FEATURE ARTICLE REGIONAL VICTORIA CENSUS PROFILE**2006 CENSUS: REGIONAL
VICTORIA IN PROFILE**

On the 8th of August 2006, Australians - 19.9 million of us who were in Australia on that night, as well as about two hundred thousand overseas visitors - participated in Australia's largest peacetime operation: the Australian Bureau of Statistics' five-yearly Census of Population and Housing. The Census collects a wide range of information on the characteristics of all Australians, from remote outback cattle stations to high-rise student apartments in the inner cities. It is a snapshot of Australians at a point in time, and once collected, processed and released, data from the Census is used by all levels of government, business, academia and social services for research, planning and infrastructure development and provides a clear idea of who we are and how our society is evolving.

For Victoria, the Census results highlighted a region of Australia which is multiculturally diverse; growing older; owning or purchasing a home; and living in a separate house with a spouse and children, but increasingly moving to different types of family arrangements. However, because Melbourne is home to approximately three quarters of Victoria's population, statistics for Victoria as a whole tend to reflect the state's urban metropolis. This article seeks to highlight the diversity of characteristics across all of Victoria, particularly Victorians who make their homes outside the Melbourne metropolitan area.

Defining Regional Victoria

For the purposes of this article, Regional Victoria is defined as that part of the state outside the Melbourne Statistical Division¹. Where "Melbourne" is referred to in this article, the reference relates to the Melbourne Statistical Division (MSD).

Regional Victoria is a large area which can be defined in many different ways. For this report, the state has been divided into several sub-regions with similar characteristics. The segments of Regional Victoria selected for comparison are:

- Regional Urban Centres,
- Coastal Towns, and
- Rural Victoria.

Regional Urban Centres are urban centres in Regional Victoria with a population of 20,000 or more. They comprise Ballarat, Bendigo, Geelong², Mildura, Shepparton - Mooroopna, Traralgon and Wodonga (Victorian part of Albury-Wodonga only).

Together, the population of Regional Urban Centres accounts for about one third of all Regional Victoria.

¹ See page 9 for a map depicting the regions referred to in the article.

² Although Geelong is located on the coast, it has been included in Regional Urban Centres due to its size.

Defining Regional Victoria continued

Coastal Towns are urban centres with a population of 1,000 or more, located on the coast. They comprise Airey's Inlet - Fairhaven, Anglesea, Apollo Bay - Marengo, Cowes, Inverloch, Lakes Entrance, Newhaven, Ocean Grove- Barwon Heads, Paynesville, Port Fairy, Portarlington, Portland, Queenscliff, San Remo, St Leonards, Torquay and Warrnambool³.

In sum, Coastal Towns represent about 7% of the population of Regional Victoria.

Rural Victoria comprises the remainder of the state; the area not included in Regional Urban Centres or Coastal Towns.

Features of Regional Victoria

Data from the 2006 Census highlighted the diversity of the different regions outside Melbourne. For example, Regional Urban Centres were more likely to have a younger, unmarried population, with a higher proportion of females, while residents of Coastal Towns were more likely to be older, living in a couple family without children, and paying higher monthly mortgage repayments or rent on their dwelling than residents of other sectors of Regional Victoria.

The Census includes data on a range of subjects, categorised as Dwelling and Household Characteristics, Family Characteristics, and Person Characteristics. This article presents data on all these categories, for the selected segments of Regional Victoria, and includes comparisons to Victoria and Melbourne.

Dwelling and Household Characteristics

DWELLING STRUCTURE

'Dwelling Structure' refers to the type of dwelling in which people live, and includes: separate house; flat, unit or apartment; semi-detached, row or terrace house, or townhouse; and caravan, cabin or houseboat. The category "flat, unit or apartment" includes dwellings built as blocks, which do not have their own private grounds, and usually share a common entrance foyer or stairwell. Semi-detached, row or terrace houses and townhouses have their own private grounds and no other dwelling above or below them.

The most common type of dwelling structure in Victoria was the separate house (76% of all occupied private dwellings), while flats, units or apartments comprised 13% of dwellings, and 9% of dwellings were semi-detached, row or terrace houses, or townhouses. In Melbourne, there was a higher proportion of households in a flat, unit or apartment (16%), or in a semi-detached, row or terrace house or townhouse (11%), compared to the rest of Victoria.

Dwellings in Regional Victoria were also predominantly separate houses (88%). However, some variation existed in the relative proportions of dwelling structures between Regional Urban Centres, Coastal Towns and Rural Victoria. The percentage of households in a flat, unit, or apartment was higher in Regional Urban Centres when compared to other parts of Regional Victoria (10% compared to 7% in Coastal Towns and 4% in Rural Victoria). The proportion of dwellings that were semi-detached, row or terrace houses or townhouses was 6% in both Regional Urban Centres and Coastal Towns. Rural Victoria had the highest proportion of households in a separate

³ Warrnambool is included as a coastal urban centre due to the similar characteristics with other coastal urban Centres.

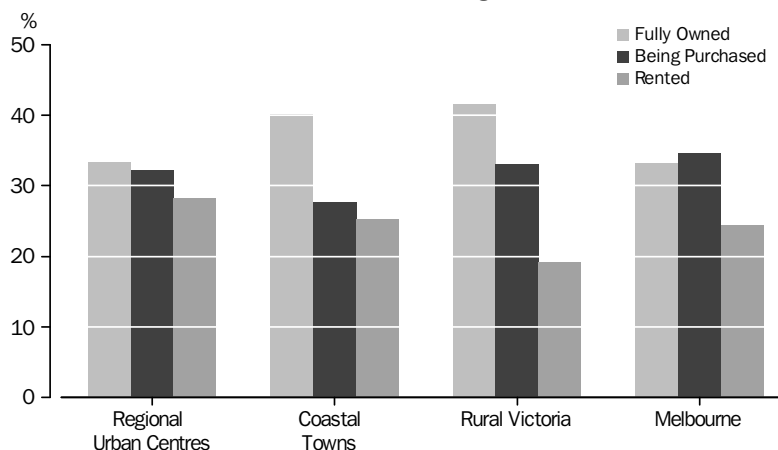

*Dwelling and Household**Characteristics continued***DWELLING STRUCTURE** *continued*

house(92%), with 4% in a flat, unit or apartment, and 2% in a semi-detached, row or terrace house or townhouse.

Separate houses have continued to be the predominant form of dwelling in all areas, however changes in housing characteristics have emerged. Since the 2001 Census, the proportion of higher density dwellings (flats, townhouses etc.) has increased. In Coastal Towns, the number of semi-detached dwellings was 33% higher than five years earlier. In Regional Urban Centres, 28% of the increase in dwellings was attributed to the combined categories of (a) flats, units or apartments and (b) semi-detached houses, row or terrace houses or townhouses.

DWELLING TENURE STATUS

The predominant forms of tenure for occupied private dwellings were: full ownership; being purchased; or being rented. Other forms of tenure accounted for less than 1% across Victoria. The proportion of households where tenure type was not stated on Census forms was relatively high, at around 7% of households.

TENURE TYPE, DWELLINGS, Percentage distribution—2006

For Victoria overall, just over a third of dwellings were fully owned, with a further third being purchased (together, 69% of dwellings were fully owned or being purchased), and 24% of dwellings were being rented. The proportions were similar for dwellings in Melbourne. For Regional Victoria, however, there was a slightly higher proportion of dwellings fully owned or being purchased (71%), with a corresponding lower proportion of dwellings being rented (22%).

Within Regional Victoria, households in Rural Victoria had the highest rates of full ownership of dwellings and dwellings being purchased compared to the other parts of Regional Victoria. Almost 75% of dwellings in Rural Victoria were partly or fully owned, while the rates of ownership in Regional Urban Centres and Coastal Towns were similar to the state average at 66% and 68% respectively.

In both Coastal Towns and Rural Victoria, 40% of dwellings were fully owned, compared to approximately one third of dwellings in Regional Urban Centres. Comparing results from the 2001 and 2006 Censuses, the proportion of dwellings in Regional Victoria that were fully owned decreased from 46% to 39% over this five year period.

*Dwelling and Household**Characteristics continued***MEDIAN HOUSING COSTS**

The 2006 Census provides information on the cost of housing for those residents of private dwellings who do not fully own their home. These housing costs are usually either payments of rent or repayments on a housing loan.

