## NOTES

### ABOUT THIS PUBLICATION

This issue contains estimates of the resident population of Australian states and territories as at 30 June of each reference year. Estimates up to 2001 are final, estimates between 2002 and 2006 are revised using results of the *2006 Census of Population and Housing*, and 2007 estimates are preliminary. For more information on rebasing population estimates over the 2001-2006 intercensal period, see *Preliminary Rebasing and Component Revision Cycles of Australia's Population Estimates in Australian Demographic Statistics, March Quarter 2007* (cat. no. 3101.0).

The next issue of this publication and accompanying spreadsheets to be released in June 2008 will contain final rebased data for 30 June 2002 to 30 June 2006.

In recognition of the inherent inaccuracy involved in population estimation, population figures over 1,000 in the text are rounded to the nearest hundred, and figures less than 1,000 are rounded to the nearest ten. While unrounded figures are provided in tables, accuracy to the last digit is not claimed and should not be assumed.

It is recommended that the relevant statistics be rounded by users for commentary based on the statistics in this publication. All data are affected by errors in reporting and processing. No reliance should be placed on statistics with small values.

## SUMMARY OF FINDINGS

---

### INTRODUCTION

In the 12 months to 30 June 2007, the Australian population increased by 315,700 people, reaching 21,017,200. The annual growth rate for the year ended 30 June 2007 (1.5%) was slightly higher than that recorded for the year ended 30 June 2006.

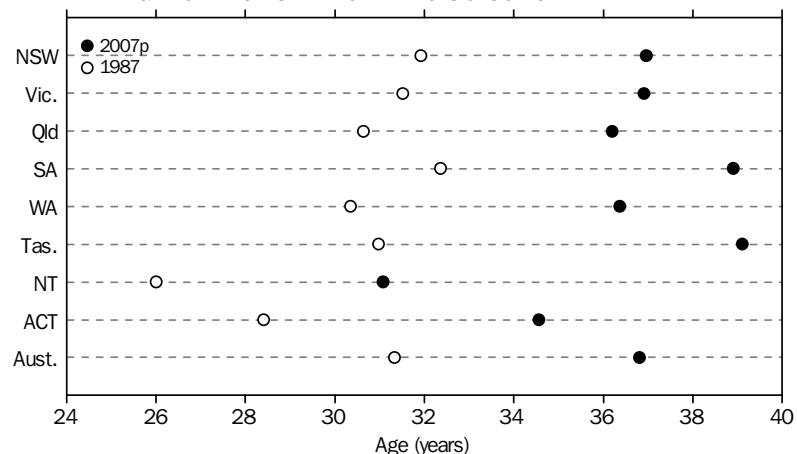

### AGEING POPULATION

Australia's population, like that of most developed countries, is ageing as a result of sustained low fertility and increasing life expectancy. This is resulting in proportionally fewer children (under 15 years of age) in the population. The median age (the age at which half the population is older and half is younger) of the Australian population has increased by 5.5 years over the last two decades, from 31.3 years at 30 June 1987 to 36.8 years at 30 June 2007. Between 30 June 2006 and 2007 the median age increased by 0.2 years. Over the next several decades, population ageing is expected to have significant implications for Australia including health, labour force participation, housing and demand for skilled labour (Productivity Commission 2005, *Economic Implications of an Ageing Australia*, Research Report, Canberra).

### STATES AND TERRITORIES

At 30 June 2007, Tasmania had the oldest population of all the states and territories with a median age of 39.1 years. The second oldest was South Australia with a median age of 38.9 years, followed by New South Wales (37.0 years), Victoria (36.9 years), Western Australia (36.4 years), Queensland (36.2 years), the Australian Capital Territory (34.6 years) and the Northern Territory (31.1 years).

MEDIAN AGE OF POPULATION—At 30 June

Tasmania experienced the largest increase in median age over the last 20 years, increasing by 8.1 years from 31.0 years in 1987 to 39.1 years in 2007. The emigration of younger adults from Tasmania to the Australian mainland has contributed to this accelerated ageing, see *Migration, Australia* (cat. no. 3412.0).

