures appearing in this publication are annually-reweighted chain Laspeyres indexes referenced to the current price values in a chosen reference year (i.e. the year when the quarterly chain volume measures sum to the current price annual values). Chain Laspeyres volume measures are compiled by linking together (compounding) movements in volumes, calculated using the average prices of the previous financial year, and applying the compounded movements to the current price

CHAIN VOLUME MEASURES  
*continued*

estimates of the reference year. Quarterly chain volume estimates are benchmarked to annual chain volume estimates, so that the quarterly estimates for a financial year sum to the corresponding annual estimate.

Chain volume measures are not generally additive. In other words, in general, component chain volume measures do not sum to a total in the way original current price components do. In order to minimise the impact of this property, the ABS uses the latest base year as the reference year (i.e. the year prior to the latest complete financial year). By adopting this approach, non-additivity does not exist for the quarters following the reference year (currently 2003–04) and is relatively small for the quarters in the reference year and the quarters immediately preceding it. The latest base year and the reference year will be advanced one year with the release of the June quarter Australian National Accounts (*Australian Economic Indicators*, October issue). A change in reference year changes levels but not growth rates, although some revision to recent growth rates can be expected because of the introduction of a more recent base year (and revisions to the current price estimates underlying the chain volume measures).

OTHER USAGES

Columns in bold in the tables indicate a total. Columns usually sum from the left, with the total appearing on the right. A major exception is the balance of payments and international investment position data in Chapter 2. These data sum from the right with the total appearing on the left – in keeping with the international standard for these statistics. Some tables include subtotal columns and columns which need to be subtracted to obtain the total. Where this is not clear a footnote explains the relationship between the columns.

Columns in italics indicate that seasonally adjusted or trend estimates are not available for that column, and original data are provided instead.

Yearly periods shown as, e.g. 2004–05, refer to the fiscal year ended 30 June 2005.

Where figures have been rounded, discrepancies may occur between sums of the component items and totals. Percentage changes may not be exactly comparable to tabulated source series due to rounding of the source series, the percentage change series or both.

METRIC PREFIXES

Deca (da) = ten  
Hecto (h) = hundred  
Kilo (k) = thousand  
Mega (M) = million  
Giga (G) = thousand million  
Tera (T) = million million

## ABBREVIATIONS

0, 0.0	zero or rounded to zero
'000	thousand
\$m	million dollars
ABARE	Australian Bureau of Agricultural and Resource Economics
ABS	Australian Bureau of Statistics
ADP	Automated Data Processing
AHECC	Australian Harmonised Export Commodity Classification
ANZSIC	Australian and New Zealand Standard Industrial Classification
ASEAN	Association of South-East Asian Nations
ASX	Australian Stock Exchange
billion	thousand million
cat. no.	catalogue number
cif	cost, insurance and freight
CNW	Change in Net Worth
CPI	Consumer Price Index
e.g.	example
etc	etcetera
EU	European Union
excl	excluding
fob	free on board
GDP	Gross Domestic Product
GDPfc	Gross non-farm product at factor cost
GFCF	Gross Fixed Capital Formation
GFS	Government Finance Statistics
GG	General Government
Govt	Government
kWh	kilowatt hours
LPG	liquid petroleum gas
Mm3	millions of cubic metres
Mt	mega tonne
M1	Currency plus bank current deposits of the private non-bank sector
na	Not available
NBFI	Non-bank Financial Intermediaries
n.e.c.	not elsewhere classified
nes	Not elsewhere specified
NLB	Net Lending/Borrowing
NOB	Net Operating Balance
np	not published
nya	not yet available
NW	Net Worth
nya	not yet available
OECD	Organisation for Economic Co-operation and Development
PFC	Public Financial Corporations
PGFCF	Private Gross Fixed Capital Formation
PNFC	Public Non-financial Corporations
RBA	Reserve Bank of Australia
S&P/ASX 200	Standard and Poor's Australian Stock Exchange top 200
SITC	Standard International Trade Classification
SUV	Sport Utility Vehicles
USA	United States of America
VFACTS	Vehicle facts
