EXPLANATORY NOTES

The statistics contained in this bulletin refer, in the main, to the individual years 1967-68 to 1969-70 compared with the averages for the three-year periods 1936-37 to 1938-39, 1946-47 to 1948-49 and 1956-57 to 1958-59. As a decade separates each of these periods, useful long term comparisons may be made in consumption patterns. These statistics constitute the main body of the bulletin and are contained in Part III.

Part IV consists of two tables ; the first shows details of supply and utilisation of foodstuffs in 1969-70 ; the second sets out details of consumption of certain foodstuffs per head in each of the years 1960-61 to 1969-70.

In general, the method employed in this bulletin in estimating consumption in Australia of each of the various foodstuffs is as follows :

$$\text{APPARENT CONSUMPTION } \left. \right\} = \left. \begin{array}{l} \text{Production} \\ \text{Imports} \\ \text{Opening stocks (a)} \end{array} \right\} \text{Minus} \left. \begin{array}{l} \text{Exports} \\ \text{Ships' stores} \\ \text{Usage for processed food} \\ \text{Non-food usage} \\ \text{Wastage} \\ \text{Closing stocks (a)} \end{array} \right\}$$

(a) Stocks, in general, are confined to those held in factories or those held in store by marketing authorities. Adequate information for a number of foodstuffs is not available from factories and/or marketing authorities. See also 2, below.

There are three significant factors which should be noted in regard to the calculation above :

1. Production. Available production statistics are confined mainly to commercial production and are deficient for the purposes of the calculation to the extent of production by householders for their own use. This applies particularly in the case of vegetables, fruit, eggs, poultry, fish, rabbits and hares. In all these cases, however, estimates of non-commercial production have been included, based on somewhat inadequate information obtained from a household expenditure survey conducted in 1944 and other investigations conducted by government departments during the 1939-45 War. Similarly, in the case of processed foods, little up-to-date information is available on the quantities of foodstuffs preserved by householders for their own use. To cover this, estimates have been made on the basis of information collected during that war.

2. Stocks. Statistics of stocks refer to in-store (i.e. those held by marketing authorities) and factory stocks. With minor exceptions no details are available of wholesalers', retailers' or householders' stocks. For perishable commodities this point is of little importance since the very nature of the commodity precludes the accumulation of stocks. This is not the case, however, with non-perishable foods, and estimates derived for consumption of such foodstuffs for individual years may not state the position correctly with regard to consumption as ordinarily understood, i.e. foodstuffs consumed by the individual. This difficulty is apparent particularly in the case of canned foodstuffs, where in some years it has been necessary to initiate special enquiries from the trade and other informed sources in an endeavour to take better account of these deficiencies.

3. Wastage. In many cases, allowance is not made for wastage before the foodstuffs are consumed. The importance of this factor is difficult to estimate, but in some seasons gluts cause considerable destruction of perishable foodstuffs, and it should therefore be taken into account when using these statistics. The effect of ignoring wastage is ultimately to overstate the consumption figures. In recent years, however, it is likely that there has been less wastage of foodstuffs than previously,

because of more efficient methods of distribution and storage (including refrigerated transport, air freight and household refrigeration).

Because of the qualifications in respect of stocks and wastage, the term "consumption" is used in a specialised sense, since the quantities actually measured are broadly the quantities available for consumption at a particular level in the process of distribution, i.e. ex-markets, ex-store or ex-factory, depending on the method of marketing and/or processing. It is considered that in most cases these foodstuffs will find their way to the ultimate individual consumers with a minimum time lag. The figures therefore represent fairly accurately total consumption in the year to which they relate.

The effect of changes in the composition of the population should be borne in mind when comparing estimates of consumption (and particularly estimates of consumption per head of population) over a number of years. The most significant change since 1945, which has almost certainly had some effect on the consumption pattern, is the increasing proportion of the population born overseas and resident for only a comparatively short period in Australia (e.g. the proportion of the population born overseas was 9.8 per cent in 1947, 14.3 per cent in 1954, 16.9 per cent in 1961, and 18.5 per cent in 1966).

