NOTES

ABOUT THIS PUBLICATION

This publication contains population projections for Tasmania and selected areas within Tasmania.

.....

ABOUT THIS ISSUE

The population projections in this issue were calculated using the preliminary population estimate for Tasmania at 30 June 2000, as published in Australian Demographic Statistics (ABS Cat. no. 3101.0), as the base population.

These projections are not intended as predictions or forecasts, but are illustrations of growth and change in the population which would occur if certain assumptions about future demographic trends prevail over the projection period.

PREFACE

This publication is the first issue of *Population Projections, Tasmania*. It provides population projections for the next 20 years for Tasmania, Hobart/balance of Tasmania, Statistical Local Areas and Local Government Areas within Tasmania. The projections are intended to assist Government agencies and other organisations within the community with their planning for the future.

The projections in this publication have been prepared by the Australian Bureau of Statistics in cooperation with the Tasmanian Government. They accommodate all known planned developments. The Australian Bureau of Statistics acknowledges the contribution of the Tasmanian Government to the production of these projections, which included providing land and building data and agreement with the assumptions used to derive the projections.

This publication is designed to complement the Australian Bureau of Statistics publication *Population Projections, Australia* (Cat. no. 3222.0), which covers projections for all States and Territories and Australia as a whole.

Stevan R. Matheson
Regional Director, Tasmania

SECTION 1

MAIN FEATURES

This publication contains projections for Tasmania by Statistical Division (SD), Statistical Subdivision (SSD), Statistical Local Area and Local Government Area for the period 30 June 1999 to 30 June 2021.

A combination of assumptions of future levels of births, deaths and migration are used to illustrate the possible size, structure and distribution of Tasmania's population over the next 22 years. Three series are produced. However, the analysis below in most cases is done using Series B.

POPULATION SIZE

Tasmania's population is projected to grow, under Series A, from 470,800 at 30 June 1999 to 479,800 at 30 June 2018 and decrease to 479,300 by 30 June 2021. Under Series B and C the population will decline to between 434,500 and 457,000.

Natural increase, the excess of births over deaths, is projected to become negative between 2015–16 and 2020–21 in Series B and C.

Since 1996 Tasmania's annual population growth rate has been slightly negative. Series A shows growth from 30 June 2001 to 30 June 2018 before declining. Series B shows decline in all but two years of the projection period. Series C shows decline throughout the projection period with a rate of decline of –0.6% for 2020–21.

Capital city/balance

The population of Greater Hobart SD, 194,400 at 30 June 1999, is projected to be between 180,000 and 200,200 by 30 June 2021. The balance of Tasmania, 276,400 at 30 June 1999, is projected to be between 254,400 and 279,100 by 30 June 2021. By 30 June 2021 it is projected that between 41% and 42% of Tasmania's population will be living in Greater Hobart SD, little changed from the 41% at 30 June 1999.

There is also likely to be little change in the distribution of population in the other Statistical Divisions with Southern SD having 8% in 2021, Northern SD between 28% and 29% and Mersey-Lyell SD 22%.

Local government areas

Of the 29 Local Government Areas (LGAs), 10 are projected to grow under all three series while 12 are projected to decline under all three series. Those projected to show strongest growth include Sorell, Latrobe, Kingborough, Kentish and Meander Valley. Those projected to show strongest decline include West Coast, Burnie, Devonport, King Island and George Town.

POPULATION AGEING

The projections show that the ageing of Tasmania's population will continue. This is the inevitable result of fertility remaining at low levels over a long period associated with increasing life expectancy. As growth slows, the population ages progressively with the median age of 36 years at 30 June 1999 increasing to 44–45 years by 30 June 2021.

By 30 June 2021, the number of people aged 65 years and over is projected to be at least fifty per cent greater than at 30 June 1999, increasing from 13% of the population at 30 June 1999 to 22–23% by 30 June 2021. In Series B, the highest annual rate of growth for this age group will occur in 2011–12 when the large cohort born in 1947, part of the post World War II 'baby boom', turns 65.

The 85 years and over age group numbered 6,400 (1.4% of the total population) at 30 June 1999. This group is projected to reach between 11,600 and 12,000 by 30 June 2021.

At 30 June 1999, the 85 years and over age group was dominated by women, who made up 70% of the group. In all three series this proportion is projected to fall to 64–65% by 30 June 2021 reflecting the increase in life expectancy of men and the narrowing gap in life expectancy between men and women.

The population aged 15–64 years, which encompasses much of the working-age population, made up 65% of Tasmania's population at 30 June 1999. This proportion increases slightly over the first nine years of the projection under all three series to reach over 66% by 30 June 2008. It then declines to just over 62% by 30 June 2021.

The population aged 0–14 made up 21% of the population at 30 June 1999. This will decline under all three series to between 15 and 16% by 30 June 2021.

Median age of the population

Under all three series the median age of Tasmania's population is projected to increase from 36 years of age at 30 June 1999 to between 44 and 45 years by 30 June 2021. In contrast, the median age of Australians is projected to increase more slowly, rising from 35 years at 30 June 1999 to between 40 and 42 years by June 2021.

Under Series B, LGAs with the highest median ages are projected to be Tasman (50 years), Glamorgan/Spring Bay (50 years), Break O'Day (50 years), Central Coast (48 years) and West Tamar (48 years). Under Series B, LGAs with the lowest median ages are projected to be Circular Head (38 years), West Coast (39 years), Brighton (39 years) and Sorell (40 years).

