## KEY POINTS

## TREND ESTIMATES

- The trend estimate (in volume terms) for inventories for the September quarter 2002 is $\$ 92,958 \mathrm{~m}$, and has remained relatively flat for the latest six quarters. The trend estimates (in volume terms) for income from sales of goods and services by Manufacturing and Wholesale trade have increased in the latest seven quarters. The trend estimate (in current price terms) for company gross operating profits for companies with 20 or more employees increased by $1.2 \%$ in the September quarter 2002. Company profits before income tax increased by $3.0 \%$, continuing the increases of the previous four quarters.

## SEASONALLY ADJUSTED ESTIMATES

- The seasonally adjusted estimate (in volume terms) for inventories has increased by $0.3 \%$ in the September quarter 2002, with Retail trade being the major contributor. Wholesale trade income from sales of goods and services increased by $2.5 \%$ in the September quarter 2002 after also increasing in the previous quarter. Manufacturing income from sales of goods and services increased $0.6 \%$, continuing the increases in the previous three quarters.
- Wholesale trade was the major contributor to the $4.7 \%$ increase in the seasonally adjusted estimate (in current price terms) for company gross operating profits.

FORTHCOMING ISSUES

CHANGES TO NEXT ISSUE

REVISIONS

ISSUE (Quarter) RELEASE DATE
December 20023 March 2003
March 2003

2 June 2003

In April 2000, the ABS released an information paper, ABS Statistics and The New Tax System (cat. no. 1358.0), which foreshadowed changes in the statistical infrastructure supporting the compilation of ABS economic series. The changes will allow better use of data available from the taxation system to improve efficiency, coverage and sample design.

This publication presents the last release of estimates from the Quarterly Economic Activity Survey compiled using the old infrastructure.

In the next release of this publication, estimates for the latest period will be compiled on the new basis. To facilitate comparisons over time, the historical series in that release will be adjusted so that all estimates are presented on the new basis.

An information paper, Improvements in ABS Economic Statistics [Arising from The New Tax System] (cat. no. 1372.0), was released on 6 May 2002. That paper described the changes in more detail and provided information about the treatment of statistical impacts of the changes across ABS economic series.

For further information, contact Mark Wise on (02) 92684241 or [mark.wise@abs.gov.au](mailto:mark.wise@abs.gov.au).

As is usually the case after the initial release of a quarter's estimates, revisions have been made to the June quarter 2002 estimates as a result of responses received or revised after the publication of the previous issue. The net effect of these revisions has been to adjust the original, current price estimates for: total inventories by $+0.2 \%$; Manufacturing income from sales of goods and services by $+0.1 \%$ : company gross operating profits by $-0.8 \%$; and wages and salaries by $-0.2 \%$. Revisions have been applied to most series in this publication and the impact can vary at the industry and state level. In a small number of cases, revisions have also been made to estimates for prior quarters.

MANUFACTURING
COMPANY GROSS OPERATING PROFITS

The current price trend estimates for both company gross operating profits and company profits before income tax have increased for the latest five quarters and, in each case, are at the highest levels recorded.

The trend estimate for total inventories (in volume terms) has remained relatively unchanged from the revised June quarter 2002 estimate.

The current price trend estimate for company gross operating profits has decreased for the latest five quarters after a period of sustained growth. Company profits before income tax has also decreased in the latest five quarters.

The trend estimate for inventories (in volume terms) has remained relatively flat in the latest two quarters after five quarters of strong growth.

The current price trend estimate for company gross operating profits has increased $2.7 \%$ in the current quarter following increases in the previous three quarters. Company profits before income tax has remained flat following three quarters of steady growth.

Note: Break in series. See Technical Note.

The trend estimate for inventories (in volume terms) decreased slightly in the September quarter 2002 after being relatively flat in the previous quarter.

The trend estimate for income from sales of goods and services (in volume terms) continued to increase,
following increases in the previous six quarters.

The current price trend estimate for company gross operating profits estimates has increased steadily over the latest two quarters. Company profits before income tax has recorded slightly stronger growth over the same period.

The current price trend estimate for company gross operating profits increased strongly in September quarter 2002, following increases in the previous four quarters. Company profits before income tax has continued to record strong growth and is more than double the level recorded twelve months earlier.

