### MAIN FEATURES

APPARENT PER CAPITA CONSUMPTION OF  
MEAT 1979-80 TO 1984-85

Apparent consumption of red meat has shown a decrease in the six years since 1979-80. Beef and veal per capita consumption decreased from 46.9 kg in 1979-80 to 42.0 kg (10.4%). This was, however, offset in other red meat consumption, particularly in mutton, lamb and pigmeat. Mutton and lamb increased 15.6% from 20.5 kg per capita in 1979-80 to 23.7 kg in 1984-85. Consumption of pigmeat has increased 13.1% from 14.5 kg per capita in 1979-80 to 16.4 kg in 1984-85.

Poultry per capita consumption in the eighties has remained around the 20 kg per capita level for a number of years but has shown an increase of 9.0% to 21.8 kg in 1984-85 from 20.0 kg in 1983-84.

Dairy products over the six years have decreased marginally in per capita consumption. Cheese consumption, however, has risen 22.7% from 6.6 kg per capita in 1979-80 to 8.1 kg in 1984-85.

Butter per capita consumption decreased from 4.6 kg in 1979-80 to 3.9 kg in 1984-85. Margarine per capita consumption on the other hand in the past six years has remained relatively stable, increasing only 1.1% from 8.9 kg to 9.0 kg between 1979-80 and 1984-85.

Consumption of fresh fruit in 1984-85 has risen 9.0% to 86.7 kg per capita over the six years, from 79.5 kg in 1979-80. Consumption of citrus fruit is the major contributor to this increase, rising from 40.2 kg in 1979-80 to 45.3 kg in 1984-85. Other fresh fruit has increased marginally (5.3%) to 41.4 kg for 1984-85 from 39.3 kg in 1979-80.

Per capita consumption of vegetables for the six years since 1979-80 has risen from 129.5 kg in 1979-80 to 142.7 kg in 1984-85. The major contributor to this increase has been potatoes which increased 8.9% from 54.9 kg per capita in 1979-80 to 59.8 kg per capita in 1984-85.

Per capita consumption of bread has decreased 5.4% from 48.0 kg in 1979-80 to 45.4 kg. Per capita consumption of sugar has decreased by 6.8% from 51.6 kg in 1979-80 to 48.1 kg.

Beer consumption has declined from 132.3 litres per capita in 1979-80 to 114.5 litres per capita in 1984-85 (13.5%). On the other hand, consumption of wine has risen 23.1% from 17.3 litres per capita in 1979-80 to 21.3 litres per capita in 1984-85.

## EXPLANATORY NOTES

### **Introduction**

This publication contains detailed statistics of the consumption of foodstuffs and nutrient intake in Australia for 1984-85 as well as comparative data for earlier years. Section I deals with the supply and utilisation of foodstuffs, while Section II deals primarily with the level of nutrient intake in Australia. These levels are compiled by officers of the Nutrition Section of the Commonwealth Department of Health to whom thanks are extended. Preliminary statistics for 1985-86 covering major food items have been published in *Apparent Consumption of Selected Foodstuffs, Australia, 1985-86, Preliminary* (4315.0), which is available from any ABS office.

### **Related publications**

2. Users may also wish to refer to the following publications which are available on request:

*Apparent Consumption of Selected Foodstuffs, Australia, 1985-86, Preliminary* (4315.0)

*Crops and Pastures, Australia, 1984-85* (7321.0)

*Fruit, Australia, 1984-85* (7322.0)

*Livestock and Livestock Products, Australia, 1984-85* (7221.0) (\$1.20, \$2.10 incl. postage)

*Manufacturing Commodities, Principal Articles Produced, Australia, 1982-83 and 1983-84* (8303.0) (\$1.90, \$2.80 incl. postage)

*Foreign Trade, Australia, 1984-85, Part 1 : Exports and Imports* (5409.0)

*Production Bulletin No. 3 : Food, Drink and Tobacco, Australia* (8359.0)—issued monthly

*Sales and Stocks of Australian Wine and Brandy by Winemakers* (8504.0)—issued monthly

3. Current publications produced by the ABS are listed in the *Catalogue of Publications, Australia* (1101.0). The ABS also issues, on Tuesdays and Fridays, *Publications Advice* (1105.0) which lists publications to be released in the next few days. The Catalogue and Publications Advice are available from any ABS office.

