SEPTEMBER QTR KEY POINTS

TREND ESTIMATES

- The trend estimate (in volume terms) of stocks held by private businesses has increased by \$1,031m (1.4%) since June 1998. Rates of growth have been steady over the last three quarters, between 1.2% and 1.4% per quarter.
- This growth has been mainly driven by increases in stocks held by Wholesalers and Manufacturers. Growth rates for Wholesale trade have been between 1.7% and 2.4% per quarter for the last six quarters.
- Stock levels for Manufacturing have increased by 6.7% since September 1997. The largest increases have been in Machinery and equipment and Food, beverage and tobacco.
- This is the sixth quarter of falling stock levels for Retail trade. Retail stocks have fallen by 3.8% (\$660m) since March 1997.

SALES

- Trend estimates for Manufacturers' sales increased by 0.9% and Wholesale trade sales increased by 2.7% from June quarter 1998.
- The second estimate (in current price terms) of Manufacturers' expected sales for 1998-99 is \$209.328m.

 ISSUE (Quarter)
 RELEASE DATE

 December 1998
 01 March 1999

 March 1999
 31 May 1999

CHANGES TO THIS ISSUE

As foreshadowed last issue, constant price data have been replaced with chain volume measures. For further information refer to paragraph 21 of the Explanatory Notes or the information paper *Introduction of Chain Volume Measures in the Australian National Accounts* (Cat. no. 5248.0).

In addition, an improvement has been made to the deflators used to derive the volume measures for Wholesalers' stocks and sales. This has led to an increase in growth rates over recent periods.

SAMPLING ERRORS

The estimates in this publication are based on a sample survey of businesses. Because data are not collected from all businesses, the published estimates are subject to sampling variability.

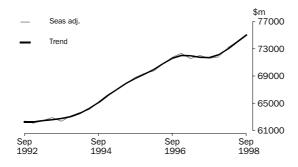

Standard errors for estimates contained in this publication are shown on pages 25–26.

REVISIONS TO TREND

Readers should exercise care in the interpretation of the trend data as the data for the last three quarters in particular are likely to be revised with the addition of subsequent quarters' data. For further information and examples showing the sensitivity of trend data, refer to Trend Estimates in paragraph 47 of the Explanatory Notes.

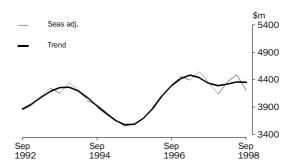

W. McLennan Australian Statistician ALL SELECTED INDUSTRIES

The current trend estimate of stocks held by private businesses is \$75,043m, an increase of \$3,345m (4.7%), since September 1997. In comparison, stock levels were relatively stable for the four quarters prior to September 1997.

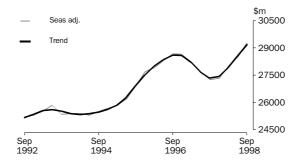

MINING

Trend estimates for stocks held by the Mining industry have been relatively stable for the past five quarters.

MANUFACTURING

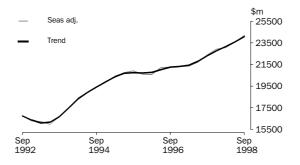

Since September 1997, Manufacturers' stocks have increased by \$1,827m (6.7%). Contributing most to this increase have been Machinery and equipment \$757m (13.3%), Food, beverage and tobacco \$448m (7.9%), Metal product \$342m (8.6%) and Petroleum, coal and chemical \$242m (4.3%).

(a) Reference year for chain volume measures is 1996–97.

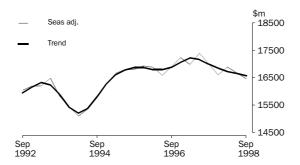

WHOLESALE TRADE

The current trend estimate of stocks held by Wholesale trade is \$24,082m. Growth rates have been between 1.7% and 2.4% per quarter, since March 1997. Since then, stock levels have increased by \$2,663m (12.4%).