The trend estimate for inventories (in volume terms) has recorded steady growth in the latest three quarters after decreasing in the previous four quarters.

COMPANY GROSS OPERATING PROFITS

The trend estimate for income from sales of goods and services (in volume terms) continued to grow, up $1.1 \%$ in September quarter 2002, though the increase was weaker than those in the previous five quarters.

The current price trend estimate for company gross operating profits recorded steady growth in September quarter 2002, following increases recorded in the previous four quarters. Company profits before income tax has recorded increases in the latest six quarters.

The trend estimate for inventories (in volume terms) decreased $0.5 \%$ in September quarter 2002, continuing the decreases in the previous three quarters.

The trend estimate for income from sales of goods and services (in volume terms) has increased this quarter, as has been the case in each quarter since the commencement of the series in September quarter 1999, although the rate of growth has slowed in the latest three quarters.

The current price trend estimate for company gross operating profits increased in September quarter 2002, continuing increases from the previous four quarters. The trend estimate for company profits before income tax recorded strong growth and is more than double the level recorded twelve months earlier.

## WHAT IF...? REVISIONS TO TREND ESTIMATES

## EFFECT OF NEW SEASONALLY ADJUSTED ESTIMATES ON TREND ESTIMATES

## TREND REVISIONS

The most recent seasonally adjusted and trend estimates are likely to be revised when original estimates for subsequent quarters become available. To assess reliability of the trend estimate at the current end, the "what-if" chart presents trend estimates under different scenarios for the next quarter. The approximate effect of two possible scenarios on the current and previous trend estimates for total company gross operating profits and total inventories are presented below.
(1) The December quarter seasonally adjusted estimate of total inventories (chain volume measures), and the December quarter seasonally adjusted estimate for company gross operating profits (current prices), are higher than the September quarter estimate by the percentage shown.
(2) The December quarter seasonally adjusted estimate of total inventories (chain volume measures), and the December quarter seasonally adjusted estimate for company gross operating profits (current prices), are lower than the September quarter estimate by the percentage shown.

The percentages shown are the historical average of the movements, without regard to sign, in the seasonally adjusted series.

1 This publication contains estimates of income from sales of goods and services, wages and salaries (from the December quarter 2001 issue), company profits, and the book value of inventories for selected industries in Australia. The series have been compiled from data collected by the Australian Bureau of Statistics (ABS) in its Quarterly Economic Activity Survey. The survey, which was fully implemented in the March quarter 2001, collects data from private businesses only.

2 Prior to March quarter 2001, data on sales, inventories and company profits were collected in the Survey of Inventories, Sales and Services and the Survey of Company Profits. The data from these surveys have been used to compile the historical estimates in this publication. From March quarter 2002, the Quarterly Economic Activity Survey has replaced the private sector component of the Survey of Employment and Earnings. However, as the measures of wages and salaries in the two surveys are different (refer to paragraph 36), data from the Survey of Employment and Earnings will not be used to produce historical estimates for this publication. For more information on the introduction of the Quarterly Economic Activity Survey, see Information Paper: Improvements to Australian Bureau of Statistics Quarterly Business Indicators (cat no. 5677.0).

3 The Quarterly Economic Activity Survey, like most ABS economic collections, is drawn from the ABS Business Register. The register provides a list of employing businesses, and it is primarily based on registrations to the Australian Taxation Office's Pay As You Go Withholding (PAYGW) scheme (and prior to 1 July 2000 its Group Employer scheme). The frame is updated quarterly to take account of new businesses, businesses which have ceased employing, changes in employment levels, changes in industry and other general business changes.

4 Businesses which have ceased employing are identified when the Australian Taxation Office cancels their PAYGW registration (or previously their Group Employer registration). In addition, from September quarter 1999, businesses which did not remit under the Group Employer scheme for the previous five quarters were removed from the frame. A similar process will be adopted to remove businesses who do not remit under the PAYGW scheme.
5 The scope excludes public sector business units (i.e. all departments, authorities and other organisations owned and controlled by Commonwealth, State and Local Government).