### **AUSSTATS**

4. A wide range of economic, social and demographic statistics is available on AUSSTATS, ABS' on-line service through CSIRONET.

5. For further information phone the AUSSTATS Help Desk on (062) 52 6017.

### **Symbols and other usages**

n.a.	not available
..	not applicable
—	nil or rounded to zero
n.e.i.	not elsewhere included
n.c.	not collected

### **Abbreviations**

g	grams
mg	milligrams
µg	micrograms
kJ	kilojoules

6. The figures shown in this publication have been revised where necessary and as a consequence may not agree with similar data shown in previous publications.

7. Where figures have been rounded, discrepancies may occur between sums of the component items and totals.

8. Year to year percentage movements are calculated using the actual figures. As a result, there may be minor differences in percentages obtained from data in Tables 1, 2 and 7 compared with those shown in the Main Features.

Nutrients available for consumption in Australia, 1974-75 and 1984-85	22	

## I. SUPPLY AND UTILISATION OF FOODSTUFFS

In general, the method employed in this publication to estimate consumption in Australia of each of the various foodstuffs is as follows:

*Apparent consumption* = (Commercial production + Estimated home production + Imports + Opening stocks) minus (Exports + Usage for processed food + Non-food usage + Wastage + Closing stocks).

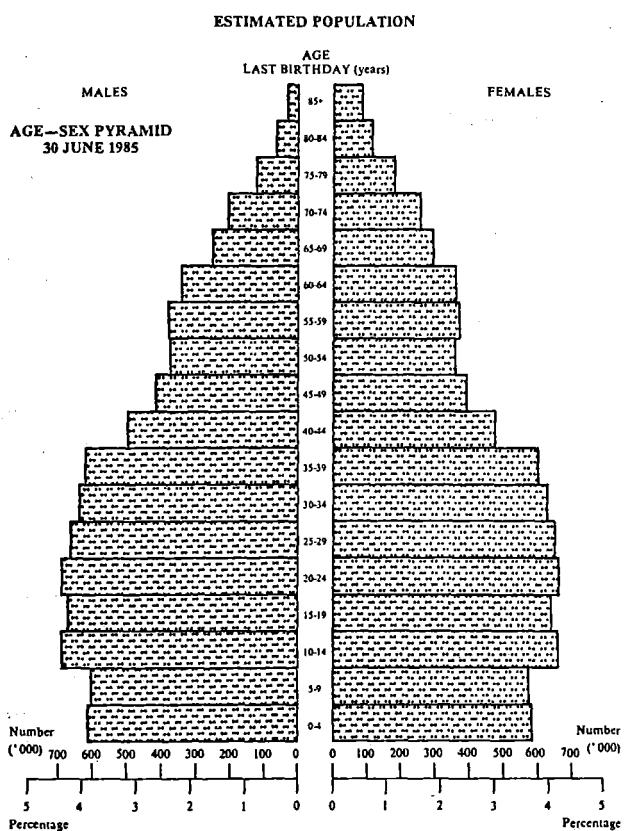

*Per capita consumption* = Apparent consumption divided by the mean population for that period.

2. The following mean population figures (year ended 30 June basis) have been used in this publication:

Average 3 years ended—	Individual years—
1938-39	6,870,261
1948-49	7,651,558
1958-59	9,741,073
1968-69	11,919,046
1978-79	14,275,870
	1979-80
	1980-81
	1981-82
	1982-83
	1983-84
	1984-85
	14,601,777
	14,809,796
	15,051,546
	15,280,879
	15,466,675
	15,651,653

