IN THIS ISSUE

CHANGES IN THIS ISSUE EXTENDED TIME SERIES

## SYMBOLS AND OTHER USAGES

Where available, the statistics in this issue are presented as time series for the last nine years of annual data, the last nine quarters or 15 months of data. To assist analysis most tables include percentage movements, as well as levels, of series.
Quarterly and monthly data for most series, and annual data for a limited number of series, are available from the ABS for earlier periods than that shown in this publication. Many series can be obtained on electronic media. Inquiries should be directed to the National Information Service on 1300135070.

For users requiring longer time series, each February issue of Australian Economic Indicators contains, for most series, a greater span of annual, quarterly and monthly data.

## NEW EXPERIMENTAL ESTIMATES OF THE DISTRIBUTION OF AUSTRALIAN HOUSEHOLD WEALTH

There is considerable interest in the composition and distribution of wealth across Australian households, and how this is changing over time. This article reports some of the findings of an exploratory study into this topic.

An ABS Working Paper 'Experimental Estimates of the Distribution of Household Wealth, Australia, 1994-2000' was released for comment today ( 30 September 2002). This working paper reports the findings of an exploratory study which has melded a range of existing data sets to construct experimental wealth data dissected by key household characteristics. The paper focuses on the data and methods used to generate the estimates, and presents some broad results which have emerged from the data modelling work.

The working paper series provides an avenue for the ABS to make public the results of research or analysis of an experimental nature, so as to encourage discussion, comment and improvement of the exploratory work. Feedback on the methods and results reported in the new wealth working paper is therefore welcomed.

The ABS first collected distributional wealth data from households as part of the 1915 War Census, but due to concerns about the public's willingness to respond to questions about their wealth, and due to competing data collection priorities within the ABS' work program, such statistics have not been collected in ABS household surveys or censuses for several decades.

In recent years the ABS has committed increased effort to the analysis of directly collected and administrative data. The purpose of this work is to gain more value from existing data, to reduce the load on data providers and to increase the comparability of statistics from different parts of the Australian statistical framework. As part of this effort, research was undertaken to identify the existing data sets relating to wealth and to explore methodologies for bringing these together to produce wealth estimates. An analytical project was subsequently initiated to construct a set of distributional household wealth estimates for Australia for most of the last decade, using existing data.

This was not the first time that the distribution of wealth has been modelled in Australia. Dilnot (1990), Bacon (1996), Baekgaard and King (1996), Kelly (2001) and others have undertaken similar types of analyses. However, most previous studies have concentrated on a selection of the assets and liabilities owned by households, and have compiled estimates for a particular point (or a selection of points) in time. In addition, the ABS has extended the work of other analysts using more detailed survey unit record information to support the analyses.

HOW THE
EXPERIMENTAL ESTIMATES WERE COMPILED

THE DISTRIBUTION
OF HOUSEHOLD
WEALTH -
EXPLORATORY
FINDINGS

The experimental estimates discussed in the working paper are constructed very differently to those which the ABS obtains via direct collections (i.e. via surveys or censuses). The new experimental estimates have been created by drawing together a range of different data sources, covering different parts of the Australian population which have been collected at different times. They have been modelled rather than directly measured.

For this study, a household's wealth was defined to equal its net worth - that is, the sum of its assets minus the sum of its liabilities. Using a variety of data sources, individual asset and liability estimates were constructed for each household represented in the Surveys of Income and Housing Costs (SIHC) and Household Expenditure Surveys (HES) covering the financial years 1993-1994 to 1999-2000. These household-level estimates were aggregated and benchmarked to the current price asset category aggregates reported in the National Accounts household sector balance sheet (adjusted to exclude non-profit institutions). The data generated by this process allow the assets, liabilities and net worth of households to be dissected by key characteristics such as household type (based on the composition of the household and the ages of the people within it), broad geography, income deciles and so on.

For each year from 1994 to 2000, mean and median household wealth increased as the age of the household reference person ${ }^{1}$ increased, peaked in the 55-64 age group and then declined. This pattern supports the theory that households build their wealth while householders are working, and then draw upon this wealth in retirement. This pattern is different to the distribution of total income across age groups, which peaks in the 45-59 age group and then falls away more rapidly.

[^0][^1]THE DISTRIBUTION
OF HOUSEHOLD
WEALTH-
EXPLORATORY
FINDINGS
continued

The distribution of wealth in all dimensions is closely related to the distribution of major household assets such as owner-occupied dwellings and superannuation. Growth in the value of these assets between 1994 and 2000 has led to strong increases in the average wealth of households in middle and older age groups (i.e. those where the age of the reference person is over 44).

The distribution of wealth is also related to income levels. Mean and median wealth rises across most income deciles. Mean wealth for the highest income decile is more than double that of the ninth decile.

Source: ABS, Experimental Estimates of the Distribution of Household Wealth, Australia, 1994-2000

The distribution of wealth between different types of households is closely linked to the effects of age and income level on wealth accumulation. Couple households had higher average net worth than lone parent or lone person households with reference people of a similar age. This is to be expected, as couples may have had access to two incomes with which to accumulate assets.

MEAN AND MEDIAN HOUSEHOLD NET WORTH BY SELECTED HOUSEHOLD TYPES, CURRENT PRICES, AS AT 30 JUNE 2000

|  | Couple |  |  |  | Lone parent with dependants |  | $\begin{gathered} \text { Lone } \\ \text { person } \\ \text { only } \\ \$ \end{gathered}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | With dependants |  |  |  |  |  |
|  | Without dependants \$ | $\begin{gathered} \text { 0-14 } \\ \text { only } \\ \$ \end{gathered}$ | $\begin{array}{r} \text { 15-24 } \\ \text { only } \end{array}$ | $\begin{array}{r} 0-14 \text { and } \\ 15-24 \text { only } \\ \$ \end{array}$ | $\begin{array}{r} 0-14 \\ \text { only } \\ \$ \end{array}$ | $\begin{array}{r} 15-24 \\ \text { only } \\ \$ \end{array}$ |  |
| Mean household net worth | 385,853 | 258,786 | 588,268 | 397,265 | 55,019 | 178,128 | 209,287 |
| Median household net worth | 243,912 | 153,477 | 392,106 | 277,439 | 16,449 | 100,174 | 111,014 |

Mean net worth grew in all states and territories between 1994 and 2000. In 2000, mean net worth was highest in NSW, where average owner-occupied dwelling values were considerably higher than those in other states. The distribution of wealth between states and territories was different from the distribution of mean annual income, as the territories had higher mean and median household incomes than the states.

THE DISTRIBUTION
OF HOUSEHOLD
WEALTH -
EXPLORATORY
FINDINGS

CONTENTS OF THE WORKING PAPER

MEAN HOUSEHOLD NET WORTH BY STATE (a), As at 30 June 2000

(a) Estimates for smaller states/tenitories (particularly the Northem Teritory) are based on relatively small sample sizes and should be used with some caution.
Source: ABS, Experimental Estimates of the Distribution of Household Wealth, Australia, 1994-2000

The percentage of total wealth owned by households in a particular wealth decile is a statistic which is commonly used to examine the concentration of wealth across households. From 1995 to 2000 , the amount of wealth held by the top wealth decile appears to have been quite stable - either $43 \%$ or $44 \%$ in each year, after falling from $49 \%$ in 1994. The percentage of total household wealth owned by other wealth deciles has also remained stable over this period.

The distributional patterns outlined above are in broad agreement with data from other sources and the findings of previous studies. However, mean household net worth estimates from the new experimental model are higher than some estimates which have been reported in the past. When interpreting these types of differences it should be remembered that these new experimental estimates incorporate some assets and liabilities which have not often been included in past analyses, the estimates have been benchmarked to National Accounts aggregates, and they have been based on more detailed survey information.

Tabulations of mean and median household net worth dissected by a range of characteristics (age of reference person, household type, state and income and wealth deciles) are presented in the appendices of the working paper. However, the main focus of the publication is to document, in some detail, the data and methods used to construct the wealth model, and provide:

- an illustration of the types of analyses which can be performed on the experimental estimates produced by the model;
- a range of quality indicators to assist potential users of the estimates to gain insights into their fitness for specific purposes. While broad dissections of the experimental data will generally yield robust results, users of the estimates should only undertake more detailed dissections with caution; and
- sufficient detail so that other analysts may provide feedback to the ABS about the methods used in this exploratory work.

POSSIBLE FUTURE WORK

There are a number of ways in which the experimental estimates could be refined in the future. For example, work is underway to increase the comparability of income statistics which were collected in the SIHC and HES across the 1990s, and this may lead to revised income data to which the model can be applied. (For further details of this work, see the feature article 'Upgrading Household Income Distribution Statistics' in the April 2002 edition of this publication).

The ABS is investigating the feasibility of compiling standard errors or alternative deviation measures, using statistical modelling techniques, to enhance the suite of quality indicators which has been provided in the working paper.

After considering feedback on the methods and experimental results reported in the working paper (and subject to further investigation of the feasibility of refinements to the model) the ABS may make more detailed disaggregations of the estimates available. In addition, the descriptive analysis conducted to date is only a fraction of that which could be undertaken using the estimates compiled in this study. Other analyses are being considered for incorporation into the ABS' analytical work program.