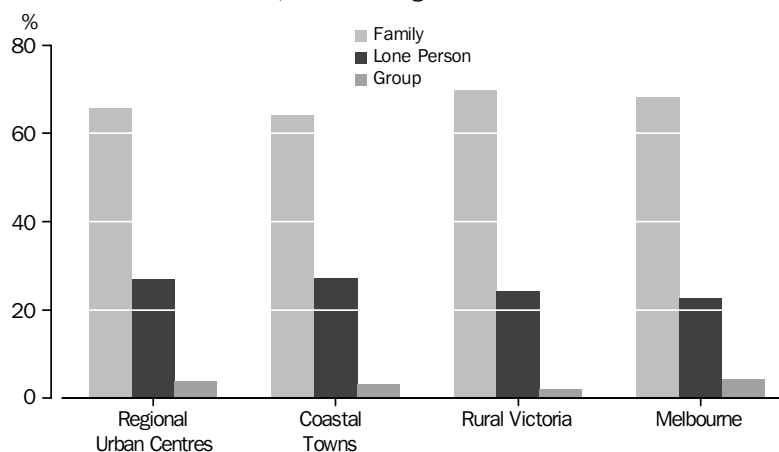

The median monthly housing loan repayment for Victorians was \$1,252, varying from \$1,300 in Melbourne to \$1,000 in Regional Victoria. The level of home ownership in Rural Victoria was high, with a comparatively low median monthly loan repayment of \$975. Home buyers in both Regional Urban Centres and Coastal Towns paid a median monthly housing loan repayment of \$1,083.

Median rental housing costs showed a similar pattern of variation across Victoria. For Victoria overall, the median weekly cost of renting a dwelling was \$185. The highest cost of renting a dwelling was in Melbourne at a median weekly cost of \$200, while the median weekly rent in Regional Victoria was well below the state median at \$145. Rental housing costs in Coastal Towns were highest within Regional Victoria at \$165, slightly higher than the median in Regional Urban Centres (\$160). Although dwellings in Rural Victoria were less likely to be rented, the median weekly rent here was the lowest in Regional Victoria (\$130).

TYPES OF HOUSEHOLDS

A household is defined as one or more persons, at least one of whom is a minimum of 15 years of age, residing in the same private dwelling. Census results show that for the state of Victoria, 68% of all households were family households, 23% were lone person households, and 4% were group households.

TYPE OF HOUSEHOLD, Percentage distribution—2006

The average household size for Victoria was 2.6 persons. Data for households in Melbourne showed a similar distribution of household type to Victoria, and a corresponding average household size of 2.6 persons. Regional Victoria had a slightly higher percentage of lone person households at 25%, which may have contributed to a lower average household size of 2.5 persons.

*Dwelling and Household**Characteristics continued*TYPES OF HOUSEHOLDS *continued*

Within Regional Victoria, Coastal Towns had the lowest percentage of family households (64%) and the highest percentage of lone person households (27%); Rural Victoria had the highest percentage of family households (70%) and the lowest percentage of lone person households (24%).

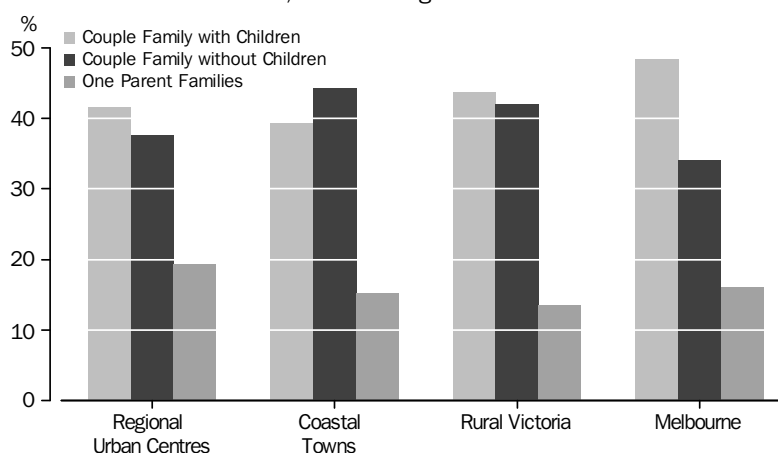

In terms of average household size, Rural Victoria was consistent with Regional Victoria at 2.5 persons, while Regional Urban Centres and Coastal Towns both averaged 2.4 persons per household.

Family Characteristics

FAMILY COMPOSITION

Almost all households that comprise families (rather than lone person households or group households) were classified as Couple Families with Children, Couple Families without Children, or One Parent Families with Children. Other types of family composition accounted for little more than 1% of families throughout most of Victoria, except in Melbourne where other family types constituted 2% of all families. 'Other family' is defined as a group of related individuals residing in the same household, who cannot be categorised as belonging to a couple or one parent family: for example, a household where two brothers live together.

FAMILY COMPOSITION, Percentage Distribution—2006

Census results showed that nearly half of all Victorian families were couple families with children (47%), while 36% were couple families without children and 15% one parent families. In Melbourne, there were similar proportions in family composition: 48% were couple families with children, 34% couple families without children, and the same ratio of one parent families (15%).

In Regional Victoria, the proportions of couple families with children and couple families without children were 43% and 41% respectively. The proportion of one parent families in Regional Victoria was consistent with Victoria overall at 15%.

When examining family structures within Regional Victoria, families in Rural Victoria had the highest proportion of couple families with children (44%), while couple families without children made up 42%. The Coastal Towns of Victoria represented the lowest percentage of couple families with children (39%), and highest percentage of couple families without children (44%) when compared to other parts of Regional Victoria.

Family Characteristics *continued*

FAMILY COMPOSITION *continued*

Family households in Regional Urban Centres had a relatively low proportion of couple families without children (38%) when compared with other parts of Regional Victoria. Regional Urban Centres were also characterized by a higher percentage of one parent families (19%), compared to Coastal Towns and Rural Victoria (15% and 14% respectively).

When compared to the 2001 Census, the proportion of couple families with children in Regional Victoria was slightly lower in 2006, at 43% compared to 45% in 2001. Over this period, the percentage of couple families without children in Regional Victoria increased slightly from 39% to 41%.

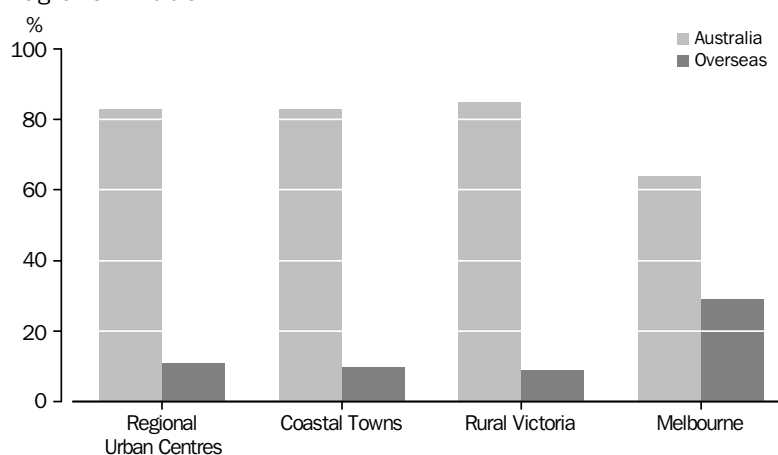

Person Characteristics

The Census includes a broad range of questions designed to measure the characteristics of individuals. In addition to basic characteristics such as age, sex and place of residence, data are available on such subjects as industry of work, qualifications, income, birthplace, migration and relationships. Presented here are several selected characteristics which provide an insight to Victorians, particularly those living outside Melbourne.

COUNTRY OF BIRTH

While the majority of Victorians in 2006 were born in Victoria, close to a quarter of the population stated their birthplace as overseas. The variety of birthplaces of Victorians is increasingly diverse, from the predominant traditional sources of migrants such as the United Kingdom, New Zealand and Europe, to places further afield like Sudan, Iran, Mauritius and Somalia.