6 The statistics in this publication exclude non-employing businesses. Though there are a substantial number of these businesses, it is expected that they would not contribute significantly to the estimates, although the impact would vary from industry to industry and from data item to data item.
7 Inventories data are not collected from businesses with fewer than 20 employees, as smaller businesses generally have difficulty in providing accurate quarterly information on the level of their inventories. Estimates for these businesses are derived by applying sales information to an estimated inventories to sales ratio. The inventories to sales ratio is based on data from the current quarter for medium sized businesses, and benchmarked to data from the annual Economic Activity Survey for small businesses.
Investigations indicate that this technique produces estimates of inventories of sufficient quality.

SCOPE AND COVERAGE
continued

8 The industries, classified according to the Australian and New Zealand Standard Industrial Classification (ANZSIC), 1993 (Cat. no. 1292.0), included in this publication are:

|  | Income <br> from <br> sales of <br> goods <br> and | Wages <br> and | Company <br> salaries |  |
| :--- | ---: | :--- | ---: | :--- |
| profits |  |  |  |  | Inventories

(a) See paragraph 5 for details of further scope exclusions for these industries.

9 Estimates for Company profits before income tax, and Company gross operating profits, only include private incorporated businesses ('companies') employing 20 or more persons and exclude companies in ANZSIC groups 733 or 734 classified to the Corporate Financial sector of the Standard Institutional Sector Classification of Australia (SISCA). Refer to paragraph 18 for more information on this classification. Estimates previously published in Company Profits, Australia (cat. no. 5651.0) related only to companies employing more than 30 persons. The ABS has collected data for companies employing between 20 and 30 persons since September 1994 and these data are now included in published estimates.

10 The estimates for all the other statistics in this publication include unincorporated businesses and businesses with fewer than 20 employees. Other than for profits estimates there are no other exclusions based on SISCA.

## STATISTICAL UNIT

11 The introduction of The New Tax System has a number of significant implications for ABS business statistics. These are discussed in Information Paper: ABS Statistics And The New Tax System (cat. no. 1358.0). The replacement of the Group Employer registration process by PAYGW registration resulted in a number of changes to most business survey frames. However, an adjustment has been made to the statistics in this publication and these changes will not affect broader level estimates of level and movement.

12 Section 68 of the Taxation Administration Act 1953 provides for the Australian Taxation Office to pass information to the Australian Statistician for the purposes of the Census and Statistics Act 1905. The ABS is currently analysing data from Business Activity Statements (BAS) as possible alternatives to direct collection of data, and to improve sample efficiency and reduce the load on businesses in completing ABS survey forms. From the December quarter 2002, the ABS will use BAS wages and salaries data to derive size benchmarks to improve the sample design of the Quarterly Economic Activity Survey.
13 In addition, the ABS will make further changes including adopting a new units model and expanding its Register to include all units on the Australian Business Register, including non-employers. These non-employers will, however, continue to be excluded from the scope of the Quarterly Economic Activity Survey. Information Paper: Improvements in ABS Economic Statistics (Arising from The New Tax System), 2002 (cat. no. 1372.0) provides further details.

14 The Quarterly Economic Activity Survey uses the management unit as the statistical unit. The management unit is the highest-level accounting unit within a business, having regard to industry homogeneity, for which accounts are maintained. In nearly all cases it coincides with the legal entity owning the business (i.e. company, partnership, trust, sole operator, etc.). In the case of large diversified businesses, however, there may be more than one management unit, each coinciding with a 'division' or 'line of business'. A division or line of business is recognised where separate and comprehensive accounts are compiled for $i t$.

15 The Australian and New Zealand Standard Industrial Classification has been developed for use in both countries for the production and analysis of industry statistics. For more information, users are referred to Australian and New Zealand Standard Industrial Classification (ANZSIC), 1993 (cat. no. 1292.0).

16 In order to classify data by industry, each statistical unit (as defined above) is classified to the Australian and New Zealand Standard Industrial Classification industry in which it mainly operates.

17 Many of the tables in this publication contain an industry classification 'Other selected industries'. For company gross operating profits, company profits before income tax, and income from sales of goods and services, Other selected industries comprises Electricity, gas and water; Accommodation, cafes and restaurants; Communication services; Other financiers; Financial asset investors; Services to finance and insurance; Cultural and recreational services; and Personal services. For inventories, it comprises Electricity, gas and water; and Accommodation, cafes and restaurants. For wages and salaries, it comprises Electricity, gas and water; Accommodation, cafes and restaurants; Communication services; Deposit taking financiers; Other financiers; Financial asset investors; Other insurance; Services to finance and insurance; Education; Health and community services; Cultural and recreational services; and Personal and other services.