Using the model which has been developed in this study, the ABS may compile distributional wealth data in years when a SIHC or equivalent survey is run, i.e. biennially, from 2003-2004. Information on wealth is planned to be directly collected every sixth year, commencing with the 2003-2004 Household Income and Expenditure Survey (a combined SIHC and HES).
'Experimental Estimates of The Distribution of Household Wealth, Australia, 1994-2000', can be found on the ABS web site [http://www.abs.gov.au](http://www.abs.gov.au), and downloaded free of charge. ## ACCOUNTING FOR THE ENVIRONMENT IN THE NATIONAL ACCOUNTS

The economy has a complex relationship with the environment. The environment provides the raw materials and energy for the production of goods and services that support our lifestyles, but it also sustains damage through the activities of households and businesses. The national accounts are sometimes criticised for including the value of goods and services produced and the income generated through the use of environmental assets, but not reflecting the economic cost of depleting those assets or the damage that arises from economic activity. This asymmetry is well recognised by national accountants, as are a number of other deficiencies relating to the use of national accounts as a comprehensive measure of the 'wellbeing' of society (e.g. the value of unpaid housework is excluded from gross domestic product (GDP)).

This article discusses how the environment is currently treated in the national accounts, and gives a broad overview of the work being done by the ABS to extend the core national accounts in what could be called a satellite account for the environment.

The national accounts are a macro-economic data set revolving around the central economic concepts of production, income, expenditure and wealth. They also comprise a monetary system, and therefore rely substantially on being able to measure the money transactions taking place between the various economic agents in a market economy. The Australian system of national accounts (ASNA) is based on the latest international standard, System of National Accounts 1993 (SNA93).

While the environment clearly provides services to the economy, these are often provided at no cost or are implicit in the value of goods and services rather than in explicit transactions. Environmental assets are often not controlled by economic agents because of their physical nature, or in some cases are so plentiful that they have a zero price. For this reason, the valuation of environmental flows and stocks is fraught with conceptual and practical difficulties. Nevertheless, international research has been proceeding over a number of years and substantial progress has been made in sorting out the issues and concepts, although there is still limited experience in practical measurement.

The United Nations Statistical Division published an interim handbook Integrated Environmental and Economic Accounting in 1993. Over the last few years it has been redeveloped and extended by an international expert working group consisting of national accountants and environmental accountants. The revised handbook, titled the System of Environmental and Economic Accounting (SEEA), is currently in final draft stage and has recently been endorsed by the United Nations Statistical Commission for publication. It will provide a detailed conceptual

INTERNATIONAL
STANDARDS
continued
and classification framework for environmental accounting and should provide an impetus for the advancement of environmental accounting internationally. Some of the material in the handbook relates to a clarification of the measurement of environmental assets in the traditional system of national accounts, but much of it concerns material that could be developed in a satellite account separate to the traditional accounts. Satellite accounts provide the freedom to develop alternative concepts, classifications and measurement techniques which are different, but at the same time retain a connection back to the national accounts based on SNA93. The environmental accounting work being done by the ABS is consistent with the recommendations in SEEA.

## NATURAL

RESOURCES IN
THE ASNA

Stocks

The national and sector balance sheets record the value of environmental assets that are defined as being within the scope of the system of national accounts - known as the asset boundary. For an asset to be included within the asset boundary of the national accounts it must have an identifiable owner, and the owner must be able to derive an economic benefit from the use of the asset. Assets included are those termed economic environmental assets such as subsoil assets, land, forests, water, and fish stocks in open seas that are under the control of an economic agent (often the government).

Environmental assets such as atmospheric and terrestrial ecosystems are outside the scope of economic assets as they do not have an identifiable owner who can derive an economic benefit from their use. This is not to suggest that these assets are of no value. On the contrary, many of them are essential to life itself. However, even if they fell within the definition of an economic asset, the valuation techniques available to measure such assets tend to be arbitrary and controversial.

The environmental assets on the Australian national and sector balance sheets are land, subsoil assets and native standing timber. Land valuations are available through administrative sources, and net present value techniques (which take into account current production rates, prices, costs, and discount rates) are used to value both subsoil and native forest assets. Plantation standing timber could also be considered an environmental asset, and plantations are included in the balance sheet as inventories because timber growth is controlled. Water and fish stocks have not been included on the Australian national balance sheet due to a lack of available data.

Stocks
continued

The Australian national balance sheet recorded $\$ 3,459 \mathrm{~b}$ worth of assets as at 30 June 2001, of which $\$ 1,160$ b (33\%) were economic environmental assets (table 1).

While land accounts for $84 \%$ of the value of Australia's economic environmental assets, the value of rural land accounts for only $12 \%$ of the total value of land. Subsoil assets account for $15 \%$ and timber (native and plantation) accounts for $1 \%$ of Australia's economic environmental assets (based on table 2). No values are included for water or fish stocks, or other environmental assets outside the SNA asset boundary.

The value of environmental assets in current prices grew strongly during the 1990s, increasing by $84 \%$ between 30 June 1993 and June 30 2001. Much of this growth was due to rising prices. Environmental assets grew in volume terms by $18 \%$ during the same period (based on table 3).

TABLE 3 AUSTRALIA'S ENVIRONMENTAL ASSETS, CHAIN VOLUME MEASURES (a) - AS AT 30 JUNE

continued

Chain volume estimates of subsoil assets increased by $29 \%$ between 30 June 1993 and 30 June 2001, compared with growth of over $160 \%$ in current prices (graph 1). The strong volume growth has been due to new discoveries exceeding extractions during this period. The current price growth has been driven by increasing prices in significant minerals such as iron ore, magnesite, crude oil, condensate, and LPG, and falling real discount rates. Minerals deposits cannot be extracted all at once, but are extracted over a long time period, and a discount rate is needed to calculate the net present value of future extractions.

GRAPH 1 SUBSOIL ASSETS-As at 30 June

(a) Reference year for chain volume measures is 1999-2000.

Source: National Income, Expenditure and Product, Australian National Accounts cat. no. 5206.0.

The volume estimates of native standing timber fell by $8 \%$ over the same period, while the current price estimates were increasing (graph 2). Volume estimates have fallen due to logging of native forests and the protection of some forests, resulting in their removal from the economic production boundary of the national accounts.

GRAPH 2 NATIVE FOREST ASSETS-As at 30 June

(a) Reference year for volume measure is 1999-2000.

Source: National Income, Expenditure and Product, Australian National Accounts cat. no. 5206.0.

While the area of land is unlikely to change very much during the normal course of events, volume change also includes changes in quality due to natural processes, soil conservation and other land improvement measures, land degradation due to human activity, and the rezoning of land so that it is available for higher value uses. The practical task of splitting value changes into their price and volume components is a difficult one. As an interim approach, the ABS has calculated the growth in volume of urban

Stocks
continued

Transactions - the national income, expenditure and production accounts

A SATELLITE
ACCOUNT FOR THE ENVIRONMENT
land at half the rate of growth in the volume of overlying construction. Zero volume growth is assumed for rural land. This assumes that land degradation, reclassification and land improvement net to zero for rural land.

The transaction accounts of the ASNA measure production, incomes, consumption, capital and financial flows during the accounting period. GDP is the most readily identifiable statistic from the national accounts. Of most interest in the context of environmental accounting is the way environmental assets are used in the production process to produce goods and services for consumption, capital investment or export. However, the services provided by the environment are often either implicit in the values for other items or they are excluded as they are costed at zero price.

Where there are explicit rents for the use of natural assets, they are shown in the item 'rent on natural assets' in the sector income accounts. The general government sector received $\$ 2.6 \mathrm{~b}$ in resource rents in 2000-2001 (mainly from petroleum, mining and forestry royalties). Many environmental assets (e.g. land) are used by their owners for which there is no money transaction.

In terms of GDP, the value of the services provided by the environment are implicit in the value of the output of the products produced and the incomes derived from their sale. In 2000-2001, the industry gross value added of the agriculture, forestry and fishing industry accounted for $3.5 \%$ of total gross value added, while the mining industry accounted for $5.2 \%$. The value added also reflects the input of labour and produced capital, as well as natural capital.

The value of new additions to environmental assets such as discoveries of subsoil assets or natural growth in native standing timber are not included as income or GDP. However, the cost of mineral exploration is regarded as fixed capital formation, and is reflected in GDP as the creation of an asset.

As mentioned, no deduction is made from income for the depletion or degradation of the natural environment. Thus,
'...a country could exhaust its mineral resources, cut down its forests, erode its soil, pollute its aquifers, and hunt its wildlife to extinction, but measured income would not be affected as these assets disappeared' (Repetto et al. 1989).

The national accounts have a wide range of potential uses for policy making and economic and social research, and thus it is unlikely that the core accounts will be able to meet all possible objectives. In recognition of this, satellite accounts allow for a more flexible approach by providing frameworks that are linked to the national accounts, but focusing on a certain aspect of social or economic life. Satellite accounts also allow for standard

A SATELLITE ACCOUNT FOR THE ENVIRONMENT continued

Measuring
depletion
concepts to be varied to suit particular studies within the context of the national accounts.

An environmental satellite account could take a number of forms and have a number of layers of detail. The ABS work program has focused on compiling asset accounts and accounts which decompose the changes in the value of assets during a period. The latter accounts can be used for adjusting the national accounts for the depletion of and additions to specific environmental assets in a satellite account framework.