## SUMMARY OF FINDINGS *continued*

.....

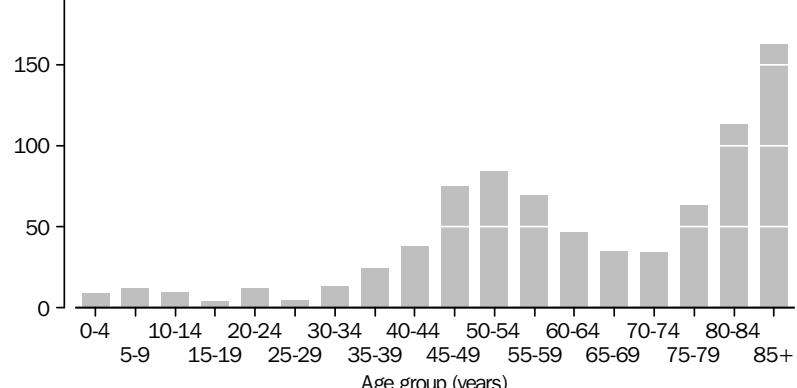

### STATES AND TERRITORIES

*continued*

### POPULATION CHANGE, Age group—1987 to 2007p

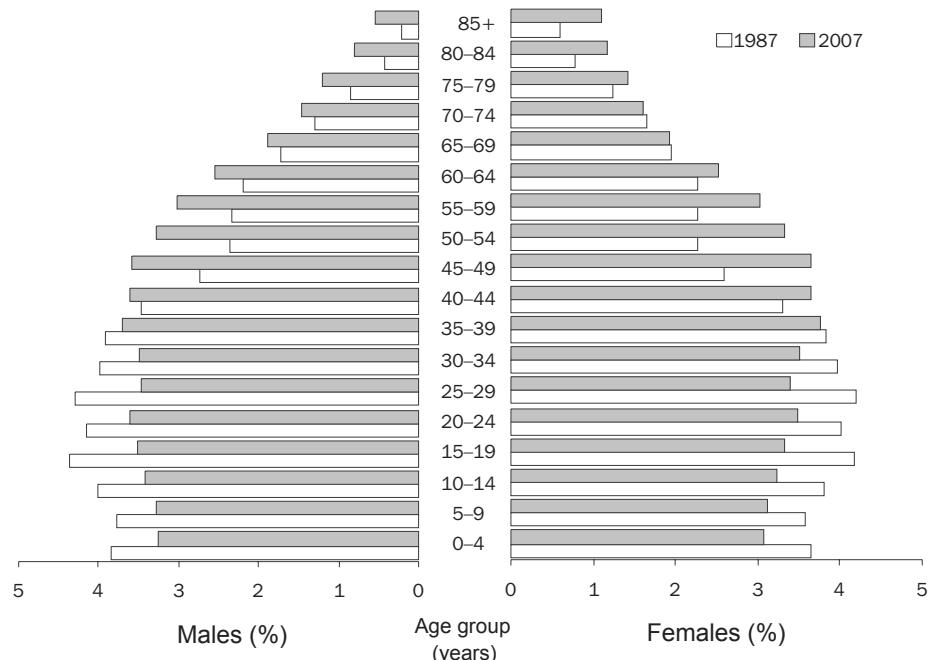

%change

200

Between 30 June 1987 and 30 June 2007, the proportion of Australia's population aged 15–64 years has remained relatively stable, increasing from 66.6% to 67.5% of the total population. The proportion of people aged 65 years and over has increased from 10.7% to 13.1%. During the same period, the proportion of population aged 85 years and over has doubled from 0.8% of the population at 30 June 1987 to 1.6% of the total population at 30 June 2007. The proportion aged under 15 years decreased from 22.7% to 19.4%.

### POPULATION STRUCTURE, Age and sex—Australia—1987 and 2007p

### MODAL AGE

The age with the greatest number of people in Australia at 30 June 2007 was 36 years with 327,700 people. This corresponds to children born during the baby boom echo in the early 1970s. However, the modal age for the Australian Capital Territory is 24 and 25 years with 6,100 people each, which corresponds to migration of younger adults to Canberra for education and employment.