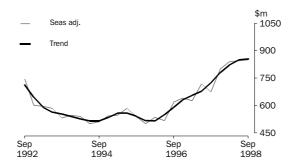

RETAIL TRADE

Stock levels held by Retail trade have been falling since March 1997. The current estimate of \$16,559m is \$660m (3.8%) lower than the estimate for March 1997.

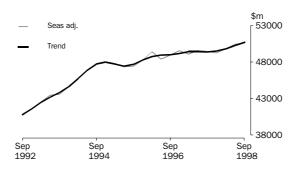

OTHER SELECTED INDUSTRIES (Electricity and gas supply; accommodation, cafes and restaurants) Growth rates for stocks held by Other Selected industries have been falling over the past three quarters, from 7.8% in December 1997 to 0.5% this quarter. The current trend estimate is \$854m.

(a) Reference year for chain volume measures is 1996–97.

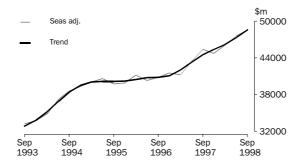

MANUFACTURERS' SALES

Since September quarter 1997, trend estimates for Manufacturers' sales have increased by 1,337m (2.7%) to 50,709m. Over this period, the major contributors to the increase have been Food, beverage and tobacco 395m (3.5%), Petroleum, coal and chemical 378m (4.2%) and Wood and paper product 300m (8.9%).

WHOLESALE TRADE SALES

Trend estimates for Wholesale trade sales have been growing at rates between 1.8% and 3.1% per quarter over the past seven quarters. The current estimate of \$48,592m is \$4,063m (9.1%) higher than for September quarter 1997.

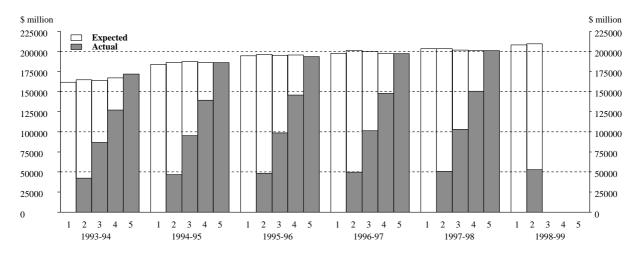

(a) Reference year for chain volume measures is 1996-97.

⁽a) Seasonally adjusted series.

INTRODUCTION

1 This publication contains estimates of the book value of stocks owned by private businesses, estimates of sales by wholesalers and sales and expected sales of goods manufactured or assembled by manufacturers in Australia. The series have been compiled from data collected by the Australian Bureau of Statistics (ABS) in its quarterly Survey of Stocks and Sales.

SCOPE AND COVERAGE

- **2** The scope of the survey:
- includes the following industries (Australian and New Zealand Standard Industrial Classification 1993 [ANZSIC] Divisions and Subdivisions):

Mining (Division B)

Manufacturing (Division C)

Food, beverages and tobacco (21)

Textiles, clothing, footwear and leather (22)

Wood and paper products (23)

Printing, publishing and recorded media (24)

Petroleum, coal, chemical and associated products (25)

Non-metallic mineral products (26)

Metal products (27)

Machinery and equipment (28)

Other manufacturing (29)

Wholesale Trade (Division F)

Basic materials (45)

Machinery and motor vehicles (46)

Personal and household goods (47)

Retail Trade (Division G excluding 5322, 5323 and 5329)

Food (51)

Personal and household goods (52)

Motor vehicle retailing and services (53 excluding 5322, 5323 and 5329)

Other Selected Industries

Electricity and gas supply (36)

Accommodation, cafes and restaurants (Division H)

excludes the following industries:

Agriculture, forestry and fishing

Water supply, sewerage and drainage services

Construction

Transport and storage

Communication services

Finance and insurance

Property and business services

Government administration and defence

Education, health and community services

Cultural and recreational services

Personal and other services

• in addition the scope excludes public sector business units (i.e. all departments, authorities and other organisations owned and/or controlled by Commonwealth, State and Local Governments). Primary producer marketing boards are classified as public sector and are also excluded.