For some foodstuffs, data relating to consumption per head should be viewed in their correct perspective. For example, while consumption per head of infants' and invalids' food has been calculated on the basis of the mean Australian population for the years concerned, these commodities are clearly consumed by a relatively small proportion of people. The effective consumption per head by these consumers would therefore be considerably higher than the figures shown in the relevant table.

In general, the statistics in the bulletin are for financial years. However, where there is a marked seasonal pattern in the production or marketing of certain crops, the statistics refer to crop years. For example, statistics relating to wheat and rice are on the basis of years ending in November and April respectively.

Part II of this bulletin, which deals primarily with the level of nutrient intake in Australia, has been compiled for the most part by officers of the Nutrition Section of the Commonwealth Department of Health, to whom thanks are extended. In addition to Australian data, a comparison is given, in Table 9, with nutrient intakes for the latest available year for the United Kingdom, New Zealand and the United States of America.

The estimates of nutrient intake in Australia, which are calculated annually to provide a continuing review of the dietary status of the population, are based on the quantities of foodstuffs consumed as calculated by this Bureau. While these estimates are in terms of Commonwealth averages, and do not, therefore, provide information regarding the dietary status of individuals or of specific groups within the population, they supply a valuable indication of overall trends and enable comparisons with other data (e.g. special surveys) within Australia and with data for other countries. Studies are made from time to time by the Nutrition Committee of the National Health and Medical Research Council and by various other health authorities in Australia to determine the adequacy of nutrients in the diet of the population as a whole or of various sections of the population.

SYMBOLS USED IN THIS BULLETIN

n.a. - Not available

p - Preliminary. Subject to revision.

.. - Nil or less than half the final digit shown.

NOTE. Any discrepancies between totals and sums of components in tables are due to rounding.

I. GENERAL REVIEW OF PRODUCTION, EXPORTS AND APPARENT CONSUMPTION1. INTRODUCTION

This Section contains statistics of production, exports and consumption of the main basic foodstuffs for 1969-70 and each of the preceding four years.

2. WHEATTABLE 1. - AREA, PRODUCTION AND UTILISATION OF WHEAT : AUSTRALIA

Year	Area of wheat sown for grain	Production of wheat (a)	Exports of wheat (b)	Apparent consumption (by humans) of wheat products (c) (in terms of wheat)	
				Total	Per head
1965-66	'000 acres	mil. bus	mil. bus	mil. bus	lb
1965-66	17,515	259.7	180.0	46.6	243.1
1966-67	20,823	466.6	314.1	45.6	234.1
1967-68	22,441	277.3	207.8	47.4	238.7
1968-69	26,799	544.0	235.9	46.2	227.6
1969-70p	23,440	387.5	297.0	46.8	225.6

(a) Includes quantities used for stock feed and for seed. (b) Includes exports of flour and breakfast foods, in terms of wheat ; year ended 30 November. (c) Flour and breakfast foods.

3. SUGARTABLE 2. - AREA OF SUGAR CANE, PRODUCTION AND UTILISATION OF SUGAR : AUSTRALIA

Year	Area of sugar cane cut for crushing	Production of raw sugar (94 net titre) (a)	Exports of sugar (b)	Apparent consumption of sugar (b)	
				Total	Per head
1965-66	'000 acres	'000 tons	'000 tons	'000 tons	lb
1965-66	503.2	1,953.4	1,321.3	603.4	117.5
1966-67	557.5	2,342.8	1,714.3	595.9	114.0
1967-68	553.0	2,334.4	1,672.4	600.9	112.8
1968-69	568.5	2,724.7	2,068.7	607.3	111.8
1969-70p	525.8	2,178.8	1,421.4	638.4	114.9

(a) Figures in this column are not comparable with those for production shown in Table 27. (b) Raw and refined sugar and sugar manufactured products, all in terms of raw sugar (94 net titre).