COUNTRY OF BIRTH, Australia and Overseas—Victorian Regions—2006

The proportion of people born overseas was consistent throughout areas in Regional Victoria, at around 10%, with around 85% of people reporting they were born in Australia⁴. This is consistent with 2001 proportions. This contrasts to Melbourne, where almost 30% of people reported they were not born in Australia. Birthplaces other than Australia were consistent across the segments of Regional Victoria. The countries of the United Kingdom and New Zealand were the most predominant, with the UK representing 5% of birthplaces of people in Coastal Towns, and 3% and 4% for people in

⁴ The remaining 5% did not state their country of origin on the Census form.

Person Characteristics
continued

COUNTRY OF BIRTH *continued*

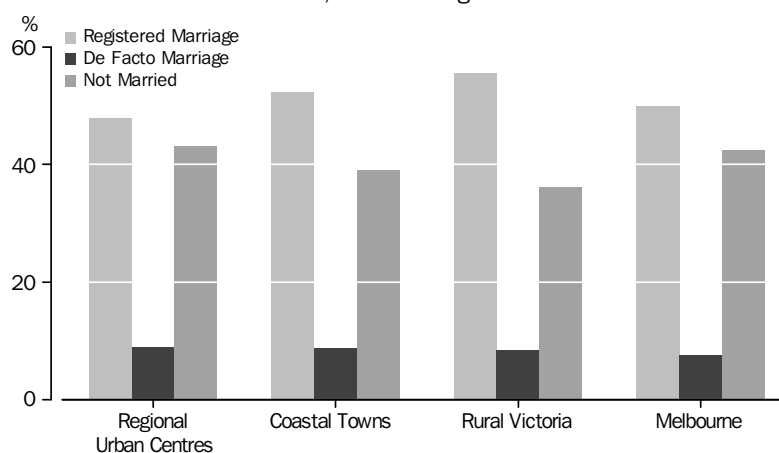

Regional Urban Centres and Rural Victoria respectively. The next most predominant birthplace for Coastal Towns and Rural Victoria was New Zealand (around 1% in each region), however for Regional Urban Centres the second-most predominant place of birth outside Australia was Italy (also around 1%). Other places of birth each represented less than 1% of the Regional Victorian population.

MARITAL STATUS

In Victoria, 51% of all persons aged 15 years or more were in a registered marriage, 8% were in a de facto marriage and 41% were not married. In Melbourne, there were similar proportions of married persons (50% in a registered marriage and 8% in a de facto marriage). Regional Victoria was characterized by a higher percentage of married persons, with 53% in a registered marriage, 9% in a de facto marriage and 38% not married.

The population of Coastal Towns had similar proportions of married and not married persons as Regional Victoria, with 52% in a registered marriage, 9% in a de facto marriage and 39% not married. Of all regions, Rural Victoria had the highest proportion of married people with 55% of persons (aged 15 years or more) in a registered marriage, 8% in a de facto marriage and 36% not married. On the other hand, Regional Urban Centres were characterized by a lower percentage of the population married: 48% in a registered marriage, 9% in a de facto marriage and 43% not married.

SOCIAL MARITAL STATUS, Percentage Distribution—2006

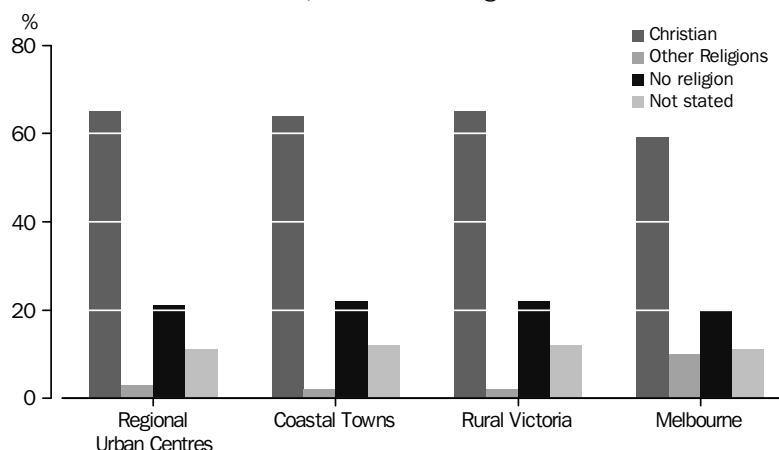

RELIGIOUS AFFILIATION

In 2006 approximately 70% of Victorians stated some religious affiliation, compared to almost 73% in 2001. There were similar proportions of people with a religious affiliation across the regions of Victoria, with approximately 69% in Melbourne compared to 68% in Regional Urban Centres, 65% in Coastal Towns and 67% in Rural Victoria. In Melbourne however, Christian denominations accounted for a lower proportion of the population, around 60% compared to around 65% in other parts of Victoria.

Person Characteristics
continued

RELIGIOUS AFFILIATION *continued*

RELIGIOUS AFFILIATION, Victorian Regions—2006

Outside Melbourne, religions other than the Christian denominations accounted for very small proportions of the population. In Regional Urban Centres the leading other religions were Islam and Buddhism, accounting for just over 1% and just over 0.5% respectively. It is important to note that across all areas, the proportion of persons who did not state a religious affiliation (Not Stated) was very high - higher than proportions of persons who reported 'Other Religions' - at around 10%.