## SUMMARY OF FINDINGS *continued*

---

### CHILDREN (UNDER 15 YEARS OF AGE)

The number of children aged 0–14 years in the population increased by 23,500 in the 12 months to 30 June 2007. The number of children aged 0–4 increased by 21,900, 5–9 increased by 1,200 and 10–14 increased by 420. While fertility rates and the number of births have increased in recent years, this does not impact on the number of children in older ages of 5–14 years.

In the year ended 30 June 2007, Western Australia recorded the largest percentage increase (1.6%) in the number of children aged 0–14 years. Queensland also recorded a positive growth of 1.2%, as did the Australian Capital Territory, Victoria and the Northern Territory which recorded increases of 0.9%, 0.6% and 0.4% respectively. New South Wales and Tasmania have remained relatively stable with changes of less than 0.1% to the population aged 0–14 years.

Between 30 June 1987 and 30 June 2007, the proportion of population aged 0–14 years decreased by 3.3 percentage points from 22.7% to 19.4%.

### WORKING AGE POPULATION (AGED 15–64 YEARS)

The number of people aged 15–64 years (working age population) increased by 1.6% (or 220,200 persons) in the year ended 30 June 2007. Queensland and Western Australia (2.3%), and the Northern Territory (2.2%) each recorded growth rates for 15–64 year olds higher than the national average. The Australian Capital Territory and Victoria (1.6%), South Australia and New South Wales (1.1%), and Tasmania (0.6%) each recorded growth rates for 15–64 year olds lower than the national average.

During the 20 years between 30 June 1987 and 30 June 2007, the proportion of population aged 15–64 years increased from 66.6% to 67.5%.

In the year ended 30 June 2007, there were 286,300 young people aged fifteen who entered the working age population while 177,100 people turned 65 years and left the working age population. However, this excess of 15 year olds over 65 year olds is projected to decline over the next decade. The major causes for this decline are because the first cohort of the baby boomers (those born in 1946) will reach the age of 65 years in 2011 leaving the working age population, while the number of 15 year olds entering the working age population will decline due to the fall in fertility and the number of births recorded through the 1990s.

### OLDER PEOPLE

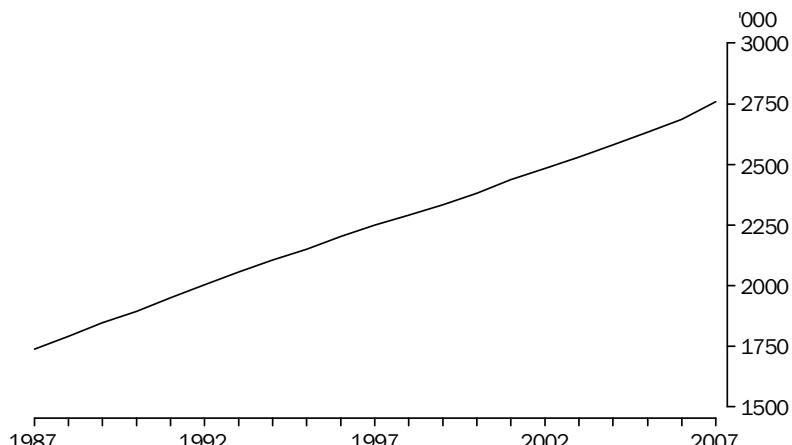

In the 12 months to 30 June 2007, the number of people aged 65 years and over in Australia increased by 72,000 people representing a 2.7% increase. The proportion of the population aged 65 years and over increased from 10.7% to 13.1% between 30 June 1987 and 30 June 2007.

## SUMMARY OF FINDINGS *continued*

.....

OLDER PEOPLE *continued*

POPULATION AGED 65 YEARS OR MORE, Australia—At 30 June

All states and territories experienced growth in their populations aged 65 years and over in the year ended 30 June 2007. The Northern Territory (8.3%), the Australian Capital Territory (4.2%), Queensland (3.5%) and Western Australia (3.4%) experienced the greatest increase in the numbers of persons aged 65 years and over.

.....