3. In interpreting the figures shown in this publication the following factors should be noted:

- (a) Changes in the composition of the population have a bearing on trends in the patterns of consumption (particularly on estimates of consumption per capita). The most significant change since 1945, which has almost certainly had some effect on the consumption pattern, is the increasing proportion of the population born overseas and resident for only a comparatively short period in Australia (e.g. the proportion of the population born overseas was 9.8 per cent in 1947, 14.3 per cent in 1954, 16.9 per cent in 1961, 18.4 per cent in 1966, 20.2 per cent in 1971, 20.1 per cent in 1976 and 20.6 per cent in 1981).
- (b) Another similar factor is the age distribution of the population which may also affect data relating to per capita consumption. For example, while per capita consumption of infants' and invalids' food has been calculated on the basis of the mean Australian population for the years concerned, these commodities are clearly consumed by a relatively small proportion of people. The effective per capita consumption by these consumers would therefore be considerably higher than the figures shown in the relevant table. The following diagram shows the age distribution of the Australian male and female population at 30 June 1985. The age distribution is based on the results of the Population Census of 30 June 1981 brought forward by reference to natural increase derived from records of births and recorded age at death, and details of overseas migration. Population and age distribution data from 30 June 1981 onwards incorporates a conceptual change in the procedures of estimating Australia's population. Details of this change and its effect on preceding years are available in the publication *Australian Demographic Statistics Quarterly, September and December 1981* (3101.0) and in the information paper *Population Estimates: An Outline of the New Conceptual Basis of ABS Population Estimates* (3216.0) published on 29 March 1982.
- (c) In general, the statistics in the publication are for financial years. However, where there is a marked seasonal pattern in the production or marketing of certain crops, the statistics in practice refer to crop years. For example, statistics relating to commercial production of citrus fruit are on the basis of the year ending 31 March.

4. In estimating apparent consumption, four significant components in the general equation should be noted.

- (a) *Consumption.* Because of qualifications in respect of stocks and wastage (described below), the term 'consumption' is used in a specialised sense, since the quantities actually measured are broadly the quantities available for consumption at a particular level in the process of distribution, i.e. ex-market, ex-store or ex-factory, depending on the method of marketing and/or processing. It is considered that in most cases these foodstuffs will find their way to the ultimate individual consumers with a minimum time lag. The figures therefore represent fairly accurately total consumption, as defined above, in the year to which they relate.

The general consumption equation is not used in those instances where certain components of the equation are not available, or where a more appropriate technique for estimating consumption is available. In this publication the equation is not used for milk, some milk products, cheese, rice, bread, butter, eggs, beer, wine, spirits and dried fruits.

- (b) *Commercial production and estimated home production.* Available production statistics are confined mainly to commercial production. Calculations of the extent of production by householders for their own use are not always available. This applies particularly in the case of vegetables, fruit, poultry and fish. However, in all these cases estimates of non-commercial production have been included, based on somewhat inadequate information obtained from a household expenditure survey conducted in 1944 and other investigations conducted by government departments during the 1939-45 War. Production statistics are derived from sources such as the annual Agricultural Census and other annual or monthly collections

for the year in question. Where these are unavailable, outside sources or reliable estimates have been used.

- (c) *Stocks.* Statistics of stocks refer to in-store (i.e. those held by marketing authorities) and factory stocks. With minor exceptions no details are available of wholesalers', retailers' or householders' stocks. For perishable commodities this point is of little importance since the very nature of the commodity precludes the accumulation of stocks. This is not the case, however, with non-perishable foods, and estimates derived for consumption of such foodstuffs for individual years may not state the position correctly with regard to consumption as ordinarily understood, i.e. foodstuffs consumed by the individual. This difficulty is apparent particularly in the case of canned foodstuffs, where in some years it has been necessary to initiate special enquiries from the trade and other informed sources in an endeavour to take better account of these deficiencies.
- (d) *Wastage.* In many cases, allowance is not made for wastage before the foodstuffs are consumed. The importance of this factor is difficult to estimate, but in some seasons gluts result in considerable destruction of perishable foodstuffs, and it should therefore be taken into account when using these statistics. The effect of ignoring wastage is ultimately to overstate the consumption figures. In recent years, however, it is likely that there has been less wastage of foodstuffs than previously, because of more efficient methods of distribution and storage (including refrigerated transport, air freight and household refrigeration).

#### **Additional information**

5. Additional information related to some of the individual food groups in Tables 1,2 and 3 is as follows:

*Sugar.* Sugar consumption represents apparent consumption in terms of disposals of sugar by refineries and the sugar content of disposals of sugar products by manufacturers. In general stocks are not taken into account. However, sugar used in the brewing industry was, in energy contribution terms, being counted twice — as sugar in manufactured foods and as alcohol in beer. Once the effect of the double count was removed in 1980-81, there resulted an apparent decrease in the potential energy contribution in sugar (in sugar forms). Data from 1975-76 has been corrected.