4. MILKTABLE 3. - PRODUCTION AND UTILISATION OF MILK : AUSTRALIA

Year	Production of milk (all purposes)	Exports of milk products (in terms of milk)	Apparent consumption of milk (a)	
			Total	Per head
1965-66	mil. gal	mil. gal	mil. gal	gal
1965-66	1,522	486.4	1,012.0	88.0
1966-67	1,605	581.4	1,022.4	87.3
1967-68	1,497	479.4	1,040.0	87.2
1968-69	1,531	451.4	1,044.6	85.8
1969-70p	1,661	601.0	1,060.7	85.2

(a) Includes milk products in terms of milk.

5. BEEF AND VEALTABLE 4. - CATTLE SLAUGHTERINGS, PRODUCTION AND UTILISATION OF BEEF AND VEAL (a)AUSTRALIA

Year	No. of cattle and calves slaughtered for meat	Production of beef and veal (b)	Exports of beef and veal (c)	Apparent consumption of beef and veal (d)	
				Total	Per head
	'000	'000 tons	'000 tons	'000 tons	lb
1965-66	6,323	931.4	436.1	494.8	96.4
1966-67	5,650	864.7	402.6	464.9	88.9
1967-68	5,656	889.6	396.0	500.0	93.9
1968-69	5,608	920.0	392.6	515.4	94.9
1969-70p	5,861	994.5	493.6	495.4	89.2

(a) Excludes offal. (b) Carcass weight. (c) Includes exports of boneless and canned meat in terms of carcass weight, and ships' stores. (d) Carcass equivalent weight.

6. MUTTON AND LAMBTABLE 5. - SHEEP AND LAMB SLAUGHTERINGS, PRODUCTION AND UTILISATION
OF MUTTON AND LAMB (a) : AUSTRALIA

Year	No. of sheep and lambs slaughtered for meat	Production of mutton and lamb (b)	Exports of mutton and lamb (c)	Apparent consumption of mutton and lamb (d)	
				Total	Per head
	million	'000 tons	'000 tons	'000 tons	lb
1965-66	34.6	598.8	165.5	427.1	83.1
1966-67	32.5	586.6	156.7	438.2	83.8
1967-68	38.0	654.0	198.0	452.6	85.0
1968-69	36.7	669.4	176.6	490.2	90.2
1969-70p	42.2	743.1	280.6	461.9	83.2

(a) Excludes offal. (b) Carcass weight. (c) Includes exports of boneless and canned meat in terms of carcass weight. (d) Carcass equivalent weight.

7. OTHER FOOD PRODUCTS

Particulars of other foodstuffs, including both fresh and processed products, are given in Part III of this bulletin for the year 1969-70 and earlier periods. In addition, a more detailed treatment of the basic commodities enumerated above is shown. In each of these cases, commodities are dealt with in the eleven broad groups into which foodstuffs have been classified.

8. ESTIMATED QUANTITIES OF FOODSTUFFS AVAILABLE FOR CONSUMPTION PER HEAD, AUSTRALIA

In Table 6, the estimated quantities of foodstuffs available for consumption per head in Australia are summarised under the eleven commodity groups into which they have been classified.

TABLE 6. - ESTIMATED QUANTITIES OF FOODSTUFFS AVAILABLE FOR CONSUMPTION : AUSTRALIA
 (Per head per year)

II. LEVEL OF NUTRIENT INTAKE, 1969-709. GENERAL

In order to determine whether the quantities of the various foodstuffs passing into consumption are likely to be sufficient for adequate nutrition, it is necessary to calculate the amount of nutrients the foods provide.

The analysis in these sections is based on the statistics collected by the Commonwealth Statistician as set out elsewhere in this bulletin and is therefore subject to the same qualifications. See the Explanatory Notes for a statement of these qualifications.