SURVEY METHODOLOGY

TIMING OF SURVEY CYCLE

SAMPLE REVISION

SEASONAL ADJUSTMENT

18 The Standard Institutional Sector Classification of Australia (SISCA) is used to classify institutional units into broad economic sectors in national accounts and related statistics. For more information, users are referred to Standard Economic Sector Classifications of Australia (SESCA), 1998 (cat. no. 1218.0).

19 The survey is conducted by mail on a quarterly basis. It is based on a random sample of approximately 16,000 units which is stratified by industry, state/territory and number of employees. All private sector units with over 250 employees, and other statistically significant units, such as joint venture partners, are included in the sample.

20 Respondents are asked to provide data on the same basis as their own management accounts. Where a selected unit does not respond in a given survey period, a value is estimated. If data are subsequently provided, the estimated value is replaced with the reported data. Aggregates are calculated from all data using the 'number raised' estimation technique. Data are edited at both individual unit level and aggregate level.

21 Surveys are conducted in respect of each quarter and returns are completed during the 8 or 9 week period after the end of the quarter to which survey data relate e.g. December quarter survey returns are completed during January and February.

22 The survey frames and samples are revised each quarter to ensure that they remain representative of the survey population. The timing for creating each quarter's survey frame is consistent with that of other ABS business surveys. This provides for greater consistency when comparing data across surveys.

23 Additionally, with these revisions to the sample, some of the units from the sampled sector are rotated out of the survey and are replaced by others, to spread the reporting workload equitably.

24 The quarterly original estimates in this publication are affected in varying degrees by seasonal influences. The seasonal adjustment process estimates and removes the effects of normal seasonal variations from the original estimates so that the effects of other influences can be more clearly recognised.

25 In the seasonal adjustment process, account has been taken of both normal seasonal factors (e.g. increase in retail sales due to the Christmas period) and also trading day effects when significant (arising from the varying lengths of the quarters and the varying numbers of Sundays, Mondays, Tuesdays etc. in each quarter) to produce the seasonally adjusted estimates. Particular care should be taken in interpreting quarterly movements in the seasonally adjusted estimates because seasonal adjustment does not remove the effect of irregular or non-seasonal influences (e.g. change in interest rates) and reflects the sampling and other errors to which the original estimates are subject.

26 In this publication, the seasonally adjusted estimates are produced by the concurrent seasonal adjustment method which takes account of the latest available original estimates. This method improves the estimation of seasonal factors, and therefore, the seasonally adjusted and trend estimates for the current and previous quarters. As a result of this improvement, revisions to the seasonally adjusted and trend estimates will be observed for recent periods. In most instances the only noticeable revisions will be to the previous quarter and the same quarter one year ago. A more detailed review is conducted annually prior to the September quarter release using data up to and including the June quarter.

SEASONAL ADJUSTMENT continued

TREND ESTIMATES

CHAIN VOLUME MEASURES

The concurrent seasonal adjustment methodology replaces the forward factor methodology used to adjust inventories and sales estimates in Inventories and Sales, Selected Industries, Australia (cat. no. 5629.0) where seasonal factors for these estimates were only revised following an annual reanalysis. The concurrent seasonal adjustment methodology has been applied to company profits estimates for some years.

27 Seasonally adjusted estimates are not available for some series contained in this publication, as at least three years of data (but preferably five years) are required to discern a seasonal pattern. In addition, some seasonally adjusted and trend series for income from sales of goods and services in this publication are considered experimental as less than five years of data are available for estimation of seasonal factors.

28 The trend estimates are derived by applying a 7-term Henderson moving average to the seasonally adjusted estimates. The 7-term Henderson moving average is symmetric, but as the end of a time series is approached, asymmetric forms of the moving average are applied. The asymmetric moving average has been tailored to suit the particular characteristics of individual series and enable trend estimates for recent quarters to be produced. Estimates of the trend will be improved at the current end of the time series as additional observations become available. This improvement is due to the combined effect of the concurrent seasonal adjustment methodology and the application of different asymmetric moving averages for the most recent three quarters. As a result of the improvement, revisions to the trend estimates will generally be observed for the most recent three quarters. ABS research shows that about $75 \%$ of the total revision to the trend estimate at the current end is due to the use of different asymmetric moving averages when the original estimate is available for the next quarter.

