KEY POINTS

TREND ESTIMATES

not applicable

- The trend estimate for short-term visitor arrivals to Australia during November 2005 (453,600 movements) decreased by 0.4% compared with October 2005. This followed monthly decreases of 0.1% for September 2005 and 0.3% October 2005.
- Currently, short-term visitor arrivals are 0.7% lower than when the series last peaked in August 2005 (456,800 movements) and 0.8% higher than in November 2004.
- During November 2005, short-term resident departures (390,700 movements) decreased by 0.1% compared with October 2005 (391,200 movements). This followed little change for September 2005.
- Due to the decline in short-term resident departures to Indonesia following the 1 October 2005 bombing in Bali, a trend break has been introduced. See NOTES (page 2) and Explanatory Note 22.

SEASONALLY ADJUSTED ESTIMATES

- Seasonally adjusted estimates for short-term visitor arrivals during November 2005 (441,100 movements) decreased by 4.0% compared with October 2005. This followed a monthly decrease of 2.0% for September 2005 and a monthly increase of 0.6% for October 2005.
- Short-term resident departures for November 2005 (392,000 movements) increased by 2.1% compared with October 2005 and followed a monthly increase of 2.4% for September 2005 and a monthly decrease of 6.1% for October 2005.

ORIGINAL ESTIMATES

 In original movement terms, there were 472,700 short-term visitor arrivals to Australia and 358,800 short-term resident departures from Australia during November 2005.

MAIN FEATURES

SHORT-TERM VISITOR ARRIVALS

In trend terms, short-term visitor arrivals to Australia in November 2005 (453,600 movements) are 0.8% higher than in November 2004. Movements for November 2005 show the third consecutive decrease in the series. Short-term visitor arrivals are currently 0.7% lower than when the series last peaked in August 2005 (456,800 movements).

The following table presents the top ten source countries (based on original estimates) for short-term visitor arrivals during November 2005. Seasonally adjusted and trend estimates are also presented for these countries, along with the percentage change in trend compared with October 2005 and November 2004.

SHORT-TERM VISITOR ARRIVALS, Major Source Countries—November 2005

	Trend	Seasonally Adjusted	Original	Oct 05 to Nov 05	Nov 04 to Nov 05
				Trend %	Trend %
	'000	'000'	'000'	change	change

SHORT-TERM RESIDENT DEPARTURES

In trend terms, short-term resident departures from Australia in November 2005 (390,700 movements) are 3.1% higher than in November 2004 and 0.1% lower than in October 2005. The series last peaked in September 2005 (401,500 movements). A trend break was introduced from October 2005 (see Explanatory Note 22).

The following table presents the top ten destinations (based on original estimates) for short-term resident departures during November 2005. Seasonally adjusted and trend estimates are also presented for these countries, along with the percentage change in trend compared with October 2005 and November 2004.

SHORT-TERM TRAVEL — SOUTH AFRICA Short-term visitor arrivals

Trend estimates for November 2005 show the number of short-term visitor arrivals from South Africa represented 1% (4,400 movements) of all short-term visitor arrivals to Australia. The series has shown fluctuations over the past ten years. The highest point in the trend series was in December 1998 (5,500 movements), while the lowest point was in November 1995 (3,000 movements). The November 2005 trend estimate for arrivals from South Africa was 1% higher than for October 2005 and 8% higher than in November 2004.

The large November 2003 peak in the seasonally adjusted series is associated with the Rugby World Cup held in Australia in late 2003.

SOUTH AFRICA, Short-term Visitor Arrivals

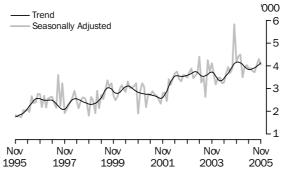

In original terms, short-term visitor arrivals from South Africa in November 2005 stated visiting friends and relatives (38%) as the main reason for journey, followed by holiday (29%) and business (19%). The main reasons for all short-term visitors to Australia were holiday (54%), visiting friends and relatives (19%) and business (13%). The median age of visitors from South Africa was 44 years (41 years for all visitors) while the median intended duration of stay was 20 days (9 days for all visitors).

New South Wales (33%), Western Australia (27%), Queensland (19%) and Victoria (17%) were the main states/territories of intended stay for short-term visitors from South Africa in November 2005. The main destinations for all short-term visitors to Australia were New South Wales (39%), Queensland (27%), Victoria (19)% and Western Australia (10%).