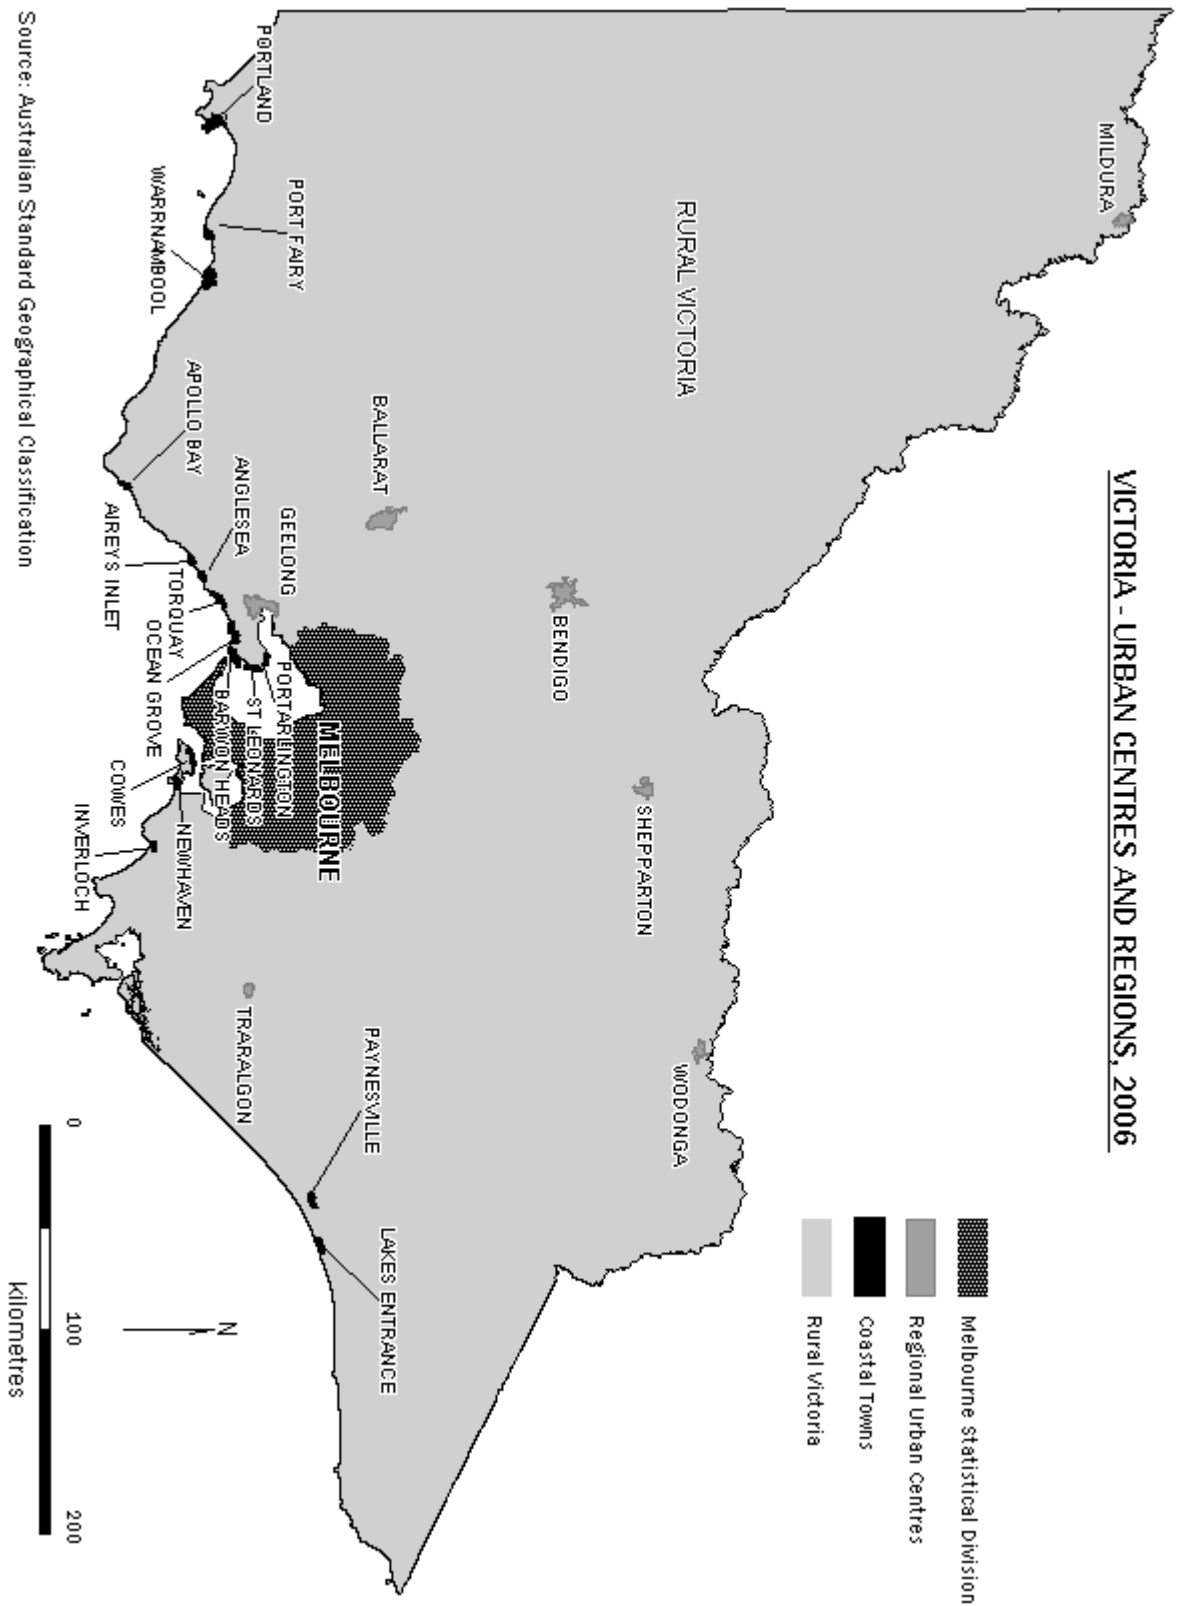

INDUSTRY OF EMPLOYMENT

In Victoria the most prevalent industry for persons aged 15 years and over was Retail Trade, which comprised 15% of working Victorians. Other major industries were Manufacturing (13%), Property and Business Services and Health and Community Services (both 11%). Across the regions of Victoria, however, there was some variability in the major employing industries.

Regional Urban Centres displayed a similar industry profile to Victoria and Melbourne, with high proportions of the working population stating Retail Trade and Manufacturing as their industries of employment (18% and 14% respectively). By contrast, in Rural Victoria Retail Trade and Agriculture, Forestry and Fishing were referenced as the major employing industries (14% in both cases), while in Coastal Towns Retail Trade and Health and Community Services were prevalent (17% and 13% respectively).

Further Information

ABS 2006 Census data are readily available from the Australian Bureau of Statistics web site <<http://www.abs.gov.au>>. Census products include Community Profile Tables, Fact Sheets, and maps. The second major release of free on-line 2006 Census results has been released on 25 October, 2007. This release includes the educational qualifications of Australia's population and characteristics of employed people, such as their occupation by industry, number of hours worked, and how people travel to work.

— nil or rounded to zero (including null cells)

(a) Percentage change figures for components of population increase indicate the contribution of each component to the total population increase.

(b) Percentage change columns indicate the difference between the percentage rate for the reference period, and the percentage rate for the same period in the previous year.

(c) Data relates to capital cities.

CHAPTER 3

POPULATION

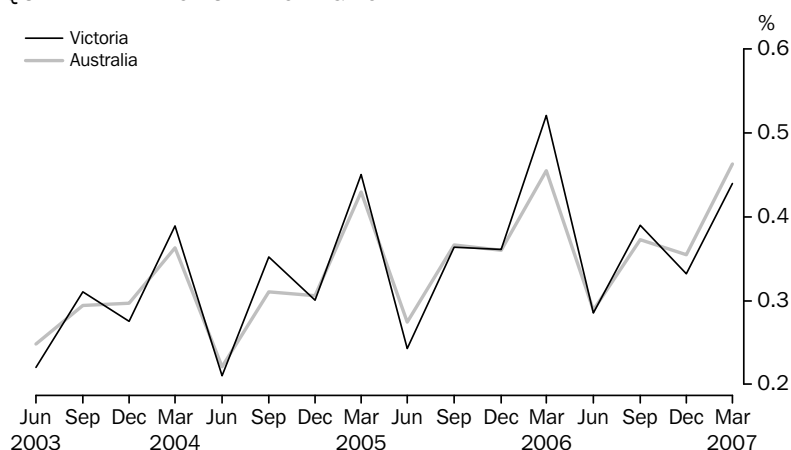

ESTIMATED RESIDENT POPULATION

Victoria's estimated resident population (ERP) at the end of any given period is the estimated population at the beginning of the period plus the sum of three components: natural increase, net overseas migration and net interstate migration.

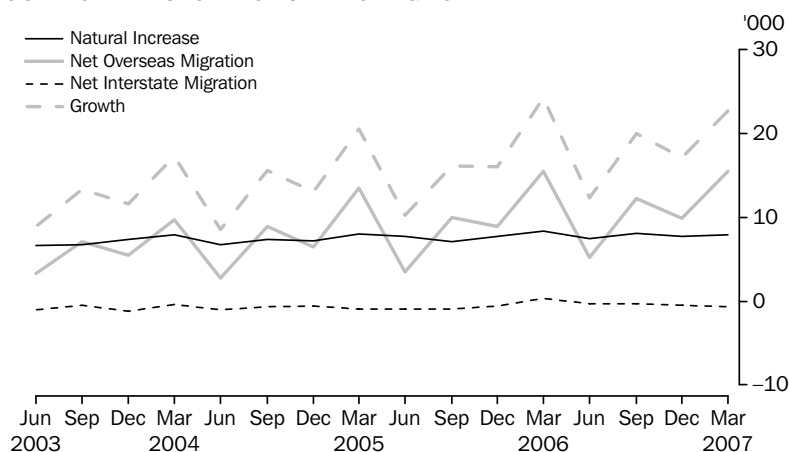

In March quarter 2007, Victoria's ERP grew by 22,700 persons or 0.44%. Australia's ERP grew by 0.46% (96,500 persons) over the same period.

Net overseas migration contributed most to Victoria's population growth in the March quarter 2007 (15,500 persons), while natural increase was 7,900 persons. Net interstate migration was a loss of 700 people. With the exception of March quarter 2006, Victoria has experienced a net loss in population to other Australian states in fifteen of the last sixteen quarters.

(a) ERP, natural increase, net overseas and net interstate migration data up to June quarter 2001 are final. All ERP data from September quarter 2001 to March quarter 2006 are revised, based on 2006 Census. June quarter 2006 and March quarter 2007 are preliminary based on 2006 Census.

(b) A revised methodology for calculating migration adjustments has been applied from the September quarter 2001 to June quarter 2006 and an improved method of net overseas migration has been applied from September quarter 2006 onwards.

