### JUNE QTR KEY POINTS

### ACTUAL EXPENDITURE

- Provisional trend estimates for total new capital expenditure (in volume terms) show an increasing rate of decline over the past five quarters. The current estimate is 5% lower than for the March quarter.
- The decline from the March quarter was broad-based, with Mining down 9%, Manufacturing down 3% and Other Selected Industries down 4%. By asset class, buildings and structures fell 10% and plant, machinery and equipment fell 2%.
- The preliminary estimate for actual expenditure (in original, current price terms) for 1998-99 is \$44,547m, which is 4% lower than actual expenditure for 1997-98. The Mining and Manufacturing estimates have each decreased, by 21% and 14%, respectively, while the Other Selected Industries estimate has increased by 9%.

### EXPECTED EXPENDITURE

The third estimate for 1999-2000 is \$36,993m. This is \$4,429m (14%) higher than the second estimate for 1999-2000 but is 17% lower than the corresponding estimate for 1998-99.

### NOTES

#### FORTHCOMING ISSUES

ISSUE (Quarter) RELEASE DATE
September 1999 25 November 1999

December 1999 24 February 2000

CHANGES TO THE ABS
BUSINESS REGISTER

For some time now the ABS has been using Australian Tax Office (ATO) information on Group Employer (GE) registrations to add new businesses to the ABS Business Register. After detailed investigation, it has now been decided to use GE information to delete from the Business Register those businesses which have ceased trading, or which are no longer employing staff.

The process of using GE information to delete businesses from the ABS Business Register has been introduced for the June quarter 1999. The result is that a large number of businesses have been deleted from the population for the Survey of New Capital Expenditure in this quarter. While the number of businesses deleted is relatively large, the impact of this on the estimates is minor.

The impact on June quarter results has been to reduce estimates of actual capital expenditure by about 1.7% and to reduce estimates of expected expenditure by about 1.1%. To lessen the impact on previous quarter-to-quarter movements, estimates for previous quarters have been adjusted in such a way as to phase in the impact over this time.

The adjustments to capital expenditure estimates will be reflected, where relevant, in the June quarter 1999 National Accounts but the impact will be negligible.

CHANGES IN THIS ISSUE

Quarterly chain volume data in this issue incorporate a new base year, 1997-98, which has resulted in revisions to growth rates, small in most cases, for the latest year. In addition, the reference year has been advanced to 1997-98, which has resulted in revisions to levels, but not growth rates, for all periods.

A new suite of non-dwelling building price indexes has been used to deflate the current price estimates, resulting in revisions to growth rates of the chain volume estimates.

REVISIONS TO TREND

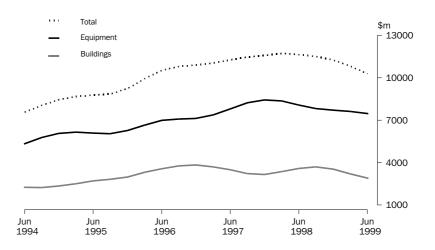

Readers should exercise care in the interpretation of the trend data as the last three observations, in particular, are likely to be revised with the addition of subsequent quarters' data. For further information, refer to Trend Estimates on page 17

W. McLennan Australian Statistician

### QUARTERLY TREND ESTIMATES OF CHAIN VOLUME MEASURES

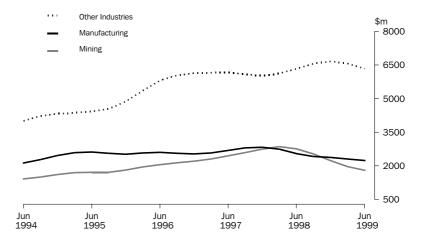

BY ASSET

Trend estimates for expenditure on buildings and structures have fallen for the past three quarters. A large seasonally adjusted decrease this quarter has led to a 10% fall in the trend estimate. Much of this decrease was contributed by Mining, which fell by 13%. Trend estimates for expenditure on plant, machinery and equipment have fallen for six quarters. While equipment expenditure for Mining increased slightly (by 1%) this quarter, expenditure by Manufacturing and Other Selected Industries fell by 3% and 2%, respectively.

BY INDUSTRY

Trend estimates for expenditure in the Mining industry have fallen for the past five quarters. The current estimate is 35% lower than that for the June quarter last year. Trend estimates for Manufacturing have fallen steadily for the past six quarters, with decreases being between 2% and 7% each quarter. Expenditure on both buildings and equipment in this industry has fallen over this period. Trend estimates for Other Selected Industries have fallen for the past two quarters following a period of growth since the December quarter 1997.