29 There may also be revisions because of changes in the original estimates. As a result of these revisions, the seasonally adjusted and trend estimates will also be revised. For further information, see Information Paper: A Guide to Interpreting Time Series - Monitoring Trend, An Overview (cat. no. 1348.0) or contact the Assistant Director, Time Series Analysis on Canberra 0262526345 or email [timeseries@abs.gov.au](mailto:timeseries@abs.gov.au).

30 The chain volume measures appearing in this publication are annually reweighted chain Laspeyres indexes referenced to current price values in the chosen reference year (currently 2000-2001). The current price values may be thought of as being the product of a price and quantity. The value in chain volume terms can be derived by linking together movements in volumes, calculated using the average prices of the previous financial year and applying compound movements to the current price estimates of the reference year. Each year's quarter-to-quarter growth rates in the chain volume series are based on the prices of the previous financial year, except for those quarters of the latest incomplete year which are based upon the second most recent financial year. Quarterly chain volume estimates are benchmarked to annual chain volume estimates, so that the quarterly estimates for a financial year sum to the corresponding annual estimate.
31 With each release of the June quarter issue of this publication, a new base year is introduced and the reference year is advanced one year to coincide with it. This means that with the release of the June quarter 2003 issue of this publication, the chain volume measures for 2002-03 will have 2001-02 (the previous financial year) as their base year rather than 2000-01, and the reference

CHAIN VOLUME MEASURES
continued

COMPARABILITY WITH
NATIONAL ACCOUNTS AND
OTHER ABS ESTIMATES
year will be 2001-02. A change in the reference year changes levels but not growth rates for all periods. A change in the base year can result in revisions, small in most cases, to growth rates for the last year.

32 Chain volume measures are not generally additive. In other words, component chain volume measures do not, in general, sum to a total in the way original current price components do. For inventories and sales data, this means that the chain volume estimates for industry groups will not add to the total for Australia. In order to minimise the impact of this, the ABS uses the latest base year as the reference year. By adopting this approach, additivity does exist for the quarters following the reference year and non-additivity is relatively small for the quarters in the reference year and those immediately preceding it. For further information on chain volume measures, refer to the Information Paper:
Introduction of Chain Volume Measures in the Australian National Accounts (cat. no. 5248.0).

33 The data collected in the Quarterly Economic Activity Survey are used in the compilation of the quarterly estimates of the Australian National Accounts. Inventories data are used to compile estimates of the increase in book value of non-farm inventories. Estimates of income from sales of goods and services are used to help derive quarterly chain volume measures of gross value added for selected industries. Company gross operating profits data are used to compile estimates of gross operating surplus of private non-financial corporations. From March quarter 2002, estimates of wages and salaries are being used to compile estimates for compensation of private sector employees. For further details see Australian National Accounts: Concepts, Sources and Methods (cat. no. 5216.0).
34 However the statistics in this publication will differ from corresponding statistics in the quarterly Australian National Accounts for the following reasons:

- the national accounts estimates are benchmarked to annual supply and use tables which are based on annual Economic Activity Survey and taxation data;
- the national accounts estimates include estimates for businesses classified to industries not in scope of the Quarterly Economic Activity Survey;
- the national accounts estimates include estimates for non-employing businesses, which are outside the scope of Quarterly Economic Activity Survey;
- the national accounts estimates for gross operating surplus of private non-financial corporations include the profits of all businesses whereas company profits estimates in this publication only include incorporated businesses with 20 or more employees;
- the national accounts estimates for gross operating surplus of private non-financial corporations are after deduction of the inventory valuation adjustment which measures the portion of income attributable to holding gains or losses resulting from inventory valuation practices;
- the national accounts estimates for gross operating surplus of private non-financial corporations do not include deductions relating to interest, net land rent and natural resource payments;
- in many cases, the processes used to seasonally adjust national accounts estimates are different to those used for the seasonally adjusted estimates in this publication.
35 The estimates for income from sales of goods and services by Retail trade in this publication will differ from turnover estimates included in Retail Trade, Australia (cat. no. 8501.0). The latter publication presents monthly estimates of the value of turnover of retail businesses, and is sourced from the Retail Business

## EXPLANATORY NOTES continued

COMPARABILITY WITH NATIONAL ACCOUNTS AND OTHER ABS ESTIMATES continued

Survey. Estimates for income from sales of goods and services in this publication exclude the Goods and Services Tax, while turnover collected in the Retail Business Survey includes the Goods and Services Tax. In addition, the Retail Business Survey includes some businesses classified to ANZSIC divisions other than the Retail trade division, and includes retail establishments associated with management units that are not classified to the Retail trade division. The use of different samples in the Retail Business Survey and Quarterly Economic Activity Survey will also contribute to differences.