CHAPTER 4

CRIME

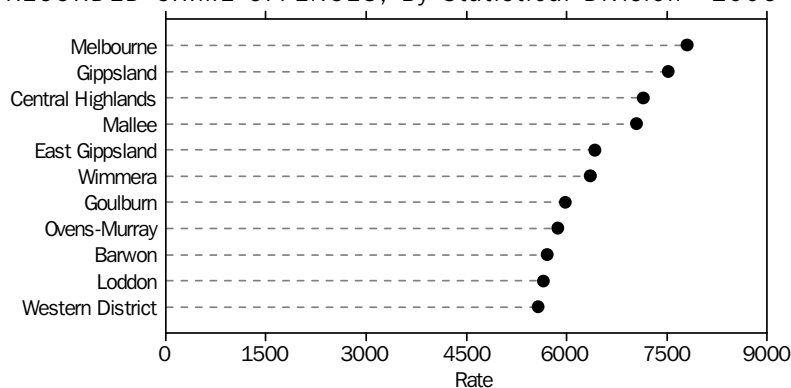

RECORDED CRIME OFFENCES

The data for this chapter is sourced directly from Victorian Police figures. The counts provided in the tables below relate to recorded offences, not offenders. Therefore, multiple offences committed by the same perpetrator are counted as separate incidents. Also, offences are recorded against the LGA in which they were committed rather than the offenders' usual place of residence. Figures must be used with caution as not all offences might be reported to the police.

Victoria recorded 376,200 crime offences during the 2006-07 financial year, an increase of 3,176 (0.9%) from the previous financial year. The majority (74.7%) of offences recorded in 2006-07 occurred against property.

Statistical Division level rates were calculated using estimated resident population as at 30 June 2006. These rates show that Melbourne Statistical Division recorded the highest crime rate of 7,807 per 100,000 population followed by Gippsland (7,523) and Central Highlands (7,148). The lowest rate was recorded in Western District (5,589) followed by Loddon (5,648) and Barwon (5,706).

RECORDED CRIME OFFENCES, By Statistical Division—2006-07

(a) Rates were calculated per 100,000 population using estimated resident population as at 30 June 2006 (Catalogue no. 3218.0).

The majority (76.5%) of offences in 2006-07 occurred in Melbourne Statistical Division (MSD). Within MSD, the highest rate of 45,725 offences per 100,000 population was recorded in Melbourne LGA followed by Yarra (18,188) and Port Phillip (13,438). Nillumbik LGA recorded the lowest rate of 2,755 followed by Manningham (3,138) and Yarra Ranges (4,335).

In Balance of Victoria (BoV), Latrobe LGA recorded the highest rate of offences (10,866) followed by Swan Hill (8,621) and Ballarat (8,515). The lowest rate of offences was recorded in Golden Plains (1,617) followed by West Wimmera (1,937) and Indigo (2,822).

STATE FINAL DEMAND

State final demand measures the total value of goods and services that are sold in a state to buyers who wish to either consume them or retain them in the form of capital assets. It excludes sales made to buyers who use them as inputs to a production activity, export sales and sales that lead to accumulation of inventories.

Measures of state final demand make no distinction between demand that is met by goods and services produced within the state in question, by supplies sourced from another state, or from overseas. State final demand is therefore not a measure of the value of production activity occurring within a state.

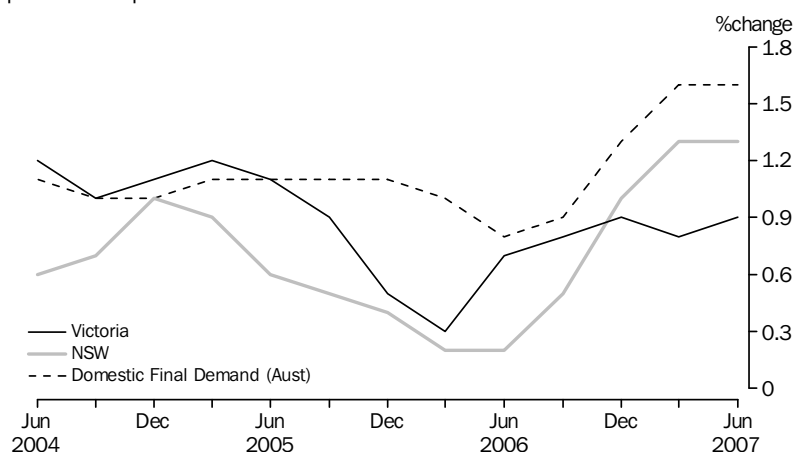

Note: As of 20 November 2006, the Telstra Corporation was effectively privatised. For the purpose of ABS statistics this change from public to private sector is effective from March quarter 2007. The classification of Telstra has changed from public sector to non-financial corporation from the March quarter 2007. There is a trend break from March quarter 2007 in a number of series related to the privatisation of Telstra. As a result no trend estimates are published for these series. For more information please see *Information Paper: Treatment of Telstra in ABS statistics* (cat. no. 8102.0) released 26 February 2007.

For the June quarter 2007, the trend estimate for Victorian final demand, in volume terms, was \$60,727m, an increase of 0.9% on the March quarter 2007. This was below the trend growth level for New South Wales (1.3%) and Australian trend estimate (domestic final demand), which increased by 1.6% over the same period.

STATE FINAL DEMAND

continued

Household final consumption expenditure is the single largest component of state final demand. In June quarter 2007, this component accounted for 58.4% of the trend volume estimate of state final demand and recorded an increase of 1.0% on the March quarter 2007. The other main contributors were private gross fixed capital formation (22.6% of trend state final demand) and government final consumption expenditure (16.3%).

CHAPTER 6

WORK AND INCOME

CIVILIAN LABOUR FORCE BY REGION

As at May 2007, an improved method of estimation for the Labour Force Survey (LFS) was introduced. The new method, known as composite estimation, produces lower standard errors than the previous estimation method. As part of introducing composite estimation, the ABS has revised all labour force statistics back to April 2001, based on the new estimation method. More information on the statistical impacts of this new estimation method is available in *Information Paper: Forthcoming Changes to Labour Force Statistics* (cat. no. 6292.0) released on 21 May 2007.

Between September quarter 2006 and September 2007, the Victorian labour force grew by 54,800 people (2.0%). During this period, the number of employed persons rose by 61,900 (2.4%) and the number of unemployed persons fell by 7,200 (–5.8%). The unemployment rate decreased from 4.6% to 4.3%.

Between September 2006 and September 2007, the labour force grew by 48,400 persons (2.5%) in the Melbourne Major Statistical Region (MSR) and by 6,300 persons (0.9%) in the Balance of Victoria MSR. The proportion of employed persons who worked full-time increased from 71.7% to 71.9% in the Melbourne MSR, but decreased in the Balance of Victoria MSR (69.6% to 68.3%).

The number of unemployed people decreased by 2,400 (–2.8%) in the Melbourne MSR and fell by 4,900 (–12.4%) in Balance of Victoria MSR. The unemployment rate decreased from 4.3% to 4.1% in the Melbourne MSR and from 5.5% to 4.8% in the Balance of Victoria MSR. The labour force participation rate rose in the Melbourne MSR (65.3% to 65.7%), but fell from 63.9% to 63.3% in the Balance of Victoria MSR.

Within the Balance of Victoria, the Central Highlands-Wimmera statistical region displayed the largest increase in employment (6,300 persons) followed by the All Gippsland statistical region (5,800 persons) and the Goulburn-Ovens-Murray statistical region (3,200 persons). Falls in employment were experienced in the Loddon-Mallee and Barwon-Western District statistical regions (3,500 and 700 persons respectively). All statistical regions experienced a fall in their unemployment rate over the period, except for the All Gippsland and Loddon-Mallee statistical regions.

EMPLOYED PERSONS BY
INDUSTRY

In August quarter 2007, the largest proportion of persons employed in the Melbourne MSR were in Property and Business services (14.7%), Retail Trade (14.5%) and Manufacturing (13.5%).

In the Balance of Victoria, the biggest employers were Retail Trade (15.4%), Health and Community Services (11.4%), and Manufacturing (10.7%).

EMPLOYED PERSONS, By Industry, Melbourne MSR and Balance of Victoria: **August quarter—2007**

In Victoria, the Mining and Construction industries had the highest proportion of total males employed (90.5% and 86.5% respectively), whilst the highest proportion of total females employed were in Health and community services and Education (82.6% and 66.8% respectively).

In terms of full-time employment, manufacturing accounted for the highest proportion of males employed in Victoria (18.5%) and Health and community services accounted for the highest proportion of full-time females employed (17.4%). In terms of part-time employment, Retail trade accounted for the largest proportion of both males and females employed (25.4% and 23.3% respectively).