Depletion is defined in the SNA93 as the
'...reduction in the value of deposits of subsoil assets as a result of the physical removal and using up of the assets, ... the depletion of water resources, and the depletion of natural forests, fish stocks in the open seas and other non-cultivated biological resources as a result of harvesting, forest clearance, or other use' (SNA93, 12.29 and 12.30).

Depletion in an economic sense results because the value of the resource stock has been lowered through its use in a productive activity, and the use has reduced the asset's ability to produce an income stream in the future. In this sense depletion is analogous to depreciation of produced assets whereby the current value of the stock of fixed assets declines from normal use.

Physical depletion may not necessarily equate to economic depletion in cases where asset values are low or the resource life is long. While the physical dimension of depletion can be fairly readily observed in practice, its value cannot. This is because the mineral or other natural resource product is not what is being valued - rather it is the decline in the value of the mineral asset below the ground or of the standing timber in the forest. Generally, one has to resort to capital theory to undertake this valuation. In capital theory the value of depletion is a derivative of the amount of the resource extracted and the resource rent.

The resource rent is the value of the flow of capital services provided by a natural asset. It is calculated as the value of the output of the natural resource production (e.g. coal, oil) after the intermediate expenses, returns to labour (wages), returns to produced capital (profits accruing from the use of produced capital), and return to government (taxes) have been removed. Algebraically, the resource rent is represented as:
$\mathrm{RR}=(\mathrm{p}-\mathrm{c}) * \mathrm{Q}$
where
RR = resource rent,
$\mathrm{p}=$ unit price,
c = unit cost (includes wages, intermediate costs, normal return to produced capital, and taxes),
$\mathrm{Q}=$ quantity extracted.

Measuring depletion
continued

The resource rent in each period is discounted to derive the net present value (NPV) of the natural asset:
$\mathrm{V}_{\mathrm{t}}=\sum_{\mathrm{t}=1}^{\mathrm{n}} \frac{\mathrm{RR}}{(1+\mathrm{r})^{\mathrm{n}}}$
where
$\mathrm{V}=\mathrm{NPV}$,
$\mathrm{r}=$ discount rate,
$\mathrm{n}=$ asset life.

Depletion can be shown to be equal to the resource rent in the year minus a return (income) on the natural resource asset.
$\mathrm{dt}=\mathrm{V}_{\mathrm{t}-1}-\mathrm{V}_{\mathrm{t}}=\mathrm{RR}_{\mathrm{t}}-\mathrm{rV} \mathrm{V}_{\mathrm{t}}$
where
$\mathrm{d}=$ depletion.

Where the total stocks of an asset are unknown, discoveries of new stocks of subsoil assets or growth in biological assets may increase the stock of a resource so that the level of currently exploitable reserves from which the economic valuation is derived is rising rather than falling. How to account for additions is a vexed issue. In the national accounts, the value of mineral exploration is included as a separate produced asset and is therefore included in income and GDP. It could be argued that this should be replaced with the actual value of discoveries.

The following sections focus on subsoil, land and forest assets respectively.

Subsoil assets are considered to be economic when they have a high geological assurance, extraction is expected to be profitable at the prevailing price and technology, and when they are owned by an economic entity (usually the government). In the Australian balance sheets economic demonstrated resources (EDR) include both proven and probable reserves.

Although SNA93 recommends that assets should be valued at their current market price, for many natural assets it is not possible to observe the market price directly as there is little trading of undeveloped stocks in the marketplace. The next best method is to value assets as the net present value (NPV) of the future expected earnings, which is theoretically equivalent to the market value. This is the approach adopted in the national balance sheet and in deriving estimates of the value of depletion and additions to subsoil assets presented in table 4.

Year-to-year changes in the value of subsoil assets for Australia can be decomposed into revaluations, depletion and discoveries. Revaluations capture the change in prices of the existing stock.

The depletion in any one year is the change in the value of the asset between the beginning and end of the year arising purely from the extraction of minerals. As can be seen from graph 3, the depletion of crude oil accounts for a high proportion of the total depletion estimate. This is a reflection of crude oil's relative scarcity and high value.

GRAPH 3 SUBSOIL DEPLETION

Source: National Income, Expenditure and Product, Australian National Accounts cat. no. 5206.0.

A discovery occurs when previously unknown stocks of minerals are found and delineated. It is valued using the same NPV techniques as described earlier. In the national accounts the value of a new discovery in itself is not considered as production or income because it is a gift of nature. However, the cost of mineral exploration is considered as production and included in income and GDP.

One approach that could be considered in a satellite account is to include the value of a discovery as production and income and to treat the exploration cost as intermediate input to the production of discoveries. As shown in graph 4, the value of discoveries shows an erratic pattern which, under such an approach, would flow through to income. A possible variation on the concept could be to record the value of discoveries as an

Subsoil assets continued
accrual over the average period of exploration in order to smooth the income flow.

GRAPH 4 SUBSOIL DISCOVERIES

Source: National Income, Expenditure and Product, Australian National Accounts cat. no. 5206.0.

As long as the value of discoveries continues to outpace or equal the value of depletion the activity can be seen to be sustainable. This is illustrated in graph 5.

GRAPH 5 SUBSOIL DEPLETION AND DISCOVERIES

Where land is used sustainably, it has an infinite life and therefore no adjustment for depletion is required - the whole value of the resource rent would rightly be considered as income. However, where land is being degraded due to economic activity, an adjustment to income for land degradation is applicable. As for subsoil assets discussed above, any economic costs should be offset against the benefits (income) derived from agricultural land use.

In the context of economic depletion used here, land degradation represents the year-to-year decline in the capital value of land resulting from economic activity (after deducting price rises due to inflation). Looked at another way it is equivalent to the year-to-year change in the net present value of the lost resource rent resulting from the declining productive capacity of the land. As such, it stops well short of a full measure of the cost of land degradation such as the cost to environmental systems and public infrastructure. The latter would, however, be captured in the national accounts estimates for consumption of fixed capital.

Land / soil assets continued

Changes in the value of agricultural land can be ascertained from data on market values or land rates data. However, data for land values are affected by a host of factors other than changes in productive capacity from the impact of land degradation, including inflation, technological advances and changes in land use due to rezoning, subdivision and 'lifestyle' considerations (Roberts, B. 1997).

Two recent national studies used different approaches to measuring economic losses due to land degradation.

- ABARE (2001) used a farm survey to ascertain the extent of land degradation on farms. Combining data from the survey with land value data, regression techniques were used to estimate that the difference in the capital value of farms with and without degradation was approximately $\$ 14.2 \mathrm{~b}$ in 1999. This represents the accumulated value of losses in land value due to degradation.
- The National Land and Water Resources Audit (2002) used models to estimate the 'yield gap', i.e. the difference between profits with and without soil degradation. Lost profit at full equity due to salinity, sodicity and acidity was estimated as \$2.6b in 1996-1997.

To compare the results, either the former estimate has to be converted to a lost profit stream or the latter has to be capitalised. Profit at full equity is a measure of the net returns to land and water resources used for agriculture, and the managerial skill of land managers. Adjusting this concept to resource rent by removing the returns to the manager's labour and produced capital, and using a real discount rate of $5.8 \%$, the capitalised value of the lost resource rent due to all past degradation is $\$ 16.4 \mathrm{~b}$ in 1996 -1997. The results using this method are sensitive to the discount rate. The real discount rate has been derived as the long term government bond rate adjusted by the CPI in 1996-1997.

While the estimates mentioned above represent the accumulated value of losses in land value due to all past degradation since European settlement, it is the year-to-year increment in the value of degradation that should be deducted from farm income in each period (consistent with the treatment of depreciation of produced assets). There are a number of issues to consider, including whether to deduct degradation from income in the periods when the effect becomes evident, or in the periods in which it was caused (sometimes decades or even a century earlier). The latter would seem appropriate in economic accounting. For the purpose of the indicative estimates contained in this article, it has been assumed that degradation accumulated evenly over a period of fifty years. Using the $\$ 14.2 b$ figure for lost land value, the annual increment (in 1999 dollar terms) is $\$ 284 \mathrm{~m}$ per year. Using the alternative estimate of $\$ 16.4 \mathrm{~b}$, degradation is $\$ 329 \mathrm{~m}$ per year (in 1997 dollar terms). The annual losses are

Land / soil assets continued

Forest assets
adjusted using the chain price index for GDP to arrive at degradation in current prices. The higher value has been taken into the summary estimates provided in a later table. For estimates post 1999 it has been assumed that degradation will accrue at the same rate. No adjustments have been made to account for land improvements that might reduce the future loss of resource rent. The resulting series are shown in graph 6 .

GRAPH 6 LAND DEGRADATION

Source: National Income, Expenditure and Product, Australian National Accounts cat. no. 5206.0.

Forests are renewable biological resources. There are two types of forest: old growth native forests ( $95 \%$ of the area of all Australian forests) and plantations. Broadleaved and coniferous plantation standing timber are treated as produced assets in the national accounts, as the growth is under the direct control, responsibility and management of the owner. They are classified as inventories. Native forests are treated as non-produced assets as, although they may be owned and available for use, their growth is not the result of an economic process. As for other non-produced assets, the depletion of native forest assets due to harvesting is not charged against income in the national accounts.