36 The estimates for wages and salaries in this publication differ from estimates for gross earnings previously included in Wage and Salary Earners, Australia (cat. no. 6248.0). The latter publication presented quarterly estimates of gross earnings collected in the Survey of Employment and Earnings, and data on gross earnings were requested on a cash (payroll) basis. Data for wages and salaries estimates are requested on an accruals (accounts) basis in the Quarterly Economic Activity Survey.

38 Current publications produced by the ABS are listed in the Catalogue of Publications and Products, Australia (cat. no. 1101.0). The ABS also issues on Tuesdays and Fridays a Release Advice (cat. no. 1105.0) which lists publications to be released in the next few days. The Catalogue and Release Advice are available from any ABS office or from the ABS web site at <www.abs.gov.au>.

39 The key indicators and main features from this publication are published on the ABS web site at <www.abs.gov.au>. Information on the Quarterly Economic Activity Survey and survey outputs are also published on the web site: see the Business Indicators Home Page under Themes.

40 As well as the statistics included in this and related publications, the ABS may have other relevant data available on request. These series include more detailed industry data (e.g. Manufacturing subdivision), and wages and salaries by state/territory by industry. The availability of more detailed data are subject to confidentiality and quality checks. Inquiries should be made to the National Information and Referral Service on 1300135070.

RELIABILITY OF THE ESTIMATES

STANDARD ERRORS

1 Estimates provided in this publication are subject to non-sampling and sampling error. The most common way of quantifying sampling error is to calculate the standard error for the published estimate. This is discussed in paragraphs 5 to 9 below.

2 Non-sampling errors may arise as a result of errors in the reporting, recording or processing of the data and can occur even if there is a complete enumeration of the population. These errors can be introduced through inadequacies in the questionnaire, treatment of non-response, inaccurate reporting by respondents, errors in the application of survey procedures, incorrect recording of answers, and errors in data entry and processing. Inventories data for businesses with less than 20 employees are derived and could therefore be subject to error (although this error is estimated to be less than the sampling and non-sampling error resulting from directly collecting these data).
3 Estimates for the latest quarter presented in this publication are considered preliminary and revised estimates will be released with the next issue. As discussed in paragraphs 28 and 29 above, seasonally adjusted and trend estimates are also subject to revision as more data are revised and more data becomes available.

4 It is difficult to measure the size of non-sampling errors. However, every effort is made in the design of the survey and development of survey procedures to minimise their effects.

5 The estimates in this publication are based on a sample drawn from units in the surveyed population. Because the entire population is not surveyed, the published estimates are subject to sampling error. In calculating the standard error for the statistics in this publication, the ABS would prefer to produce a smoothed standard error for the major published aggregates as this approach takes account of the variability in standard error estimates for quarterly statistics. This estimated standard error would then be used as an indication of the sampling error for the current published series. As the data in this publication are sourced from the Quarterly Economic Activity Survey, which has only been conducted since March quarter 2001, this does not allow for a smoothed estimate of the standard error to be calculated. Therefore standard errors are based upon the data in the currently published quarter. Details of standard errors are available below.

6 To illustrate, let us say that the published level estimate for company profits before income tax is $\$ 8,900 \mathrm{~m}$ and the calculated standard error in this case is $\$ 200 \mathrm{~m}$. The standard error is then used to interpret the level estimate of $\$ 8,900 \mathrm{~m}$. For instance, the standard error of $\$ 200 \mathrm{~m}$ indicates that:

- There are approximately two chances in three that the real value falls within the range $\$ 8,700 \mathrm{~m}$ to $\$ 9,100 \mathrm{~m}(\$ 8,900 \mathrm{~m} \pm \$ 200 \mathrm{~m})$.
- There are approximately nineteen chances in twenty that the real value falls within the ranges $\$ 8,500 \mathrm{~m}$ and $\$ 9,300 \mathrm{~m}(\$ 8,900 \mathrm{~m} \pm \$ 400 \mathrm{~m})$.
- The real value in this case is the result we would obtain if we could enumerate the total population.
7 The following table shows the standard errors for national quarterly level estimates based upon the data in the current quarter.

