## KEY POINTS

## TREND ESTIMATES

- The trend estimate of turnover for the Australian Retail and Hospitality/Services series increased by $0.3 \%$ in September 2004. This follows increases of $0.4 \%$ in August and July.
- In September 2004, the trend estimate increased in all states and territories except New South Wales which was flat. The largest increases were in Western Australia ( $+0.8 \%$ ) and Northern Territory and Queensland (both $+0.6 \%$ ).
- Over the three months to September 2004 the trend estimate increased by $\$ 178 \mathrm{~m}$. Food retailing $(+\$ 66 \mathrm{~m})$, Other retailing $(+\$ 39 \mathrm{~m})$ and Department stores $(+\$ 38 \mathrm{~m})$ had the largest increases.

## SEASONALLY ADJUSTED ESTIMATES

- The seasonally adjusted estimate of turnover for the Australian Retail and Hospitality/Services series increased by $0.8 \% ~(+\$ 139 \mathrm{~m})$ in September 2004. This followed a revised small increase of 0.1\% (+\$21m) in August 2004.
- All states and territories recorded growth with Northern Territory $(+2.7 \%$ or $+\$ 4 \mathrm{~m})$ and Western Australia $(+2.4 \%$ or $+\$ 40 \mathrm{~m})$ having the strongest percentage growth.

## ORIGINAL ESTIMATES

- In original terms, Australian turnover increased by $2.8 \%$ in September 2004 compared with August 2004. Chains and other large retailers (which are completely enumerated) increased by $4.0 \%$, while 'smaller' retailers (the sampled units) increased by $1.2 \%$.
- Australian turnover rose by $6.9 \%$ in September 2004 compared with September 2003. Chains and other large retailers rose by $9.7 \%$, while 'smaller' retailers rose by $3.4 \%$.

## VOLUME MEASURES

- The trend volume measure of turnover rose by $1.1 \%$ in the September quarter 2004. This follows an increase of $1.3 \%$ in the June quarter 2004. In seasonally adjusted terms, the volume measure rose by $0.9 \%$ in the September quarter 2004.

Quarterly chain volume data are shown in tables 14 and 15 of this issue.

An electronic release, Contribution of Gambling to Retail Estimates (cat no 8501.0.55.003), will be available on 10 November free of charge from the Australian Bureau of Statistics (ABS) web site. This release will present estimates of Net proceeds from gambling to September quarter 2004 incorporating the new sample design and improved estimation method which were introduced into the main Retail trade series in the July 2004 issue. Refer to the July issue for further information.

In addition, the release will incorporate revisions resulting from the annual review of the seasonal adjustment process of these quarterly series. The annual review was based on data on the new basis up to June quarter 2004.

Standard errors for the Australian estimates (original data) for September 2004 contained in this publication are:

| Data Series | Estimate | Standard error |
| :---: | :---: | :---: |
| Level of retail turnover (\$m) | 16267.8 | 120.1 |
| Change from preceding month (\$m) | 438.1 | 41.5 |
| \% change from preceding month (\%) | 2.8 | 0.3 |

Estimates for sampled businesses in the first month of each quarter can be influenced by the quarterly rotation of sampled businesses. The aim of the rotation is to spread the reporting load across retailers and to ensure the sample remains representative of the population. At times, the businesses rotated into the sample can perform differently from the businesses they replace or those already in the sample. The potential impact of the quarterly rotation is reflected in the sampling errors for the relevant months.

For more information see the Explanatory Notes, paragraphs 32-36.

## MONTHLY SEASONALLY ADJUSTED AND TREND ESTIMATES

TOTAL RETAIL

FOOD RETAILING

DEPARTMENT STORES

After 10 months of moderate trend growth the Australian Retail and Hospitality/Services series had weak growth in September 2004. Department stores and Clothing and soft good retailing have had strong growth for seven and six months, respectively, while Food retailing has had weak growth for the last two months. Hospitality and services has been in decline for four months.