The basis for the calculations of estimated supplies of nutrients passing into consumption in Australia (section 10 following) was changed after Bulletin No. 23 (1967-68) and is now based on conversion factors calculated from "Tables of Consumption of Australian Foods" (Sucy Thomas and Margaret Corden, Canberra, 1970). The previously used Tables, compiled by Anita Osmond and Winifred Wilson, 1954, have been revised and considerably enlarged and nutrient values for almost all food items altered in the light of improved analysis techniques. Whilst comparison with figures published for previous years is no longer entirely valid, the differences in conversion factors are not so great as to negate the value of all such comparisons. The level of nutrient intake 1967-68 has been recalculated using the new conversion factors and any comments on changes in apparent availability of nutrients over the previous year have been made using this recalculation.

Following a recommendation of the joint FAO/WHO Expert Group which reported on the "Requirements of Vitamin A, Thiamine, Riboflavin and Niacin" (FAO Rome) 1967 the total vitamin A of the diet (sections 10 and 12) is now stated as microgrammes of retinol (vitamin A, alcohol) activity. Strict comparisons between retinol activity values published this year cannot be made with vitamin A activity values of years prior to 1968-69, since the values given for individual food items vary considerably in the reference food composition tables (1970 and 1954).

10. NUTRIENTS AVAILABLE FOR CONSUMPTION

Details of the estimated supplies of nutrients passing into consumption during the year 1969-70 are shown in Table 7, page 5. Data for previous years and for other countries are given in Tables 8 and 9 respectively, pages 6 to 8.

Losses due to processing have been allowed for in Tables 7, 8 and 9 by way of an adjustment to the conversion factors used for processed and preserved foods. No allowances have been made for losses of nutrients due to the effect of storage and cooking; losses of vitamin C are referred to in Section 11 following and of vitamins B1 and C in Section 12, page 9.

11. LOSS OF VITAMIN C IN COOKING

As a result of storage and cooking, certain foods, particularly fruit and vegetables, lose some of their nutritive value. Estimates of possible loss of vitamin C (ascorbic acid) in cooking are set out in Tables 10 and 11, page 9. Losses in cooking of other nutrients do occur but (except for vitamin B1, referred to in Section 12, page 9) not in amounts likely to be significant. Losses due to storage have not been estimated.

Losses of vitamin C cover a wide range, from almost nil to 100 per cent. The estimates given in Tables 10 and 11 are applicable to average conditions and methods, but losses could be reduced to less than these figures by careful cooking.

Losses from tomatoes, citrus fruit and other uncooked fruits and vegetables are assumed to be negligible, while (as mentioned in Section 10 above) losses in canning and drying of fruit and vegetables have been accounted for in the calculations made for the figures in Table 7.

TABLE 7. - ESTIMATED SUPPLY OF NUTRIENTS AVAILABLE FOR CONSUMPTION : AUSTRALIA, 1969-70^a

(Per head per day)

Commodity group	Protein	Fat	Carbo-hydrate	Calcium	Iron	Vitamin A (Retinol Activity) (a)	Vitamin C (ascorbic acid)	Vitamin B1 (thiamine)	Riboflavin	Niacin	Energy Kilo-calories
1. Milk and milk products (excluding butter)	22.2	20.9	27.8	766.2	0.6	231.9	7.5	0.2	1.0	0.6	395.1

TABLE 10. - AVERAGE LOSS OF VITAMIN C IN COOKING

Food	Estimated average loss of vitamin C in cooking
Leafy, green vegetables	60%
Potatoes	50% (Cooked in skin, negligible loss) (Boiled and mashed, 60% or more)
Other vegetables	50%
Stewed fruit	50%

TABLE 11. - ESTIMATED VITAMIN C AVAILABLE AFTER ALLOWANCE FOR COOKINGLOSSES, 1969-70

(Milligrammes per head per day)

Food	Calculated value (see Table 7)	Amount available
Milk	7.5	{ a}
Meat	2.5	{ a}
Fruit and fruit products -		
Fresh and canned	5.8	5.8
Cooked	2.5	1.3
Citrus	22.2	22.2
Vegetables -		
Tomatoes	7.2	7.2
Lettuce	0.7	0.7
Canned vegetables	1.0	1.0
Potatoes and other vegetables	42.9	21.5
TOTAL	92.3	59.7

(a) Little vitamin C would be retained in these foods.