Short-term residentTrend estimates show the number of short-term residents departing Australia for South
Africa represented 1% (4,100 movements) of all short-term resident departures in
November 2005. While the series has shown fluctuations over the past ten years it has
generally followed an upward trend. The highest point in the series was in December
2004 (4,200 movements) while the lowest point was in November 1995 (1,700
movements). The November 2005 trend estimate for departures to South Africa was 2%
higher than for October 2005 and 1% lower than for November 2004.

Short-term resident departures continued

SOUTH AFRICA, Short-term Resident Departures

In original terms, 42% of Australian residents travelling to South Africa in November 2005 stated visiting friends and relatives as their main reason for journey, followed by holiday (36%) and business (11%). For all residents departing Australia short-term the main reasons for journey were holiday (41%), visiting friends and relatives (26%) and business (19%). The median age of residents departing to South Africa was 40 years (41 years for all residents) while the median intended duration of stay was 27 days for residents departing to South Africa, compared with 14 days for all residents departing short-term.

PERMANENT ANDThere were 10,800 permanent (settler) arrivals to Australia during November 2005, anLONG-TERM MOVEMENTSincrease of 14.0% when compared with November 2004 (9,470 movements). People born
in the United Kingdom accounted for the largest proportion of settlers (20%), followed
by people born in New Zealand (12%) and India (7%).

There were 4,750 Australian residents departing permanently from Australia during November 2005, an increase of 3.3% when compared with November 2004 (4,600 movements).

Statistics on overseas arrivals and departures relate to the number of movements of travellers rather than the number of travellers. Therefore, care should be taken when using long-term movements data as it is known that some individuals who travel multiple times in a year are counted each time they cross Australia's borders (see paragraph 5 of the Explanatory Notes). Long-term movements in this publication are not an appropriate source of migration statistics. For further information refer to *Australian Demographic Statistics* (cat. no. 3101.0).

STATISTICAL SIGNIFICANCE The above presentation of movements in estimates does not take into account whether the change in movement is statistically significant. Care should be taken when interpreting the impact of numeric and/or percentage change. Please see the Standard Errors section of this issue for more detail.

SEASONALLY ADJUSTED AND TREND ESTIMATES

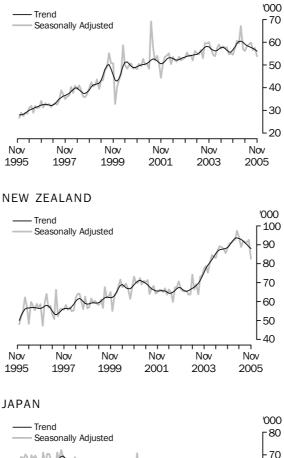

INTRODUCTION

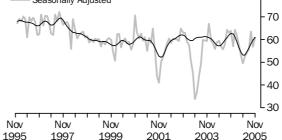

Seasonally adjusted and trend estimates add to the understanding of overseas arrivals and departures (OAD) statistics. Seasonally adjusted estimates allow users to analyse short-term movements including irregular impacts on the series, while trend estimates provide a better method to analyse and monitor the underlying direction of the short-term movement series. In most cases the trend series is the best source of information on the long-term direction of these statistics.

SHORT-TERM VISITOR ARRIVALS Selected source countries

The graphs presented below illustrate the long-term increase in the trend series for arrivals from the United Kingdom and the recent decline in arrivals of short-term visitors from New Zealand. The graph for Japan shows the significant impact of Severe Acute Respiratory Syndrome (SARS) on the seasonally adjusted arrivals series in mid-2003.

UNITED KINGDOM

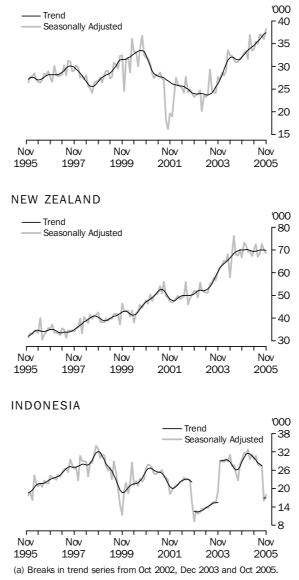

SHORT-TERM RESIDENT DEPARTURES Selected destinations

For residents departing to the United States of America the graph illustrates the effect of the 11 September 2001 terrorist attacks in that country on short-term departures of Australian residents to the United States of America. The graph for New Zealand illustrates that departures of Australian residents, which had been experiencing strong growth since May 2003, have plateaued over recent months. For Indonesia the graph shows the impact of the 12 October 2002 Bali bombing and the reduced level of travel experienced in the next twelve months. The effect of the 1 October 2005 Bali bombing is also evident and a new break in the trend series has been introduced.