There was weak trend growth in August and September 2004 after 18 months of moderate growth. Growth in New South Wales and Victoria has weakened since the start of 2004 with Victoria flat for the past four months. Western Australia and the Northern Territory have had the strongest rates of growth in recent months.

There has been strong trend growth for the last seven months. Over the last six months Victoria, Queensland, South Australia and Western Australia have had strong trend growth with Queensland and Western Australia the strongest. The trend in New South Wales has moderated in the last two months

## MONTHLY SEASONALLY ADJUSTED AND TREND ESTIMATES

CLOTHING AND SOFT
GOOD RETAILING

HOUSEHOLD GOOD RETAILING

RECREATIONAL GOOD RETAILING

There has been strong growth in the trend estimate in each of the last six months. Victoria, South Australia and the Northern Territory have had strong trend growth for six or more months, Tasmania for four months and Western Australia and the Australian Capital Territory for three months. New South Wales has had weak trend growth in the last two months.

The rate of trend growth decreased from June 2003 to March 2004 but has been slightly stronger in recent months. Western Australia is the only state showing sustained strong trend growth. Over the last three months, New south Wales and Victoria have had moderate growth and Queensland has been flat

Trend growth was in decline in September and August 2004 after no growth in July. New South Wales has been in decline for 11 months, Queensland for three months and South Australia for two months after a period of strong growth. Northern Territory has been mostly flat or in decline since August 2003. Tasmania has had six months of strong trend growth. The other states have had moderate growth over the last three months.

## MONTHLY SEASONALLY ADJUSTED AND TREND ESTIMATES

OTHER RETAILING

TOTAL RETAIL
(EXCLUDING HOSPITALITY AND SERVICES)

There has been moderate trend growth for the last five months, driven by strong growth in Queensland and Western Australia. South Australia was flat in September 2004 after three months of weak growth and six months of decline. New South Wales has been in decline for 11 months and the Australian Capital Territory for six months. Victoria has had nine months of being flat or in decline.

Total retail (excluding Hospitality and services) has had moderate growth for the last six months. Over this period, the rate of trend growth has been slightly stronger or the same as that of Total industries (including Hospitality and services).

After weak trend growth for five months, the industry has been in decline for the last four months. New South Wales, Queensland, South Australia and Tasmania have been in decline for at least the last three months. Northern Territory has had strong trend growth for the last six months. Victoria has had weak growth for the last three months.

## MONTHLY SEASONALLY ADJUSTED AND TREND ESTIMATES

NEW SOUTH WALES

VICTORIA

QUEENSLAND

After 11 months of weak to moderate trend growth, September 2004 was flat. Over the last six months Department stores has had strong growth. Food, Clothing and soft good and Household good retailing have had moderate trend growth. Recreational good and Other retailing have been in decline over this period. Hospitality and services has been in decline for the last three months.

After five months of weak trend growth, August and September had moderate trend growth. Over the last six months Department stores and Clothing and soft good retailing have had strong growth. After being in decline, Household good retailing and Recreational good retailing have shown moderate growth in the last three months. The other industries have had weak trend growth or were flat in this period.

Trend growth has been moderate over the last 10 months. Over the last seven months Department stores, Clothing and soft good retailing and Other retailing have had strong trend growth, Food retailing has had moderate growth, and Hospitality and services has been in decline. Recreational good retailing has been in decline for three months.

## MONTHLY SEASONALLY ADJUSTED AND TREND ESTIMATES

SOUTH AUSTRALIA

WESTERN AUSTRALIA

In September 2004, the trend continued its fifth month of weak growth. Over the last six months there was strong growth in Clothing and soft good retailing and Department stores. Recreational good retailing was in decline in August and September after 10 months of strong growth. Hospitality and services continued to be in decline and the other industries had weak growth or were flat in September 2004.

Trend growth has been strong for eight months. Department stores and Household good retailing have had strong growth for the last six months. In September 2004, Food and Other retailing had moderate growth after a period of strong growth, and Clothing and soft good and Recreational good retailing had strong growth after being in decline.