The valuation of the depletion of renewable assets presents a different set of issues to non-renewable assets as it may be possible to replace (over time) the part of the asset that is used in the current period. Where a forest is harvested sustainably, no depletion adjustment is required. SEEA suggests that either depletion and additions can be calculated separately, or that just the net depletion could be calculated. Where old growth will not be replaced, only a depletion adjustment will apply. In some areas however, old growth forest will become second growth forest. Where extractions (i.e. timber harvesting) still exceed growth, depletion should exceed additions. Once the transition period from old growth forest to second growth forest is complete, growth may exceed harvest. In this case yield can be considered economically sustainable.

In principle, the best approach would be to calculate both depletion and addition adjustments as this allows for the two impacts to be explicitly identified. Depletion is calculated as the change in the NPV of the forest arising from the harvesting of

Forest assets
continued

Adjusting the national accounts
timber (similar to subsoil assets). The value of additions is the NPV of the growth in any one year. The compilation of this series requires data on the annual increase in forest cover.

It is also possible that forests will come into or out of scope of the balance sheet due to land use management decisions or catastrophic events (e.g. bushfires) that affect the volumes of standing timber. Such changes should not be recorded as depletion because they are not regular economic events. Rather, they should be included as either positive or negative additions to assets in the balance sheet and recorded in the 'other change in assets account'.

Estimates are not yet available for depletion of native forests. However, given that the value of native forests on the national balance sheet is $\$ 2.6 \mathrm{~b}$ compared with $\$ 172.9 \mathrm{~b}$ for subsoil assets, it is expected that depletion of the former will be relatively insignificant. This of course is taking an economic view only, and does not account for damage to intrinsic non-monetary values such as ecosystem services, biodiversity and aesthetic/recreational values.

It was stated earlier in this article that there is an asymmetry in the national accounts between the treatment of produced assets such as buildings, and plant and natural (non-produced) assets. Depreciation of produced assets (termed consumption of fixed capital in the national accounts (COFC)) is deducted to derive the various 'net' income measures in the national accounts such as net domestic product (NDP), net operating surplus (NOS), net

Adjusting the
national accounts continued
national income and net saving. No such deduction is made for natural assets when they are used up or degraded as a result of economic activity. The net measures thus fall short of being sustainable concepts of income, although they are superior to the various 'gross' measures in the national accounts in this respect.

The experimental estimates derived for the value of depletions and discoveries of subsoil assets and the degradation of agricultural land are indicative of adjustments that could be made to the national accounts in the context of a satellite account and are illustrated in Table 5. Depletion adjustments unambiguously lower the net values. If the value of discoveries is included in income in place of the value of mineral exploration, the net effect of that adjustment can be positive or negative.

The net saving levels are changed by the same amount as for NOS, but the nation's net lending position is left unchanged.

Adjusting the national accounts for depletion and additions of subsoil assets also affects growth rates, which may increase or decrease. As table 6 shows, the adjustments have the biggest impact on both NDP and NOS in 1994-1995, due to the low value of subsoil asset additions in that year compared to the previous one.

RELATED
DEVELOPMENTS

A satellite account for energy and greenhouse gas emissions using the input-output framework was published by the ABS in Energy and Greenhouse Gas Emissions Accounts (4604.0) in 2001. It presented information on the supply, use and stock of primary energy resources, supply and use of secondary energy products, and greenhouse gas emissions associated with the use of these energy resources. Energy use and emissions of greenhouse gases were linked with economic data and tracked through the economy so that emissions were allocated to final end users of products, rather than the producers of products.

Of the total net energy supply (13 397 PJ), 66\% was exported, 7\% was consumed by households and $18 \%$ consumed by industry. Together household electricity use and motor vehicle use by households accounted for over 30\% of Australia's energy related greenhouse gas emissions.

FUTURE WORK
AND FURTHER INFORMATION

The work program on environmental satellite accounting is continuing. The ABS hopes to extend the depletion adjustment to include native forests. Other areas of work will be to highlight environmental protection expenditures and to look at extending the economic asset boundary to include the value of water and possibly fish. Work on the valuation of environmental damage (externalities associated with human and economic activity) is an undeveloped field of research and it is unlikely that the ABS will have the capacity to make advances in this area in the foreseeable future.

The ABS welcomes comments on environmental satellite accounts and measuring the depletion of Australia's natural resources. These can be directed to Luisa Ryan on Canberra 02 62527346 or email [luisa.ryan@abs.gov.au](mailto:luisa.ryan@abs.gov.au).

## Q U A R T ERLY REVIE W

## The Quarterly Review refers to trend estimates unless otherwise specified.

1 GDP,
Chain volume measure-
Quarterly \% change

Source: ABS cat. no. 1350.0 \& 5206.0, Quarterly data.

2 CONTRIBUTION TO GROWTH IN GDP,
Chain volume measure, Trend

Source: ABS cat. no. 5206.0, Quarterly data.
3. EXPERIMENTAL COMPOSITE LEADING INDICATOR, (XCLI) AND GDP (Chain volume measure)-
Deviation of trend from historical long-term trend

Source: ABS cat. no. 1350.0, Quarterly data.

## OVERVIEW

- In the June quarter 2002, the trend chain volume measure of GDP rose $0.7 \%$ and its bistorical long-term trend rose $0.6 \%$ (graph 1). GDP long-term trend growth has been slowing since the June quarter 1998. The trend chain volume measure of GDP rose $3.9 \%$ between June quarter 2001 and June quarter 2002. In seasonally adjusted terms, the chain volume measure of GDP rose $0.6 \%$ in the June quarter 2002, and by 3.8\% between June quarter 2001 and June quarter 2002.
- Final consumption expenditure contributed 0.9 percentage points to the $0.7 \%$ increase in the trend chain volume measure of GDP in the June quarter 2002 (graph 2). This was mainly from households, with general government contributing 0.1 percentage points. The contribution of gross fixed capital formation (GFCF) to growth in GDP was 0.4 percentage points, with 0.5 percentage points being contributed by business investment and 0.2 percentage points being contributed by dwellings. Public gross fixed capital formation made a negative contribution of 0.2 percentage points.

Graph 3 shows the growth cycles in the experimental composite leading indicator (XCLI) and GDP. The XCLI decreased in the June quarter 2002 (down 0.07 to 0.03 ), following five quarters of growth. This indicates a provisional peak in the March quarter 2002. This peak, based on historical performance, indicates that the GDP business cycle could be expected to reach a peak two quarters later. The last trough in the XCLI was in the December quarter 2000 and this was followed by a trough in the GDP cycle in the March quarter 2001, one quarter later.

## CONSUMPTION

- In the June quarter 2002 the chain volume measure of bousebold final consumption expenditure (HFCE) grew by $1.3 \%$ in trend and $1.5 \%$ in seasonally adjusted terms (graph 4). The strongest trend growth rates were recorded for furnishings and bousebold equipment (up 2.6\%), recreation and culture (up 2.4\%) and purchase of vehicles (up 2.0\%). Recreation and culture was the largest contributor to growth, being responsible for 0.3 percentage points of the $1.3 \%$ growth. In seasonally adjusted terms, the components which showed the strongest growth rates were transport services (up 4.4\%), bealth (up 3.8\%) and botels, cafes and restaurants (up 3.8\%). The largest seasonally adjusted fall was alcobolic beverages (down 3.2\%).
- The trend chain volume measure of government final consumption expenditure (GFCE) excluding defence rose $0.2 \%$ in the June quarter 2002 (graph 5). The trend rose $1.2 \%$ between June 2001 and June 2002. In seasonally adjusted terms there was a rise of $0.9 \%$ in the June quarter. The trend chain volume measure of defence final consumption expenditure rose by $2.3 \%$ in the June quarter, and rose by $19.2 \%$ between June quarter 2001 and June quarter 2002.
- In the June quarter 2002, retail turnover rose by $1.6 \%$ in trend chain volume terms, the same as the increase in the March quarter 2002. All of the seven industries showed an increase with the largest rises recorded in bousebold good retailing (up 4.8\%), recreational good retailing (up 2.5\%) and clothing $\&$ soft good retailing (up $1.5 \%$ ). In seasonally adjusted chain volume terms retail turnover rose by $2.5 \%$ (graph 6). Most industries recorded seasonally adjusted rises with the largest rise occurring in housebold good retailing (up 7.8\%). There was a seasonally adjusted fall in clothing and soft good retailing (down $0.9 \%$ ) while all other industries rose.
- The trend estimate of the number of new motor vehicle sales (excluding motor cycles) rose by 0.8 (to 69,127) in August 2002, following an increase of 0.2 in July (graph 7). Passenger vehicles rose by $0.3 \%$ (to 44,576), while other vehicles rose $1.7 \%$ (to 24,551 ). Estimates for total new vehicle sales, in seasonally adjusted terms, rose by $4.1 \%$ (to 70,806). Passenger vehicles rosel by 3.2\% (to 45,256 ) while other vehicles rose by $5.9 \%$ (to $25,550)$. There is a trend break between June 2000 and July 2000 resulting from the introduction of The New Tax System. The Technical note "Statistics on Sales of New Motor Vehicles" in the March 2002 issue of AEI provides some background to these statistics.