*Aged 85 years and over*

In the 12 months to 30 June 2007, the number of people aged 85 years and over increased by 22,900 people (7.1%) to reach 344,900. Over the past two decades, the number of elderly people increased by 158%, compared with a total population growth of 29% over the same period. Increased life expectancy for both males and females has contributed to this rise. There were over twice as many females (230,800) than males (114,100) in this age group at 30 June 2007 which reflects the higher life expectancy at birth for females compared with males.

In the year ended June 2007, the largest increases in the number of people aged 85 years and over occurred in the Northern Territory (14.0%), followed by the Australian Capital Territory (10.7%), New South Wales and Queensland (7.3%), South Australia (6.9%), Western Australia and Victoria (6.8%) and Tasmania (6.2%).

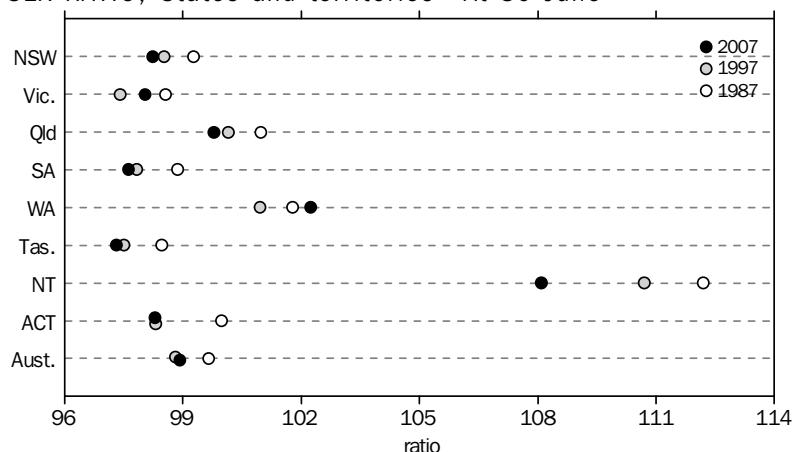

## SUMMARY OF FINDINGS *continued*

---

### SEX RATIOS

At 30 June 2007, the sex ratio of the total population for Australia was 98.9 males per 100 females. At birth, the sex ratio for Australia in 2006 was 105.8 males per 100 females (see *Births, Australia, 2006* (cat. no. 3301.0)). This excess of males in the earlier years contrasts with the opposite situation in the older years and for the total population which can be attributed to female longevity.

SEX RATIO, States and territories—At 30 June

Across the states and territories in 2006–07, Tasmania, South Australia, Victoria, New South Wales, the Australian Capital Territory and Queensland all had lower numbers of males than females. Tasmania had the lowest sex ratio, with 97.3 males per 100 females. Western Australia and the Northern Territory had an excess of males compared to females. The Northern Territory had the highest sex ratio with 108.1 males per 100 females. Migration can influence sex ratios, especially in the younger working ages where there may be a greater proportion of male migrants.

### INTERNATIONAL COMPARISON

Population ageing is a notable demographic characteristic of most developed countries. In countries such as Japan, Italy and Greece the number of people aged 65 years and over already exceeds the number of children aged 0–14 years. Population ageing is caused by sustained low fertility and increasing life expectancy, which has resulted in fewer children in the population. In Australia, based on the latest Series B population projections, the number of people aged 65 years and over is projected to exceed the number of children aged 0–14 years around the year 2018. For more information, see *Population Projections, Australia, 2004 to 2101* (cat. no. 3222.0).

According to United Nations projections, all countries selected for analysis are expected to experience decreases in the proportion of children aged 0–14 years in their populations between 2005 and 2010. In most of these countries, the decrease in children aged 0–14 years is expected to be accompanied by increases in the proportions of people aged 15–64 years or people aged 65 years and over. Countries like Japan and Italy are expected to experience proportional declines in their populations aged 15–64 years as well as their populations aged 0–14 years, and are expected to experience large proportional increases in their population aged 65 years and over.

(a) International data are United Nations medium variant projections.  
Australian data are ABS medium series (Series B) projections.

(b) Births per woman. United Nations and ABS projections are medium variant projections for the period 2005–2010.