The trend growth was weak in the last two months after five months of moderate growth. Over the last four months Clothing and soft good retailing and Recreational good retailing have had strong trend growth, Household good retailing has had moderate growth, Food retailing has had weak growth and Hospitality and services has been in decline.

## INTRODUCTION

SCOPE AND COVERAGE

1 This publication presents monthly estimates of the value of turnover of retail businesses classified by industry, and by state and territory. The principal objective of the series is to show month to month movement of turnover.

2 Estimates of turnover contained in this publication are compiled from the Retail Business survey. Following a new sample design introduced in the July 2004 issue, the survey includes about 4,350 retail and selected service businesses. All 'large' businesses are included in the survey, while a sample of about 3,500 'smaller' businesses is selected. The 'large' business' contribution of approximately $55 \%$ of the total estimate ensures a highly reliable Australian total turnover estimate.

3 The scope of the Retail Business survey is all employing businesses with at least one retail outlet. Like most ABS economic surveys, the frame used for the Retail Business survey is taken from the ABS Business Register which includes registrations to the Australian Taxation Office's (ATO) Pay-As-You-Go-Withholding (PAYGW) scheme. Each statistical unit (as defined below) included on the ABS Business Register is classified to the Australian and New Zealand Standard Industrial Classification (ANZSIC) industry in which it mainly operates. The frame is supplemented with information about businesses which are classified as non-retail but which have significant retail activity.
4 The frame is updated quarterly to take account of new businesses, businesses which have ceased employing, changes in industry and other general business changes. The estimates include an allowance for the time it takes a newly registered business to get on to the survey frame. Businesses which have ceased employing are identified when the ATO cancels their Australian Business Number (ABN) and/or PAYGW registration. In addition, businesses with less than 50 employees, and which do not remit under the PAYGW scheme in each of the previous five quarters are removed from the frame.

5 The following industries included in the survey are as defined in ANZSIC:

- Food Retailing

Supermarkets and grocery stores (5110) and non-petrol sales of convenience stores of selected petrol stations
Takeaway food retailing (5125)
Other food retailing
Fresh meat, fish and poultry retailing (5121)
Fruit and vegetable retailing (5122)
Liquor retailing (5123)
Bread and cake retailing (5124)
Specialised food retailing n.e.c. (5129)

- Department Stores (5210)
- Clothing and Soft Good Retailing

Clothing retailing (5221)
Footwear, fabric and other soft good retailing
Footwear retailing (5222)
Fabric and other soft good retailing (5223)

- Household Good Retailing

Furniture and floor covering retailing
Furniture retailing (5231)
Floor covering retailing (5232)
Domestic hardware and houseware retailing (5233)
Domestic appliance and recorded music retailing
Domestic appliance retailing (5234)
Recorded music retailing (5235)

SCOPE AND COVERAGE
continued

STATISTICAL UNITS DEFINED ON THE ABS BUSINESS REGISTER

## ATO Maintained Population

ABS Maintained Population

- Recreational Good Retailing

Newspaper, book and stationery retailing (5243)
Other recreational goods retailing
Sport and camping equipment retailing (5241)
Toy and game retailing (5242)
Photographic equipment retailing (5244)

- Other Retailing

Pharmaceutical, cosmetic and toiletry retailing (5251)
Other retailing n.e.c.
Antique and used good retailing (5252)
Garden supplies retailing (5253)
Flower retailing (5254)
Watch and jewellery retailing (5255)
Retailing n.e.c. (5259)

- Hospitality and Services

Hotels and licensed clubs
Pubs, taverns and bars (5720)
Clubs (Hospitality) (5740)
Cafes and restaurants (5730)
Selected services
Video hire outlets (9511)
Hairdressing and beauty salons (9526).
6 The ABS uses an economic statistics units model on the ABS Business Register to describe the characteristics of businesses, and the structural relationships between related businesses. The units model is also used to break groups of related businesses into relatively homogeneous components that can provide data to the ABS.