SURVEY METHODOLOGY

- **3** The survey is conducted by mail on a quarterly basis. It is based on a stratified random sample of approximately 7,500 private businesses selected from the ABS register of businesses. The sample is stratified by industry and number of employees. All business units with over 250 employees, and other statistically significant units, such as many joint venture partners, are included. The figures obtained from these businesses are also supplemented by adjustments for new businesses not yet included in the sample framework.
- **4** Respondents are asked to provide data on the same basis as their own management accounts. Where a selected business unit does not respond in a given survey, an estimate is substituted. Revisions may be made to these estimate adjustments if data are provided subsequently from those businesses. Aggregates are calculated from original data using the 'number raised' estimation technique. Data are edited at both individual unit level and at aggregate level.
- **5** Adjustments are included in the estimates to allow for lags in processing new businesses to the ABS business register, and the omission of some businesses from the business register. The majority of businesses affected and to which the adjustments apply are small in size. The adjustments contributed 3.9% to the current quarter's estimate of reported stocks and 3.6% to reported sales. These adjustments were introduced in the June quarter 1997 publication and have been made back to the June quarter 1984. For further information see the June quarter 1997 publication or an Information Paper *Improvements to ABS Economic Statistics 1997* (Cat. No. 1357.0) issued on 22 August 1997.

TIMING AND CONSTRUCTION OF SURVEY CYCLE

- **6** Surveys are conducted in respect of each quarter and returns are completed during the 8 or 9 week period after the end of the quarter to which survey data relate e.g. December quarter survey returns are completed during January and February.
- **7** In addition to data on stocks, manufacturers and wholesalers are requested to provide sales figures for actual sales made during the reference quarter.

 Manufacturers are also requested to provide expected sales for future periods:
- a short term expectation (E1); and
- a longer term expectation (E2).
- **8** Full details of the reporting cycle are shown in the table below.

Period to which reported data relates 1997-1998 1998-1999 1999-2000 Survey quarter Dec Jun Sep Mar Jun Sep Mar Jun E1 E2 June 1998 Actual September 1998 Actual E1 E2 F1 F2 December 1998 Actual March 1999 Actual E1 E2 June 1999 E1 E2

TIMING AND CONSTRUCTION
OF SURVEY CYCLE continued

9 For the manufacturing industry this survey cycle produces estimates of sales and expected sales for the next 9 or 12 months. Realisation ratios (actual sales divided by expected sales) are published in this issue as an aid in interpreting expectation statistics. Since realisation ratios tend to vary according to factors such as the stage of the economic cycle, caution should be used when interpreting the data on expected sales and realisation ratios.

SAMPLE REVISION

- **10** Prior to the June quarter 1996 survey, the survey frames and samples were revised annually to ensure that they remained representative of the survey population. Adjustments were made to the survey estimates each quarter to reflect changes in the size of the survey frame throughout the year. From the June quarter 1996 survey, the survey frames and samples are being revised each quarter. The aim is to further improve the quality of the survey estimates by selecting a sample which will be more representative of the business population. The timing of sample selection will now be consistent with other ABS surveys. This will lead to greater consistency when comparing data across these surveys.
- **11** With these revisions to the sample, some of the business units are rotated out of the survey and are replaced by others to spread the reporting workload equitably. The rate of rotation under quarterly sample selection is slightly higher than one quarter of the previous annual rate of rotation.
- **12** When frames and samples were updated annually some data would be revised as a consequence. No data revisions of this nature will be needed given quarterly updates to frames and samples. Data may be revised however on the basis of further processing.

STATISTICAL UNIT

13 This survey uses the management unit as the statistical unit. The management unit is the highest-level accounting unit within a business, having regard to industry homogeneity, for which accounts are maintained. In nearly all cases it coincides with the legal entity owning the business (i.e. company, partnership, trust, sole operator, etc.). In the case of large diversified businesses, however, there may be more than one management unit, each coinciding with a 'division' or 'line of business'. A division or line of business is defined where separate and comprehensive accounts are compiled for it. Prior to 1989, the survey was on a different business unit basis. Further details are available on request.