(c) Life expectancy at birth. United nations and ABS projections are medium variant projections for the period 2005–2010, for males and females combined.

Source: United Nations World Population Prospects, 2006 Revision; ABS Estimated Resident Population; ABS, Population Projections, Australia 2004 to 2101 (cat. no. 3222.0).

### INTERNATIONAL COMPARISON *continued*

According to Australian Bureau of Statistics projections, the proportion of children in the Australian population is expected to decline by more than one percentage point between 2005 and 2010, from 19.7% to 18.4%, while the proportion of people aged 15–64 years is expected to decrease slightly, from 67.4% to 67.3%. The proportion of people aged 65 years and over is expected to increase by more than one percentage point from 12.9% to 14.3%.

In 2005, the age structure of Australia's population was similar to that of Canada and the United States of America. Generally, the European countries and Japan had smaller proportions of children and higher proportions of older people than Australia. In contrast, other countries in Asia tended to have proportionally more children and far fewer older people, generally reflecting considerably higher fertility rates and lower life expectancies at birth than those experienced in Australia.

CHANGE IN ESTIMATED RESIDENT POPULATION(a)(b), by age groups and sex—at 30 June  
2007

(a) The mean age is the average age of the population.

(b) Includes Jervis Bay Territory prior to 1994.

(c) Includes Other Territories from 1994—see paragraph 2 of the Explanatory Notes.

(d) Figures revised since previous issue.

(e) Preliminary figures—subject to further revision.

MEAN AGE(a), by sex—at 30 June *continued*

| 2005(d)         | 37.9     | 37.9       | 37.0            | 39.2              | 37.0     | 38.6               | 31.6                            | 35.9         |
| 2006(d)         | 37.8     | 37.8       | 37.0            | 39.2              | 37.0     | 38.8               | 31.7                            | 35.9         |
| 2007(e)         | 38.0     | 38.0       | 37.1            | 39.4              | 37.1     | 39.0               | 32.0                            | 36.0         |

(a) The mean age is the average age of the population.

(b) Includes Jervis Bay Territory prior to 1994.

(c) Includes Other Territories from 1994—see paragraph 2 of the Explanatory Notes.

(d) Figures revised since previous issue.

(e) Preliminary figures—subject to further revision.

## SEX RATIO(a)—at 30 June

|         | New South Wales | Victoria | Queensland | South Australia | Western Australia | Tasmania | Northern Territory | Australian Capital Territory(b) | Australia(c) |
|---------|-----------------|----------|------------|-----------------|-------------------|----------|--------------------|---------------------------------|--------------|

np not available for publication but included in totals where applicable, unless otherwise indicated

(a) Includes Other Territories – see paragraph 2 of the Explanatory Notes.

## EXPLANATORY NOTES

---

### INTRODUCTION

**1** This publication contains revised estimates of the resident populations (ERP) by age and sex, of Australian states and territories, as at 30 June 2006 and preliminary estimates as at 30 June 2007. Mean ages and sex ratios for the states, territories and Australia are also included. These data are based on the *2006 Census of Population and Housing*.

**2** Following the 1992 amendments to the *Acts Interpretation Act* to include the Indian Ocean Territories of Christmas Island and the Cocos (Keeling) Islands as part of geographic Australia, population estimates commencing from September quarter 1993 include estimates for these two territories. To reflect this change, another category of the state and territory level has been created, known as Other Territories. Other Territories include Jervis Bay Territory, previously included with the Australian Capital Territory, as well as Christmas Island and the Cocos (Keeling) Islands, previously excluded from population estimates for Australia. Data for Other Territories, while not detailed separately, are included in tables where specifically noted.

### RESIDENT POPULATION ESTIMATES SERIES

**3** Australia's population estimates for the period since 1971 are compiled according to the place of usual residence of the population. An explanation of the place of usual residence conceptual basis for population estimates is given in *Demographic Estimates and Projections: Concepts, Sources and Methods, Statistical Concepts* (cat. no. 3228.0).