7 In mid-2002, to better use the information available as a result of The New Tax System, the ABS changed its economic statistics units model. The new units model allocates businesses to one of two sub-populations. The vast majority of businesses are in what is called the ATO Maintained Population, while the remaining businesses are in the ABS Maintained Population. Together, these two sub-populations make up the ABS Business Register population.

8 Most businesses and organisations in Australia need to obtain an ABN, and are then included on the ATO Australian Business Register. Most of these businesses have simple structures; therefore the unit registered for an ABN will satisfy ABS statistical requirements. For these businesses, the ABS has aligned its statistical units structure with the ABN unit. The businesses with simple structures constitute the ATO Maintained Population, and the ABN unit is used as the statistical unit for all economic collections.

9 For the population of businesses where the ABN unit is not suitable for ABS statistical requirements, the ABS maintains its own units structure through direct contact with each business. These businesses constitute the ABS Maintained Population. This population consists typically of large, complex and diverse businesses. The new statistical units model described below has been introduced to cover such businesses.

Enterprise Group: This is a unit covering all the operations in Australia of one or more legal entities under common ownership and/or control. It covers all the operations in Australia of legal entities which are related in terms of the current Corporations Law (as amended by the Corporations Legislation Amendment Act 1991), including legal entities such as companies, trusts, and partnerships. Majority ownership is not required for control to be exercised.

ABS Maintained Population continued

Enterprise: The enterprise is an institutional unit comprising (i) a single legal entity or business entity, or (ii) more than one legal entity or business entity within the same Enterprise Group and in the same institutional subsector (i.e. they are all classified to a single Standard Institutional Sector Classification of Australia subsector).

Type of Activity Unit (TAU): The TAU is comprised of one or more business entities, sub-entities or branches of a business entity within an Enterprise Group that can report production and employment data for similar economic activities. When a minimum set of data items are available, a TAU is created which covers all the operations within an industry subdivision (and the TAU is classified to the relevant subdivision of the ANZSIC). Where a business cannot supply adequate data for each industry, a TAU is formed which contains activity in more than one industry subdivision.

10 For more information on the impacts of the introduction of the new economic statistics units model, refer to Information Paper: Improvements in ABS Economic Statistics [Arising from the New Tax System] (cat. no. 1372.0).

11 Prior to the July 2002 reference month, the Retail Business survey used the management unit as the statistical unit. From the July 2002 reference month onwards, the statistical unit is the ABN unit for businesses with simple structures, and the TAU for businesses with complex structures. In most cases, ABN/TAU units concord with the management units previously used.

12 The survey is conducted monthly by both telephone interview and a questionnaire mailed to businesses. The businesses included in the survey are selected by random sample from a frame stratified by state, industry and business size. Following the new sample design introduced in the July 2004 issue, the survey uses annualised turnover as the measure of business size. For the ATO Maintained Population, the annualised turnover is based on the ATO's Business Activity Statement item Total sales and for the ABS Maintained Population a modelled annualised turnover is used. For stratification purposes the annualised turnover allocated to each business is not updated each quarter as to do so would result in increased volatility in the estimates.

13 The July 2004 issue also saw the introduction of the generalised regression estimation methodology which replaced ratio estimation. For estimation purposes the annualised turnover allocated to each business is updated each quarter. The introduction of the new sample design and new estimation methodology resulted in changes to the level of the Retail Trade series. However, to facilitate comparisons over time, the historical series were revised to make the time series of estimates as continuous as possible. For more information about the changes introduced in the July 2004 issue refer to Information Paper: Changes to the Retail Trade Series (cat. no. 8501.0.55.002) which is available from the ABS web site [http://www.abs.gov.au](http://www.abs.gov.au).

14 In the first month of each quarter, some businesses in the sample are replaced, at random, by other businesses so that the reporting load can be spread across smaller retailers

15 Most businesses can provide turnover on a calendar month basis and this is how the data are presented. When businesses cannot provide turnover on a calendar month basis, the reported data and the period they relate to are used to estimate turnover for the calendar month.

16 Most retailers operate in a single state/territory. For this reason, estimates of turnover by state/territory are only collected from the larger retailers which are included in the survey each month. These retailers are asked to provide turnover for sales from each state/territory in which the business operates. Turnover for the smaller businesses is allocated to the state of their head office or main outlet.