EXPLANATORY NOTES

INTRODUCTION	1 This publication contains statistics of persons arriving in, and departing from, Australia, together with the major characteristics of travellers. More detailed statistics can be made available on request (see paragraph 28).
SOURCE OF THE STATISTICS	2 Persons arriving in, or departing from, Australia provide information in the form of incoming and outgoing passenger cards (see Appendix 1). Incoming persons also provide information in visa applications (apart from people travelling as Australian or New Zealand (NZ) citizens). These and other information available to the Department of Immigration and Multicultural and Indigenous Affairs (DIMIA) serve as a source for statistics of overseas arrivals and departures (OAD).
	3 In July 1998, DIMIA revised the incoming and outgoing passenger cards and associated procedures as well as computer systems. Following these changes, some questions on the passenger cards were not compulsory and answers to these questions were not checked by Customs officers. The question on marital status was deleted. Data on marital status is now derived from visa applications (only for certain visa classes) and is therefore not available for Australian or NZ citizens. The changes also affect the data for 'previous country of residence' which is imputed for Australian and NZ citizens. For more information see the May 1998 issue of this publication. Since July 1998, there have been additional minor changes to both incoming and outgoing passenger cards.
	4 From July 2001, DIMIA adopted a new passenger card processing system which involved electronic imaging of passenger cards and intelligent character recognition of the data stored in the images. This process has yielded several improvements to the processing of passenger card data, most notably the detailed information about missing values. There have also been several changes to data quality. Information on these changes appears in Appendix 2.
SCOPE	5 The statistics in this publication relate to the number of movements of travellers rather than the number of travellers (i.e. multiple movements of individual persons during a given reference period are each counted separately). The statistics exclude the movements of operational air and ships' crew, transit passengers who pass through Australia but are not cleared for entry, passengers on pleasure cruises commencing and finishing in Australia, and unauthorised arrivals.
STATE AND TERRITORY CLASSIFICATION	6 Following the 1992 amendment to the <i>Acts Interpretation Act</i> to include the Indian Ocean Territories of Christmas Island and the Cocos (Keeling) Islands as part of geographic Australia, population estimates commencing with September quarter 1993 include estimates for these two territories. To reflect this change, another category of the state/territory classification has been created, known as Other Territories. Other Territories includes Jervis Bay Territory, Christmas Island and the Cocos (Keeling) Islands. OAD data for Other Territories are not available prior to February 1995.
COUNTRY CLASSIFICATION	7 The classification of countries in this publication is the Standard Australian Classification of Countries. For more detailed information refer to the ABS publication <i>Standard Australian Classification of Countries</i> (SACC) (cat. no. 1269.0).
	8 The statistics on country of birth, citizenship, residence or main destination have certain limitations because of reporting on passenger cards. For instance, United Kingdom includes England, Scotland and Wales. Similarly Korea includes both the Republic of Korea and the Democratic People's Republic of Korea.
	9 A large number of short-term residents departing state Europe as their main destination on the passenger card. These responses are grouped into inadequately described, unless otherwise indicated.