*Vegetables.* Vegetables are shown in terms of fresh or fresh equivalent, that is, the statistics in effect relate to the pre-processing stage. For example, the consumption of tomatoes includes fresh tomatoes consumed plus the fresh equivalent of tomatoes consumed as tomato products (canned tomatoes, tomato juice, etc.). Stocks, imports and exports of processed tomatoes are converted to fresh equivalent for this purpose. Data on processed vegetables (product weight) and fresh vegetables are no longer available for publication; some data are available on request by contacting the ABS on Canberra (062) 52 5038 or by writing to P.O. Box 10, Belconnen, A.C.T. 2616.

*Alcoholic beverages.* The increased market share of 'low alcohol' beers and wines had led to a revision in the methodology of calculating litres of alcohol consumption. From 1984-85,

alcohol consumption data will show the apparent decrease resulting from the inclusion of low alcoholic beverages.

*Fruit.* Fruit is shown in terms of fresh or fresh equivalent and, as in the case of vegetables, relates to the pre-processing stage. Stocks, imports and exports are converted to fresh equivalent for this purpose. Data are also shown for some fruit as product weight. Melons and cantaloupes, included in vegetables in earlier issues of this publication, are now included in fruit.

*Meat.* The methodology for calculating meat consumption has been revised from 1975-76 and now shows meat consumption in carcass weight equivalent terms. Canned meat as such is not available. Carcass weight is defined as ex-abattoir (i.e. bone-in). Owing to diverse cutting practices by butchers and the difficulty in clearly defining 'retail weight of meat' it is considered impractical to derive a factor for the purpose of expressing estimated meat consumption in terms of retail weight. (Estimates of retail weight as a percentage of carcass weight range from 70 per cent for beef, 80 to 85 per cent for lamb and 80 per cent for pork).

*Eggs and egg products.* Data prior to 1982-83 for eggs are based on Egg Boards' records of output from areas under their control, plus estimates of production for uncontrolled areas and for 'back-yard' poultry keepers based on information obtained from other sources. Because of the inadequacy of data covering the volume of uncontrolled production the data shown from 1982-83 consists of commercial disposals, by State Egg Boards, of areas under their control. The Northern Territory and North Queensland are not included. Care should therefore be taken in comparing current egg consumption with data from earlier years.