## EXPLANATORY NOTES continued

SEASONAL ADJUSTMENT

17 Turnover includes retail sales; wholesale sales; takings from repairs, meals and hiring of goods (except for rent, leasing and hiring of land and buildings); commissions from agency activity (e.g. commissions received from collecting dry cleaning, selling lottery tickets, etc.); and net takings from gaming machines etc. From July 2000, turnover includes the Goods and Service Tax.

18 Turnover presented in the Retail Trade series includes net proceeds from licensed gambling activities undertaken in the Hotels and licensed clubs industry. The impact of net proceeds from gambling on movements in the Retail Trade series was discussed in Feature article: Contribution of gambling to retail estimates included in the December 2002 issue of this publication. The article concluded that net proceeds from gambling had not had a significant impact on quarterly movements for the series but net proceeds from gambling had increased over time and users should be aware of this when interpreting the series. An electronic release, Contribution of Gambling to Retail Estimates (cat no 8501.0.55.003), will provide updated quarterly information and will be available free of charge from the ABS web site. It will be released approximately a week after the release of the March, June, September and December issues of this publication. The upcoming release will present estimates of Net proceeds from gambling to September 2004 incorporating the new sample design and improved estimation method which were introduced into the main Retail trade series in the July 2004 issue.

19 Seasonally adjusted estimates are derived by estimating and removing systematic calendar related effects from the original series. In the Retail trade series, these calendar related effects are known as seasonal (e.g. increased spending in December as a result of Christmas) and trading day influences (arising from the varying length of each month and the varying number of Sundays, Mondays, Tuesdays, etc. in each month). Each influence is estimated by separate seasonal and trading day factors which, when combined, are referred to as the combined adjustment factors.

20 The seasonally adjusted estimates also have an allowance for an Easter proximity effect, which is caused when Easter falls late in March or early in April. This effect, when present, is combined with the seasonal and trading day factors to form the combined adjustment factors. There is also a similar allowance for the variable timing of Father's Day. See the Appendix of the July 2001 and August 2002 issues respectively of this publication for more information.

21 The Retail series uses a concurrent seasonal adjustment methodology to derive the combined adjustment factors. This means that data from the current month are used in estimating seasonal and trading day factors for the current and previous months. For more information see Information Paper: Introduction of Concurrent Seasonal Adjustment into the Retail Trade Series (cat. no. 8514.0).

22 Concurrent adjustment can result in revisions each month to estimates for earlier periods. However, in most instances, the only noticeable revisions will be to the combined adjustment factors for the current month, the previous month and the same month a year ago. The following table shows how the combined adjustment factor for these months, at the total Australian Retail and Hospitality/Services level, evolved under the concurrent seasonal adjustment methodology. The table presents two different estimates of the combined adjustment factors. The first row gives the combined adjustment factors estimated following the last annual reanalysis in September 2004 using data up to and including the July 2004 reference month. The second row gives the most recent combined adjustment factors estimated and used in this month's calculation of the concurrent seasonally adjusted series.

## COMBINED ADJUSTMENT FACTORS

|  | $\begin{array}{r} \text { Sep } \\ 2003 \end{array}$ | $\begin{array}{r} \text { Aug } \\ 2004 \end{array}$ | $\begin{array}{r} \text { Sep } \\ 2004 \end{array}$ |
| :---: | :---: | :---: | :---: |
| Factors as estimated at last reanalysis (July 2004 reference month) | 0.96663 | 0.95826 | 0.97427 |
| Factors as estimated with current month's data (September 2004 reference month) | 0.96661 | 0.95597 | 0.97427 |

23 The revision properties of the seasonally adjusted and trend estimates can be improved by the use of Autoregressive Integrated Moving Average (ARIMA) modelling. ARIMA modelling relies on the characteristics of the series being analysed to project future period data. The projected values are temporary, intermediate values, that are only used internally to improve the estimation of the seasonal factors. The projected data do not affect the original estimates and are discarded at the end of the seasonal adjustment process. The retail collection uses ARIMA modelling where appropriate for individual time series. The ARIMA model is assessed as part of the annual reanalysis and following the 2004 annual reanalysis $93 \%$ of Retail series use an ARIMA model. For more information on the details of ARIMA modelling see Feature article: Use of ARIMA modelling to reduce revisions in the October 2004 issue of Australian Economic Indicators (cat. no. 1350.0).