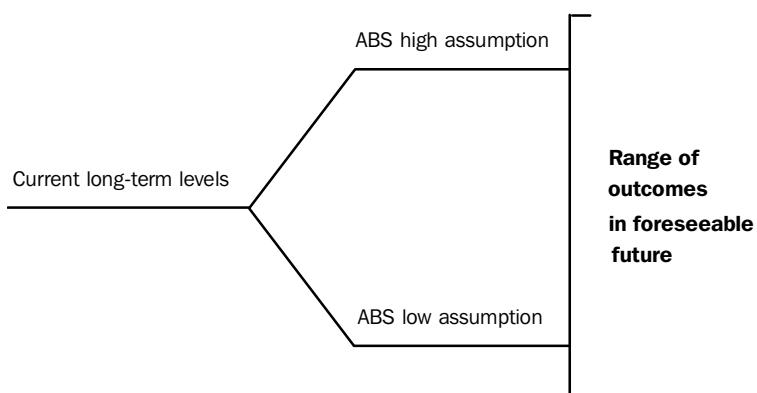

Under Series B, LGAs with the highest median ages for males are projected to be Break O'Day (50 years), Tasman (50 years) and Glamorgan/Spring Bay (49 years). Under Series B, LGAs with the lowest median ages for males are projected to be Circular Head (38 years), West Coast (38 years), Brighton (39 years) and Sorell (39 years).

Under Series B, LGAs with the highest median ages for females are projected to be Glamorgan/Spring Bay (51 years), Tasman (50 years) and Break O'Day (50 years). Under Series B, LGAs with the lowest median ages for females are projected to be Circular Head (38 years), West Coast (39 years) and Brighton (40 years).

SECTION 2 ASSUMPTIONS

PRINCIPLES OF ASSUMPTIONS

The future is characterised by uncertainty, which is why the Australian Bureau of Statistics (ABS) uses a range of assumptions about future fertility, mortality, overseas migration and internal migration. The assumptions are not intended to show the full range of possible futures, but rather illustrate some of the more likely possibilities within that range.

SUMMARY OF ASSUMPTIONS

Fertility

One assumption is made:

The total fertility rate declines to 1.67 babies per woman in 2007–08, and then remains constant.

Mortality

One assumption is made:

The 1986–1996 rate of improvement in life expectancy continues for the next five years and then gradually declines, resulting in life expectancy at birth of 80.1 years for males and 84.0 years for females in 2021.

Overseas migration

One assumption is made:

Annual net overseas migration gain of 129 from 2001–02.

Interstate migration

Three assumptions are made:

- 1 Annual net interstate migration loss of 500 persons.
- 2 Annual net interstate migration loss of 1,500 persons.
- 3 Annual net interstate migration loss of 2,500 persons.

FERTILITY ASSUMPTION

Summary

There is one long-term fertility assumption. This assumption is based on the fact that the decline in the total fertility rate (TFR) will continue and result in a TFR of 1.67 babies per woman in 2007–08. It then remains constant to the end of the projection period.

Trends in the total fertility rate

Before the end of the baby boom in Tasmania in the mid-1960s, the TFR reached its highest level in 1961 at 3.5 babies per woman. It fell in the following years, initially slowly but then rapidly in the early 1970s. Below replacement level fertility (2.1 babies per woman) was reached in 1976. In the 1990s, fertility declined further.

Assumed total fertility rates

Given the current trends in Tasmania's fertility only one assumption was proposed for the future total fertility rate. It is proposed that by 2008 the TFR will drop to 1.67 and then remain constant till the end of the projection period.

Since the late 1970s, Tasmania's TFR has fluctuated between 1.8 and 2.0 babies per woman. Despite the small falls in the 1990s, it is reasonable to assume that the declines in the TFR over the last 10 years will continue over the next 10 years to around 1.67 babies per woman. This assumption is consistent with factors that are considered associated with lowering of fertility, such as increased participation of women in education and in the labour force. These higher participation rates may result in smaller families and increasing childlessness, both of which would lower the TFR.

TOTAL FERTILITY RATES(a): Observed and assumed

| Year | Greater Hobart SD | Balance of Tasmania | Total Tasmania |
|-----------|-------------------|---------------------|----------------|
| 2000 | 1.70 | 1.93 | 1.84 |
| 2001 | 1.63 | 1.90 | 1.82 |
| 2002 | 1.61 | 1.88 | 1.80 |
| 2003 | 1.59 | 1.86 | 1.78 |
| 2004 | 1.57 | 1.84 | 1.75 |
| 2005 | 1.55 | 1.81 | 1.73 |
| 2006 | 1.54 | 1.79 | 1.71 |
| 2007 | 1.52 | 1.77 | 1.69 |
| 2008–2021 | 1.50 | 1.75 | 1.67 |

(a) Per woman.

MORTALITY ASSUMPTION

One assumption was made at the Tasmanian level. The assumption is that life expectancy at birth increases from the 1996–1998 level of 75.2 years for males and 80.6 years for females to 80.1 years for males and 84.0 years for females by 30 June 2021. It is based on the Australian average annual rate of improvement in life expectancy from 1986–1996 of 0.30 years per year for males and 0.22 years per year for females continuing from 1999 to 2003 and then gradually slowing.

The pattern of change in Australian age-specific death rates from 1970–1972 to 1995–1997 has been assumed to continue for the projection period. This has been applied to base age-sex mortality rates taken from 1996–1998 Tasmanian life tables. Where the trend from 1970–1972 to 1995–1997 showed an increase in age-specific death rates (e.g. males aged 30–34 years), some arbitrary adjustment was performed to prevent the age-specific death rates from increasing in the future. Further adjustments were made to the assumed rates of change in age-specific death rates to conform to the predetermined life expectancies at birth for future years.