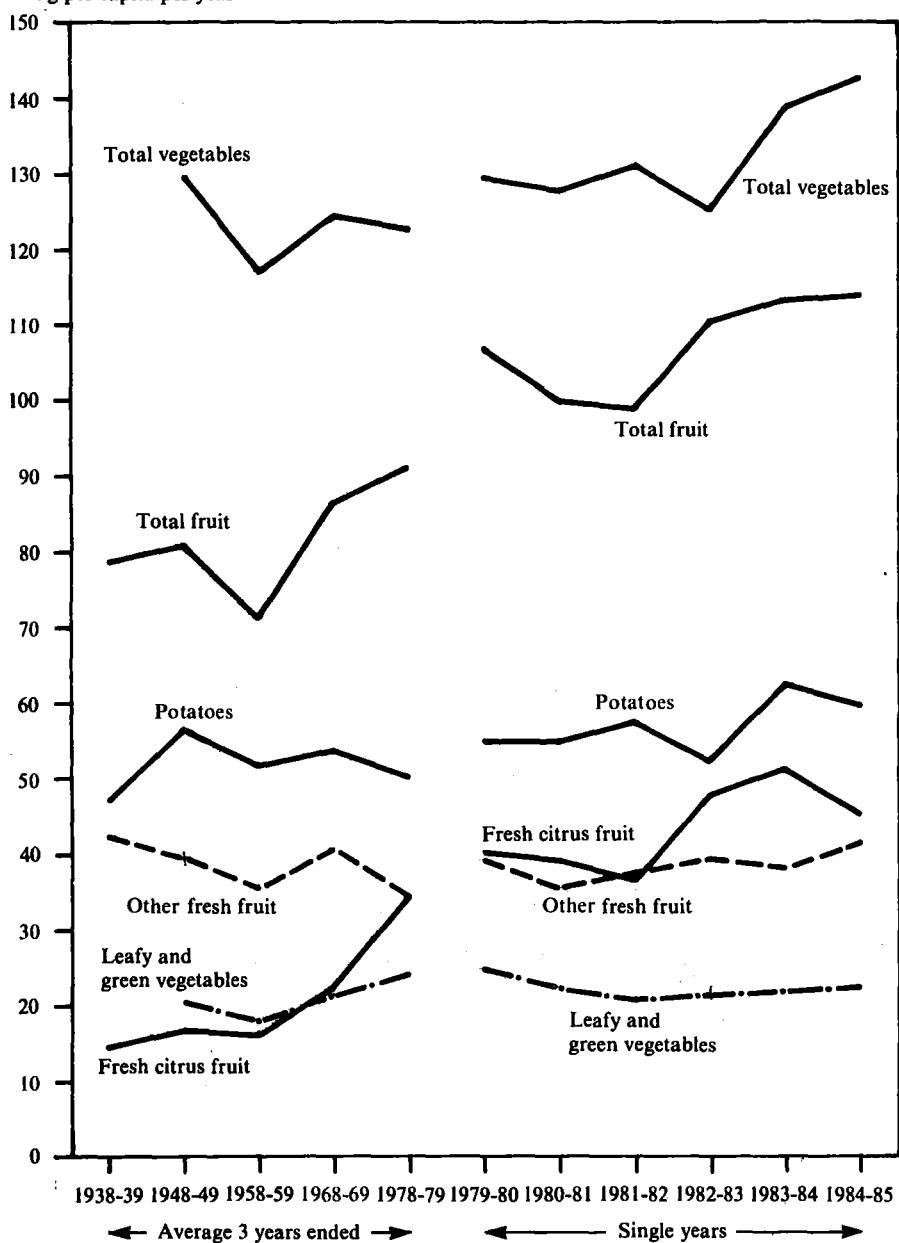

Advances in poultry technology have resulted in a gradual increase in the average weight of eggs produced. For statistical purposes, the average weight of an egg was increased in 1960-61 from 49.6g to 56.7g. Although the increase in average weight actually occurred over a period of years, no adjustment has been made to 1959-60 and earlier years. No further adjustments are anticipated.

*Fish.* For the purpose of estimating supplies of fish available for consumption in this publication, an allowance of 10 per cent of commercial production has been made for the non-commercial catch of fish. No such allowances have been made for crustacea or molluscs. Fresh and frozen seafood is expressed in edible weight (i.e. the edible portion of the fish or shellfish).

*Oils and fats (including butter).* In assessing consumption of all oils and fats no allowance is made for fats consumed in association with carcass meat. The quantities of carcass meat shown in Table 3 include fats which remain in the carcass after slaughtering and which may or may not be subsequently removed for boiling down, etc., prior to retailing of the meat. No duplication occurs for fats removed from the carcass at the slaughtering stage. It has, however, been necessary to estimate the availability of other edible oils and fats. Source limitations have always made this difficult to update but a new method for estimating the availability of these foods was determined in 1980-81. Data from 1975-76 have been revised accordingly and these revisions have increased the apparent per capita consumption of fat by about 27 per cent.

(a) Comprises canned seafood only prior to 1972-73. Prepared seafood other than canned was included with 'fresh and frozen' in this period. (b) Prior to 1978-79 known as Fluid Whole Milk. (c) Included ice-cream mix prior to 1972-73. (d) Combined product and natural equivalent weights prior to 1971-72. (e) Includes an allowance for estimated cream consumption. (f) Sweet potatoes included with 'other root and bulb vegetables' since 1968-69; formerly included with 'other vegetables'. (g) Includes flour used for breadmaking. (h) Data from 1982-83 consists only of commercial disposals by State Egg Boards. (i) Includes sugar content for vegetable oils and other fats. Prior to 1975-76 this was estimated at 2kg, from 1975-76 onwards estimated at 10kg. See notes on the Supply and Utilisation of Foodstuffs, page 5. (j) Includes sugar content of syrups, honey and glucose. (k) Coffee and coffee products in terms of roasted coffee. (l) From 1984-85 data makes allowance for low alcohol beers and wines.