CLASSIFICATION BY INDUSTRY

- **14** The Australian and New Zealand Standard Industrial Classification (ANZSIC) has been developed for use in both countries for the production and analysis of industry statistics. It replaces the Australian Standard Industrial Classification (ASIC) and the New Zealand Standard Industrial Classification (NZSIC).
- **15** For more information, users are referred to *Australian & New Zealand Standard Industrial Classification*, *1993*, *ANZSIC*, ABS (1292.0) and Statistics New Zealand (19.005.0092).
- **16** In order to classify stocks and sales data by industry, each statistical unit (as defined above) is classified to the Australian and New Zealand Standard Industrial Classification (ANZSIC) industry in which it *mainly* operates.
- **17** All of the stocks, sales and expected sales of each statistical unit are classified to that unit's industry even though it may have activities in other industries.

DESCRIPTION OF TERMS

18 *Manufacturers' Sales*. All sales of goods manufactured by the business unit or manufactured for it on commission. Excludes commission earned by the business for manufacturing work done on customers' materials and sales of goods not manufactured (e.g. merchanted goods) by the business.

DESCRIPTION OF TERMS continued

- **19** *Wholesale trade Sales*. All sales of goods by businesses classified to the Wholesale Trade Industry.
- **20** *Stocks*. All stocks of materials etc., work in progress and finished goods owned by the business, whether held at locations of the business or elsewhere.

INTRODUCTION OF CHAIN VOLUME MEASURES

- **21** Constant price estimates have been replaced with chain volume measures from September quarter 1998. This change is being made to all other ABS volume series. The reason for the change and some of the properties of chain volume measures are described below.
- **22** Both constant price estimates and chain volume measures have the objective of removing price influences from stocks and sales movements. Each method achieves this objective in different ways and so the differences between the constant price estimates and chain volume measures varies considerably from statistic to statistic. The impact largely depends on the extent of differences in growth rates between the prices and volumes of the components of particular series.
- **23** Chain volume measures have been introduced because they provide a better measure of growth in volume than the previously used constant price estimates. To understand this it is necessary to briefly explain how constant price estimates are derived.
- **24** While current price estimates of stocks and sales reflect both price and volume changes, constant price estimates eliminate the direct effect of price changes and therefore only reflect volume changes. This is achieved by replacing the unit price of each type of good in the current period with the corresponding unit price in the chosen base year. The base year unit prices used to derive constant price estimates are effectively the weights used to combine quantities of different goods.
- **25** The prices of different goods tend to grow at different rates—some at dramatically different rates. For example, the prices of computer equipment are estimated to have declined by about 75% between 1989–90 and June quarter 1998, while the prices of most other goods have increased. Thus, over time, the relative prices of some goods change appreciably.
- **26** Changes in relative prices adversely affect the usefulness of constant price estimates, particularly for periods distant from the base year, and consequently the base year used to derive constant price estimates needs to be changed from time to time. It has been ABS practice to change the base year every five years, but it has been found that better estimates of growth in volume can be obtained by rebasing every year and linking the resulting indexes to form annually reweighted chain volume measures.
- **27** The chain volume measures appearing in this publication are annually reweighted chain Laspeyres indexes referenced to the current price values in a chosen reference year (currently 1996–97). They can be thought of as current price values re-expressed in (i.e. based on) the prices of the previous year and linked together to form continuous time series. They are formed in a multi-stage process of which the major steps are described in Section 15 of the information paper *Introduction of Chain Volume Measures in the Australian National Accounts* (5248.0).