EXPLANATORY NOTES *continued*

ESTIMATION METHOD	10 OAD statistics are derived from a combination of full enumeration and sampling. All permanent movements and all movements with a duration of stay of one year or more are fully enumerated. All movements with a duration of stay of less than one year are sampled. Statistics relating to these movements are therefore estimates which may differ from statistics which would have been obtained if details of all these movements had been processed. Sample standard errors can be found in the Standard Errors section of this publication.
	11 Since January 1997 variable sample skips were used in the selection of records to be sampled. Separate skips were applied for each country of citizenship. Over a year about 3.5% of all short-term movements were selected for sampling. However, for operational reasons variable skips across months were ceased from August 2000. From January 2005, 4.9% of all short-term movements have been selected for sample. The skip values correspond to the lowest skip value (i.e. the highest sample selected) for each country from a sample design including individual month and direction of travel as sub-categories.
	12 The statistics in this publication have been rounded to the nearest 100 for short-term movements and to the nearest 10 for permanent and long-term movements. As a result, sums of the components may not add exactly to totals. Analysis featured in the Key Points and Main Features of this publication is based on unrounded data. Calculations made on rounded data may differ to those published.
CORRECTIONS AND IMPUTATIONS	13 The imprecision due to sampling errors should not be confused with errors arising from imperfections in reporting, which may occur in any data collection, whether sampled or not. Every effort is made to minimise such errors, both through careful design of the passenger cards and through checks on the information once it is received. During the edit process some items are corrected where they conflict with other known information. Missing replies to certain items such as age, state and country of stay/residence are also imputed by reference to other related items. Information on non-response rates and data imputation appears in Appendix 2.
	14 Errors of this kind differ from discrepancies arising from the fact that certain information reflects the travellers' intentions at the time the passenger cards were completed. These intentions are, of course, subject to change. Particularly affected is the distinction between permanent and temporary movement and in the latter case, length of intended stay, country in which most time will be spent and main reason for journey.
SEASONAL ADJUSTMENT AND TREND ESTIMATES	15 Seasonally adjusted and trend estimates of short-term overseas movements are shown in tables 1, 2, 3, 4, 7 and 8.
	16 Seasonally adjusted estimates are derived by estimating and removing systematic calendar related effects from the original series. In the short-term visitor arrival and short-term resident departure series, these calendar related effects are known as seasonal (e.g. increased travel in December due to the Christmas holiday period) and trading day influences (arising from the varying length of each month and the varying number of Sundays, Mondays, Tuesdays, etc. in each month). Each influence is estimated by separate seasonal and trading day factors which, when combined, are referred to as the combined adjustment factors.
	17 From November 2004 ABS has introduced an improved method for removing trading day effects from seasonally adjusted estimates. Corrections for trading day effects are now applied as prior corrections to the original estimates, rather than being applied within the seasonal adjustment process. This is now consistent with the treatment of any corrections for large extremes, changes in level, changes in seasonal pattern, Easter, and other effects. This change in methodology will result in revisions to seasonally adjusted and trend estimates. From July 2003 concurrent seasonal adjustment methodology has

SEASONAL ADJUSTMENT AND TREND ESTIMATES continued

been used to derive the combined adjustment factors. This means that data from the current month are used in estimating seasonal and trading day factors for the current and previous months. Concurrent seasonal adjustment replaces the forward factor methodology used since seasonal adjustment of short-term visitor arrivals began in 1969 and short-term resident departures in 1976.

18 Concurrent adjustment can result in revisions each month to the seasonally adjusted estimates for earlier periods. However, in most instances, the only noticeable revisions will be to the combined adjustment factors for the current month, the previous month and the same month a year ago. Although there is no specific Information Paper on concurrent adjustment to short-term visitor arrivals or resident departures, more detail on the method in general can be found in the *Information Paper: Introduction of Concurrent Seasonal Adjustment into the Retail Trade Series* (cat. no. 8514.0).

19 Seasonal adjustment procedures do not aim to remove the irregular or non-seasonal influences which may be present in any particular month, such as the effect of major sporting and cultural events, changes in airfares and the fluctuation of the Australian dollar relative to other currencies. Irregular influences that are highly volatile can make it difficult to interpret the movement of the series even after adjustment for seasonal variation. Trend estimates take these irregular influences into account.

20 The trend estimates of short-term overseas visitor arrivals and short-term Australian resident departures are derived by applying a 13-term Henderson-weighted moving average to all months of the respective seasonally adjusted series except the first and last six months. Trend series are created for the last six months by applying surrogates of the Henderson weighted moving average to the seasonally adjusted series.

21 While this technique enables smoothed data for the latest period to be produced, it does result in revisions to the smoothed series, principally of recent months, as additional observations become available. There may also be revisions as a result of the re-estimation of the seasonal factors. For further information, see *A Guide to Interpreting Time Series—Monitoring Trends* (cat. no. 1349.0).

22 Occasionally situations occur that necessitate breaks being applied to the trend series. These breaks are necessitated because of a change in the underlying level of the original series. While the breaks apply to an individual country (e.g. Indonesia) a consequence is that breaks are also applied to the regional total series (e.g. Total South-east Asia) and the total series (e.g. Total). Breaks currently included in the trend series are as follows:-

- October 2002: Short-term resident departures Indonesia, Total South-east Asia and Total — Trend series breaks due to the decrease in movements resulting from the Bali bombing of 12 October 2002.
- December 2003: Short-term resident departures Indonesia, Total South-east Asia and Total — Trend series breaks due to a return to the trend levels experienced prior to the Bali bombing of 12 October 2002.
- October 2005: Short-term resident departures Indonesia, Total South-east Asia and Total — Trend series breaks due to the decrease in movements resulting from the Bali bombing of 1 October 2005.