(a) Stocks supplied by the Australian Meat and Livestock Corporation. (b) Domestic sales supplied by the Australian Dairy Corporation. (c) Cold store stocks of apples and pears. (d) Deliveries year ended 30 June as recorded by the Australian Dried Fruits Association. (e) Comprises deliveries for consumption in Australia. (f) Per capita data on bread is now shown in kg per year. (g) Commercial disposals by State Egg Boards. (h) Imports cleared for consumption in Australia. (i) Comprises quantities union which exercise duty was paid and imports cleared for consumption in Australia. (j) Comprises quantity of sales by winemakers and imports cleared for consumption in Australia.

## II. LEVEL OF NUTRIENT INTAKE

In order to determine whether the quantities of the various foodstuffs available for consumption are likely to be sufficient for adequate nutrition, it is necessary to calculate the amount of nutrients the foods provide.

2. The analysis in this section is based on the statistics collected by the Australian Statistician as set out elsewhere in this publication and is therefore subject to the same qualifications. See notes to Section I for a statement of these qualifications.

3. The basis for the calculations of estimated supplies of nutrients available for consumption in Australia was changed after Bulletin No. 23 (1967-68) and is now dependent on conversion factors calculated from *Metric Tables of Composition of Australian Foods* (Sucy Thomas and Margaret Corden, A.G.P.S. Canberra, 1977). The previously used Tables, compiled by Anita Osmond and Winifred Wilson, 1954, have been revised and considerably enlarged and nutrient values for almost all food items altered in the light of improved analytical techniques. While comparison with figures published for previous years is no longer entirely valid, the differences in conversion factors are not so great as to negate the value of all such comparisons.

4. Following a recommendation of the joint FAO—WHO Expert Group which reported on the *Requirements of Vitamin A, Thiamine, Riboflavin and Niacin* (FAO Rome, 1967) the total vitamin A of the diet is now stated as micrograms of vitamin A (retinol) activity. Strict comparisons between vitamin A activity values published since 1968-69 cannot be made with previous values, since the values given for individual food items vary considerably in the food composition tables (1954 and 1977).

5. *Nutrients available for consumption.* Details of the estimated supplies of nutrients passing into consumption in the years 1979-80 to 1984-85 are shown in Table 4. All nutrient determinations are based on the fresh equivalent weight of the foods with an allowance for natural wastage, i.e. from skins, seeds, bones, etc. The exceptions are foods such as cheese, powdered and canned milks, bacon, ham, dried fruit, canned fish and alcoholic beverages.

6. Losses in total food available for consumption due to processing have been allowed for by way of an adjustment to the conversion factors used for processed and preserved foods. No allowances have been made for losses of nutrients (other than vitamins) due to the effect

of storage and cooking; losses of vitamins are referred to in the following paragraphs. The figures in Tables 7 and 8 are adjusted for losses of vitamins in cooking and for the additional niacin obtained from the metabolism of protein (see Table 5 for these adjustments).

7. *Loss of vitamins in cooking.* As a result of storage and cooking, certain foods, particularly fruit and vegetables, lose some of their nutritive value. Estimates of possible loss of vitamin C (ascorbic acid) and thiamin in cooking are set out in Table 5. Losses in cooking of other nutrients do occur but not in amounts likely to be significant. Losses due to storage have not been estimated.

8. Losses of vitamin C cover a wide range, from almost nil to 100 per cent. On average, 60 per cent of vitamin C in leafy green vegetables is lost through cooking, while losses for skinned potatoes, other vegetables and stewed fruit are approximately 50 per cent. There is also a significant loss of thiamin in the cooking of meat and vegetables, the amount of loss depending on the method and duration of cooking. In a normal mixed diet it is accurate enough for statistical purposes to allow 15 per cent deduction from the total thiamin available. The estimates in Table 5 are calculated assuming average conditions and methods of cooking. Losses could be reduced to less than these figures by careful cooking. Losses from uncooked fruits and vegetables are assumed to be negligible.

### **Trends in the consumption of nutrients:**

All nutrients available for consumption are in excess of the estimated recommended dietary allowances for the Australian population. With the statistics shown on page 22 of this publication, it should be noted that revised dietary allowances for calcium, iron, thiamin, riboflavin, niacin equivalent and retinol equivalent have been used since 1977-78. This change in the time series suggests a 'lowered' availability for some of these nutrients relative to earlier years but is explained by the change in the basis of comparison. Calcium has been the most affected, now being available in about 10% of excess of the estimated recommended dietary allowance for the population.