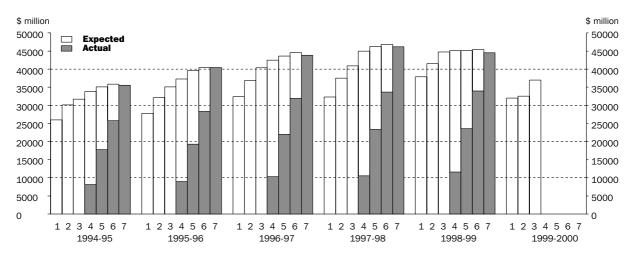

### ACTUAL AND EXPECTED NEW CAPITAL EXPENDITURE

### FINANCIAL YEARS AT CURRENT PRICES

**EXPENDITURE** 

The seven estimates of actual and expected expenditure for each financial year which appear in the graph below relate to data contained in Table 4. Care should be taken when using these series and the associated realisation ratios.

INTRODUCTION

**1** This publication contains estimates of actual and expected new capital expenditure by private businesses in Australia. The series contained in this publication have been compiled from data collected in a quarterly survey of private businesses.

SCOPE OF THE SURVEY

- **2** This survey aims to measure the value of new capital expenditure by private businesses in Australia. Private households and public sector businesses (i.e. all departments, authorities and other organisations owned or controlled by Commonwealth, State or Local Government) are outside the scope of the survey.
- **3** The scope of the survey:
- includes the following Australian and New Zealand Standard Industrial Classification (ANZSIC) industries

Mining (Division B)

Manufacturing (Division C)

Food, beverages and tobacco (21)

Textiles, clothing, footwear and leather (22)

Wood and paper products (23)

Printing, publishing and recorded media (24)

Petroleum, coal, chemical and associated products (25)

Non-metallic mineral products (26)

Metal products (27)

Machinery and equipment (28)

Other manufacturing i29)

Other Selected Industries

Construction (Division E)

Wholesale trade (Division F)

Retail trade (Division G)

Transport & storage (Division I)

Finance and insurance (Division K)

Property & business services (Division L)

Other selected services (including electricity & gas; communication; accommodation, cafes & restaurants; cultural & recreational services; and personal services (36,37,57,71,91–93,95)

excludes the following industries

Agriculture, forestry and fishing

Government administration & defence

Education

Health and community services

SURVEY METHODOLOGY

**4** This quarterly survey is based on a stratified random sample of private business units recorded on the ABS register of businesses. The sample consists of approximately 7,000 units. The figures obtained from the selected businesses are supplemented by data from units which have large capital expenditure and/or large employment and which are outside the sample framework, or not adequately covered by it.

SURVEY METHODOLOGY continued

- **5** Adjustments are included in the estimates to allow for lags in processing new businesses to the ABS business register, and the omission of some businesses from the business register. The majority of businesses affected and to which these adjustments apply are small in size. The adjustments contributed 5.4% to the current quarter's estimate of reported capital expenditure. These adjustments were introduced in the June quarter 1997 publication and have been made back to the June quarter 1987. For further information see the June quarter 1997 publication or Information paper—*Improvements to ABS Economic Statistics 1997* (Cat. no. 1357.0) issued on 22 August 1997.
- **6** Respondents are asked to provide data on the same basis as their own management accounts. Where a selected business unit does not respond in a given survey, an estimate is substituted. Revisions may be made to these estimate adjustments if data are provided subsequently from those businesses. Aggregates are calculated from original data using the 'number raised' estimation technique. Data are edited at both individual unit level and at aggregate level.
- **7** Surveys are conducted in respect of each quarter and returns are completed in the 8 or 9 week period after the end of the quarter to which the survey data relate (e.g. March quarter survey returns are completed during April and May). Full details of the reporting cycle are shown below.

TIMING AND CONSTRUCTION OF

Period to which reported data relates 1997-1998 1998-1999 1999-2000 Survey quarter Mar Jun Dec Mar Jun Sep Dec Mar Sep December 1997 Act F1 E2 Act Act E1 E2 March 1998 Act Act Act E1 E2 June 1998 September 1998 E2 December 1998 E2 March 1999 June 1999 Act Act Act E2 E1

- **8** This survey cycle facilitates the formation of estimates of expenditure for financial years (12 months ending 30 June). For example, as the table above shows, the first estimate for 1998–1999 was available from the December 1997 survey as a longer term expectation (E2). It was subsequently revised in the March 1998 survey (again as a longer term expectation) and in the June 1998 survey as the sum of two expectations (E1 + E2). In the September and subsequent surveys the estimate is derived as the sum of actual expenditure (for that part of the year completed) and expected expenditure (for the remainder of the year). The final (or seventh) estimate from the June quarter 1999 survey, will be derived by summing the actual expenditure for each of the four quarters.
- **9** Businesses are requested to provide 3 basic figures each survey:
- Actual expenditure incurred during the reference period (Act)
- A short term expectation (E1)
- A longer term expectation (E2).