12. DIETARY ALLOWANCES

The nutritive value of the food passing into consumption may be compared with some arbitrary standard such as the Dietary Allowances for use in Australia (1970 Revision), formulated by the Nutrition Committee of the National Health and Medical Research Council. This comparison has been made in Table 12 where the quantity of nutrients available for consumption in the Australian diet in 1969-70 (as shown in Table 7), less estimated cooking losses, is compared with desirable quantities recommended by the Council. When using this table, note should be taken of the reservations set out on page 11.

SOURCE OF NUTRIENTS IN THE AUSTRALIAN DIET, 1969-70
(By Type of Food)

NUTRIENTS AVAILABLE FOR CONSUMPTION IN AUSTRALIA IN 1969-70
Expressed as percentages in excess of dietary allowances of nutrients

TABLE 12. - NUTRIENTS AVAILABLE FOR CONSUMPTION IN AUSTRALIA, 1969-70COMPARED WITH DIETARY ALLOWANCES

(Per head per day)

Nutrient	Dietary allowance (a)	Nutrients available less estimated cooking losses (b) p
Protein (grammes)	54.00	100.30
Calcium (milligrammes)	445.00	980.00
Vitamin A (retinol activity) (microgrammes)(c)	658.00	1,548.00
Vitamin B1 (thiamine) (milligrammes)	0.83	1.36
Riboflavin (milligrammes)	1.06	2.90
Niacin equivalents (milligrammes) (d)	13.40	36.14
Vitamin C (ascorbic acid) (milligrammes)	32.00	59.70
Iron (milligrammes)	10.50	14.80
Energy value (kilocalories)	2,107.00	3,264.00

(a) Source : National Health and Medical Research Council, May 1970. (b) Losses have been estimated for vitamins B1 and C only; losses of other nutrients are not likely to be significant. (c) The total vitamin A is the sum of the retinol content and one-sixth of the carotene equivalent value. (d) The niacin equivalent of a diet is computed from dietary niacin plus 0.16 times the dietary protein in grammes, expressed in milligrammes.

The allowances shown in Table 12 are averages, weighted according to the various age groups in the population. Comparison such as that set out in the table is useful as an indication of trends in food consumption, although it must be emphasised that these allowances do not necessarily represent nutrient requirements; rather were they devised for the planning of practical diets within the average Australian food pattern. Precise information concerning human requirements of certain nutrients is far from complete, and no conclusion regarding the nutritional status of the community should be drawn from comparisons with these allowances. A deviation from the allowances of the order of 10-15 per cent is not regarded as a serious deficiency. Even if the nutrient intake is more than 15 per cent below the allowance, a nutritional deficiency cannot be assumed without clinical verification.

The calculated figures, being averages, give no information regarding the food consumption of individuals or of specific groups within the population. Also the figures represent food available for consumption, which is not the same as foods consumed. The Food and Agriculture Organisation of the United Nations estimates that in communities with a plentiful food supply up to 15 per cent of the food available may be wasted.

There is a significant loss of vitamin B1 in the cooking of meat and vegetables, the amount of loss depending on the method and duration of cooking. In a normal mixed diet it is accurate enough to allow 15 per cent deduction from the total vitamin B1 available, and such an allowance has been made in Table 12. Allowance has also been made in Table 12 for vitamin C losses as set out in Section 11.

The supply of all nutrients available per head for consumption in 1969-70 compares favourably with the dietary allowances.