24 The seasonal adjustment methodology is able to produce combined adjustment factors for future months. The latest factors for some future months are shown in the following table. While these factors represent the best current estimate, the actual factors used for estimating the seasonally adjusted estimates in these months will differ because they will incorporate subsequent months' data as they become available.

## COMBINED ADJUSTMENT FACTORS

|  | Oct | Nov | Dec |
| :--- | ---: | ---: | ---: |
| Factors as estimated with current month's data <br> (September 2004 reference month) | 2004 | 2004 | 2004 |
|  | 1.02181 | 1.03510 | 1.31124 |

25 The seasonal and trading day factors are reviewed annually at a more detailed level than possible in the monthly processing cycle. The annual reanalysis will not normally result in significant changes. For Retail Trade, the results of the latest review are shown in the August 2004 issue.

SEASONAL ADJUSTMENT continued

CHAIN VOLUME MEASURES

26 In the seasonal adjustment process, both the seasonal and trading day factors evolve over time to reflect changes in spending and trading patterns. Examples of this evolution include the slow move in spending from December to January; and, increased trading activity on weekends and public holidays. The seasonally adjusted estimates still reflect the sampling and non-sampling errors to which the original estimates are subject.

27 As a result of the different treatment of Australian and state totals in the seasonal adjustment process, the Australian total for an industry group may not necessarily equal the sum of the state totals for that industry group.

28 The monthly trend estimates are derived by applying a 13-term Henderson moving average to the seasonally adjusted estimates (7-term for quarterly series). The Henderson moving average is symmetric, but as the end of a time series is approached, asymmetric forms of the moving average have to be applied. The asymmetric moving averages have been tailored to suit the particular characteristics of individual series and enable trend estimates for recent periods to be produced. Estimates of the trend will be improved at the current end of the time series as additional observations become available. This improvement is due to the combined effect of the concurrent seasonal adjustment methodology and the application of different asymmetric moving averages for the most recent six months (or three quarters). As a result of the improvement, most revisions to the trend estimates will be observed for the most recent six months (or three quarters).

29 Trend estimates are used to analyse the underlying behaviour of the series over time. As a result of the introduction of The New Tax System, a break in the monthly trend series has been inserted between June and July 2000. Care should therefore be taken if comparisons span this period. For more details refer to the Appendix in the December 2000 issue of this publication.

30 For further information on trend estimates, see Information Paper: A Guide to Interpreting Time Series - Monitoring Trends, 2003 (cat. no. 1349.0) or contact the Assistant Director, Time Series Analysis on Canberra (02) 62526345 or by email at [timeseries@abs.gov.au](mailto:timeseries@abs.gov.au).

31 The chain volume measures of retail turnover appearing in the quarterly issue of this publication are annually reweighted chain Laspeyres indexes referenced to current price values in a chosen reference year. The reference year is advanced in each June issue and is currently 2002-03. Each year's data in the Retail chain volume series are based on the prices of the previous year, except for the quarters of the latest incomplete year. Data for the 2004-05 financial year will initially be based upon price data for the 2002-03 financial year. Comparability with previous years is achieved by linking (or chaining) the series together to form a continuous time series. While current price estimates reflect both price and volume changes, chain volume estimates measure changes in value after the direct effects of price changes have been eliminated and hence only reflect volume changes. Further information on the nature and concepts of chain volume measures is contained in the ABS publication Information Paper: Introduction of Chain Volume Measures in the Australian National Accounts (cat. no. 5248.0).