23 An improved correction method has been implemented in the seasonal adjustment process, to remove the effects of Chinese New Year and Ramadan from the seasonally adjusted estimates.

EXPLANATORY NOTES continued

SEASONAL ADJUSTMENT AND TREND ESTIMATES continued

- Chinese New Year Chinese New Year often falls in February but on some occasions falls in January. The movement of Chinese New Year between the boundary of January and February can cause biased seasonally adjusted and trend estimates. The previous correction method for Chinese New Year assumed that all of the activity due to the holiday fell in the month in which it started. However, it has been shown that the occurrence of Chinese New Year causes an increase in activity leading up to the holiday period and then a gradual decrease in activity during the holiday period. A proximity correction method has been implemented, which assumes a quadratic increase in activity in the seven days leading up to the holiday and then a quadratic decrease in activity in the six days after the date of Chinese New Year. This method is similar to that used for Easter proximity corrections (Zhang, McLaren, Leung, 2001, Australian Journal of Statistics, Volume 43, No. 3).
- *Ramadan* Ramadan is the ninth month of the Islamic calendar and starts eleven days earlier each year in the Western calendar, so adjustments for this effect apply to different months over the years. The adjustment was made after the detection of a significant influence on travel for Malaysia and Indonesia associated with the end of the Islamic month of Ramadan. The estimates for Total South-east Asia were also corrected as a consequence of the Malaysia and Indonesia series corrections. Other time series did not have a significant Ramadan effect and were not corrected.

24 For a detailed discussion and analysis of OAD time series estimates, see the *ABS Demography Working Paper 2004/2 – Interpretation and Use of Overseas Arrivals and Departures Estimates* (cat. no. 3106.0.55.002), available on the ABS web site.

REFORMATTED PUBLICATION	29 A number of changes were introduced in the August 2004 issue of this publication. Changes included the introduction of four new tables (tables 3, 4, 7 and 8), a new table structure and a reformatting of the time periods presented in tables 3 to 12. The key figures, key points and main features were also redesigned to give more focus to trend estimates. For more detail about these changes, refer to the Demography Theme Page on the ABS web site.
ACKNOWLEDGMENTS	30 This publication draws extensively on information provided by DIMIA. This continued cooperation is very much appreciated; without it, the statistics published would not be available. Information received by the ABS is treated in strict confidence as required by the <i>Census and Statistics Act 1905</i> .

APPENDIX 2 DATA QUALITY ISSUES

.

.

.

SCANNING AND IMAGING	The introduction of a new passenger card processing system from July 2001 has meant that information is now available on the frequency and impact of data item imputation. Much of this information has not been available previously. Additionally, the move to a new processing system has also given rise to new data quality issues directly associated with scanning and imaging.
DEFECTIVE CARDS	There are a small number of unreadable or damaged passenger cards for each month. The Australian Bureau of Statistics (ABS) receives a count of these cards from the Department of Immigration and Multicultural and Indigenous Affairs (DIMIA) by movement direction, box type (category of traveller) and port of clearance. The information on these cards is then physically processed by the ABS and included in the estimates presented here.
DURATION OF STAY	From July 1998 DIMIA has been able to determine the actual length of stay for departing overseas visitors and arriving Australian residents which was previously collected from information on intended length of stay supplied on the arrival and departure card by the passenger. This new method has resulted in a change in data distribution with the number of passengers staying for one year exactly declining significantly when compared with movements prior to July 1998.
	The introduction of the new passenger card processing system from July 2001 has shown further evidence of rounding to exactly one year in intended duration of stay/travel as reported by visitors arriving in Australia and Australian residents departing the country. To reflect the historical movement patterns, the records with a reported duration of exactly one year are allocated to short-term and long-term. For visitors, 75% of such records are allocated to short-term and 25% to long-term. The ratio is 67:33 for residents departing Australia.
TRIPS AND MATCHING OF MOVEMENTS ON THE SECOND LEG OF TRAVEL	Each month there are records for long-term residents returning to Australia and long-term visitors departing Australia which could not be matched with DIMIA's Travel and Immigration Processing System (TRIPS) records. Records which did not match with a passenger card have been created directly from TRIPS and added to the ABS processing system.
NEW ZEALAND CITIZENS	Under the Trans-Tasman Agreement, New Zealand (NZ) citizens are not required to have a visa to travel to Australia. As a result, on arrival in Australia their visa documentation cannot be used to determine whether they are either a permanent migrant or a temporary visitor, or an Australian resident returning from NZ. DIMIA believes that a substantial proportion of holders of NZ passports tick Box A (migrating to Australia) each time they arrive in the country, causing an overcount of NZ migrants entering Australia.
	The following edits were applied to correct the overcounting of NZ migrants:
July 2001 to June 2002	With the introduction of the new processing system from July 2001, DIMIA coded all NZ citizen arrivals who had ticked Box A and had been to Australia previously (based on immigration records) to resident returning (Box C). If these people were visitors previously, this recoding had the effect of incorrectly reducing the number of NZ migrants whilst at the same time incorrectly increasing the number of NZ citizen returning residents. This problem was overcome by moving the NZ citizens that have been changed by DIMIA from Box A to Box C back to Box A.