There has been a slight shift in the types of meat consumed during 1969-70. Slightly less beef and mutton and correspondingly more poultry has resulted in a little less fat and iron being available for consumption. This shift, together with the apparently lower consumption of butter and potatoes, largely accounts for the decrease in available kilocalories. The decrease in available ascorbic acid is accounted for by the apparent decrease in available potatoes, tomatoes and oranges.

III. SUPPLY, DISTRIBUTION AND APPARENT CONSUMPTION OF INDIVIDUAL COMMODITIES
13. MILK AND MILK PRODUCTS (excluding Butter)

TABLE 13. - WHOLE MILK : PRODUCTION AND UTILISATION : AUSTRALIA
('000 gallons)

Year	Total whole milk production	Quantity used for -			
		Butter (factory and farm)	Cheese (factory and farm)	Processed milk products	Other purposes
Average 1936-37 to 1938-39	1,141,776	891,755	54,933	33,226	161,862
Average 1946-47 to 1948-49	1,153,236	738,370	91,642	78,739	244,485
Average 1956-57 to 1958-59	1,330,853	865,347	90,561	79,687	295,258
1967-68	1,497,484	(a) 892,898	(a) 149,444	98,555	356,587
1968-69	1,530,597	(a) 908,565	(a) 158,286	98,945	364,802
1969-70	1,661,013	(a) 1,021,105	(a) 160,597	103,557	375,755

(a) Excludes farm production, which is included in "Other Purposes".

The apparent consumption of fluid milk per head of population has shown little variation during recent years. When expressed in terms of milk solids, total consumption of milk and milk products in 1969-70 amounted to 56.7 lb per head. Of this 35.8 lb per head was derived from fluid milk consumed, 5.3 lb from cheese, 9.3 lb from powdered skim milk, 2.1 lb from unsweetened condensed, concentrated and evaporated full cream milk, 1.6 lb from powdered full cream milk and 2.6 lb from other milk products.

Pigmeat	88.5	92.8	97.4	147.4	159.6	171.5
Total carcass meat	976.6	941.3	1,361.7	1,691.1	1,749.0	1,909.0
Offal (edible)	48.0	45.9	69.4	88.2	88.6	99.2
Total meat (carcass equivalent weight)	1,024.6	987.2	1,431.1	1,779.3	1,837.6	2,008.2

Particulars of the production and utilisation of meat are shown in the four following tables:

Table 18. Separate details for each class of carcass meat, distinguishing between the quantities exported or consumed as fresh or frozen meat and the quantities used for canning and curing.

Table 19. Particulars of the production and utilisation of processed meat (canned meat and bacon and ham), and total output of processed meat in terms of carcass equivalent weight.

Table 20. Total production and utilisation of all meat (excluding offal), expressed in terms of carcass equivalent weight.

Table 21. The apparent consumption per head of all meat (and edible offal).

Owing to diverse cutting practices by butchers in Australia and because of the difficulty of clearly defining the term "retail weight of meat", it is considered impracticable to derive a satisfactory factor for the purpose of expressing estimated meat consumption in terms of retail weight. Depending on cutting practices employed and whether or not bones, etc., sold to customers are included in retail weight of meat, the retail weight as a proportion of carcass weight ranges from about 60 per cent to 75 per cent for beef, from 80 per cent to 95 per cent for mutton and lamb and from 90 per cent to 95 per cent for pork. However, estimates of the edible weight of meat consumed have been used for the purpose of calculating nutrient intake.

15. POULTRY, FISH, RABBITS AND HARES

As mentioned in the Explanatory Notes (page ii), it is difficult to measure precisely the quantities of rabbits and hares entering consumption in Australia. As a result, some broad estimation is necessary to cover those areas for which information is either not collected or is inadequate.

In the case of rabbits and hares, investigations have indicated that consumption per head has fallen from the figure of 5.4 lb which appeared in earlier issues of this bulletin. Consumption has been estimated at 2.0 lb per head and this level has been applied to the years following 1955-56.