LIFE EXPECTANCY AT BIRTH: Observed and Assumed

| 2021 | 79.8 | 83.7 | 80.3 | 84.1 | 80.1 | 84.0 |

OVERSEAS MIGRATION ASSUMPTION

The long-term assumed level of net overseas migration is about 130. This is based on the 10-year moving average series of net overseas migration over the last 50 years. This average incorporates past fluctuations in net overseas migration and the associated influence of economic cycles. The assumption represents Tasmania's share of the Australian long-term average of net overseas migration—86,000 for the last 50 years, and 95,000 for the last 20 years.

The proportion of migrants going to Greater Hobart SD and the balance of Tasmania was based on the average distribution of migrants arriving in 1990–91 and 1995–96, according to the 1991 and 1996 Censuses respectively. This distribution remains constant throughout the projection period.

Assumed future age–sex profile of overseas migrants

The assumed age–sex structure of each migration component (permanent and long-term) for Tasmania was based on the average structure from 1996–97 to 1998–99.

Age–sex profiles at the part of State level were derived from the 1996 Census question on residence one year ago. Overseas departures are assumed to have the same age–sex distribution as overseas arrivals. These distributions were constrained to Tasmanian overseas arrivals and departures data for 1995–96.

INTERSTATE MIGRATION ASSUMPTIONS

Because of the volatility of net interstate migration flows, three long-term assumptions are made. For Tasmania these assumptions provide high, medium and low levels of losses due to interstate migration.

The medium assumption is based on averages for the last three decades, with more weight given to the past 10 years. The high and low assumptions reflect the variability in the historical data, and give a plausible broad range of projection outcomes. They also reflect the net interstate migration levels experienced during 1997–98 and 1998–99.

Trends

Interstate migration is the most volatile component of population change for Tasmania. Therefore this movement of people between regions is an important determinant of Tasmania's population distribution.

Apart from a distinct pattern of net flows to warmer climates, the levels of interstate migration are sensitive to the differences between State and Territory economies and the number of permanent and long-term overseas arrivals.

Over recent years, Tasmanian interstate migration patterns have been dominated by a northward stream on the east coast with a smaller stream to the west coast. These streams result in net gains for all mainland States and Territories. The average annual net gain to Queensland over the past decade has been about 1,300 people, 500 to Victoria, 300 to Western Australia, 100 to New South Wales, 100 to the ACT and negligible gains to South Australia and the Northern Territory.

(a) Average annual for financial years.

Assumed interstate migration

Tasmania has experienced net losses in most years since 1971–72. Since 1991–92, increasing net losses have been recorded due to an increase in departures. Queensland initially received the majority of departures but in 1997–98 were replaced by Victoria. Tasmanian net interstate migration losses in that year reached almost 4,000, the highest loss experienced by Tasmania since World War II. The preliminary estimates for 1999–2000 indicate a slightly smaller net loss of just under 3,000 .

The levels of assumed net interstate migration for the 1999–2021 projections have been derived by analysing the trends during the past two decades. Three alternative assumptions are made to allow for a variety of scenarios for interstate migration levels across Tasmania.

Assumption 1 assumes high levels of net gains and losses, with assumptions 2 and 3 assuming medium and low levels, respectively. Overall, the medium assumption most closely reflects the long-term average net interstate migration experience of Tasmania. The high and low levels attempt to cover a wide range of net interstate movements, capturing many of the less extreme net gains and losses experienced by Tasmania over the same time period.

Each assumption remains constant after a transitional period from 1999–2000 to 2002–2003. These assumptions should be interpreted as average annual levels of net interstate migration and not as actual levels.

Assumed capital city and balance of State migration

The interstate migration assumptions for Greater Hobart Statistical Division and the balance of Tasmania are based on historical trends. Net total migration to Greater Hobart Statistical Division and the balance of Tasmania is assumed to be the difference between population growth and natural increase in these regions. Net interstate migration is assumed to be the difference between net total migration and net overseas migration.

SERIES

These assumptions can be combined to create three population projection series. These three series are published in detail in Section 3, representing high (Series A), medium (Series B) and low (Series C) population projections for Tasmania.

Which projection series to use

Future uncertainty, along with the subjective nature of assessing current trends, means that using a range of possible outcomes rather than a single projection series gives a more realistic view of possible future size, distribution and age structure of Tasmania's population.

Different series, representing different combinations of assumptions, may be appropriate for specific time horizons (shorter or longer term) and the region being studied.

SECTION 3

PROJECTION RESULTS

INTRODUCTION

The projections in this publication are not predictions or forecasts but an assessment of what would happen to Tasmania's population if the assumed levels of the components of population change—birth, deaths and migration—were to continue for the next 20 years. These projections span the period from 30 June 1999 to 30 June 2021 and show the size, structure and distribution of the future population based on the various assumptions made about each of the components of change.

ASSUMPTIONS

The base population for the projections was the preliminary estimated resident population at 30 June 2000, as published in Australian Demographic Statistics (ABS Cat. no. 3101.0), which was 470,400.

Three projection series have been generated by using one assumption about future births, one assumption about future deaths, one assumption about future levels of overseas migration and three alternative assumptions about future levels of interstate migration. From these assumptions, three projection series have been generated.