SAMPLE REVISION

- **10** Prior to the June quarter 1996 survey, the survey frames and samples were revised annually to ensure that they remained representative of the survey population. Adjustments were made to the survey estimates each quarter to reflect changes in the size of the survey frame throughout the year. From the June quarter 1996 survey, the survey frames and samples are being revised each quarter. The aim is to further improve the quality of the survey estimates by selecting a sample which will be more representative of the survey population. Additionally, the timing of sample selection will now be consistent with other ABS surveys. This will lead to greater consistency when comparing data across these surveys.
- **11** With these revisions to the sample, some of the business units are rotated out of the survey and are replaced by others to spread the reporting workload equitably. The rate of rotation under quarterly sample selection is slightly higher than one quarter of the previous annual rate of rotation.
- **12** When the frames and samples were updated annually prior to the June quarter 1996, some data would be revised as a consequence. No data revisions of this nature will be needed given quarterly updates to frames and samples. Data may be revised, however, on the basis of further processing.

STATISTICAL UNIT

**13** This survey uses the Management Unit as the statistical unit. The management unit is the highest level accounting unit within a business, having regard to industry homogeneity, for which accounts are maintained. In nearly all cases it coincides with the legal entity owning the business (i.e. company, partnership, trust, sole operator, etc). In the case of large diversified businesses, however, there may be more than one management unit, each coincides with a 'division' or 'line of business'. A division or line of business is defined when separate and comprehensive accounts are compiled for it. Prior to 1989, the survey was on a different business unit basis. Further details are available on request.

CLASSIFICATION BY INDUSTRY

- **14** The Australian and New Zealand Standard Industrial Classification (ANZSIC) has been developed for use in both countries for the production and analysis of industry statistics. It replaced the Australian Standard Industrial Classification (ASIC) and the New Zealand Standard Industrial Classification (NZSIC).
- **15** For further information, users are referred to *Australian & New Zealand Standard Industrial Classification*, *1993*, *ANZSIC*, (Cat. no. 1292.0) and *Statistics New Zealand* (Cat. no. 19.005.0092).

CHAIN VOLUME MEASURES

**16** The chain volume measures appearing in this publication are annually reweighted chain Laspeyres indexes referenced to current price values in the chosen reference year (currently 1997-1998). Chain volume measures were introduced in the September quarter 1998, replacing constant price estimates. Chain volume measures can be thought of as current price values re-expressed in (i.e. based on) the prices of the previous year and linked together to form continuous time series. Each year's quarter-to-quarter growth rates in the chain volume series are based on the prices of the previous year, except for those of the quarters of the latest incomplete year which are based upon the second most recent financial year. With each release of the June quarter issue of this publication, a new base year will be introduced and the reference year will be advanced one year to coincide with it. This means that with the release of the June guarter 2000 issue of this publication, the chain volume measures for 1999–2000 will have 1998–1999 (the previous financial year) as their base year rather than 1997-1998, and the reference year will be 1998-1999. A change in reference year changes levels but not growth rates.

CHAIN VOLUME MEASURES

17 Chain volume measures are not generally additive. In other words, component chain volume measures do not, in general, sum to a total in the way original current price components do. For capital expenditure data this means that the original chain volume estimates for industry groups will not add to total capital expenditure for Australia. However, by using the latest base year as the reference year, non-additivity does not exist for the quarters following the reference year and is relatively small for the quarters in the reference year and those immediately preceding it. For further information on chain volume measures refer to the information paper *Introduction of Chain Volume Measures in the Australian National Accounts* (Cat no. 5248.0).