11 VALUE OF RESIDENTIAL BUILDING APPROVALS,
Chain volume measure, Trend-
Quarterly \% change

[^4]INVESTMENT . . . . . . . . .

- The trend chain volume measure of total gross fixed capital formation (GFCF) rose by $1.8 \%$ in the June quarter 2002, following rises in the previous four quarters (graph 8) after four quarters of decline. It is now at a level $13.3 \%$ above that of June quarter 2001. In seasonally adjusted terms GFCF rose by $5.1 \%$ in the June quarter.
- The trend chain volume measure of total private gross fixed capital formation rose by $3.5 \%$ in the June quarter 2002 (graph 9), while public gross fixed capital formation fell by $4.6 \%$. In the private sector, dwellings rose by $3.9 \%$, other buildings and structures rose by $8.6 \%$, and machinery and equipment rose by $2.1 \%$. Livestock fell by $0.4 \%$, intangible fixed assets fell by $0.4 \%$ and ownership transfer costs were flat. For public GFCF, public corporations fell by $3.5 \%$, national general government fell by $12.3 \%$, and state and local general government fell by $2.1 \%$.
- Trend total private dwellings rose by $3.9 \%$ in the June quarter 2002 (graph 10). New and used dwellings rose by $4.5 \%$ while alterations and additions rose by $2.9 \%$. Expenditure on other buildings and structures rose by $8.6 \%$. There was a $12.5 \%$ increase in new engineering construction and a $2.6 \%$ increase in new building.
- The chain volume measure of total buildings approved rose by $0.6 \%$ in the June quarter 2002. There was a $1.9 \%$ increase in total residential building which was partially offset by a $1.6 \%$ decrease in non-residential building. New residential building rose by $1.9 \%$ due to a $0.4 \%$ rise in new houses and a $5.9 \%$ rise in new other residential building. Alterations and additions to residential buildings rose by $2.0 \%$ (graph 11). On average, a lag of a few months exists between building approvals and the actual undertaking of the work which is recorded in the national accounts, but some work that is approved may not go ahead. A feature article on the relationship between changes in interest rates and building approvals was published in the November 2001 issue of AEI.

[^5]
## LABOUR MARKET . . . . . .

- In August 2002, the total number of employed persons increased $0.1 \%$ to $9,334,900$. Female employment increased $0.2 \%$ to $4,120,900$ while male employment increased slightly to 5,214,000 (graph 12). Full-time employment rose slightly to $6,680,200$ while part-time employment rose $0.3 \%$ to $2,654,700$.
- In August 2002, the unemployment rate remained steady at $6.2 \%$. The male unemployment rate fell 0.1 percentage points to $6.3 \%$ while the female unemployment rate remained at 6.1\% (graph 13). In August 2002 the number of persons looking for full-time work fell $0.5 \%$ to 462,000 and the number of persons looking for part-time work rose 1.9\% to 158,400 .
- In August 2002, the overall participation rate remained steady at $63.6 \%$. The female participation rate rose 0.1 percentage points to $55.3 \%$ (graph 14) while the male participation rate fell by 0.1 percentage point to $72.0 \%$ (graph 15 ).
- The chain volume measure of market sector GDP per hour worked rose by $0.6 \%$ in the June quarter 2002 (graph 16). Hours worked in the market sector also showed a rise of $0.6 \%$. Market sector GDP per hour worked is sometimes used as a proxy for labour productivity, and this would imply a rise in labour productivity. Using this proxy measure implies that labour productivity grew in every quarter from the March quarter 1995 to June quarter 2000 before falling for two quarters and then rising again. This measure, however, reflects the contribution of capital and other factors to changes in production as well as the contribution of labour. A feature article on Further Developments in the Analysis of Productivity Growth in Australia was included in the January 2002 issue of AEI.

INCOME

- In the June quarter 2002, the wages share of total factor income fell to 53.3\% (down 0.2 percentage points) (graph 17). Compensation of employees rose by $1.3 \%$. In seasonally adjusted terms, compensation of employees grew by $1.5 \%$. Average earnings rose by $1.5 \%$, while the number of wage and salary earners was flat.
- In the June quarter 2002, the profits share of total factor income rose 0.1 percentage point to $24.0 \%$ (graph 18). This profit measure comprises the gross operating surplus (GOS) of financial and non-financial corporations, which rose by $2.1 \%$ in the June quarter following a rise of $3.3 \%$ in the March quarter 2002.
- The proportion of household disposable income devoted to consumption in the June quarter 2002 was $99.1 \%$. The remaining $0.9 \%$ is the bousebold saving ratio (graph 19). However, caution should be exercised as the bousebold saving ratio is a derived measure and major components of household income and expenditure may still be subject to significant revisions which could cause changes in both the magnitude and direction of the household savings ratio trend..
- During the June quarter 2002 trend real net national disposable income rose by $0.8 \%$, while the increase in the trend chain volume measure of GDP rose by $0.7 \%$ (graph 20). Real net national disposable income (RNNDI) is a recently introduced national accounting measure showing a broad measure of economic well being. This measure adjusts the chain volume measure of GDP for the terms of trade effect, real net incomes from overseas and consumption of fixed capital.

For further details about RNNDI see the article in the April 2002 issue of AEI.

## PRICES . . . . . . . . . . . .

This commentary refers to original estimates unless otherwise specified.

- In the June quarter 2002, the all groups consumer price index (CPI) rose by $0.7 \%$, following a $0.9 \%$ rise in the March quarter 2002 (graph 21). Graph 22 shows the major contributors to change in the CPI for the June quarter.
- The national accounts domestic final demand chain price index rose by $0.5 \%$ in the June quarter 2002, following a $0.7 \%$ rise in the previous quarter (graph 23). The largest rise was recorded by general government excluding defence (up 1.8\%). Several components showed falls. The domestic final demand chain price index is a broad based measure of price change and it comprises final consumption and capital expenditure, for both private and public sectors.
- Each of the stage of production price indexes increased in the June quarter 2002 (graph 24). The preliminary index showed the largest rise of $0.7 \%$ with a $0.9 \%$ increase in the domestic index and a $0.2 \%$ increase in the imports index; the intermediate index rose by $0.3 \%$ due to a $0.5 \%$ increase in the domestic index being partially offset by a $1.0 \%$ fall in the prices of imported commodities; and the final index rose by $0.2 \%$ due to a $0.9 \%$ increase in the domestic index being partially offset by a $3.2 \%$ fall in the prices of imported commodities.
- In the June quarter 2002, the price index of materials used in manufacturing industries rose by $1.5 \%$, but despite this there was a decrease through the year to June quarter 2002 of $3.7 \%$. A large increase in the world price for crude oil during the June quarter was the main driver of the increase. Other inputs having notable price rises were sheep and lambs and whole milk. There was a $3.0 \%$ rise in the price index for domestic materials and a $1.0 \%$ fall in the price index for imported materials (graph 25).
- The export price index fell by $2.2 \%$ in the June quarter 2002 (graph 26). The fall was mostly due to the appreciation of the Australian dollar against the US dollar and price falls for cotton. These impacts were offset to some extent by large price increases for petroleum oils and wool exports.
- The import price index fell by $3.0 \%$ in the June quarter 2002 (graph 26). This was mostly due to the appreciation of the Australian dollar against the US dollar. This impact was offset to some extent by large price rises for petroleum oils.

## INTERNATIONAL . . . . . . .

- In the June quarter 2002 the trend current account deficit was $\$ 7.2 \mathrm{~b}$. This was an increase of $\$ 1.0 \mathrm{~b}(17 \%)$ on the March quarter 2002 (graph 27). The main contributors to the rise in the deficit were goods exports (down $\$ 0.1 \mathrm{~b}$ ), goods imports (up 0.7 b ) and services imports (up $\$ 0.2 \mathrm{~b}$ ). The trend estimate of the net income deficit rose 0.1 b to $\$ 5.2 \mathrm{~b}$. In seasonally adjusted terms the current account deficit rose $\$ 2.3 \mathrm{~b}$ to $\$ 7.5 \mathrm{~b}$, with a balance on goods and services deficit of $\$ 2.4 \mathrm{~b}$ (compared with a deficit of $\$ 0 \mathrm{~b}$ the previous quarter.
- In the June quarter 2002, the balance on financial account in original terms was a net inflow of $\$ 8.0 \mathrm{~b}$. This comprised a net inflow on debt of $\$ 9.7 \mathrm{~b}$ and a net outflow on equity of $\$ 1.7 \mathrm{~b}$ (graph 28). In terms of type of investment, the $\$ 8.0 \mathrm{~b}$ net inflow was composed of:
- a net inflow of $\$ 0.6 \mathrm{~b}$ on direct investment in Australia, down $\$ 9.4 \mathrm{~b}$ from the previous quarter (graph 29). Australia's direct investment abroad was an outflow of $\$ 1.5$ b, compared with a $\$ 5.3 \mathrm{~b}$ outflow in the previous quarter;
- a \$1.6b net inflow on portfolio investment, a $\$ 2.0 \mathrm{~b}$ turnaround from the net outflow of $\$ 0.4 \mathrm{~b}$ recorded in the March quarter 2002 (graph 29);
- a very small inflow on financial derivatives;
- a net inflow of $\$ 10.5 \mathrm{~b}$ in other investment, a turnaround of $\$ 14.5$ b on the net outflow of $\$ 3.9 \mathrm{~b}$ recorded in the March quarter 2002. Net inflows of $\$ 10.2$ b for Australian depository corporations contributed significantly to the turnaround; and
- a $\$ 3.4 \mathrm{~b}$ net outflow on reserve assets, a turnaround of $\$ 6.3 \mathrm{~b}$ on the previous quarter's inflow of $\$ 3.0 \mathrm{~b}$.
- Australia's net international investment position as at 30 June 2002 was a net foreign liability of $\$ 391$ b, up $\$ 13$ b from 31 March 2002. The rise resulted from net transactions of $\$ 8 \mathrm{~b}$, price changes of $\$ 5 \mathrm{~b}$ and other adjustments of \$1b. During the June quarter 2002 the level of net debt liabilities rose $\$ 2 \mathrm{~b}$ to $\$ 330 \mathrm{~b}$, reflecting net new debt raisings of $\$ 10 \mathrm{~b}$, exchange rate changes of $-\$ 5 \mathrm{~b}$ and market price changes of $-\$ 2 \mathrm{~b}$. Net equity liabilities rose $\$ 11 \mathrm{~b}$ to $\$ 61 \mathrm{~b}$ reflecting market price increases of $\$ 7 \mathrm{~b}$, exchange rate increases of $\$ 5 \mathrm{~b}$ and transactions of -\$2b.
- Graph 30 shows the Trade Weighted Index (TWI) of the value of the \$A. In the June quarter 2002 the quarterly average TWI rose to 53.4 (from 52.2 in the previous quarter), reflecting the appreciation of the Australian dollar, on average, in the June quarter 2002.