Total apparent energy consumption has shown a small increase over the past 6 years, but has fluctuated from year to year.

**TABLE 4. ESTIMATED SUPPLY OF NUTRIENTS, UNADJUSTED, AUSTRALIA(a)**  
 (per capita per day)

(a) Adjustments have not been made for the loss of nutrients in cooking, or the extra niacin obtained from the metabolism of protein. See Table 5 for adjustments for specific vitamin availabilities. (b) Expressed as the sum of retinol content and one sixth of the β carotene equivalent. (c) Comprises beer, wine and spirits, the energy value of which includes the contribution made by alcohol.

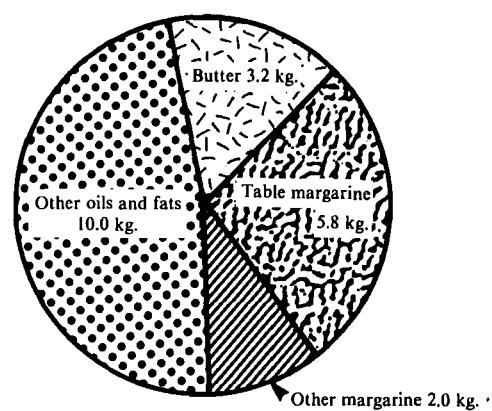

### SOURCES OF NUTRIENT FAT

### APPARENT PER CAPITA CONSUMPTION OF BUTTER, MARGARINE AND OTHER OILS AND FATS IN TERMS OF FAT CONTENT

Average 3 years ended 1938-39

1984 -85

TABLE 5. ADJUSTMENTS TO THE AVAILABILITY OF SPECIFIC VITAMINS, AUSTRALIA(a)  
(milligrams per capita per day)

Nutrient	1979-80		1980-81		1981-82		1982-83		1983-84		1984-85	
	Calculated value	Amount available										
<b>Vitamin C—</b>												
Milk and milk products—												
Fluid whole milk	2.8	2.8	2.9	2.9	2.8	2.8	2.8	2.8	2.8	2.8	2.8	2.8
Other milk products	1.5	1.5	1.4	1.4	1.8	1.8	1.6	1.6	1.6	1.6	1.4	1.4
Meat and meat products	2.0	(b)	2.1	(b)	2.2	(b)	2.2	(b)	1.7	(b)	1.7	(b)

Cooked	0.3	0.2	0.3	0.2	0.4	0.2	0.4	0.2	0.4	0.2	0.4	0.2
Citrus	39.7	39.7	37.4	37.4	34.7	34.7	46.5	46.5	49.4	49.4	43.9	43.9
<b>Vegetables—</b>												
Fresh tomatoes	8.2	4.9	8.9	5.6	9.5	6.0	9.4	6.1	10.5	7.1	11.1	7.6
Lettuce	1.0	1.0	1.0	0.5	0.9	0.9	1.0	1.0	1.1	1.1	1.2	1.2
Canned vegetables	5.9	2.4	6.7	2.8	6.8	3.1	6.8	3.0	6.7	2.9	6.8	3.3
Cooked potatoes and other vegetables	37.0	18.5	34.6	17.3	34.8	17.4	33.0	16.5	36.5	18.3	38.9	19.5
<b>Total vitamin C</b>	<b>108.9</b>	<b>79.8</b>	<b>106.7</b>	<b>77.9</b>	<b>105.3</b>	<b>76.9</b>	<b>115.2</b>	<b>87.7</b>	<b>122.1</b>	<b>93.3</b>	<b>120.8</b>	<b>90.8</b>
Thiamin	1.75	1.48	1.77	1.50	1.77	1.51	1.79	1.52	1.85	1.57	1.84	1.57
Niacin equivalent(c)	22.0	38.2	22.2	38.6	22.5	38.9	22.7	38.7	22.8	38.9	23.0	39.3