EMPLOYED PERSONS BY
OCCUPATION

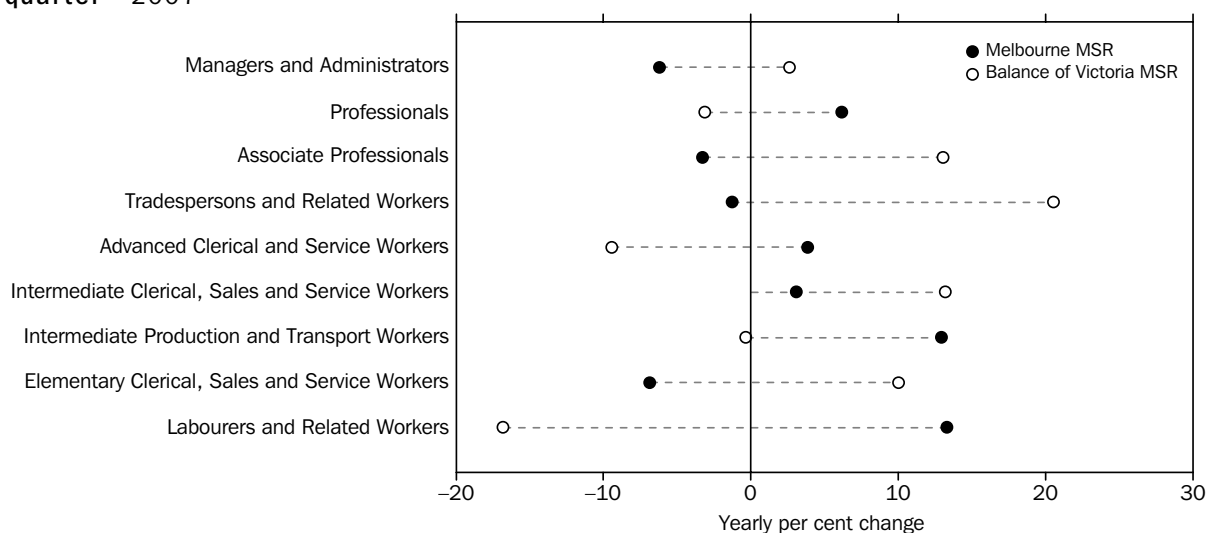

In August quarter 2007, there were approximately 1,821,100 persons employed full-time in Victoria. The Melbourne Major Statistical Region (MSR) accounted for 1,348,800 (74.1%) of total full-time employed persons and the Balance of Victoria MSR, 472,200 persons (25.9%).

In the Melbourne MSR over half of full-time and part-time workers were employed in three occupational categories: Professionals (23.1%), Intermediate clerical sales and service workers (16.5%) and Tradespersons (12.2%). In the Balance of Victoria, Tradespersons were the predominant group of workers (15.7%) followed closely by Professionals (15.6%) and Intermediate clerical, sales and service workers (14.4%).

Dissecting occupation by gender reveals that in the Melbourne MSR the three most predominant occupations for female employees were Professionals, Intermediate clerical sales and service and Associate professionals (26.6%, 24.8% and 12.6% respectively). For male employees, the three most predominant occupations within the same geographically defined area were Professionals, Advanced clerical and service workers and Tradespersons (20.2%, 19.3% and 12.5% respectively). In comparison, the proportion of female employees working as Professionals in Balance of Victoria was slightly lower (20.6%) and significantly lower for male employees (11.7%). The predominant occupation for females in Balance of Victoria was Intermediate clerical, sales and service (25.3%) while male employees tended to work as Tradespersons (24.4%), Intermediate production and transport workers (14.9%) and Managers and administrators (14.0%).

EMPLOYED PERSONS BY
OCCUPATION *continued*

Full-time workers in the Melbourne MSR worked mainly as Professionals (24.5%), Intermediate clerical, sales and service workers and Advanced clerical and service workers (14.2% for both categories). In the Balance of Victoria the three most predominant occupational groups working on a full-time basis were Tradespersons (20.0%), Professionals (16.2%) and Managers and administrators (13.5%). In terms of part-time workers, in the Melbourne MSR three occupational groups comprised 61.8% of the total: Intermediate clerical, sales and service (22.1%), Associate professionals (20.1%) and Professionals (19.6%). Part-time workers in Balance of Victoria were characterised by fewer Professionals (14.5%) and tended to predominantly concentrate in the following occupations: Intermediate clerical, sales and service (21.0%) and Elementary clerical, sales and service (20.1%).

PART-TIME WORKERS

In August quarter 2007, there were 540,100 part-time workers in the Melbourne MSR. From August quarter 2006 to August quarter 2007 total part-time workers decreased by 5,000 persons (–0.9%) in the Melbourne MSR. Females accounted for the majority of part-time workers (69.8%) in the Melbourne MSR. Most part-time workers (78.2%) preferred not to work more hours, and this was more common amongst females than males.

In the Balance of Victoria, the total number of part-time workers in August quarter 2007 was 222,500, an increase of 15,500 persons (7.5%) since August quarter 2006. The majority of these part-time workers (71.1%) preferred not to work more hours. Again this response was more prevalent amongst females than males.

(a) The LGA data which appears here is aggregated from SLA data provided by the Department of Employment and Workplace Relations (DEWR).

(b) For methodology see Explanatory notes in DEWR publication Small Area Labour Markets, available from the DEWR website.

(c) Local Government Area is based on ASGC 2001.

(d) The majority of the Yarra Ranges (S) LGA is in the Melbourne statistical division. However, the Yarra Ranges (S) — Pt. B SLA is in the Gippsland statistical division. The estimates for the entire Yarra Ranges LGA have been reported as part of Melbourne. Therefore, summing LGA estimates within Melbourne will slightly over-report the true estimate for Melbourne SD, and summing LGA estimates within Gippsland or Balance of Victoria will slightly under-report the true estimate for the corresponding ASGC regions.

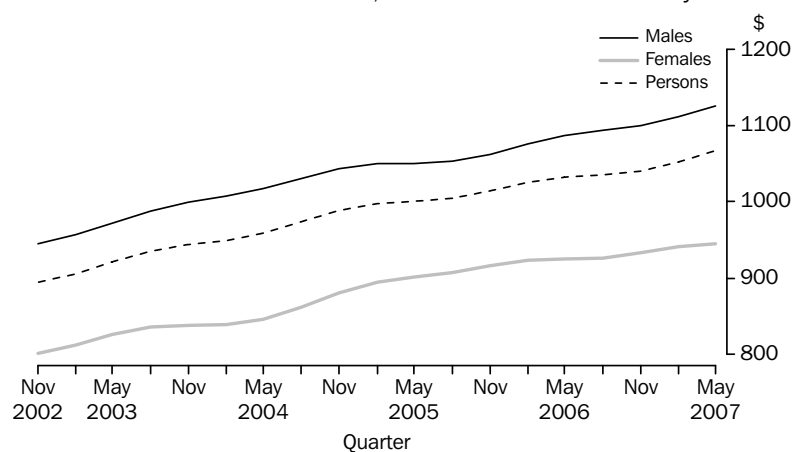

(e) Due to the small size of the labour force, particular care should be exercised when interpreting these estimates.

(a) Movements in average weekly earnings can be affected by both changes in the level of earnings per employee and changes in the composition of the labour force. For example, changes in the proportions of full-time, part-time, casual and junior employees and variations in the distribution of occupations can affect movements in earnings series. For more information, see paragraphs 17 and 18 of the Explanatory Notes in the source publication.

CONSUMER PRICE INDEX

Between June quarter 2007 and September quarter 2007, the all-groups CPI for Melbourne rose by 0.8%. The groups which recorded the largest increases were Financial and insurance services (2.6%), Food (2.3%) and Recreation (2.0%). The groups which recorded largest decreases were Household contents and services (−1.9%), Education (−0.9%) and Clothing and footwear (−0.8%).

Between September quarter 2006 and September quarter 2007, the all-groups CPI for Melbourne rose by 2.1%. The CPI all-groups weighted average for the eight capital cities rose by 1.9% over the same period. The biggest yearly increases for Melbourne occurred in Health (4.7%), Alcohol and tobacco (3.8%) and Financial institution and insurance services (3.6%). The groups which recorded decreases for the year were Household contents and services (−1.4%) and Transportation (−1.0%).