In recent years a collection of poultry slaughterings was commenced in all States of Australia, and estimates of poultry consumption from 1964-65 have been based mainly on this collection. Corresponding information is not available for earlier years, and the consumption figures for those years have been discontinued.

For the purpose of estimating supplies of fish available for consumption, as shown in the following table, an allowance of 10 per cent of commercial production has been made for the non-commercial catch of fish. No such allowances have been made for crustaceans or molluscs as it is considered that the non-commercial take is not significant.

The commercial production of fresh fish during 1969-70 was 122.0 million lb (live weight) compared with 108.1 million lb for 1968-69 and 102.6 million lb for 1967-68. Production of crustaceans and molluscs increased to 103.9 million lb in 1969-70 compared with 94.2 million lb in 1968-69 and 118.9 million lb in 1967-68.

(a) See notes on previous page. (b) Includes cured. (b) Included with fresh.

Particulars of the estimated supplies and utilisation of poultry, rabbits and hares, and fish for 1969-70 are shown in Table 55, Section IV of this bulletin.

16. EGGS AND EGG PRODUCTS

The production of eggs shown in the following table is based on Egg Boards' records of output from areas under their control, plus estimates of production for uncontrolled areas and for "back-yard" poultry-keepers based on information obtained from other sources. Because of the inadequacy of data as to the volume of uncontrolled production, the figures should be used with some reserve.

Advances in poultry technology have resulted in a gradual increase in the average weight of eggs produced. For statistical purposes, the average weight of an egg was increased in 1960-61 from 1.75 oz to 2.0 oz in the following and other relevant tables, thus affecting comparability between the years from 1960-61 onwards and previous years. Although the increase in average weight actually occurred over a period of years, no adjustment has been made to 1959-60 and earlier years.

It is estimated that the level of total egg production in 1969-70 was about 272 million dozen compared with 257 million dozen in 1968-69.

Details from 1965-66 onwards may not be strictly comparable with those for earlier years because of the effects of legislation introduced in July 1965 for the stabilisation of the egg industry.

(a) See note on average egg weight on page 20.

17. OILS AND FATS (including butter)

NOTE. Reference is made in Part III, Section 13, to the use of milk for butter making.

Following the termination of butter rationing in June 1950, consumption of butter increased sharply to 30.9 lb per head in 1950-51. It reached a post-war maximum of 31.2 lb per head in 1951-52, but has since shown an almost continuous decline.

In assessing consumption of all oils and fats no allowance is made in the following tables for fats consumed in association with carcass meat. The quantities of carcass meat given in Section 14, Meat, commencing on page 15, include fats which remain in the carcass after slaughtering and which may or may not be subsequently removed for boiling down, etc., prior to retailing of the meat. As a result, some small duplication exists between fats reported as part of the carcass weight of meat and the oils and fats shown in this section. No duplication occurs for fats removed from the carcass at the slaughtering stage.

(a) Includes dry butter fat, ghee and tropical spread expressed as butter. (b) Balance figure for 1946-47 and subsequent years. (c) Recorded as such. No allowance is made for table margarine used for other than "table" purposes. (d) Recorded as margarine, other than table. No allowance is made for other margarine use for "table" purposes.

The data given in the following table for vegetable oils and other fats include an estimate for lard, shown separately prior to 1960-61. It should also be noted that the estimate has been revised for years from 1956-57 on the basis that consumption of lard per head is now considerably less than in earlier years.

TABLE 26. - "VISIBLE" FATS AND OILS AVAILABLE FOR CONSUMPTION : AUSTRALIA
(lb per head per year)

(a) Primarily based on consumer survey data of 1944; no data are available as to recent trends in consumption.

18. SUGAR AND SYRUPS

The estimates of sugar consumption given in this Report represent apparent consumption measured in terms of disposals of sugar by refineries and sugar content of disposals of sugar products by manufacturers. In general, the estimates do not take into account stocks in the following categories for which data are not available:

- (i) Wholesalers', retailers' and householders' stocks of sugar
- (ii) Sugar content of stocks of manufactured products held by producers, wholesalers, retailers and householders.