APPENDIX 2 DATA QUALITY ISSUES continued

.

July 2002 onwards	From July 2002, DIMIA has introduced a new e Arrivals of NZ citizens statistics. 	are now separately available from rebruary 17;	// Onwards.		

STATE WHERE SPENT MOST For the months of August 1998, September 1998 and October 1998, data entry problems TIME experienced by DIMIA caused an overstatement of the Northern Territory as the main state of stay with a corresponding understatement for the remaining states and territories. In November 1998 these numbers returned to levels more comparable with previous years, with DIMIA indicating that they had instigated data quality procedures to address this issue. From the January 1999 issue of this publication, published figures (table 11 in this issue) referencing these months were revised. The revised data were calculated by estimating the number of persons indicating the Northern Territory as their main state of stay using past trends and proportionally allocating any persons in excess of these estimates amongst the remaining states and territories. With the introduction of the new processing system from July 2001, DIMIA has provided the ABS with data on all missing values of state of stay and state of usual residence. These missing values are now imputed. DATA IMPUTATIONS Data was imputed for non-response for state of stay/residence. For state of stay, non-responses were imputed at the category of traveller and state of clearance level. Non-response rates for state of stay are presented in the table below: NON-RESPONSE RATES FOR STATE OF STAY BY CATEGORY OF A2 TRAVELLER(a)

	November 2005
Category of traveller	%
Permanent arrivals – settlers	6.0
Long-term residents returning	1.3
Long-term visitors arriving	4.2
Short-term residents returning	0.4
Short-term visitors arriving	5.9
Residents departing permanently	2.4
Long-term residents departing	2.8
Long-term visitors departing	3.3
Short-term residents departing	1.7
Short-term visitors departing	7.7

(a) Non-response rates are weighted.

Non-responses for country of stay and country of usual residence were imputed in two stages. In the first stage, records with country of stay/residence missing were set to country of disembarkation/embarkation if a response was available. In the second stage, for remaining records where country of stay/residence was missing, values were imputed at the category of traveller, reason for journey and country of citizenship level based on responses to other cards within each subgroup. Accordingly, the level of records with data for country of stay/residence not stated has been minimised.

A procedure has been applied before prorating of a non-response to state of stay for long-term visitor departures. If a correction to the box marked by a passenger is made (e.g. a visitor marks a resident box), the state of stay recorded in the incorrect box is applied.

Country of stay

	SARs and Taiwan) and Hong Kor	ng (SAR of China) in September 1995 to September 1998.	

.

SEPTEMBER QUARTER 2000 PROCESSING	A processing error was identified which affected the distribution of short-term resident departures by reason for journey for the months of August and September 2000. Affected data was re-processed, and a revised copy of table 3 for the September quarter 2000 was reissued in the supplement October to December 2000 issue of this publication.
CHANGE TO PROCESSING OF INTENDED LENGTH OF STAY	There is evidence to suggest that when completing the intended length of stay question on the incoming passenger card (Box B), some passengers are entering their arrival/departure date or their birth date rather than their intended length of stay.
	From September 2003 a rule has been implemented to the data processing system stating that if all three elements are complete (years, months and days), then the intended length of stay is to be coded to a non-response. The ABS currently assigns 'not stated' duration as a short-term movement, however a review of this procedure will be undertaken in the near future.
	This procedure changes the prior data processing system which read only the years from the field on the passenger cards. The previous data processing system could have added

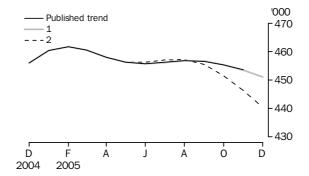

the field on the passenger cards. The previous data processing system could have added to overestimation of the number of long-term visitor arrivals.