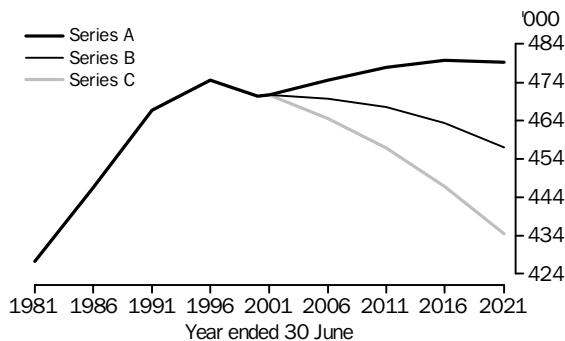

All series assume that the total fertility rate (TFR) will fall to 1.67 and remain there from 2007–08 and that net overseas migration will be 129 per year from 2001–02. Series A assumes a net outflow of 500 for interstate migration, Series B a net outflow of 1,500 and Series C a net outflow of 2,500. All series assume that life expectancy at birth will rise and attain levels of 80.1 years for males and 84.0 years for females by 30 June 2021.

This analysis uses Series A and C to show a range of the projected populations. To simplify the analysis, the medium series, Series B, has been chosen in almost all instances to illustrate in graphs.

POPULATION SIZE

Tasmania's population is projected to change from the 30 June 1999 population of 470,800 to between 434,500 and 479,300 by 30 June 2021. Under Series A, the population would continue to grow, but at declining rates, reaching its peak a few years before the end of the projection period before declining to 479,300 by 30 June 2021. Under Series B, the population would decline to 457,000 by 30 June 2021 with minor increases in 2003–04 and 2004–05. Series C, with the most pessimistic assumptions, would result in a population of 434,500 by 30 June 2021.

The higher negative growth rates reflect the fact that the level of net interstate migration accentuates the effect of the declining number of births combined with an increasing number of deaths.

POPULATION SIZE *continued***TOTAL POPULATION: Observed and projected—Tasmania**

GROWTH RATES

The growth rate of the population reflects the interaction of the components of growth—natural increase (the excess of births over deaths), net overseas migration and net internal migration.

Tasmania has experienced marginal population decline since 1996 compared to population growth nationally.

In Series A, Tasmania experiences a peak growth rate of 0.25% in 2003–04, which declines to –0.06% in the last three years of the projection period. The growth is sustained only by a lower interstate migration loss than in the other series.

In the other two series Tasmania's rate of decline reaches –0.32% by 2020–21 in Series B and –0.62% by 2020–21 in Series C.

PROJECTED SIZE AND GROWTH OF TASMANIA'S POPULATION

| 2010–2011 | 478.0 | 0.11 | 467.6 | -0.13 | 456.9 | -0.38 |
| 2015–2016 | 479.7 | 0.04 | 463.4 | -0.21 | 446.9 | -0.48 |
| 2020–2021 | 479.3 | -0.06 | 457.0 | -0.32 | 434.5 | -0.62 |

BIRTHS AND DEATHS

Natural increase is projected to remain the dominant component in any increase to Tasmania's population. In 1999–2000, there were 5,800 births and 3,700 deaths in Tasmania, resulting in a natural increase of 2,200 to the population. In 2020–21 there could be between 4,100 and 4,700 births and between 4,500 and 4,600 deaths, resulting in a natural increase of between –300 and 100. The increase in deaths is attributable to an ageing population and, in particular, by the progression of the large cohorts born during the post World War II 'baby boom' into these older age groups.

NET OVERSEAS MIGRATION

Net overseas migration is projected to be a minor component of population change for Tasmania throughout the projection period.

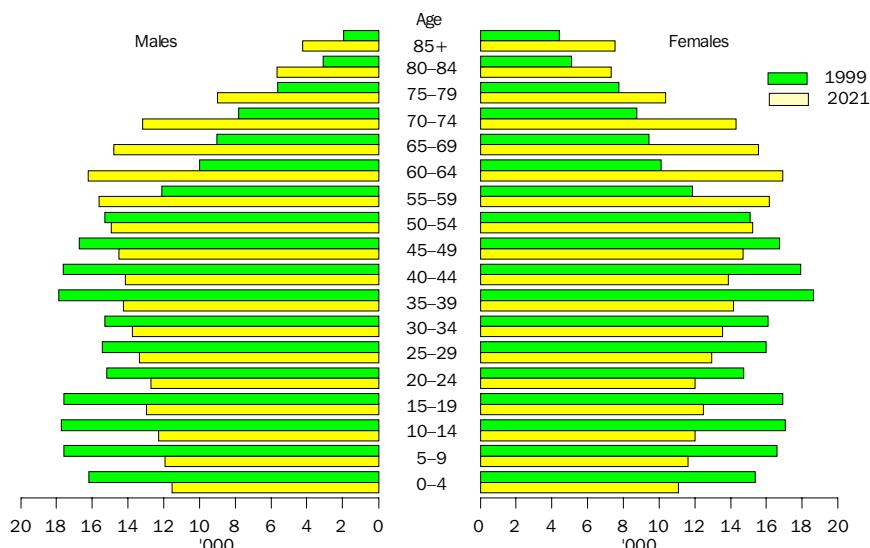

NET INTERSTATE MIGRATION

Net interstate migration is the most volatile component of population change for Tasmania. In Series A, net interstate migration for Tasmania is projected to decrease from –3,700 in 1998–99 to –500 by 2003–04 and then remain constant to the end of the projection period. In contrast, in Series B, net interstate migration will decrease to –1,500 by 2003–04 and in Series C to –2,500.

AGE STRUCTURE

Of all the changes that are projected to occur in Tasmania's population, ageing is the most dramatic, resulting in major changes to the age structure of the population.

The projections show that the ageing of the population, which is already evident, is set to continue. This is the inevitable result of fertility remaining at low levels over a long period while mortality rates decline. As Tasmania's population growth slows, the median age of Tasmanians will increase from 36.0 years at 30 June 1999 to 44–45 years by 30 June 2021.