(a) Trend data used instead of seasonally adjusted.
(b) Sales is defined as gross non-farm product plus imports of goods and services less changes in private non-farm inventories
(c) Corporate gross operating surplus include private corporate trading enterprises plus financial enterprises less imputed bank service charge. GNFPfc $=$ Gross non-farm product at factor cost.
(d) Interest paid component contains original data.
(e) By convention, zero productivity growth is assumed for industries in the non-market sector mainly government and some service industries. Therefore, a better indicator of productivity change is provided by the series showing market sector constant price gross product per hour worked.

NATIONAL ACCOUNTS

GFS NET LENDING/BORROWING -
TOTAL PUBLIC SECTOR 2000-2001

Source: ABS cat. no. 5512.0, Annual data.

Accruals-based GFS are presented in the form of Operating Statements, Cash Flow Statements, Balance Sheets and Statements of Stocks and Flows and the main analytical measures are described below:

Net Operating Balance(NOB) - the difference between GFS revenues and expenses. This measure reflects the sustainability of government operations;
Net Lending/Borrowing(NLB) — NOB minus the total net acquisition of non-financial assets. It represents the government's call on the financial sector and reflects the economic impact of government operations. A positive result reflects a net lending position and a negative result a net borrowing position.
Net Worth(NW) - the economic measure of 'wealth' is calculated as assets less liabilities for the general government (GG) sector and assets less liabilities and shares and other contributed capital for public corporations (financial and non-financial). Net worth of unlisted corporations will always be zero because owners' equity is the difference between assets and liabilities. For listed corporations net worth will be positive or negative depending upon the difference between the value of shares on the balance sheet and the value of traded shares. As the equity of public

TOTAL PUBLIC SECTOR,
SURPLUS/DEFICIT AS A PERCENTAGE OF GDP

1995-96 1996-97 1997-98 1998-99 1999-00 2000-01
A negative percentage of GDP represents a general govemment deficit. A positive percentage of GDP represents a general govemment surplus Source: ABS cat. no. 5512.0, Annual data.
corporations held by the GG sector consolidate out at the total public sector level, only equity held external to the public sector will appear.
Change in Net Worth(CNW) - this is the change in NW over two adjacent periods. CNW (due to transactions) is also equivalent to the NOB and excludes the impact of revaluations and other changes in volume of assets and liabilities.
Surplus(+)/Deficit(-) - is a cash-based measure and is calculated as:
Net cash flows from operating activities
plus Net cash flows from investments in non-financial assets less Distributions paid (public corporations sector only) less Acquisitions of assets under finance leases and similar arrangements

The new Surplus(+)/Deficit(-) measure, while conceptually comparable to the previous Deficit(+)/Surplus(-) measure has undergone a sign change - a surplus is now shown as positive and in practice has been compiled on a different methodological basis to that of previous years, hence resulting in a break in series. The Surplus/Deficit is the cash-based equivalent of Net Lending/Borrowing described above.

(a) The estimates for goods and services are not necessarily consistent with the corresponding monthly estimates, shown in Tables 2.4 to 2.7 obtained from International Trade in Goods and Services, Australia cat. no. 5368.0 - issued monthly, due to data revisions to the original monthly data not feeding into the quarterly original series until the next quarterly release of Balance of Payments and International Investment Position, Australia cat. no. 5302.0.
b) In addition to the differences outlined in footnote (a), the quarterly seasonally adjusted estimates for goods and services are not necessarily consistent with the corresponding monthly seasonally adjusted estimates, shown in Table 2.1 obtained from International Trade in Goods and Services, Australia cat. no. 5368.0 - issued monthly, because of the independent seasonal adjustment of the monthly and quarterly data.

(a) For all time periods, estimates for Sugar, sugar preparations and honey are included in Other non-rural.
(b) The estimates for goods and services are not necessarily consistant with the corresponding quarterly estimates, shown in Table 2.1 obtained from Balance of Payments and International Investment Position, Australia cat. no. 5302.0 due to data revisions to the original monthly data not feeding into the quarterly original series until the next quarterly release of Balance of Payments and International Investment Position, Australia cat. no 53020
(c) In addition to the differences outlined in footnote (b), the monthly seasonally adjusted estimates for goods and services are not necessarily consistent with the corresponding quarterly seasonally adjusted estimates, shown in Table 2.1 obtained from
Balance of Payments and International Investment Position, Australia cat. no. 5302.0, because of the independent seasonal adjustment of the monthly and quarterly data.

(a) Derived from current price original data. The net international investment position ratios are derived from the net foreign liabilities at the end of the period and GDP for the year ended with that period. Other ratios use only data for the year ended with the period shown.
(b) For the latest reference period, GDP for the year ended with the previous quarter is used.

(a) The exports and imports data presented in this table differ from those in Tables 2.1 to 2.5 because they are recorded on an international trade basis rather than a balance of payments basis and are compiled from a different edition of the data.
(b) The ten member nations of ASEAN are Brunei, Cambodia, Indonesia, Laos, Malaysia Myanmar, Philippines, Singapore, Thailand and Vietnam.
(c) The fifteen Member States of European Union (EU) are Austria, Belgium, Denmark, Finland, France, Germany, Greece, Ireland, Italy Luxembourg, Netherlands, Portugal, Spain, Sweden and the United Kingdom. Figures for Belgium and Luxembourg are presented as combined totals.

(a) The exports and imports data presented in this table differ from those in Tables 2.1 to 2.5 because they are recorded by a foreign trade
basis rather than a balance of payments basis and are compiled from a different edition of the data.
(b) The fifteen Member States of European Union (EU) are Austria, Belgium, Denmark, Finland, France, Germany, Greece, Ireland, Italy, Luxembourg, Netherlands, Portugal, Spain, Sweden and the United Kingdom. Figures for Belgium and Luxembourg are presented as combined totals.

(a) As advised in the June 2002 issue of Retail Trade, Australia cat. no. 8501.0, July 2002 represents the first release of estimates from the Retail Business Survey compiled using new statistical infrastructure. In addition, the opportunity has been taken to incorporate several improvements to coverage and quality. To facilitate comparisons over time, the historical series in this release have been revised to make the time series of estimates as continuous as possible. This has been done by estimating the impacts of the infrastructure and other changes on the statistics, and smoothing this impact back to April 1982, the earliest period for which State and industry data are available. The estimates of the impacts were compiled by combining survey data collected on the old basis in respect of April 2002 with information about the changes. The level estimate for the total Retail and Hospitality/Services series for June 2002 on the new basis is $1.4 \%$ lower than the old basis. The new infrastructure was described in an information paper, Improvements in ABS Economic Statistics [Arising from The New Tax System] cat. no. 1372.0, released by the ABS on 6 May 2002. Further details on the transition and its impact on the estimates are presented in Retail Trade, Australia cat. no. 8501.0, July 2002 issue.

(a) There is a series break between 1985-86 and 1986-87, resulting from a change in survey methodology for engineering construction, introduced from the September quarter 1986. The most significant was the introduction of public sector units into the survey.

(a) All annual data are end of period
(b) All annual data are annual averages.

- All annual data are aggregates.
(d) From the March quarter 1998, the scope of the quarterly Survey of Tourist Accommodation has included licensed hotels, motels and guest houses with facilities and serviced apartments with 15 or more rooms or units. The survey no longer collects data on caravan parks, holiday flats, units and houses or visitor hostels on an ongoing basis.