LEVEL ESTIMATES continued

movement estimates
8 The following example illustrates how to use the standard error to interpret a movement estimate. Let us say that one quarter the published level estimate for inventories is $\$ 90,000 \mathrm{~m}$, and the next quarter the published level estimate is $\$ 92,000 \mathrm{~m}$. In this example the calculated standard error for the movement estimate is $\$ 850 \mathrm{~m}$. The standard error is then used to interpret the published movement estimate of $+\$ 2,000 \mathrm{~m}$. For instance, the standard error of $\$ 850 \mathrm{~m}$ indicates that:

- There are approximately two chances in three that the real movement over the two quarter period falls within the range $\$ 1,150 \mathrm{~m}$ to $\$ 2,850 \mathrm{~m}$ ( $\$ 2,000 \mathrm{~m} \pm \$ 850 \mathrm{~m}$ ).
- There are approximately nineteen chances in twenty that the real movement falls within the range $\$ 300 \mathrm{~m}$ to $\$ 3,700 \mathrm{~m}(\$ 2,000 \mathrm{~m} \pm \$ 1,700 \mathrm{~m})$

9 The following table shows the standard errors for national quarterly movement estimates based upon the data in the current quarter.

11 As previously discussed, the estimates presented in this publication are partial indicators used in the compilation of the quarterly national accounts. The movements in the Business Indicators estimates will not always be the same as the movements in the comparable national accounts series but they should be reasonably consistent after taking account of differences in concepts, scope and methodology described in paragraph 34 of the Explanatory Notes. If after taking account of these differences, there are concerns about data quality and coherence, the national accounts area provides feedback to the survey area. This process may result in adjustments being applied to the Business Indicators estimates prior to release in this publication. The objective use of the national accounts framework to provide data coherence across all ABS economic statistics ensures that a common understanding of recent economic developments is presented.

INCOME FROM SALES OF GOODS AND SERVICES TIME SERIES

12 With the introduction of the Quarterly Economic Activity Survey from the March quarter 2001, the ABS commenced the collection of income from sales of goods and services from Mining (ANZSIC Division B); Electricity, gas and water supply (Division D); Construction (Division E); Food retailing (Subdivision 51); Personal and household good retailing (Subdivision 52); Services to finance and insurance (Subdivision 75); Libraries, Museums, and Parks and gardens (Groups 921-923); Video hire outlets (Class 9511); and Hairdressing and beauty salons (Class 9526).

13 The different time periods for which series are available can pose some inconsistencies between the series published in original terms and those released in seasonally adjusted and trend terms, as a minimum of three years worth of data are required in order to produce seasonally adjusted and trend estimates. To reduce these inconsistencies, the ABS has modelled estimates based on data from the monthly Retail Business survey to produce a time series for Food retailing, Personal and household good retailing, Video hire outlets and Hairdressing and beauty salons. There are some significant differences between the monthly Retail trade series and the quarterly income from sales of goods and services and series, and these are discussed in paragraph 35 in the Explanatory Notes. To address these differences in the modelling of the time series, movements from the aggregated monthly series have been applied to the level quarterly estimates for the March quarter 2001, and a time series has been created by backcasting. This has facilitated the production of seasonally adjusted and trend estimates for these industries.

14 The ABS does not have alternative data sources to model quarterly time series for income from sales of goods and services for Mining; Electricity, gas and water supply; Construction; and Services to finance and insurance; and data for these industries are only published in original terms for periods since March quarter 2001. The ABS also does not have an alternative data source to model time series for Libraries, Museums, and Parks and gardens. However as the scope for estimates in this publication exclude public sector business units, estimates for Libraries, Museums, and Parks and gardens are relatively small and have been incorporated in estimates for Cultural and recreational services from the March quarter 2001. While this has caused a small break in series in the March quarter 2001, it does not impact on quarterly movements (except for the March quarter 2001), although it will impact on comparisons of year to year movements. This has facilitated the production of seasonally adjusted and trend estimates for Cultural and recreational services.