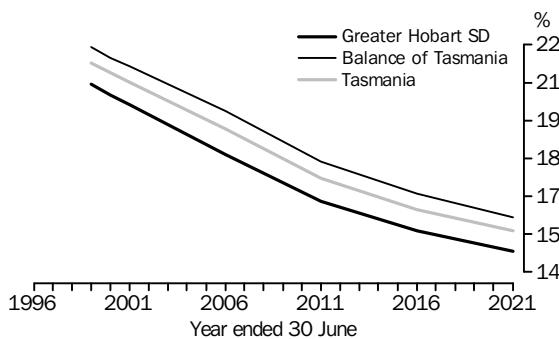

AGE STRUCTURE: Observed and projected, Series B—Tasmania

People aged 14 years and under

In Tasmania, the number of children aged 14 years and under is projected to change from 100,500 at 30 June 1999 to between 66,000 and 75,000 by 30 June 2021. As a proportion of the total population, this age group is projected to decline from 21% to 15–16% over the same period.

It is projected that both Greater Hobart SD and the balance of Tasmania will experience a similar decline in the proportion of their population aged 14 years and under. In Greater Hobart SD the proportion in this age group could decline from 21% of the population at 30 June 1999 to 15% by 30 June 2021, while in the balance of Tasmania the proportion could decline from 22% to 16% over the same period.

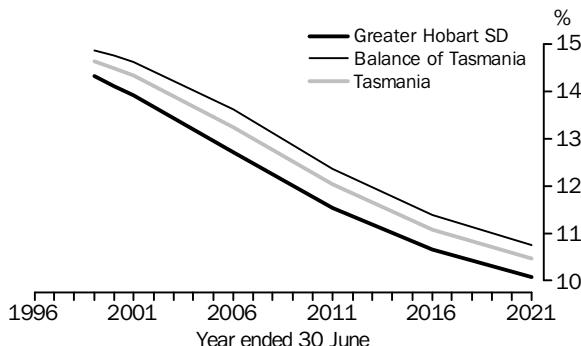

PROPORTION OF POPULATION AGED 14 YEARS AND UNDER: **Series B**

People aged 5–14 years

Changes in the number of persons aged 5–14 years, which closely aligns to the compulsory ages for schooling, in Tasmania will impact upon the provision of primary and secondary education. The proportion of young people in the population declines for all series. At 30 June 1999, this age group represented 15% of the population (69,000). By 30 June 2021, this is projected to drop to 10–11% of the population (between 45,000 and 51,000).

PROPORTION OF POPULATION AGED 5–14 YEARS: **Series B**

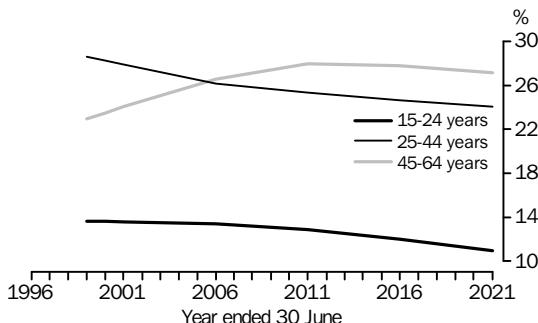

People aged 15–64 years

The population aged 15–64 years encompasses much of the working age population. In Tasmania this age group is projected to decrease from 307,000 at 30 June 1999 to between 269,000 and 300,000 by 30 June 2021. As a proportion of the total population, this age group is projected to decrease slightly from 65% at 30 June 1999 to 62–63% by 30 June 2021.

Similar proportions are projected for both Greater Hobart SD and the balance of Tasmania. In Greater Hobart SD the proportion of the population aged 15–64 is projected to decline slightly, from 66% at 30 June 1999 to 63–64% by 30 June 2021. The balance of Tasmania is projected to decrease from 65% at 30 June 1999 to 61% by 30 June 2021.

The proportion of Tasmania's population aged 15–24 years is projected to decline substantially under all three series from 14% to 11%. The proportion aged 25–44 years is also projected to decline, from 29% to 23–25% over the same period. In contrast, the proportion aged 45–64 is projected to increase from 23% at 30 June 1999 to 27% by 30 June 2021.

PROPORTION OF POPULATION AGED 15–64 YEARS: Series B—Tasmania

People aged 65 years and over

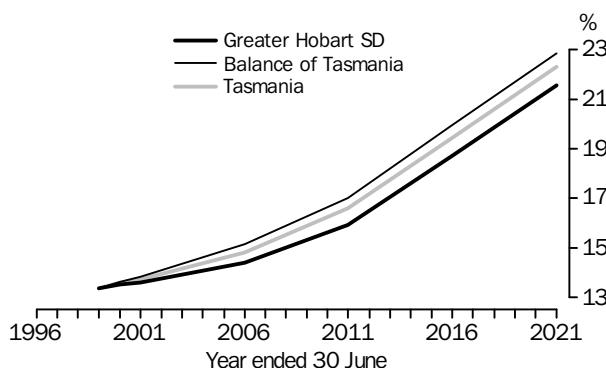

Significant growth is projected for the older age groups in Tasmania. The number of persons aged 65 years and over could increase from 63,000 at 30 June 1999 to between 100,000 and 104,000 by 30 June 2021. As a proportion of the total population, persons aged 65 years and over would have almost doubled from 13% to 22–23% over the same period.