(a) Original data provided.
(b) The weights used are based on the average share of Australia's imports from the US, Japan, UK and West Germany from 1984-85 to 1987-88. The four countries are the source for about 60 per cent of Australia's imports. Observations are quarterly averages. A rise (fall) implies a deterioration (improvement) in Australian costs and prices relative to our four major trading partners after adjusting for exchange rate changes.
(c) The adjusted CPI index is the ratio of the Australian consumer price index to the weighted geometric average of the exchange rate adjusted consumer price indexes of Australia's four major trading partners.
(d) The adjusted GDP deflator index is the ratio of the GDP deflator for Australia to the weighted geometric average of the exchange rate adjusted GDP deflators of Australia's four major trading partners.
(e) The adjusted unit labour cost index is the ratio of unit labour costs in the non-farm sector of the Australian economy to the weighted geometric average of the exchange rate adjusted unit labour cost indexes estimated for the business sectors of Australia's four major geometric averag
trading partners.

(a) In April 2001 the ABS implemented a redesigned Labour Force Survey Questionnaire. To ensure continuity revisions have been made to core labour force series. For details refer to Information Paper: Implementing the Redesigned Labour Force Survey Questionnaire (cat. no. 6295.0).
(b) Series is non-seasonal. Original data provided instead of seasonally adjusted and trend data.
(c) For unemployment and participation rates, the changes are given as percentage points.

(a) In April 2001 the ABS implemented a redesigned Labour Force Survey Questionnaire. To ensure continuity revisions have been made to core labour force series. Table 6.5 has been redesigned to better show Duration of unemployment data. For further detail refer to Information Paper: Implementing the Redesigned Labour Force Survey Questionnaire cat. no. 6295.0.

(a) Total population increase is equal to the change in population. Prior to 1992 this is not equal to natural increase (live births less deaths)
(b) Includes Cocos (Keeling) Islands, Christmas Island and Jervis Bay Territory from September an intercensal discrepancy for 1986 - 91.
(b) Includes Cocos (Keeling) Islands, Christmas Island and Jervis Bay Territory from September quarter 1993.

## SHORT TERM VISITOR ARRIVALS

Source: ABS cat. no. 3401.0, Monthly data.

SHORT TERM RESIDENT DEPARTURES

Source: ABS cat. no. 3401.0, Monthly data.

There have been significant delays in the receipt of final Overseas Arrivals and Departures (OAD) data from August 2000 onwards from the Department of Immigration and Multicultural and Indigenous Affairs (DIMIA). Because of the use of overseas arrivals and departures data in population estimates which affects State and Territory Government funding, DIMIA is giving priority to processing passenger cards for July 2001 and subsequent months before finalising processing for earlier months - August 2000 through to June 2001.

(a) Excludes Commonwealth and State Government and interbank deposits but includes deposits of the non-bank sector with the Reserve Bank.
(b) Currency plus bank deposits (including certificate of deposit with trading banks) of the private non-bank sector.
(c) Borrowings (other than from banks and related corporations) by permanent building societies, credit co-operatives, finance companies, authorised money market dealers, pastoral finance companies, money market corporations, general financiers and cash management trusts; less borrowings by authorised money market dealers from those non-bank intermediaries. Breaks occur from time to time due to changes in number of reporting corporations.
(d) M3 plus borrowing from private sector by non-bank financial intermediaries less the latter's holding of currency and bank deposits.
(e) Holdings of notes and coin by private sector, plus deposits of banks with the Reserve Bank and Reserve Bank Liabilities to the private Holdings of notes and coin by private sector, plus deposits
non-bank sector.
Loans and advances of those financial intermediaries whose deposit liabilities are included in broad money.
(f) Loans and advances of those financial intermediaries whose deposit liabilities
(g) Bills outstanding under acceptance and endorsement commitments by banks.
(g) Bills outstanding under acceptance and endorsement commitments by banks.

(a) Rates are for the last trading day of the reference period.
(b) On January 1, 1999 eleven European Union nations launched the euro, a single currency giving control of interest rate and exchange rate policy to the European Central Bank. The euro was immediately available for electronic financial and business transactions, but euro coins and notes will not be issued to the general public until January 2002. The participating nations are Austria, Belgium, Finland, France, Germany, Ireland, Italy, Luxembourg, the Netherlands, Portugal and Spain. Greece adopted the Euro on 1 January 2001 and Britain, Denmark and Sweden chose not to adopt the euro.

(a) As advised in the June 2002 issue of Retail Trade, Australia cat. no. 8501.0, July 2002 represents the first release of estimates from the Retail Business Survey compiled using new statistical infrastructure. In addition, the opportunity has been taken to incorporate severa improvements to coverage and quality. To facilitate comparisons over time, the historical series in this release have been revised to make the time series of estimates as continuous as possible. This has been done by estimating the impacts of the infrastructure and other changes on the statistics, and smoothing this impact back to April 1982, the earliest period for which State and industry data are available. The estimates of the impacts were compiled by combining survey data collected on the old basis in respect of April 2002 with information about the changes. The level estimate for the total Retail and Hospitality/Services series for June 2002 on the new basis is $1.4 \%$ lower than the old basis. The new infrastructure was described in an information paper, Improvements in ABS Economic Statistics [Arising from The New Tax System] cat. no. 1372.0, released by the ABS on 6 May 2002. Further details on the transition and its impact [Arising from The New Tax System] cat. no. 1372.0, released by the ABS on 6 May 2002.
(b) Extreme care should be exercised in using the seasonally adjusted and trend series for turnover of retail establishments for the Northern Territory. The highly erratic nature of these data makes reliable estimation of the seasonal pattern and of the trend very difficult.

## 10 INTERNATIONAL COMPARISONS

TABLES
10.1 Real gross domestic product volume index ..... 140
10.2 Balance on current account : percentage of seasonally adjusted GDP ..... 141
10.3 Balance on merchandise trade ..... 142
10.4 Private consumption expenditure volume index ..... 142
10.5 Private fixed capital investment volume index ..... 143
10.6 Industrial production volume index ..... 144
10.7 Consumer price index: all items ..... 145
10.8 Consumer price index : excluding shelter ..... 146
10.9 Producer prices index ..... 147
10.10 Wages index. ..... 148
10.11 Employment index ..... 148
10.12 Unemployment rates. ..... 149
10.13 M1 plus quasi-money index ..... 150

## NOTES

1. The statistics for Germany in these tables refer to Germany after unification.
2. Consumer price index (CPI). Due to the many differences in the structure of the housing sector in different countries and in the way that housing is treated in their CPIs, a simple comparison of All items (or headline) CPIs is often inappropriate. To provide a better basis for international comparisons, the Fourteenth International Conference of Labour Statisticians adopted a resolution which called for countries to "provide for dissemination at the international level of an index which excludes shelter, in addition to the all-items index."

Table 10.8 presents indexes for selected countries on a basis consistent with the above resolution and comparable to the Australian series All groups excluding housing. The series in this table are presented on a reference base consistent with that used for publication of the Australian CPI
(i.e. $1989-90=100.0$ ) and as such are not directly comparable with those for All items published in Table 10.7 (presented on a reference base of $1995=100.0$ ).

SEASONALLY
ADJUSTED AND TREND ESTIMATES

Explanatory notes in the form found in other ABS publications are not included in Australian Economic Indicators. Readers are directed to the explanatory notes contained in related ABS publications.

Australian Economic Indicators presents a statistical summary of the Australian economy, together with international comparisons of selected economic indicators. Except for the special February issue, it also includes commentaries, articles, technical notes, and the Experimental Composite Leading Indicator. Australian Economic Indicators has been developed primarily as a reference document, providing a broad basis for economic analysis and research.

The tables contain mainly ABS data, although data from other sources are included. For ABS sourced data, the publication name and catalogue number are included in the footnotes of the tables. If the data are from other sources, the source organisation's name is included in the footnotes.

The statistics shown are the latest available as at 13 September 2002.

A list of related publications is included in each chapter under the table of contents. These include publications which are the source of the data in the tables and other related publications.

Other useful sources of detailed information are the 'Concepts, Sources and Methods' and classification publications. These are released irregularly, each relating to a specific publication, collection or standard classification. The publications most relevant to Australian Economic Indicators include:

- Australian and New Zealand Standard Industrial Classification (ANZSIC) (Cat. no. 1292.0)
- Classification Manual for Government Financial Statistics, Australia (Cat. no. 5514.0)
- Australian National Accounts: Concepts, Sources and Methods (Cat. no. 5216.0)
- Balance of Payments, Australia: Concepts, Sources and Methods (Cat. no. 5331.0)
- A Guide to Labour Statistics (Cat. no. 6102.0)
- The Australian Consumer Price Index: Concepts, Sources and Methods (Cat. no. 6461.0)

Series in this publication include original, seasonally adjusted and trend series. Special care should always be taken in interpreting data for the most recent months and quarters. Some of the original and all of the seasonally adjusted and trend series are subject to revision.

SEASONALLY ADJUSTED AND TREND ESTIMATES continued

Concurrent seasonal adjustment and trend estimates

## CHAIN VOLUME MEASURES

It is not uncommon for movements in original time series data and those provided from seasonally adjusted and trend series to differ significantly. Movements in a time series of original data may reflect several factors, including:

- longer-term changes in the item being measured (i.e. trend movements);
- short-term irregular changes;
- regular seasonal influences;
- normal 'trading', 'working' or 'pay' day patterns; and
- systematic holiday effects.