INTRODUCTION OF CHAIN VOLUME
MEASURES continued

- 28 Chain volume measures are not generally additive. In other words, component chain volume measures do not, in general, sum to a total in the way original current price components do. For stocks and sales this means that the original chain volume estimates for industry groups will not add to total stocks or sales for Australia. However, in order to minimise the impact of this property, the ABS is using the latest base year as the reference year. By adopting this approach, non-additivity does not exist for the quarters following the reference year (currently 1996–97) and is relatively small for the quarters in the reference year and the quarters immediately preceding it.
- 29 Each year's quarter-to-quarter growth rates in the chain volume series are based on the prices of the previous year, except for those of the quarters of the latest incomplete year (i.e. for the 1998–99 financial year) which are based upon the 1996–97 financial year. With each release of the June quarter issue of this publication, the reference year will be advanced one year. This means that from June next year, chain volume measures for 1998–99 will have 1997–98 (the previous financial year) as their base year rather than 1996–97. Some revision to recent growth rates can be expected because of the introduction of a more recent base year and, if they occur, revisions to the current price estimates underlying the chain volume measures. In addition, 1997–98 will become the reference year for the entire chain volume series. A change in reference year changes levels but not growth rates.

DERIVATION AND USEFULNESS OF REALISATION RATIOS

- **30** Once the actual level of manufacturers' sales is known, it is useful to investigate the relationship between it and each of the previous expected estimates. The resultant realisation ratios (subsequent actual sales divided by expected sales) then indicate how the value of actual sales compared with the value of expected sales at the various times of reporting. Realisation ratios can also be formed separately for 3 or 6 month expectations as well as the 12 month estimates or combinations of estimates containing at least some expectation components (e.g. 6 months actual and 6 months expected sales).
- **31** Realisation ratios provide an important tool in understanding and interpreting expectations statistics for future periods. The application of realisation ratios enables the adjustment of expectations data for known under (or over) realisation patterns in the past and hence provides a valid basis for comparison with other expectations data and actual sales estimates. For example, if one wished to predict actual sales for 1998–99 based on the June 1998 survey results and compare these with 1997–98 actual sales, it is necessary to apply relevant realisation factors to the expectation to put both estimates on the same basis. Once this has been done the predictions can be validly compared with each other and with previously derived estimates of actual sales for earlier years.
- **32** There are many ways in which realisation ratios can be applied to make predictions of sales for a future period. For instance, the adjusted estimates could be derived using realisation ratios which are the average of the latest available five observations or any of the five could be used. Realisation ratios are provided in table 9 on page 15.
- **33** In using realisation ratios to adjust expectations data, attention should be paid to the range of values that has occurred in the past. A wide range of values is indicative of volatility in the realisation patterns and hence greater caution should be exercised in the application of realisation ratios. This is particularly the case with the twelve months expectations collected in the December and June surveys.

RELIABILITY OF THE ESTIMATES

34 Two types of error are possible in an estimate based on a sample survey: sampling error and non–sampling error. Sampling error is explained and quantified on pages 25 and 26.

Non-sampling error arises from inaccuracies in collecting, recording and processing the data. The major errors of concern and which may affect the data are:

- misreporting of data by respondents; and
- deficiencies in the register of economic units, particularly in respect of small units.

Every effort is made to minimise the non-sampling error by careful design of questionnaires, efficient operating procedures, and appropriate methodology.

NEW BUSINESS INVESTIGATION

- **35** The ABS Business Register should ideally record all employing businesses as soon as they commence operations. However, the ability to achieve this is limited by the time it takes to obtain and process information from the ATO and other sources and the requirement to extract survey frames prior to the end of the reference period to which they relate. Adjustments to survey estimates are made to account for this. These are discussed in paragraph 5.
- **36** This method of adjustment assumes that the level of stocks and sales of those units not yet on the Business Register at the time of selection is of similar extent and nature to those already represented in the survey. Because it could be reasonably expected that economic characteristics of new businesses could vary from that of established businesses, the ABS conducted the Survey of Business Performance to establish the nature and extent of any bias in the methodology used for estimating the contribution of missing businesses. The population source for the survey was the new ATO Group Employer registrations that were not on the survey frame for the March 1997 quarter, due to the timing problems explained above.
- 37 The survey, which was conducted over two quarters in December quarter 1996 and March quarter 1997, found that only an estimated 36% of newly registered businesses were truly new, with remaining businesses equally divided between existing businesses that had expanded and begun to employ staff and existing businesses that had been purchased or taken over by other businesses. However, the proportion of truly new businesses was not constant over all the ANZSIC divisions. As the following table demonstrates, the rate of occurrence of truly new businesses was relatively low in Retail trade and Accommodation, cafes and restaurants with the low rate of truly new businesses in both cases being offset by the relatively high percentage of purchased businesses. These results indicate a relatively strong connection between certain activities and the particular location of businesses in these industries.