The consumption of sugar (excluding that consumed in manufactured products) during 1946-47, the last complete year of rationing, was 65.9 lb per head. It rose initially following the cessation of rationing but in more recent years has been relatively stable.

Table 27 includes small quantities of beet sugar for the years up to and including 1947-48, after which production ceased.

TABLE 27. - SUGAR : SUPPLY AND UTILISATION : AUSTRALIA

19. PULSE AND NUTS

In estimating the available supplies of peanuts for the years since 1956-57 data relating to receivals of peanuts by the Peanut Marketing Board have been used, together with available information on changes in stocks held by the Board, in lieu of production data. This permits a better assessment of utilisation than previously.

The other commodities included in this group consist of edible tree nuts and cocoa (raw beans).

TABLE 29. - PULSE AND PEANUTS : SUPPLY AND UTILISATION : AUSTRALIA

(a) Principally imported coconuts and Australian-grown almonds and walnuts. (b) All imported.

20. VEGETABLES

Basic data available on the production of vegetables excludes, for the most part, home gardens, where production is generally undertaken on a non-commercial scale. In this bulletin estimates of home garden produce and the like have been added to commercial production. These data are set out in detail in commodity group 8 of Table 55.

In the following tables, all vegetables are shown in terms of fresh or fresh equivalent, that is, the statistics in effect relate to the pre-processing stage. For example, the consumption of tomatoes includes fresh tomatoes consumed plus the fresh equivalent of tomatoes consumed as tomato products (canned tomatoes, tomato juice, etc.). Production, imports, exports, etc., are treated similarly.

(i) Root and bulb vegetables. Details of this class as a whole are given in the following table, while details of the individual vegetables appear in Table 55 (page 41).

TABLE 31. - ROOT AND BULB VEGETABLES (a) : SUPPLY AND UTILISATION (b) : AUSTRALIA

(a) Beetroot, carrots, onions, parsnips and turnips. (b) Includes fresh equivalent of processed products. (c) Fresh equivalent of canned vegetables. (d) Partly estimated.

(ii) Potatoes (white and sweet)

The data relating to white potatoes for the years 1946-47 to 1948-49 have been compiled from information supplied by State Potato Marketing Boards. For later years, information collected by Statisticians, plus an estimate for self-suppliers, has been used. Little information is available concerning recent trends in home growing of potatoes and the estimates of consumption shown below must therefore be regarded as approximate.

(e) Includes an allowance for the fresh equivalent of stocks, imports and exports of most other vegetables not separately specified.

21. FRUIT AND FRUIT PRODUCTS. - As in the case of vegetables, data relating to consumption of fruit in this section contain an estimate for home producers. Commodity group 9 in Table 55 shows these estimates in relation to the recorded commercial production.

(i) Citrus fruit. The production of citrus fruit is as recorded on annual returns submitted by growers, plus an estimate of the output of self suppliers (home grown fruit etc.).

IV. DETAILED STATISTICAL DATA SHOWING ESTIMATED SUPPLY AND
UTILISATION OF FOODSTUFFS

The data presented in the previous pages of this Report for the year 1969-70 are based upon the statistics in Table 55 following, which show the supply position in Australia for each item included in the eleven foodstuff groups, and provide a detailed analysis of distribution, movement in stocks and the apparent quantity consumed for the year ended June 1970. In cases where production is of a seasonal nature, e.g. fruit and vegetables, it is not possible to relate production and distribution strictly to fiscal or calendar years. It has been necessary, therefore, to apply details appropriate to the seasonal period covered by the years specified. In certain cases information on stocks is not available, and details of the apparent consumption of these commodities therefore exclude the effect of stock changes.

Table 56 pages 45 to 48 shows the estimated quantities of certain foodstuffs and beverages available for consumption annually per head of population in Australia for the years 1960-61 to 1969-70.