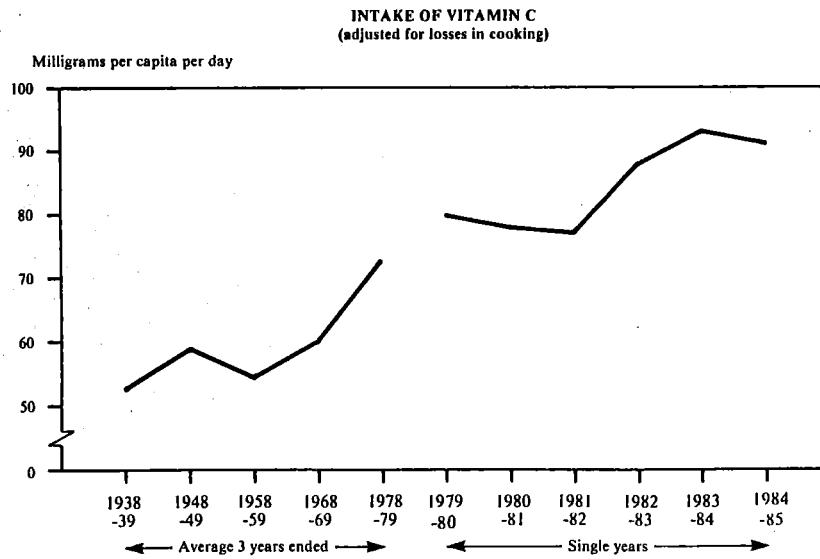

(a) Losses in cooking have been estimated for vitamin C and thiamin only; losses of other nutrients are not likely to be significant. (b) Little vitamin C would be retained in these foods. (c) The niacin equivalent of a diet is computed from dietary niacin plus 0.16 times the dietary protein in grams, expressed in milligrams.

**Dietary allowances.** The nutritive value of food available for consumption may be compared with an arbitrary standard such as the *Dietary Allowances for Use in Australia (1984 Edition)*, formulated by the Nutrition Committee of the National Health and Medical Research Council. This comparison has been made in Table 8, where the quantity of nutrients available for consumption in the Australian diet (as shown in Table 4), less estimated cooking loss for some vitamins, is compared with desirable quantities recommended by the Council. The allowances shown in Table 8 are averages weighted according to the various age groups in the population. The allowance data are based on information from the publication *Estimated Age Distribution of the Population* (3201.0). See the age-sex pyramid of the Australian population in the notes to Section I of this publication.

The comparisons in these tables are useful as an indication of trends in food consumption, although it

must be emphasised that the allowances do not necessarily represent nutrient requirement; rather they were devised for the planning of practical diets within the average Australian food pattern. Precise information concerning human requirements of certain nutrients is far from complete, and no conclusion regarding the nutritional status of the community should be drawn from comparison with these allowances. A deviation from the allowances of the order of 10-15 per cent is not regarded as a serious deficiency. Even if the nutrient intake is more than 15 per cent below the allowance, a nutritional deficiency cannot be assumed without clinical verification.

The calculated figures, being averages, give no information on the food consumption of individuals or of specific groups within the population. Also the figures represent food available for consumption, which is not the same as foods consumed. The Food and Agriculture Organisation of the United Nations estimates that in communities with a plentiful food supply, up to 15 per cent of the food available may be wasted.

(a) Not comparable with years prior to 1968-69. Figures are based on conversion factors calculated from the revised and enlarged edition of S. Thomas and M. Corden *Metric Tables of Composition of Australian Food A.G.P.S.*, Canberra 1977. See notes to Section II. Adjustments have been made for loss of nutrients in cooking and the extra niacin obtained from the metabolism of protein.

(a) Adjustments have been made for the loss of nutrients in cooking and the extra niacin obtained from the metabolism of protein.

NOTE: 1. Sources: for protein, energy and vitamin C, the National Health and Medical Research Council's 'Dietary Allowances for use in Australia', 1984. For calcium, iron, retinol equivalent (vitamin A), thiamin, riboflavin and niacin equivalent, the Commonwealth Department of Health's 'Nutrition Policy Statements', 1986.  
 2. Protein, thiamin, riboflavin, niacin and iron are calculated on the mid value for the dietary allowance range given for each age group.  
 3. Population allowances are averages weighted according to various age groups in the population; the age distributions at the beginning of each period have been used.