NEWLY REGISTERED BUSINESSES

Industry Division	New businesses	Purchased businesses	Previously non-employing businesses
	%	%	%
Mining	54	27	19
Manufacturing	36	38	26
Wholesale	41	32	27
Retail	23	55	22
Accommodation, cafes and restaurants	20	68	12

Source: ABS Survey of Business Performance

NEW BUSINESS INVESTIGATION continued

- **38** With the exception of Mining and Accommodation, cafes and restaurants, the proportion of new businesses where the registrant had previously operated as a non-employing business did not vary noticeably across industries. Wholesale reported the highest rate of businesses which had previously operated as non-employing businesses (27%), while Accommodation, cafes and restaurants had the lowest rate (12%).
- **39** Given the high proportion of businesses already operating among new registrants, it is not surprising that the pattern of stocks and sales among these businesses was found to be very similar to businesses included in the Survey of Stocks and Sales. In other words, the Survey of Businesses Performance found no evidence to support any variation to the method employed for estimating missing businesses outlined in paragraph 5.

SEASONAL ADJUSTMENT

- **40** The quarterly stocks and sales series in this publication are affected to some extent by seasonal influences and it is useful to recognise and take account of this element of variation.
- **41** Seasonal adjustment may be carried out by various methods and the results may vary slightly depending on the procedure adopted. Accordingly, seasonally adjusted statistics are only indicative and should not be regarded as in any way definitive. In interpreting seasonally adjusted data it is important therefore to bear in mind the methods by which they have been derived and the limitations to which the methods used are subject.
- **42** Seasonal adjustment is a means of reassessing the estimated effects of normal seasonal variations for the series so that the effects of other influences can be more clearly recognised.
- **43** In the seasonal adjustment of the series, account has been taken of both normal seasonal factors and 'trading' day effects (arising from the varying length of each quarter) and the varying numbers of Sundays, Mondays, Tuesdays etc in the quarter. Seasonal adjustment does not remove from the series the effect of irregular or non-seasonal influences (e.g. change in interest rates).
- 44 At least once each year the seasonally adjusted series are revised to take account of the latest available data. The most recent reanalysis takes into account data collected up to and including the March quarter 1998 survey. Data for periods after March 1998 are seasonally adjusted on the basis of extrapolation of historical patterns. The nature of the seasonal adjustment is such that the magnitude of some revisions resulting from reanalysis may be quite significant especially for data for more recent quarters. Care should be exercised when interpreting quarter to quarter movements in the seasonally adjusted series in the publication, particularly for recent quarters.
- **45** It should be noted that the seasonally adjusted figures necessarily reflect the sampling and other errors to which the original figures are subject.
- **46** Details of the seasonal adjustment methods used for stocks and sales, together with selected measures of variability for these series are available on request.

TREND ESTIMATES

47 The trend estimates are derived by applying a 7–term Henderson moving average to the seasonally adjusted series. The 7–term Henderson average (like all Henderson averages) is symmetric, but as the end of a time series is approached, asymmetric forms of the average are applied. Unlike the weights of the standard 7-term Henderson moving average, the weights employed here have been tailored to suit the particular characteristics of individual series. While the asymmetric weights enable trend estimates for recent quarters to be produced, it does result in revisions to the estimates for the most recent three quarters as additional observations become available. There may also be revisions because of changes in the original data and as a result of the re-estimation of the seasonal factors. For further information, see *A Guide to Interpreting Time Series—Monitoring 'Trend' An Overview* (1348.0) or contact the Assistant Director, Time Series Analysis.