In Greater Hobart SD the number of persons aged 65 years and over could increase from 26,000 at 30 June 1999 to between 40,000 and 42,000 by 30 June 2021. The proportion in this age group in Greater Hobart SD could increase from 13% to 21–22% over the same period.

The balance of Tasmania is projected to experience a similar increase in the number of persons aged 65 years and over, increasing from 37,000 at 30 June 1999 to between 60,000 and 62,000 by 30 June 2021. The proportion of the population in this age group is projected to almost double from 13% to 22–24% over the same period.

People aged 65 years and over continued

PROPORTION OF POPULATION AGED 65 YEARS AND OVER: **Series B**

The very old population

At 30 June 1999, the population aged 85 years and over was relatively small, at 6,400, but it is projected to experience the highest growth rates of all groups within the population. Annual growth for this group will peak in 2005–06 at 5%. This peak represents the cohort of people born in 1921, part of the post World War I 'baby boom'.

Under all series, this group's size is projected to almost double by 30 June 2021 to between 11,600 and 12,000 (almost 3% of the total population). Growth of this magnitude has important implications for the provision of health services and appropriate housing, given that non-private dwellings are the most common form of housing for people in this age group.

The other noticeable change within this age group is the decreasing proportion of women, associated with the increase in life expectancy of men and the narrowing gap in life expectancy between men and women. The proportion of women in this age group is projected to fall from 70% currently to 64–65% by 30 June 2021.

EXPLANATORY NOTES

INTRODUCTION

- 1** This publication contains three series of population projections for Tasmania by Statistical Division (SD) and major urban areas for the period 30 June 1999 to 30 June 2021 and by Statistical Subdivision (SSD) and Statistical Local Area (SLA) for the period 1999 to 2006, 2011, 2016 and 2021. Population projections by age and sex are also included for Tasmania and all SLAs and LGAs for the period 1999 to 2006, 2011, 2016 and 2021.
- 2** Additional data relating to this series of projections, including population by sex and single years of age, can be obtained by contacting the ABS Information Service.

OBJECTIVES

- 3** The Australian Bureau of Statistics (ABS) has published three series of population projections for Tasmania and lower geographical levels in Tasmania to service the needs of users of population projections.
- 4** The projection results published by the ABS are not intended as predictions or forecasts, but are illustrations of growth and change in the population which would occur if the assumptions about future demographic trends prevail over the projection period.
- 5** While the assumptions for the projections are formulated on the basis of an assessment of past demographic trends, both in Australia and overseas, there is no certainty that any of the assumptions will or will not be realised. In addition, no assessment has been made of changes in non-demographic conditions such as major government policy decisions and economic factors which may affect future demographic behaviour.
- 6** Accordingly, three projection series have been provided in recognition of this uncertainty and to provide users with a range of options.

DEVELOPMENT

- 7** The process of developing population projections involves research, analysis, consultation and computation. Analysis of demographic trends, research into the determinants of population growth and distribution, and consultation with government at both national and State levels are necessary to formulate the various assumptions and to ensure their general relevance for the projection period.
- 8** Consultation has been ongoing with the Tasmanian Government. Assumptions initially specified in a Memorandum of Understanding were refined and finalised for the three series of population projections. One assumption was used for fertility, mortality and overseas migration and three assumptions were used for internal migration.

PROJECTION TECHNIQUES

9 There are many techniques which may be used for population projections, ranging from simple extrapolations through broad economic, social and time-series analysis to detailed component methods. The ABS uses the cohort-component method, which begins with a base population for each sex by single years of age and advances it year by year by applying assumptions regarding future mortality and migration. Assumed age-specific fertility rates are applied to the female populations of child-bearing ages to provide the new cohort of births. This procedure is repeated for each year in the projection period for Tasmania. It is also repeated to obtain projections by Statistical Division and capital city/balance for Tasmania, while constraining annually by age and sex to the Tasmanian projections. The technique was also used for population projections at the Statistical Local Area level, with the assumptions taking into account major economic activities that are likely to impact on the population of SLAs in the next 10 years.

10 Projections of SLAs with very small populations often significantly diverge from what the future actually holds. The cohort-component projection method employed uses the population by single year of age and sex, but when most of the cells are between 0 and 2 the generation of robust assumptions and a plausible age-sex projection is extremely difficult. Accordingly, the SLAs of Hobart Inner and Launceston Inner were held constant for the duration of the projection period.

ASSUMPTIONS

Fertility

11 Single year age-specific fertility rates for Tasmania were calculated by applying the 1996–1998 ratios of Tasmania to Australian age-specific fertility to the low Australian fertility assumption. This assumption assumes fertility declines to 1.67 babies per woman by 2007–08 for Tasmanian mothers and then remains constant to the end of the projection period.

12 Age-specific fertility rates for Hobart capital city and the balance of Tasmania were calculated by applying fertility differentials for each single year of age to the assumed age-specific fertility rate for Tasmania for each year in the projection period. Fertility differentials for Hobart capital city and the balance of Tasmania were assumed to be the average differential of the years 1996–1998.

13 Fertility assumptions for SLAs were based on average age-specific fertility rates observed in each SLA between 1995 and 1999, projected to follow the assumed changes at the Tasmanian level until 2008 and then remain constant to 2021.

Mortality

14 Projected life expectancy at birth was based on the Australian trend in life expectancy at birth using five yearly intervals between 1985–1987 and 1995–1997 (centring on the population census years). From 1996–1998, male and female life expectancies for Australia were projected to increase by 0.30 and 0.22 years respectively, each year until 2001–2003, thereafter, life expectancy was assumed to increase at a diminishing rate.