TECHNICAL NOTE TREND REVISIONS

EFFECT OF NEW SEASONALLY ADJUSTED ESTIMATES ON TREND ESTIMATES

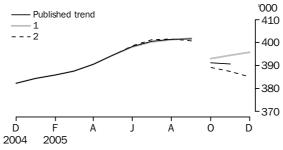

1 The most recent trend estimates for short-term visitor arrivals and short-term resident departures are likely to be revised when the next month's seasonally adjusted estimates become available. To assist readers of this publication in analysing short-term movement trends, the approximate effect of two possible scenarios on the previous trend estimate of short-term visitor arrivals and resident departures are presented below. Visitor arrivals

- 1 The November seasonally adjusted estimate of visitor arrivals is 2.9% higher than October.
- 2 The November seasonally adjusted estimate of visitor arrivals is 2.9% lower than October.

Resident departures

- 1 The November seasonally adjusted estimate of resident departures is 3.1% higher than October.
- 2 The November seasonally adjusted estimate of resident departures is 3.1% lower than October.

Break in series from October 2005.

2 The figures of 2.9% for visitor arrivals and 3.1% for resident departures were chosen because they represent the average absolute monthly percentage change for visitor arrivals and resident departures over the last ten years, respectively.

3 Under concurrent seasonal adjustment, the most recent seasonally adjusted and trend estimates are likely to be revised when original estimates for subsequent months become available. The trend revision is a combined result of the revision of the seasonally adjusted estimates and the revision derived from the use of asymmetric moving averages as future data become available. ABS research shows that about 75% of the total revision to the trend estimate at the current end of the time series is due to the use of different asymmetric moving averages when the original estimate for the next time period becomes available. To assess the reliability of the trend estimate at the current end, the 'what-if' charts present trend estimates under two different scenarios for the next time period. The charts show only the impact due to the changes of the asymmetric moving averages and do not include the unknown impact of revision to seasonal factor estimates that would arise when the original estimate for the next time period becomes available.

STANDARD ERRORS

RELIABILITY OF ESTIMATES

Estimates based on a sample are subject to sampling variability, that is, they may differ from those that would be obtained from full enumeration.

The sampling error associated with any estimate can be estimated from the sample results and one measure so derived is the standard error. Given an estimate and the standard error on that estimate, there are about two chances in three that the sample estimate will differ by less than one standard error from the figure that would have been obtained from full enumeration, and about nineteen chances in twenty that the difference will be less than two standard errors. The relative standard error is the standard error on the estimate expressed as a percentage of the estimate.

It would be impractical to publish estimates of standard errors for all figures in individual tables. However, the following table of standard errors and relative standard errors gives an indication of the magnitude of the sampling error associated with any estimate of a particular size for short-term and total movement.

APPROXIMATE STANDARD ERROR ON ESTIMATES FOR STRATIFIED SAMPLE

100	71	70.6	52	51.8	58	58.3

An example of the use of this table is as follows. If the estimate of the number of Australian resident departures for short-term visits abroad is 1,000, then the standard error on this estimate is 219 i.e. there are two chances in three that the actual number of Australian resident departures for short-term visits abroad will lie between 781 and 1,219 and nineteen chances in twenty that it will lie between 562 and 1,438.

The larger the size of an estimate the smaller the relative standard error. For any estimate of greater than 5,000,000 the relative standard error will be less than 0.2%.

The estimate of the difference between an estimate in two different periods, or between different estimates from the same period, is also subject to sampling error. The standard error on the difference between any two estimates which are subject to sampling error can be approximated by using the larger standard error of the estimates inflated by a factor of 1.4.

STANDARD ERRORS continued

RELIABILITY OF ESTIMATES continued

An example of the use of this procedure is as follows. Assume the estimates of the number of arrivals to Australia from Germany during January 2004 and January 2005 are 7,500 and 10,000 respectively. The difference between the 2004 and 2005 figure is 2,500 and the standard errors on these estimates are approximately 392 and 455. The standard error on the difference is approximately 637 (1.4×455), and there are nineteen chances in twenty that the estimate of the difference between the two years will lie between 1,226 and 3,774.