HOUSE PRICE INDEXES

The price index for established houses covers transactions in detached residential dwellings on their own block of land regardless of age (i.e. including new houses sold as a house/land package as well as second-hand houses). Price changes therefore relate to changes in the total price of dwelling and land.

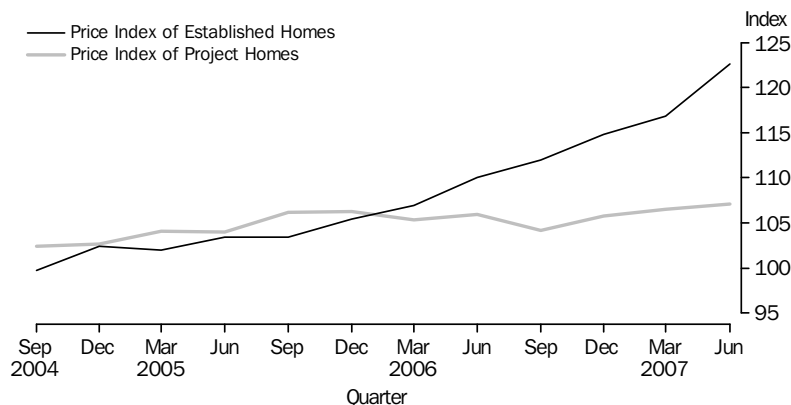

Project homes are dwellings available for construction on an existing block of land. Price changes relate only to the cost of constructing the dwelling (excluding land).

September quarter 2005 saw the introduction of a new methodology for compiling the established house price index. A detailed discussion of the new methodology is provided in *Information Paper: Renovating the Established House Price Index* (cat. no. 6417.0) released on 30 November 2005. The new established house price index commenced from March quarter 2002 and has a reference base of 2003-04 = 100.0. A new weighting pattern for the project home price index was introduced in September quarter 2005 (see Explanatory Notes to cat. no. 6416.0).

The price of project homes in Melbourne rose by 0.6% during the June quarter 2007. Preliminary estimates show the price of established homes have risen by 5.0% in Melbourne over the same period. This was the highest quarterly price increase since June quarter 2003. These followed a rise of 0.7% in project homes and a rise of 1.7% in established homes in the previous quarter. The weighted average of the eight capital cities showed a rise of 3.2% in established house prices and 1.1% in project house prices in June quarter 2007.

From the June quarter 2006 to June quarter 2007, established home prices in Melbourne rose by 11.5% while project home prices rose by 1.1%.

BUILDING APPROVALS

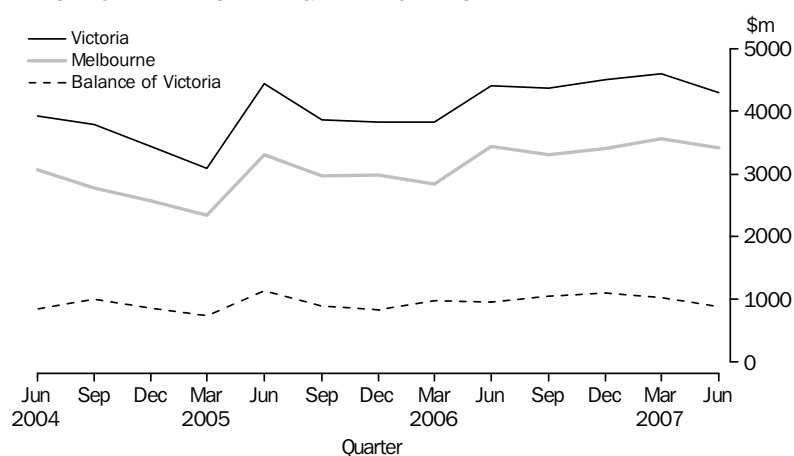

In June quarter 2007, the total number of new dwelling units approved in Victoria was 9,754. This was 1,112 more than in the March quarter 2007, or an increase of 12.9%. Over the same period, the number of new dwelling units approved in Melbourne MSR increased by 13.6%, while in the Balance of Victoria MSR the increase was 11.0%. The three LGAs with the highest number of new dwelling units approved in the June 2007 quarter were Wyndham (678), Casey (601) and Melbourne (521). From June quarter 2006 to June quarter 2007 the biggest increase in new dwelling unit approvals was in Melbourne (339), Moreland (140) and Kingston (89) and the largest decrease was in Maribyrnong (-133), Boroondara (-127) and Greater Geelong (-97).

DWELLING UNIT APPROVALS

The value of new building approvals for Victoria was \$293.4 million lower in June quarter 2007 than in the previous quarter.

**ENGINEERING
CONSTRUCTION ACTIVITY**

The total value of engineering work done during June quarter 2007 was \$1,943.8m, an increase of 12.7% from March quarter 2007. The overall increase in June quarter 2007 was mainly due to increases in the value of work done for Telecommunications (\$111.1m), Heavy industry (\$65.7m) and Electricity generation, transmission etc. and pipelines (\$37.7m).

In contrast, the value of work done on Roads, highways and subdivisions decreased by \$14.8m.

TOURIST
ACCOMMODATION

In June quarter 2007, total takings from tourist accommodation in Victoria were \$301.1m, an increase of 6.9% over June quarter 2006. The Melbourne Tourism Region accounted for the majority of Victoria's accommodation takings (79.0%).

The highest growth in accommodation takings between June quarter 2007 and June quarter 2006 occurred in the Tourism Regions of Melbourne East (20.5%), Gippsland (18.6%) and Upper Yarra (16.0%). Over the same period, the largest declines in accommodation takings occurred in Phillip Island (–15.9%), followed by Western Grampians (–10.5%) and High Country (–8.2%).

CHAPTER 10

ENVIRONMENT

AIR QUALITY

The Air Quality Index compiled by the Victorian Environment Protection Authority measures the concentration of various pollutants relative to the levels at which they may cause harm. The index is available for four areas in the Port Phillip Region (East, West, City and Geelong) and the Latrobe Valley.

The Visibility Pollutant Index is an indicator of visibility reduction. Visibility incidents are generally higher during cooler months of Autumn and Winter (from May to September), whereas ozone values are generally higher during warmer months of Spring and Summer (from November to February).

r revised

- (a) The Environment Protection Authority (EPA) reports air quality as an index for any given pollutant as its concentration expressed as a percentage of the relevant standard. It enables easy interpretation of whether the pollutant is at a level which may cause harm. An index value of 100 means the pollutant is currently at a concentration equal to the National Environment Protection Measure (Air NEPM) or State Environment Protection Policy (The Air Environment) (SEPP) standard levels (levels designed to protect human health and the environment). Indexes are calculated separately for each measured pollutant: Ozone, Nitrogen Dioxide, Sulfur Dioxide, Carbon Monoxide, Fine Particulates (PM10), Visibility (Airborne Particle Index). For each station, the daily pollutant indexes are the maximum index values for that day. Note that not all pollutants are measured at each station. The EPA also calculates an overall Air Quality Index, which amalgamates each pollutant index into an overall measure of air quality at each station.
- (b) Data have been provided for the Ozone and Visibility (or Airborne Particle) Indexes as these are the dominant pollutants and are widely measured across the EPA network. It should also be noted that meteorological conditions are a major determinant on the incidence of elevated pollutant levels. Hence significant daily, seasonal and annual variations can be expected in air quality. For more information on Air Quality, see the EPA web site, <<http://www.epa.vic.gov.au>>.
- (c) The index is converted into a qualitative scale with five commonly understood terms. Very Good (0–33), Good (34–66) and Fair (67–99) represent measurements within the standards, while Poor (100–149) and Very Poor (150+) represent measurements exceeding the standards.
- (d) For reporting purposes the Port Phillip Region (PPR) has been divided into 4 regions: East, West, City and Geelong. Air monitoring stations assigned to each region are: East—Alphington, Brighton, Box Hill, Dandenong, Mooroolbark; City—RMIT, Richmond; West—Footscray, Melton, Point Cook, Paisley; Geelong—Point Henry, Geelong South. In addition, the Latrobe Valley has stations at Moe and Traralgon. The regional index is considered to be the maximum of the station indexes calculated within each particular region. The daily index reported for a region is the maximum region index recorded each day.