DERIVATION AND USEFULNESS OF REALISATION RATIOS

- **18** Once actual expenditure for a financial year is known, it is useful to investigate the relationship between each of the prior 6 estimates and that actual. The resultant realisation ratios (subsequent actual expenditure divided by expected expenditure) then indicate how much expenditure was actually incurred against the amount expected to be incurred at the various times of reporting. Realisation ratios can also be formed separately for 3 or 6 month expectations as well as the 12 month E2 estimates or combinations of estimates containing at least some expectation components (e.g. 6 months actual and 6 months expected expenditure).
- **19** Realisation ratios provide an important tool in understanding and interpreting expectation statistics for future periods. The application of realisation ratios enables the adjustment of expectation data for known under (or over) realisation patterns in the past and hence provides a valid basis for comparison with other expectation data and actual expenditure estimates. For example, if one wished to predict actual expenditure for 1999–2000 based on the June 1999 survey results and compare this with 1998–1999 expenditure, it is necessary to apply relevant realisation factors to the expectation to put both estimates on the same basis. Once this has been done the predictions can be validly compared with each other and with previously derived estimates of actual expenditure for earlier years.
- **20** There are many ways in which realisation ratios can be applied to make predictions of actual expenditure for a future period. A range of realisation ratios for both type of asset and industry estimates is provided in Tables 4 and 5.
- **21** In using realisation ratios to adjust expectations data, attention should be paid to the range of values that has occurred in the past. A wide range of values is indicative of volatility in the realisation patterns and hence greater caution should be exercised in the application of realisation ratios. This is particularly the case with the twelve month expectations collected in the December and March surveys.

**DESCRIPTION OF TERMS** 

**22** *New capital expenditure* refers to the acquisition of new tangible assets either on own account or under a *finance lease* and includes major improvements, alterations and additions. In general, this is expenditure charged to fixed tangible assets accounts excluding expenditure on second hand assets unless these are imported for the first time.

DESCRIPTION OF TERMS continued

- **23** Some estimates are dissected by type of asset:
- Buildings and Structures. Includes industrial and commercial buildings, houses, flats, home units, water and sewerage installations, lifts, heating, ventilating and similar equipment forming an integral part of buildings and structures, land development and construction site development, roads, bridges, wharves, harbours, railway lines, pipelines, power and telephone lines. Also includes mine development (e.g. construction of shafts in underground mines, preparation of mining and quarrying sites for open cut extraction and other developmental operations primarily for commencing or extending production). Excludes purchases of land, previously occupied buildings and speculatively built projects intended for sale before occupation.
- *Equipment, plant and machinery*. Includes plant, machinery, vehicles, electrical apparatus, office equipment, furniture, fixtures and fittings not forming an integral part of buildings, durable containers, special tooling, etc. Also includes goods imported for the first time whether previously used outside Australia or not.

RELIABILITY OF THE ESTIMATES

- **24** Since the estimates are based on data obtained from a sample rather than a complete enumeration, the data and the movements derived from them are subject to sampling variability; that is, they may differ from the figures that would have been obtained if all units had been included in the survey. One measure of the likely difference is given by the standard error, which indicates the extent to which an estimate might have varied by chance because only a sample of units was included. There are about two chances in three that a sample estimate will differ by less than one standard error from the figure that would have been obtained if all units had been included, and about nineteen chances in twenty that the difference will be less than two standard errors.
- **25** Another measure of sampling variability is the relative standard error which is obtained by expressing the standard error as a percentage of the estimate to which it refers. The relative standard error is a useful measure in that it provides an immediate indication of the percentage errors likely to have occurred due to sampling. The sample estimates of quarter to quarter movement in the value of new capital expenditure are also subject to sampling variability. The relative standard error of the estimate of movement is expressed as a percentage of the quarterly estimate of the level of capital expenditure.

	RELATIVE STANDARD
	ERROR
Total new capital expenditure:	
Mining	1.6%
Manufacturing	2.5%
Other Selected Industries	2.6%
Buildings & Structures	3.0%
Equipment, Plant & Machinery	1.6%
Total Selected Industries	1.6%

**26** The imprecision due to sampling, which is measured by the standard error, is not the only type of inaccuracy to which the estimates are subject. Other inaccuracies, referred to collectively as non-sample error, may occur for a number of reasons, for example misreporting of data by respondents or imputation for missing respondents.