.

GLOSSARY

Australian resident	Australian residence is self-defined as reported by travellers when completing Incoming and Outgoing Passenger Cards.
Category of movement	 Overseas Arrivals and Departures are classified according to length of stay (in Australia or overseas), recorded in months and days by travellers on passenger cards. There are three main categories of movement: permanent movements long-term movements (one year or more) short-term movements (less than one year).
	A significant number of travellers (i.e. overseas visitors to Australia on arrival and Australian residents going abroad) state exactly 12 months or one year as their intended period of stay. Many of them stay for less than that period and on their departure from, or return to, Australia are therefore classified as short-term. Accordingly in an attempt to maintain consistency between arrivals and departures, movements of travellers who report their actual or intended period of stay as being one year exactly are randomly allocated to long-term or short-term, in proportion to the number of movements of travellers who report their actual length of stay as up to one month more, or one month less, than one year.
Country of residence	Country of residence refers to the country in which travellers regard themselves as living or as last having lived.
Intended length of stay	On arrival in Australia, all overseas visitors are asked to state their 'Intended length of stay in Australia'. On departure from Australia, all Australian residents are asked to state their 'Intended length of stay abroad'.
Long-term arrivals	 Long-term arrivals comprise: overseas visitors who intend to stay in Australia for 12 months or more (but not permanently) Australian residents returning after an absence of 12 months or more overseas.
Long-term departures	 Long-term departures comprise: Australian residents who intend to stay abroad for 12 months or more (but not permanently) overseas visitors departing who stayed 12 months or more in Australia.
Main destination	Australian residents travelling overseas are asked on departure for the name of the country in which they intend to spend most time.
Main reason for journey	 On arrival in, or departure from, Australia all overseas visitors and Australian residents are asked to state their purpose of journey. From September 1994, all statistics relating to main reason for journey have been published using the following categories: convention/conference business visiting friends/relatives holiday employment education other.
	In tabulations of data collected before September 1994, the 'Other' category included 'In transit' and the 'Holiday' category included both 'Student vacation' and 'Accompanying business visitor'.
Overseas Arrivals and Departures	Overseas Arrivals and Departures refer to the arrival or departure of Australian residents or overseas visitors, through Australian airports (or sea ports), which have been recorded on Incoming or Outgoing Passenger Cards. Statistics on Overseas Arrivals and Departures relate to the number of movements of travellers rather than the number of travellers (i.e. the multiple movements of individual persons during a given reference period are all counted).

GLOSSARY continued

Permanent arrivals	 Permanent arrivals (settlers) comprise: travellers who hold migrant visas (regardless of stated intended period of stay) New Zealand citizens who indicate an intention to settle those who are otherwise eligible to settle (e.g. overseas born children of Australian citizens).
	This definition of settlers is used by the Department of Immigration and Multicultural and Indigenous Affairs (DIMIA). Prior to 1985 the definition of settlers used by the ABS was the stated intention of the traveller only. Numerically the effect of the change in definition is insignificant. The change was made to avoid the confusion caused by minor differences between data on settlers published separately by the ABS and DIMIA.
Permanent departures	Permanent departures are Australian residents (including former settlers) who on departure state that they intend to settle permanently in another country.
Short-term arrivals	Short-term arrivals comprise:overseas visitors whose intended stay in Australia is less than 12 monthsAustralian residents returning after a stay of less than 12 months overseas.
Short-term departures	Short-term departures comprise:Australian residents who intend to stay abroad for less than 12 monthsoverseas visitors departing after a stay of less than 12 months in Australia.
State where spent most time	Overseas visitors are asked on departure for the name of the state or territory in which they spent the most time. This differs from 'state of clearance' which is available on request.

FOR MORE INFORMATION .

INTERNET	www.abs.gov.au the ABS web site is the best place for data from our publications and information about the ABS.
LIBRARY	A range of ABS publications are available from public and tertiary libraries Australia wide. Contact your nearest library to determine whether it has the ABS statistics you require, or visit our web site for a list of libraries.

INFORMATION AND REFERRAL SERVICE

	Our consultants can help you access the full range of information published by the ABS that is available free of charge from our web site, or purchase a hard copy publication. Information tailored to your needs can also be requested as a 'user pays' service. Specialists are on hand to help you with analytical or methodological advice.