15 This publication includes estimates of income from sales of goods and services, by industry, and by state/territory, but estimates of national total income from sales of goods and services are not published. Total income from sales of goods and services is not an adequate indicator of the performance of the Australian economy as it includes duplication; for example, goods sold by retailers may also be included in goods sold by wholesalers in the same period. However this publication does include total income from sales of goods and services, by state/territory, as it is considered that there may be interest in this item as a measure of relative activity. This data should be used with caution given the potential for the data to include duplication across industries.

INCOME FROM SALES OF GOODS AND SERVICES TIME
SERIES continued

PROFITS TIME SERIES

16 Seasonally adjusted and trend data by state/territory are not provided in this publication but are available on request for a limited set of industries excluding Mining; Construction; Electricity, gas and water; and Services to finance and insurance. State/territory estimates which are most impacted by the limited scope are Western Australia and Northern Territory where income from sales of goods and services for Mining and Construction are relatively significant.

17 With the introduction of the Quarterly Economic Activity Survey from the March quarter 2001, the ABS commenced the collection of profits items from Libraries, Museums, and Parks and gardens (Groups 921-923). The ABS does not have an alternative data source to model quarterly time series for Libraries, Museums, and Parks and gardens. However as the scope for estimates in this publication exclude public sector business units, estimates for Libraries, Museums, and Parks and gardens are relatively small and have been incorporated in Company profits before income tax, and Company gross operating profits estimates for Cultural and recreational services from the March quarter 2001. While this has caused a small break in series in the March quarter 2001, it does not impact on quarterly movements (except for the March quarter 2001), although it will impact on comparisons of year to year movements. This has facilitated the production of seasonally adjusted and trend estimates for Cultural and recreational services.

18 Estimates for Company gross operating profits were formerly included in Company Profits, Australia as the experimental series "Company profits before income tax, net interest, depreciation and selected items". Data were published in respect of businesses employing more than 30 persons. Estimates for Company gross operating profits are compiled by deducting estimates for depreciation, net interest paid and some additional items from the Company profits before income tax series. The additional items include activities that do not involve the production of goods and services such as net foreign exchange gains/losses, unrealised gains/losses on the revaluation of assets and some other items often defined in accounting terms as abnormal items that are considered out of scope of the national accounts item Gross operating surplus.
19 While Company profits before income tax estimates for businesses employing 20 or more persons are available from September quarter 1994, data for 'abnormal' items for these businesses only became available with changes in data collection and processing introduced from the June quarter 1999. Therefore the Company gross operating profits estimates from September quarter 1994 to March quarter 1999 include 'abnormal' items reported by businesses with 20 to 30 employees, whereas Company gross operating profits estimates from the June quarter 1999 exclude these items where they are considered out of scope of the national accounts item Gross operating surplus. As these items are generally small in value for businesses with 20 to 30 employees, this difference in treatment is expected to have a minimal impact on the time series.
INVENTORIES TIME SERIES

PRIVATISED MARKETING
AUTHORITIES

20 With the introduction of the Quarterly Economic Activity Survey, the ABS commenced the collection of inventories from businesses classified to ANZSIC classes 5322 Automotive electrical services, 5323 Smash repairs and 5329 Automotive repair and services nec. These classes contribute about $2.0 \%$ to the level estimates for Retail trade inventories and about $0.5 \%$ to the level estimate for Total inventories. Their contribution to movement estimates is not consistent with the movement estimates for Retail trade which suggests that the characteristics of these classes differ from other Retail trade classes. As a result, there is a break in the series for Retail trade inventories and Total inventories, between the December quarter 2000 and the March quarter 2001.

21 Three significant privatised marketing authorities came into scope of the estimates in this publication from the September quarter 1999. The introduction of these units resulted in a break in series for estimates for inventories and income from sales of goods and services between the June and September quarters 1999 and comparison of the series over time should be undertaken with care.

22 The methodology used by the ABS has ensured that the trend series has not been distorted by the introduction of these units, although there is a trend break evident between the June and September quarters 1999. For this reason, the trend estimates of movement have not been released for the Wholesale trade inventories, Total inventories and Wholesale trade sales series in respect of the September quarter 1999.