RELIABILITY OF THE ESTIMATES continued

SEASONAL ADJUSTMENT

- **27** In the design of questionnaires and in the processing of survey data every effort is made to reduce the non-sample error to a minimum.
- **28** The quarterly actual new capital expenditure series in this publication are affected to some extent by seasonal influences and it is useful to recognise and take account of this element of variation.
- **29** Seasonal adjustment may be carried out by various methods and the results may vary slightly depending on the procedure adopted. Accordingly, seasonally adjusted statistics are in fact only indicative and should not be regarded as in any way definitive. In interpreting seasonally adjusted data it is important therefore to bear in mind the methods by which they have been derived and the limitations to which the methods used are subject.
- **30** At least once each year the seasonally adjusted series are revised to take account of the latest available data. The most recent reanalysis takes into account data collected up to and including the March quarter 1999 survey. Data for periods after March 1999 are seasonally adjusted on the basis of extrapolation of historical patterns. The nature of the seasonal adjustment process is such that the magnitude of some revisions resulting from reanalysis may be quite significant, especially for data for more recent quarters. Care should be exercised when interpreting quarter to quarter movements in the seasonally adjusted series in the publication, particularly for recent quarters.
- **31** It should be noted that the seasonally adjusted figures necessarily reflect the sampling and other errors to which the original figures are subject.
- **32** Details of the seasonal adjustment methods used together with selected measures of variability for these series are available on request.
- **33** The trend estimates are derived by applying a 7–term Henderson moving average to the seasonally adjusted series. The 7–term Henderson average (like all Henderson averages) is symmetric, but as the end of a time series is approached, asymmetric forms of the average are applied. Unlike the weights of the standard 7-term Henderson moving average, the weights employed here have been tailored to suit the particular characteristics of individual series. While the asymmetric weights enable trend estimates for recent quarters to be produced, it does result in revisions to the estimates for the most recent three quarters as additional observations become available. There may also be revisions because of changes in the original data and as a result of the re-estimation of the seasonal factors. For further information, see *A Guide to Interpreting Time Series—Monitoring 'Trends': an Overview* (Cat. no. 1348.0) or contact the Assistant Director, Time Series Analysis on (02) 6252 6076.

TREND ESTIMATES

COMPARABILITY WITH NATIONAL ACCOUNTS ESTIMATES

- **34** The statistics for new capital expenditure shown in this publication differ from estimates of private gross fixed capital expenditure shown in the Australian National Accounts for the following reasons:
- National Accounts estimates incorporate data from other sources as well as information from the capital expenditure survey. For example, estimates for capital expenditure on 'equipment' are based on annual statistics of depreciable assets available from the Taxation Commissioner. Quarterly estimates are interpolated between and extrapolated from the annual taxation based estimates using a variety of indicators including this survey. The ABS's quarterly Building Activity Survey and Engineering Construction Survey are the main sources for estimating the National Accounts dwelling and non-dwelling construction items respectively.
- National Accounts estimates include capital expenditure by all private businesses including units classified to agriculture, forestry, fishing and hunting and community services industries and capital expenditure on dwellings by households. Data for these sectors are excluded from this publication.
- National Accounts estimates include the value of work done on speculative construction projects as the work is put into place. The statistics in this publication, however, include full value of the speculative projects as new capital expenditure of the purchases (if in scope), when the project is sold.
- For equipment, the National Accounts estimates relate to acquisitions less disposals of all fixed tangible assets whereas the survey figures are acquisitions of new fixed tangible assets only.
- **35** For a more detailed explanation of the concepts and methods used in compiling the National Accounts estimates see *Australian National Accounts: Concepts, Sources and Methods* (Cat. no. 5216.0).

#### EFFECT OF NEW SEASONALLY ADJUSTED ESTIMATES ON TREND ESTIMATES

Each time new seasonally adjusted estimates become available, trend estimates are revised (see paragraphs 28 to 33 of the Explanatory Notes).

#### TREND REVISIONS

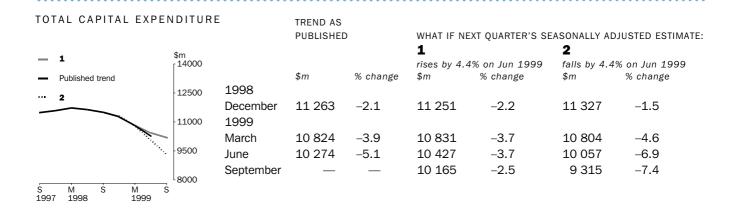

The examples in the tables below show two scenarios and the consequent revisions to previous trend estimates of capital expenditure by private businesses.

- **1** The September quarter seasonally adjusted estimate of chain volume measures is higher than the June quarter estimate by the percentage shown.
- **2** The September quarter seasonally adjusted estimate of chain volume measures is lower than the June quarter estimate by the percentage shown.

The percentages chosen are approximately the long term average movement, without regard to sign, in the seasonally adjusted series.