WATER RESOURCES

At the end of September 2007, Victoria's water storages were at 24.3% of capacity. This was 1.1% higher than the level in August 2007, and 7.0% lower than in September 2006.

Melbourne's water storage levels at the end of September 2007 were at 39.8% of capacity. This was 1.1% higher than in August 2007 and 6.1% lower than in September 2006. Rural water storages held 24.5% of their capacity at the end of September 2007, 0.8% higher than in August 2007, and 3.9% below levels in September 2006.

LIVESTOCK
SLAUGHTERING AND MEAT
PRODUCTION

Between July 2006 and July 2007, the trend estimate for total meat production for Victoria fell by 3.3% from 55,451 tonnes to 53,596 tonnes. The production of veal increased by 10.7% and lamb by 2.8%, while mutton, pig meat and beef decreased by 26.1%, 7.4% and 1.3% respectively over the period.

TOTAL MEAT PRODUCTION, Victoria: Trend

Trend estimates for calf slaughtering increased by 8.7% and lamb by 3.2%, while sheep, pig and cattle slaughtering decreased by 29.8%, 4.9% and 0.2% respectively between July 2006 and July 2007.

r revised

(a) Dairy Australia has changed its milk production collection to more accurately reflect where milk is produced on farm rather than where it is received. As a result, historical data has been revised from September quarter 2005.

(b) Original series.

(c) Includes processed cheese.

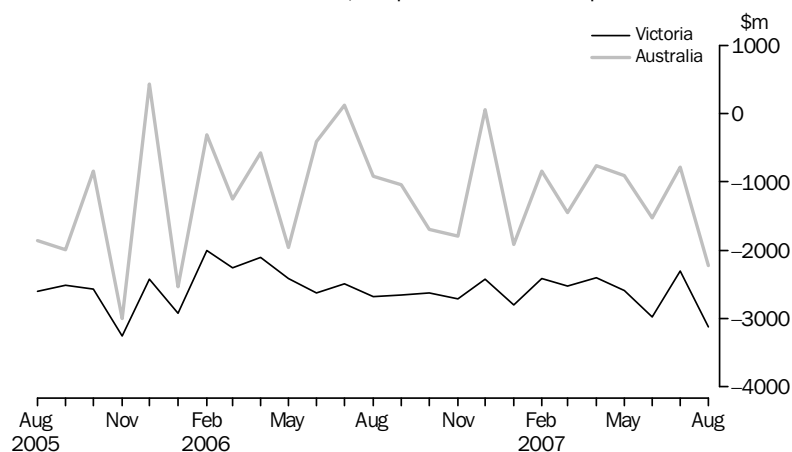

(d) Data from September quarter 2001 onwards are for Australia. For confidentiality reasons, state data are no longer available. The majority of whole milk powder production occurs in Victoria.

BALANCE OF TRADE

In August 2007, the value of Victoria's exports was \$1,711m. This was 4.3% lower than in August 2006. Over the same period, the value of imports rose by 8.3% and Victoria's overall net trade position declined by \$447m or 16.7%. On average, Victoria recorded a monthly trade deficit of \$2,627.8m in merchandise trade for the year ended in August 2007.

At the national level, exports (including re-exports) were 2.8% higher in August 2007 than in August 2006, whilst imports rose by 11.2%.

TRADE BY COMMODITY

For the year ended August 2007, Victoria's merchandise exports rose by \$748m (3.9%) in comparison to the year ended August 2006. The main items that contributed to this rise were increases in exports of Chemical and related products, n.e.c (\$412m), Manufactured goods classified chiefly by material (\$305m), Commodities and transactions merchandise trade n.e.c. (\$251m) and Machinery and transport equipment (\$149m). Falls in exports were recorded for Food and live animals (–\$303m), Beverages and tobacco (–\$111m) and Mineral fuels, lubricants and related materials (–\$55m).

Over the same period, the total value of Victoria's merchandise imports increased by \$2,042m (4.1%), with increases recorded in most of the import commodity categories. The largest increases were recorded in Miscellaneous manufactured articles (\$534m) and Manufactured goods classified chiefly by material (\$432m).

MAJOR TRADING PARTNERS

For the year ended August 2007, Victoria recorded its highest trade deficit with China (–\$6,629m) followed by USA (–\$5,066m) and Japan (–\$3,118m). For the same period, Victoria recorded its highest trading surplus with Saudi Arabia (\$948m) followed by Papua New Guinea (\$125m) and Hong Kong (\$120m).

GLOSSARY

Chain volume measures Annually-reweighted chain Laspeyres indexes referenced to the current price values in a chosen reference year (i.e. the year when the quarterly chain volume measures sum to the current price annual values). Chain Laspeyres volume measures are compiled by linking together (compounding) movements in volumes, calculated using the average prices of the previous financial year, and applying the compounded movements to the current price estimates of the reference year. Quarterly chain volume estimates are benchmarked to annual chain volume estimates, so that the quarterly estimates for a financial year sum to the corresponding annual estimate.

Generally, chain volume measures are not additive. In other words, component chain volume measures do not sum to a total in the way original current price components do. In order to minimise the impact of this property, the ABS uses the latest base year as the reference year. By adopting this approach, additivity exists for the quarters following the reference year and non-additivity is relatively small for the quarters in the reference year and the quarters immediately preceding it. The latest base year and the reference year will be advanced one year with the release of the June quarter data each year. A change in reference year changes levels but not growth rates, although some revision to recent growth rates can be expected because of the introduction of a more recent base year (and revisions to the current price estimates underlying the chain volume measures).

Duration of unemployment The elapsed period to the end of the reference week since a person began looking for work, or since a person last worked for two weeks or more, whichever is the shorter. Brief periods of work (of less than two weeks) since the person began looking for work are disregarded.

Employed Persons aged 15 years and over who, during the reference week:

- worked for one hour or more for pay, profit, commission or payment in kind, in a job or business or on a farm (comprising employees, employers and own account workers);
- worked for one hour or more without pay in a family business or on a farm (i.e. contributing family workers);
- were employees who had a job but were not at work and were:
 - away from work for less than four weeks up to the end of the reference week;
 - away from work for more than four weeks up to the end of the reference week and received pay for some or all of the four week period to the end of the reference week;
 - away from work as a standard work or shift arrangement;
 - on strike or locked out;
 - on workers' compensation and expected to return to their job;
- were employers or own account workers who had a job, business or farm, but were not at work.

Part-time workers Employed persons who usually worked less than 35 hours a week (in all jobs) and either did so during the reference week, or were not at work in the reference week.

Particles as PM₁₀ Particles with an aerodynamic diameter of 10 micrometres or less.

Seasonal adjustment A means of removing the estimated effects of normal seasonal variations from economic time series so that the effects of other influences are obvious. Seasonal variations are the systematic (though not necessarily regular) intra-year movements of economic time series. These are often the result of non-economic phenomena, such as climatic changes and regular religious festivals (e.g. Christmas and Easter).

State final demand	<p>Conceptually identical to domestic final demand at the national level (the sum of private and government final consumption expenditure and private and public gross fixed capital formation).</p> <p>National estimates are based on the concepts and conventions embodied in the System of National Accounts, 1993, but for regional (including state) estimates there is no separate international standard. Although national concepts are generally applicable to state accounts, there remain several conceptual and measurement issues that either do not apply or are insignificant nationally. Most of the problems arise in the measurement of gross state product for the transport and storage, communication services, and finance and insurance industries, where production often takes place across state borders. In these cases, a number of conceptual views can be applied to the allocation of value added by state. For more information, see chapter 28 of Australian System of National Accounts: Concepts, Sources and Methods (cat. no. 5216.0).</p>
Trend estimates	<p>Smoothing seasonally adjusted series produces a measure of trend by removing the impact of the irregular component of the series. The trend estimates are derived by applying a 13-term Henderson weighted moving average to the respective seasonally adjusted series. Readers are reminded that trend estimates are subject to revision as subsequent months' data become available.</p>
Unemployed	<p>Persons aged 15 years and over who were not employed during the reference week, and:</p> <ul style="list-style-type: none">■ had actively looked for full-time or part-time work at any time in the four weeks up to the end of the reference week and:<ul style="list-style-type: none">■ were available for work in the reference week;■ were waiting to start a new job within four weeks from the end of the reference week, and could have started in the reference week if the job had been available then.