Seasonal adjustment and trend estimates help the user to identify the effect of these influences on the time series. Seasonal adjustment removes the effect of the last three listed influences from the data, leaving only the trend and short-term irregular movements. Trend estimates are then obtained by removing the effects of the short-term irregularities, which in many series can be a major contributor to movements in the original data. By comparing the historical trend series with the seasonally adjusted series, the user can identify the short-term irregularities which have influenced the original series.

Trend estimates produced by the ABS are based on Henderson Moving Averages, and are therefore subject to revision especially for the latest few months or quarters.

The general methods used in the ABS for making seasonal adjustments are described in Seasonally Adjusted Indicators, Australia 1983 (1308.0). The method used to estimate trends is described in Information Paper: A Guide to Smoothing Time Series - Estimates of Trend (Cat. no. 1316.0).

The ABS has introduced the use of concurrent seasonal adjustment to derive the combined adjustment factors for the Retail Series. This means that data from the current month are used in estimating seasonal and trading day factors for the current and previous months. Concurrent adjustment can result in revisions each month to estimates for earlier periods. However, in most instances, the only noticeable revisions will be to the combined adjustment factors for the current month, the previous month and the same month a year ago. As a result of the concurrent seasonal adjustment the trend estimates are also concurrently estimated.

The chain volume measures appearing in this publication are annually-reweighted chain Laspeyres indexes referenced to the current price values in a chosen reference year (i.e. the year when the quarterly chain volume measures sum to the current price annual values). Chain Laspeyres volume measures are compiled by linking together (compounding) movements in volumes, calculated using the average prices of the previous financial year, and applying the compounded movements to the current price

CHAIN VOLUME MEASURES continued

OTHER USAGES

METRIC PREFIXES
estimates of the reference year. Quarterly chain volume estimates are benchmarked to annual chain volume estimates, so that the quarterly estimates for a financial year sum to the corresponding annual estimate.

Chain volume measures are not generally additive. In other words, in general, component chain volume measures do not sum to a total in the way original current price components do. In order to minimise the impact of this property, the ABS uses the latest base year as the reference year (i.e. the year prior to the latest complete financial year). By adopting this approach, non-additivity does not exist for the quarters following the reference year (currently 2000-2001) and is relatively small for the quarters in the reference year and the quarters immediately preceding it. The latest base year and the reference year will be advanced one year with the release of the June quarter Australian National Accounts (Australian Economic Indicators, October issue). A change in reference year changes levels but not growth rates, although some revision to recent growth rates can be expected because of the introduction of a more recent base year (and revisions to the current price estimates underlying the chain volume measures).

Columns in bold in the tables indicate a total. Columns usually sum from the left, with the total appearing on the right. A major exception is the balance of payments and international investment position data in Chapter 2. These data sum from the right with the total appearing on the left - in keeping with the international standard for these statistics. Some tables include sub-total columns and columns which need to be subtracted to obtain the total. Where this is not clear a footnote explains the relationship between the columns.

Columns in italics indicate that seasonally adjusted or trend estimates are not available for that column, and original data are provided instead.

Yearly periods shown as, e.g. 2000-2001, refer to the fiscal year ended 30 June 2001.

Where figures have been rounded, discrepancies may occur between sums of the component items and totals. Percentage changes may not be exactly comparable to tabulated source series due to rounding of the source series, the percentage change series or both.

Deca (da) $=$ ten
Hecto (h) = hundred
Kilo (k) = thousand
Mega (M) = million
Giga (G) $=$ thousand million
Tera (T) $=$ million million

    Source: Private New Capital Expenditure and Expected Expenditure, Australia cat. no. 5625.0

[^13]:    (a) Excludes public sector and all businesses classified to agriculture, forestry, fishing, hunting, community services and construction. Data is as at the end of period.
    Source: Business Indicators, Australia cat. no. 5676.0.

[^14]:    a) Original sales data are provided by the Federal Chamber of Automotive Industries and sourced from VFACTS.
    b Includes cars, station wagons and people movers but excludes all-terrain vehicles.
    (c) Includes all-terrain vehicles but excludes motor cycles, plant and equipment and unpowered vehicles

[^15]:    (a) Total industrial production describes the sum of the three groups: Mining excluding services to mining, manufacturing and electricity, gas and water.
    Source: Australian National Accounts, ABS data available on request.

[^16]:    a) Brokers' and dealers' receivals of taxable woo
    (b) Excludes the Northern Territory, the Australian Capital Territory and Tasmania (after 1986-1987).
    (c) Seasonally adjusted data not available. Original data provided.

[^17]:    a) Quarterly data for the Brown coal component no longer collected by ABARE, from September quarter 1994
    b) Includes naturally occurring LPG.
    c) Stabilised (includes condensate).

    Source: Quarterly Mineral Statistics - Australian Bureau of Agricultural and Resource Economics (ABARE).

[^18]:    Source: Building Approvals, Australia cat. no. 8731.0.

[^19]:    (a) Weighted average of eight capital cities.

[^20]:    (a) Weighted average of six state capital cities.

    Source: Producer Price Indexes, Australia cat. no. 6427.0.

[^21]:    (a) Standard International Trade Classification, Revision 3.

[^22]:    (a) Excluding exports.

[^23]:    (a) In April 2001 the ABS implemented a redesigned Labour Force Survey Questionnaire. To ensure continuity revisions have been made to core labour force series. For details refer to Information Paper: Implementing the Redesigned Labour Force Survey Questionnaire (cat. no. 6295.0).
    (b) For civilian population aged $15+$ seasonally adjusted and trend estimates are not available. Original data provided.
    c) For unemploment and participation rates, the changes are given as percentage points.

[^24]:    (a) In April 2001 the ABS implemented a redesigned Labour Force Survey Questionnaire. To ensure continuity revisions have been made to core labour force series. For details refer to Information Paper: Implementing the Redesigned Labour Force Survey Questionnaire (cat. no. 6295.0).
    (b) For civilian population aged $15+$ seasonally adjusted and trend estimates are not available. Original data provided.
    c) For unemployment and participation rates, the changes are given as percentage points.

[^25]:    (a) In April 2001 the ABS implemented a redesigned Labour Force Survey Questionnaire. To ensure continuity revisions have been made to core labour force series. For details refer to Information Paper: Implementing the Redesigned Labour Force Survey Questionnaire
    (cat. no. 6295.0)
    (b) For unemployment rates for total males, females and persons, use Tables 6.1, 6.2 and 6.3.

[^26]:    (a) Data from February 2000 onwards are not strictly comparable with earlier data. See the November 1999 issue of Labour Fource, Australia (Cat.no. 6203.0).

    Source: Labour Force, Australia cat. no. 6203.0.

[^27]:    Source: Overseas Arrivals and Departures, Australia, cat. no. 3401.0.

[^28]:    (a) The indexes in Table 7.4 combine ordinary time and overtime hourly rates and therefore include the effect of any changes in overtime penalty rates but are not affected by changes in penalty payments (which fluctuate depending on the number of hours paid at penalty rates) and allowances (which fluctuate according to how much work is performed under special work conditions e.g. height, dirt and/or heat allowances).

[^29]:    (a) Seasonally adjusted data not available. Original data provided.

[^30]:    (a) All data are end of period unless otherwise specified.
    (b) Data are an average of the assessed daily market yields for the week ended the last Wednesday of the month.
    (c) The 11am call rate. Data are the average of daily figures.
    (d) Indicator rates on variable rate business loans (i.e. overdrafts and fully drawn loans).
    (e) Standard variable rate loans of large bank housing lenders.

[^31]:    (a) Share prices on joint trading floors. Monthly figures are average of daily figures for the month. Annual index is from the last month of the
    year. The annual high (low) is the highest (lowest) of the year
    (b) 31 December $1979=1,000$

[^32]:    (a) These estimates are considered to be of poor quality. They should be used with caution.

[^33]:    (a) Excludes Jervis Bay Territory from September quarter 1993.
    (b) Includes Cocos (Keeling) Islands, Christmas Island and Jervis Bay territory from September quarter 1993.

[^34]:    a) Original sales data are provided by the Federal Chamber of Automotive Industries and sourced from VFACTS
    (b) Extreme care should be exercised in using the seasonally adjusted series for the number of new motor vehicle sales in Tasmania, the Northern Territory and the Australian Capital Territory. The highly erratic nature of these data makes reliable estimation of the seasonal pattern very difficult.

[^35]:    (a) Extreme care should be exercised in using the trend series for number of building approvals in the Northern Territory and the Australian Capital Territory. The highly erratic nature of these data makes reliable estimation of the trend very difficult.
    Source: Building Approvals, Australia cat. no. 8731.0.

[^36]:    (a) Statistics are calculated as the original balance on current account as a percentage of the seasonaly adjusted current price gross domestic product, except for Japan and Germany, where real gross national product replaces gross domestic product.
    (b) $1991=100.0$

    Source: Organisation for Economic Co-operation and Development (OECD) and the Australian Bureau of Statistics (ABS).

[^37]:    (a) Fixed capital investment volume indexes for Germany, France, Italy and the United Kingdom are for gross domestic fixed investment. Source: Organisation for Economic Co-operation and Development (OECD) and the Australian Bureau of Statistics (ABS).