### METHOD OF ESTIMATION

**4** The estimates by age of the population of Australia and the states and territories at the date of the census are derived from the census counts by place of usual residence, by adjusting for under-enumeration and adding the number of Australian residents estimated to have been temporarily overseas at the time of the census.

**5** Post-censal population estimates are obtained by advancing the previous year's estimates to the next year by subtracting deaths and adding births and net estimated interstate and overseas migration. After each census, estimates for the preceding intercensal period are revised by incorporating an additional adjustment (intercensal discrepancy) to ensure that the total intercensal increase at each age agrees with the difference between the estimated resident populations at the two respective census dates.

### Natural increase: births and deaths

**6** Natural increase is a major component of ABS quarterly state and territory population estimates and is calculated using the estimated number of births and deaths, by state and territory of usual residence, using year/quarter of registration for preliminary data and year/quarter of occurrence for both revised and final data. This may affect time series comparisons within relevant tables. For preliminary estimates, births and deaths by quarter of registration are used as a proxy for quarter of occurrence. For revised estimates, a factor has been applied to the number of occurrences to allow for those occurrences which were yet to be registered at the time of revision. For final estimates between 30 June 1991 and 30 June 2001, year/quarter of occurrence data are used. For further details see *Demography Working Paper 1998/2 – Quarterly Birth and Death Estimates* (cat. no. 3114.0).

**7** The timeliness and accuracy of ABS quarterly population estimates depends in part on the timeliness and accuracy of estimates of births and deaths which are based on registrations. To be able to provide timely estimates the ABS produces preliminary estimates using births and deaths by quarter of registration as a proxy for quarter of occurrence. The major difficulty in this area stems from the fact that while the vast majority of births and deaths are registered promptly, a small proportion of registrations are delayed for months or even years. Lags or accumulations in births and deaths registrations can be caused by either:

- late notification of a birth or death event to a state or territory registry;
- delays arising from incomplete information supplied for a registration;

## EXPLANATORY NOTES *continued*

---

### *Natural increase: births and deaths continued*

- procedural changes affecting the processing cycles in any of the state and territory registries; and
- resolution of issues that may arise within the ABS or registry processing systems.

**8** Preliminary births and deaths estimates are subject to fluctuations caused by lags or accumulations in the reporting of births and deaths registrations. Accumulations can result from the eventual processing of lagged registrations in a later quarter. As a result, preliminary quarterly estimates can be an underestimate or an overestimate of the true numbers of births and deaths occurring in a reference period. Note that estimates from September quarter 2006 onwards are preliminary.

### *Net overseas migration*

**9** Conceptually, net overseas migration (NOM) is the difference between permanent and long-term arrivals, and permanent and long-term departures. Estimates of NOM are derived from information provided on incoming and outgoing passenger cards, as well as other data supplied by the Department of Immigration and Citizenship (DIAC), formerly the Department of Immigration and Multicultural Affairs (DIMA) and the Department of Immigration and Multicultural and Indigenous Affairs (DIMIA). Data on the intended duration of stay of overseas visitors arriving in Australia and the intended duration of absence of Australian residents travelling overseas are used to initially determine the numbers of permanent and long-term arrivals, and permanent and long-term departures. Passenger card data are then used to calculate migration adjustments and determine the state and territory distribution of NOM.

**10** The Australian Bureau of Statistics (ABS) has developed an improved method for calculating NOM for September quarter 2006 onwards. Estimates from the past time series based on the previous method, and the current time series based on the improved method are not comparable. Preliminary estimates for September quarter 2006 onwards based on the new method are included in Table 2 of this issue. The key change is the introduction of a '12/16 month rule' for determining a person's residency in Australia, replacing the previous '12/12 month rule'. For further information on the new improved method see Information Paper: Improved Methods for Estimating Net Overseas Migration (cat. no. 3107.0.55.003) and Information Paper: Statistical Implications of Improved Methods for Estimating Net Overseas Migration, Australia 2007 (cat. no. 3107.0.55.005).

**11** The previous method used to estimate net overseas migration from September quarter 2001 to June quarter 2006 compared data on actual travel movements over a one year period with those advised by individual travellers, and are explained in more detail in Demography Working Paper 2003/5 - Net Overseas Migration: Adjusting for Actual Duration of Stay or Absence (cat.no.3137.0). In order to conduct such a comparison, data for a 15 month period (i.e. one year plus one quarter) were required.