COMPARISON WITH OTHER ABS STATISTICS

- **48** The data collected in the Survey of Stocks and Sales are used to compile estimates of the increase in book value of non-farm stocks in the quarterly and annual national accounts. For further details see *Australian National Accounts: Concepts, Sources and Methods* (5216.0).
- **49** The statistics shown for the movement in the book value of stocks in this publication will differ from corresponding data for private non-farm stocks shown in the national accounts publications because the national accounts estimates include estimates for the construction and transport industries.

The ABS also issues on Tuesdays and Fridays a *Release Advice* (1105.0) which lists publications to be released in the next few days. The Catalogue and Release Advice are available from any ABS office.

UNPUBLISHED DATA

52 In addition to the data contained in this and related publications, more detailed industry information may be made available on request. Data are available at the ANZSIC Group (i.e. 3 digit) level for stocks and manufacturers' sales.

SYMBOLS AND OTHER USAGES

ANZSIC Australian and New Zealand Standard Industrial Classification (1292.0) 1993 edition

STANDARD ERRORS

The estimates in this publication are based on information gained from a sample survey. Because the entire population of businesses is not surveyed, the published estimates are subject to sampling error and this can be quantified in a number of ways. A common measure is *standard error*. In this publication standard errors are presented as a percentage of the estimate to which they apply (i.e. *relative standard error*). In the case of the relative standard errors of movement, they are expressed as a percentage of the estimate of the data level for the earlier period.

There are about two chances in three that a sample estimate will differ by less than one standard error from the figure that would have been obtained if all businesses had been included in the survey, and there are about nineteen chances in twenty that the difference will be less than two standard errors. Put another way, this means that we can be 67% confident that the 'true' figure is within plus or minus one standard error of the sample estimate and 95% confident that the 'true' figure is within two standard errors of the sample estimate. Tables of relative standard errors are presented on the next page and examples of their application are given below.

LEVEL ESTIMATES

To illustrate, let us say the published level estimate for manufacturers' stocks is \$21,000m. The relative standard error for this case, obtained from the table on the next page, is 1.4%. This relative standard error is then used to interpret the level estimate of \$21,000m. For instance, the relative standard error of 1.4% indicates that:

- There are approximately two chances in three that the real value falls within the range \$20,706m to \$21,294m (\$21,000m ± 1.4 % x \$21,000m)
- There are approximately nineteen chances in twenty that the real value falls within the range \$20,412m to \$21,588m ($$21,000m \pm 2 \times 1.4\% \times $21,000m$)

The real value in this case is the result we would obtain if the total population had been enumerated.

The following tables show the relative standard errors for this quarter's level estimates.

MOVEMENT ESTIMATES

The following example illustrates how to use the standard error to interpret a movement estimate. Suppose that for one quarter the published level estimate for manufacturers' stocks in Australia is 22,100m; the next quarter the published level estimate is 22,400m. The relative standard error for the movement estimates, obtained from the next page, is 0.4%. This relative standard error is then used to interpret the published movement estimate of 300m. For instance the relative standard error of 30.4% indicates that:

- There are approximately two chances in three that the real movement over the two quarters falls within the range \$212m to \$388m ($$300m \pm 0.4\% \times $22,100m$)
- There are approximately nineteen chances in twenty that the real value falls within the range \$123m to \$477m ($$300m \pm 2 \times 0.4\% \times $22,100m$).

The following tables show the relative standard errors for this quarter's movement estimates.

EFFECT OF NEW SEASONALLY ADJUSTED ESTIMATES ON TREND ESTIMATES

TREND REVISIONS

The examples in the tables below show two scenarios and the consequent revisions to previous trend estimates of stocks owned by private businesses and manufacturers' and wholesalers' sales.

- **1** The December quarter seasonally adjusted estimate of chain volume measures is higher than the September quarter estimate by the percentage shown.
- **2** The December quarter seasonally adjusted estimate of chain volume measures is lower than the September quarter estimate by the percentage shown.

The percentages chosen are the long term average movements, without regard to sign, in the seasonally adjusted series.