32 There are two types of error possible in estimates of retail turnover: Sampling error which occurs because a sample, rather than the entire population, is surveyed. One measure of the likely difference resulting from not including all establishments in the survey is given by the standard error, see below. Sampling error may be larger for the first month of each quarter, when some of the businesses in the sample are replaced by other businesses so that the reporting load can be spread across retailers.

RELIABILITY OF ESTIMATES continued

Non sampling error which arises from inaccuracies in collecting, recording and processing the data. The most significant of these errors are: misreporting of data items; deficiencies in coverage; non-response; and processing errors. Every effort is made to minimise reporting error by the careful design of questionnaires, intensive training and supervision of interviewers, and efficient data processing procedures.

33 Seasonally adjusted and trend estimates and chain volume measures are also subject to sampling variability. For seasonally adjusted estimates, the standard errors are approximately the same as for the original estimates. For trend estimates, the standard errors are likely to be smaller. For chain volume measures, the standard errors may be up to $10 \%$ higher than those for the corresponding current price estimates because of the sampling variability contained in the prices data used to deflate the current price estimates.

34 Estimates, in original terms, that have an estimated relative standard error (RSE) between $10 \%$ and $25 \%$ are annotated with the symbol ' ${ }^{\wedge}$ '. These estimates should be used with caution as they are subject to sampling variability too high for some purposes. Estimates with an RSE between $25 \%$ and $50 \%$ are annotated with the symbol ${ }^{\prime} *$ ', indicating that the estimates should be used with caution as they are subject to sampling variability too high for most practical purposes. Estimates with an RSE greater than $50 \%$ are annotated with the symbol ${ }^{\prime * *}$ ' indicating that the sampling variability causes the estimates to be considered too unreliable for general use.
35 To further assist users in assessing the reliability of estimates, key data series has been given a grading of A to E . Where:

- A represents a relative standard error on level of less than $2 \%$. The published estimates are highly reliable for movement analysis
- B represents a relative standard error on level between $2 \%$ and $5 \%$, meaning the estimate is reliable for movement analysis purposes
- C represents a relative standard error on level between $5 \%$ and $10 \%$, meaning users are advised to exercise some caution in interpreting movements for such series
- D represents a relative standard error on level between $10 \%$ and $15 \%$ meaning users are advised to exercise caution in interpreting movements for such series
- E represents a relative standard error on level greater than $15 \%$ (mainly affects unpublished state by industry series).

36 The table below provides an indicator of reliability for key retail turnover estimates.

|  | Food retailing | Depart -ment Stores | Clothing \& soft good retailing | House -hold good retailing | Recrea -tional good retailing | Other retailing | Hospit -ality \& services | Total |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

EFFECT OF NEW SEASONALLY ADJUSTED ESTIMATES ON TREND ESTIMATES

1 The most recent trend estimates published in this release are likely to be revised when next month's seasonally adjusted estimates become available. To assist readers of this publication in analysing retail trends, the approximate effect of the two possible scenarios on the previous trend estimates of the percentage change in total retail turnover for Australia are presented below. For more information see the trend estimates section of the Explanatory Notes.

1 The October seasonally adjusted estimate of retail turnover is $1.0 \%$ higher than the September estimate.
2 The October seasonally adjusted estimate of retail turnover is $1.0 \%$ lower than the September estimate.

2 Under concurrent seasonal adjustment, the most recent seasonally adjusted and trend estimates are likely to be revised when original estimates for subsequent months become available. The trend revision is a combined result of the revision of the seasonally adjusted estimates and the revision derived from the use of asymmetric moving averages as future data become available (for more information, refer to paragraph 28 in the Explanatory Notes). ABS research shows that about $75 \%$ of the total revision to the trend estimate at the current end of the time series is due to the use of different asymmetric moving averages when the original estimate for the next time period becomes available. To assess the reliability of the trend estimate at the current end, the 'what-if' chart presents trend estimates under two different scenarios of the next time period. The chart shows only the impact due to the changes of the asymmetric moving averages and does not include the unknown impact of revision to seasonal factor estimates that would arise when the original estimate for the next time period becomes available.