### *Net interstate migration*

**12** Interstate migration is a key determinant of the accuracy of state and territory population estimates. Data on interstate migration can not be directly estimated. Instead, post-censal estimates of interstate migration are modelled using administrative by-product data. Currently the data used by the ABS is information on interstate changes of address advised to Medicare Australia and to the Department of Defence in the case of the military. The Medicare-based model used for generating post-censal estimates of interstate migration is largely superseded when new Census information becomes available.

**13** When Census data on interstate movement becomes available part of the process of rebasing ERPs for states and territories is the re-derivation of interstate migration for the intercensal period. The overall approach is to minimise state intercensal error using data analysed from the Census questions concerning an individual's place of residence one-year ago, five-years ago and at Census night. When new Census data are available, interstate migration estimates for the intercensal period are replaced with estimates

## EXPLANATORY NOTES *continued*

---

### *Net interstate migration continued*

derived from Census data on place of usual residence five years ago. These estimates are then scaled so that they sum to zero at the Australian level. A similar process is carried out for the year prior to the Census, using Census data on place of usual residence one year ago. The difference between the original interstate migration estimates and the rebased estimates is apportioned across all quarters, movement categories, ages and sex categories in the intercensal period in order to minimise quarterly change.

**14** Due to the non-compulsory and non-universal nature of the available (indirect) data sources, post-censal quarterly estimates of interstate migration have long been considered the weakest measure of a component of population change. For further information on the process of estimating interstate migration and the administrative data used, see the *Demography Working Paper: 2004/1 Review of Interstate Migration Method* (cat.no.3106.0.55.001) and the *Information Paper: Evaluation of Administrative Data Sources for Use in Quarterly Estimation of Interstate Migration, 2006 to 2011* (cat.no.3127.0.55.001).

### AVERAGE ANNUAL RATE OF GROWTH

**15** The average annual growth rate,  $r$ , is calculated as a percentage using the formula:

$$\left[ \left( \frac{P_n}{P_o} \right)^{\frac{1}{n}} - 1 \right] \times 100$$

where  $P_o$  is the population at the start of the period,  $P_n$  is the population at the end of the period and  $n$  is the length of the period between  $P_n$  and  $P_o$  in years.

### ACCURACY/RELIABILITY

**16** It should be noted that while the Australian Bureau of Statistics (ABS) seeks to produce the most accurate estimates of the population possible, the accuracy of the estimates depends on the quality of the source data used. The major source of potential error is considered to be the estimates of interstate migration based on Medicare transfer data.

**17** Single year age estimates are not shown for persons aged 85 years or older. The reliability of age estimates decreases as older ages are reached. However, estimates for each age up to 99 and 100 years or more have been calculated and are available on request.

**18** In recognition of the inherent accuracy involved in population estimation, population figures over 1,000 in the text are rounded to the nearest hundred, and figures less than 1,000 are rounded to the nearest ten. While unrounded figures are provided in tables, accuracy to the last digit is not claimed and should not be assumed.

### ACKNOWLEDGMENT

**19** ABS publications draw extensively on information provided freely by individuals, businesses, governments and other organisations. Their continued cooperation is very much appreciated: without it, the wide range of statistics published in the ABS would not be available. Information received by the ABS is treated in strict confidence as required by the *Census and Statistics Act 1905*.

### RELATED PRODUCTS

**20** Previous issues of this series containing consolidated data were issued on 23 August 1982 (containing estimates for the years 1977 to 1982); 8 December 1987 (containing estimates for the years 1981 to 1987); 21 July 1993 (containing estimates for the years 1992 to 1997); 27 March 2003 (containing estimates for the years 1997 to 2002). Time series spreadsheets of these data for each state and territory and Australia from June 1971 to June 2007 are available for free from the ABS web site, or on AusStats and ABS@Products and Information then time series spreadsheets under cat. no. 3201.0.