Mortality continued

15 The pattern of decline in age–sex-specific death rates from 1970–1972 to 1995–1997 was assumed to continue from 1999 to 2021, within the constraints of the predetermined levels of life expectancy at birth. Where there was an upward trend in age–sex-specific death rates, some limitations were applied to prevent an increase in assumed future mortality rates for particular ages.

16 The mortality assumptions for Hobart capital city and the balance of Tasmania were based on the age-specific assumptions for Tasmania, adjusted for differences in historical life expectancy. The percentage differentials in life expectancy between Hobart capital city and the balance of Tasmania prevailing in 1996–1998 were maintained throughout the projection period.

17 The mortality assumptions for SLAs were based on the age-specific assumed mortality rates for Tasmania, adjusted across all ages to provide consistency with the overall mortality experienced in each SLA between 1995 and 1999.

Overseas migration

18 Tasmania's average share of Australia's net overseas migration for the three-year period 1996–97 to 1998–99 was used as the basis for calculating the share going to Tasmania during the projection period.

19 Net overseas migration to Tasmania was divided between the Hobart capital city and the balance of Tasmania based on the proportion of recent arrivals recorded in the 1991 and 1996 Censuses. The average of these two censuses was used to divide net overseas migration into overseas migration by Statistical Division.

20 The assumed age–sex structure of each overseas migration component for Tasmania was based on the average structure from 1996–97 to 1998–99. This varies during the projection period because the relative contribution of permanent and long-term components changes as long-term arrivals and departures increase from year to year. Age–sex profiles at the part of Tasmania level were derived from the 1996 Census question on residence one year ago. Overseas departures are assumed to have much the same age–sex distribution as overseas arrivals. These distributions were constrained to Tasmanian overseas arrivals and departures data for 1995–96. Age–sex profiles for category jumping are assumed to be the same as for permanent arrivals.

Internal migration

21 The long-term average net interstate migration experience of Tasmania was used as the basis for the medium assumption for Tasmania, with more weight given to the past 10 years. The high and low assumptions reflect the volatility in Tasmania's interstate migration data and give a plausible broad range of projection outcomes, particularly in the short term.

22 Net internal migration to Hobart capital city and the balance of Tasmania was based on historical trends. Historical net total migration was assumed to be the difference between population growth and natural increase. Net internal migration was assumed to be the difference between net total migration and net overseas migration.

23 Assumed age–sex profiles of future internal flows were derived from the 1996 Census distribution of internal movements in 1995–96, constrained to estimates for internal migration in 1995–96. Profiles for arrivals and departures were generated separately. Age–sex profiles were assumed to remain unchanged throughout the projection period.

GEOGRAPHIC BOUNDARIES

24 This publication contains data presented according to the geographic boundaries defined in *Australian Standard Geographical Classification (ASGC) 2000* (Cat. no. 1216.0).

25 Maps have been included on pages 99 and 100. However, a map showing all Statistical Local Areas for Tasmania has not. A copy is available from any ABS office or on the ABS Website at <URL: <http://www.abs.gov.au>> and accessing Statistics/Statistical Concepts Library/ABS Classifications.

ACKNOWLEDGMENT

26 ABS publications draw extensively on information provided freely by individuals, businesses, governments and other organisations. Their continued cooperation is very much appreciated: without it, the wide range of statistics published by the ABS would not be available. Information received by the ABS is treated in strict confidence as required by the *Census and Statistics Act 1905*.

GLOSSARY

| | |
|-------------------------------------|--|
| Age-specific death rates | Age-specific death rates are the number of deaths (occurred or registered) during the calendar year at a specified age per 1,000 of the estimated resident population of the same age at mid-point of the year (30 June). Pro rata adjustment is made in respect of deaths for which the age of the deceased is not given. |
| Age-specific fertility rates | Age-specific fertility rates are the number of live births (occurred or registered) during the calendar year, according to the age of the mother, per 1,000 of the female resident population of the same age at 30 June. For calculating these rates, births to mothers under 15 are included in the 15–19 age group, and births to mothers aged 50 and over are included in the 45–49 age group. Pro rata adjustment is made for births for which the age of the mother is not given. |
| Balance of State/Territory | The aggregation of all Statistical Divisions within a State or Territory other than its Capital City Statistical Division. (Further details are included in <i>Australian Standard Geographical Classification (ASGC) 2000</i> (Cat. no. 1216.0)). |
| Birth | The delivery of a child, irrespective of the duration of pregnancy, who, after being born, breathes or shows any other evidence of life such as a heartbeat. |
| Capital city | Capital cities refer to the '05' Statistical Division of States and Territories as defined in <i>Australian Standard Geographical Classification (ASGC) 2000</i> (Cat. no. 1216.0). |
| Category jumping | Category jumping is the term used to describe changes between intended and actual duration of stay of travellers to and from Australia, such that their classification as short-term or as long-term/permanent movers is different at arrival from that at departure. Category jumping consists of two components—an Australian resident component and an overseas visitor component. The Australian resident component of category jumping for a reference quarter is estimated by comparing the number of residents departing short-term in that quarter with all residents who left in that quarter and return in the following 12 months, to obtain the net number of Australian residents who jump category. Similarly, the number of overseas visitors arriving short-term in a quarter is compared with all overseas visitors who arrived in that quarter and depart in the following 12 months, to obtain the net number of overseas visitors who jump category. Estimates of category jumping are derived by subtracting the Australian resident component from the overseas visitor component. |