## GLOSSARY

---

|  |  |
|--|--|
| <b>Ageing of the population</b>            | Ageing of the population is the consideration of the proportion of the population aged 65 years and over, and the way this proportion is continuing to increase, mostly due to persistent low fertility rates and declining mortality rates.   |
| <b>Average annual rate of growth</b>       | The average annual growth rate, $r$ , is calculated as a percentage using the formula:<br>$\left[ \left( \frac{P_n}{P_o} \right)^{\frac{1}{n}} - 1 \right] \times 100$ <p>where <math>P_0</math> is the population at the start of the period, <math>P_n</math> is the population at the end of the period and <math>n</math> is the length of the period between <math>P_n</math> and <math>P_0</math> in years.</p>  |
| <b>Census count</b>                        | The Census of Population and Housing enumerates persons on the basis of where they were located on census night. Characteristics of households are only available according to place of enumeration. The census also compiles information on people according to their place of usual residence. This information is coded to Statistical Local Area. This means that census counts of people can be produced according to their location on census night as well as their place of usual residence.   |
| <b>Estimated resident population (ERP)</b> | The official measure of the population of Australia is based on the concept of usual residence. It refers to all people, regardless of nationality or citizenship, who usually live in Australia, with the exception of foreign diplomatic personnel and their families. It includes usual residents who are overseas for less than 12 months. It excludes overseas visitors who are in Australia for less than 12 months.   |
| <b>Intercensal discrepancy</b>             | Intercensal discrepancy is the difference between two estimates at 30 June of a census year population, the first based on the latest census and the second arrived at by updating the 30 June estimate of the previous census date estimate with intercensal components of population change which take account of information available from the latest census. It is caused by errors in the start and/or finish population estimates and/or in estimates of births, deaths or migration in the intervening period which cannot be attributed to a particular source.                               |
| <b>Life expectancy</b>                     | Life expectancy refers to the average number of additional years a person of a given age and sex might expect to live if the age-specific death rates of the given period continued throughout his/her lifetime.   |
| <b>Mean age</b>                            | The average age of the population.   |
| <b>Median age</b>                          | For any distribution the median value is that which divides the relevant population into two equal parts, half falling below the value, and half exceeding it. Thus, the median age is the age at which half the population is older and half is younger.  |
| <b>Migration adjustment</b>                | The ABS applies a number of adjustments to overseas arrivals and departures data in order to produce estimates of net overseas arrivals and departures (NOM). These mainly comprise adjustments designed to reflect differences between stated travel intentions and actual travel behaviour, but (in the case of revised NOM estimates) also include adjustments to transform numbers of overseas movements into numbers of travellers. These adjustments are collectively referred to as 'migration adjustments', although they have been referred to in the past as 'category jumping' adjustments. |
| <b>Modal age</b>                           | The age in years with the greatest frequency in a population.  |
| <b>Natural increase</b>                    | Excess of births over deaths.  |
| <b>Net interstate migration</b>            | The difference between the number of persons who have changed their place of usual residence by moving into a given state or territory and the number who have changed their place of usual residence by moving out of that state or territory during a specified time period. This difference can be either positive or negative.   |
| <b>Net overseas migration</b>              | Net overseas migration is net permanent and long-term overseas migration, adjusted for change in traveller duration, intention and multiple movement error.  |

## **GLOSSARY** *continued*

---

|                               |   |
|-------------------------------|---|
| <b>Population growth</b>      | For Australia, population growth is the sum of natural increase and net overseas migration. For states and territories, population growth also includes net interstate migration. After the census, intercensal population growth also includes an allowance for intercensal discrepancy. |
| <b>Population projections</b> | Population projections are not predictions or forecasts. They are an assessment of what would happen, in future years, to Australia's population given a set of assumptions about future trends in fertility, mortality and migration.  |
| <b>Sex ratio</b>              | The sex ratio relates to the number of males per 100 females. The sex ratio is defined for the total population, at birth, at death and among age groups by appropriately selecting the numerator and denominator of the ratio.   |
| <b>Usual residence</b>        | Usual residence within Australia refers to that address at which the person has lived or intends to live for a total of six months or more in a given reference year.   |