| | |
|--------------------------------------|--|
| Category of movement | Overseas arrivals and departures are classified according to length of stay (in Australia or overseas), recorded in months and days by travellers on passenger cards. There are three main categories of movement: <ul style="list-style-type: none"> ▪ permanent; ▪ long-term (one year or more); and ▪ short-term (less than one year). <p>A significant number of travellers (i.e. overseas visitors to Australia on arrival and Australian residents going abroad) state exactly 12 months or one year as their intended period of stay. Many of them stay for less than that period and on their departure from, or return to, Australia, are therefore classified as short-term. Accordingly in an attempt to maintain consistency between arrivals and departures, movements of travellers who report their actual or intended period of stay as being one year exactly are randomly allocated to long-term or short-term in proportion to the number of movements of travellers who report their actual length of stay as up to one month more, or one month less, than one year.</p> |
| Estimated resident population | The concept of estimated resident population (ERP) links people to a place of usual residence within Australia. Usual residence is that place where each person has lived or intends to live for six months or more in a reference year. The ERP is an estimate of the Australian population obtained by adding to the estimated population at the beginning of each period the components of natural increase (on a usual residence basis) and net overseas migration. For the States and Territories, account is also taken of the estimated interstate movements involving a change of usual residence. Estimates of the resident population are based on census counts by place of usual residence, to which are added the estimated net census undercount and Australian residents estimated to have been temporarily overseas at the time of the census. Overseas visitors in Australia are excluded from this calculation. |
| Infant mortality rate | After each census, estimates for the preceding intercensal period are revised by incorporating an additional adjustment (intercensal discrepancy) to ensure that the total intercensal increase agrees with the difference between the ERPs at the two respective census dates. |
| Intercensal discrepancy | The number of deaths of children under one year of age in a calendar year per 1,000 live births in the same calendar year. Intercensal discrepancy is the difference between two estimates of a census year population, the first based on the latest census and the second arrived at by updating the previous census date estimate with intercensal components of population change which take account of information available from the latest census. It is caused by errors in the start and/or finish population estimates and/or in estimates of births, deaths or migration in the intervening period which cannot be attributed to a particular source. |
| Life expectancy | Life expectancy refers to the average number of additional years a person of a given age and sex might expect to live if the age-specific death rates of the given period continued throughout his or her lifetime. |

| | |
|--------------------------------------|--|
| Long-term arrivals | Long-term arrivals comprise overseas visitors who intend to stay in Australia for 12 months or more (but not permanently) and Australian residents returning after an absence of 12 months or more overseas. |
| Long-term departures | Long-term departures comprise Australian residents who intend to stay abroad for 12 months or more (but not permanently) and overseas visitors departing who stayed 12 months or more in Australia. |
| Mean age | The average age of the population. |
| Median age | The age at which half the population is older and half is younger. |
| Natural increase | The excess of births over deaths. |
| Net internal migration | The difference between the number of persons who have changed their place of usual residence by moving into a defined geographical area and the number who have changed their place of usual residence by moving out of that defined geographical area during a specified time period. This difference may be either positive or negative. |
| Net interstate migration | The difference between the number of persons who have changed their place of usual residence by moving into a given State or Territory and the number who have changed their place of usual residence by moving out of that State or Territory. This difference may be either positive or negative. |
| Net overseas migration | Net overseas migration is net permanent and long-term overseas migration plus an adjustment for the effect of category jumping. |
| Permanent arrivals (settlers) | Permanent arrivals (settlers) comprise travellers who hold migrant visas (regardless of stated intended period of stay), New Zealand citizens who indicate an intention to settle and those who are otherwise eligible to settle (e.g. overseas-born children of Australian citizens). |
| | This definition of settlers is used by the Department of Immigration and Multicultural Affairs (DIMA). Prior to 1985 the definition of settlers used by the Australian Bureau of Statistics (ABS) was the stated intention of the traveller only. Numerically the effect of the change in definition is insignificant. The change was made to avoid the confusion caused by minor differences between data on settlers published separately by the ABS and the DIMA. |
| Permanent departures | Permanent departures are Australian residents (including former settlers) who on departure state that they are departing permanently. |
| Population growth | For Australia, population growth is the sum of natural increase and net overseas migration. For States and Territories, population growth also includes net interstate migration. After each census, intercensal population growth also includes an allowance for intercensal discrepancy. |
| Rate of population growth | Population change over a period as a proportion (percentage) of the population at the beginning of the period. |

| | |
|--|---|
| Replacement level fertility | Replacement level fertility is the number of babies a woman would need to have over her reproductive life span to replace herself and her partner. Given the current mortality of women up to age 49, replacement fertility is estimated at 2.1 babies per woman. |
| Short-term arrivals | Short-term arrivals comprise overseas visitors whose intended stay in Australia is less than 12 months and Australian residents returning after an absence of less than 12 months overseas. |
| Short-term departures | Short-term departures comprise Australian residents whose intended period of stay abroad is less than 12 months and overseas visitors departing who stayed less than 12 months in Australia. |
| State or Territory of usual residence | State or Territory of usual residence refers to the State or Territory of usual residence of: <ul style="list-style-type: none">▪ the population (estimated resident population);▪ the mother (birth collection); or▪ the deceased (death collection). In the case of overseas movements, State or Territory of usual residence refers to the State or Territory regarded by the traveller as the one in which he/she lives or has lived. State or Territory of intended residence is derived from the intended address given by settlers, and by the Australian residents returning after a journey abroad. Particularly in the case of the former, this information does not necessarily relate to the State or Territory in which the traveller will eventually establish a permanent residence. |
| Total fertility rate | The sum of age-specific fertility rates (live births at each age of mother per female population of that age). It represents the number of children a woman would bear during her lifetime if she experienced current age-specific fertility rates at each age of her reproductive life. |
