NOTES ON THE ESTIMATES

MAIN FEATURES

NOTE: Changes in individual quarters are necessarily subject to the uncertainties discussed in the Explanatory Notes under Interpretation of quarterly estimates, and furthermore some may be substantially revised as firmer data come to hand. This applies particularly to the estimates for the two most recent years for gross operating surplus, the income of private corporate trading enterprises and non-farm unincorporated enterprises, and therefore to the estimated magnitude of change in gross non-farm product.

ESTIMATES OF MAIN AGGREGATES AT AVERAGE 1984-85 PRICES — SEASONALLY ADJUSTED

	Percentage Change		Percentage Points Contribution to Growth in GDP	
	Sept. qtr 1989 to Dec. qtr 1989	Dec. qtr 1988 to Dec. qtr 1989	Sept. qtr 1989 to Dec. qtr 1989	Dec. qtr 1988 to Dec. qtr 1989
Final consumption expenditure —				
Private	0.6	4.4	0.4	2.5
Government	2.1	8.0	0.4	1.4
Gross fixed capital expenditure	-3.4	-0.6	-0.9	-0.2
Increase in stocks —				
Private non-farm	-0.9	-1.1
Farm and public authority	0.6	0.4
Statistical discrepancy	-0.9	1.6
Gross national expenditure	-1.2	4.5	-1.3	4.7
Exports of goods and services	3.7	7.7	0.6	1.3
Imports of goods and services	-1.8	9.0	0.4	-1.9
Gross domestic product	-0.2	4.2	-0.2	4.2
Gross farm product	2.9	8.7	0.1	0.3
Gross non-farm product	-0.4	4.0	-0.3	3.9

In current price seasonally adjusted terms, wages, salaries and supplements rose by 2.4 per cent in December quarter 1989 following a rise of 2.9 per cent in the previous quarter, while gross operating surplus of private corporate trading enterprises fell 0.7 per cent in the December quarter 1989 following a rise of 3.3 per cent in the previous quarter.

Revisions in this issue

Quarterly estimates for all aggregates have been revised in accordance with revised annual estimates which will be published shortly in *Australian National Accounts: National Income and Expenditure, 1988-89, Summary* (5201.0).

Gross domestic product

The growth in the estimates of gross domestic product at average 1984-85 prices from 1987-88 to 1988-89 has been revised up marginally from 3.4 per cent to 3.6 per cent. Growth in the seasonally adjusted estimates between the June and September quarters 1989 has also been revised up marginally from 0.7 per cent to 0.9 per cent. However, there have been a number of more significant revisions to movements in the expenditure aggregates for September quarter 1989.

Expenditure aggregates

September quarter 1989 estimates of general government final consumption expenditure and gross fixed capital

expenditure were revised down due to the availability of more complete and up-to-date information and the correction of some large errors.

Private non-farm stocks and gross fixed capital expenditure on non-dwelling construction for September quarter 1989 were revised using final survey data from the Stocks Survey and the Building Activity Survey.

Exports and imports of goods and services at constant prices

As noted in the March quarter 1988 issue of this publication, the introduction of the Harmonised Commodity Description and Coding System (HS) in January 1988 caused difficulties for the constant price estimation of exports and imports of goods and services.

A result of the implementation of the HS was that the constant price estimation had to be carried out at a less detailed level, and using less satisfactory methods, than previously. Sufficient observations on the HS basis are now available to permit estimation at a much more

detailed level, using the preferred methods. As a result, the constant price estimates of exports and imports of goods and services have been revised back to March quarter 1988. The difficulties caused by the introduction of the HS were most acute for the constant price estimation of imports and, as a result, the estimates of imports at constant prices have been revised downwards for all quarters from June quarter 1988 to September quarter 1989.

A correction has also been made to historical data for constant price estimates of exports of goods and services resulting in upward revisions for all quarters prior to September quarter 1978.

Seasonally adjusted estimates

Seasonally adjusted estimates have been revised following the annual reanalysis of all adjusted series. The reanalysis of wages, salaries and supplements also incorporated the results of a Pay Periodicity Survey conducted in respect of September quarter 1988. The results of this survey enable the calculation of up-to-date adjustments for the occurrence of different numbers of paydays in each quarter.

Changes in this issue

In Tables 18 and 19 the former series *other goods and services* has been replaced by three series *other goods*, *other services*, and *net expenditure overseas* to explicitly show the adjustment required to allow for net expenditure overseas when compiling estimates of private final consumption expenditure (PFCE). See also the note below covering PFCE.

The inclusion of detailed tables for components of exports and imports of goods and services at current and constant prices has been discontinued because these tables are published in *Balance of Payments, Australia* (5302.0) which is normally released before the corresponding issue of 5206.0.

Implicit price deflators — GFCE, public enterprises

The sharp fall of 2.4 per cent in the implicit price deflator for gross fixed capital expenditure by public enterprises in the September quarter 1989 and the sharp rise of 3.7 per cent in the following quarter were caused by compositional changes. In particular, there was a relatively high level of expenditure on aircraft in the September quarter which was deflated by a relatively low price index (i.e. the price of aircraft has grown relatively slowly since the base year). In combination, these two factors depressed the total implicit price deflator in the September quarter.

ACT self government

Following the introduction of self government for the Australian Capital Territory (ACT), it is included in the State and local government sub-sector with effect from September quarter 1989. For previous periods the equivalent transactions are recorded in the Commonwealth government sub-sector. This affects estimates in Tables 25, 26 and 28-31.

Private final consumption expenditure

Estimates of private final consumption expenditure (PFCE) are included in Tables 18 and 19 of this publication. The primary source for almost one half of this aggregate is the monthly retail survey conducted by the ABS. Up until June 1987 quarterly commodity sales data were available from this collection and were used to produce estimates for the relevant components of PFCE (primarily food; alcoholic drinks; clothing, footwear and drapery; household appliances; other household durables; other goods). These data are no longer available and component estimates for more recent quarters have been derived by applying relationships between industry and commodity sales data from the 1985-86 Retail Census and the 1986-87 Selected Service Industry Surveys to monthly industry data from the retail survey. The changeover in the monthly retail survey to collecting data on a retail turnover rather than a retail sales basis from July 1988 has further complicated the estimation of these components. The estimates of these individual components for periods after June 1987 should therefore be used with some caution. However the impact of the changes on the estimates of total PFCE is minimal.

Users should note that estimates of PFCE relate to expenditures of Australian residents. Individual components of PFCE are estimated on the basis of all activity occurring within Australia. The aggregate is converted to an Australian resident basis by the addition of 'net expenditure overseas', which is now shown as a separate component series in this publication. 'Net expenditure overseas' is defined as the expenditure of Australian residents overseas less the expenditure of non-residents in Australia and is obtained from the relevant Balance of Payments statistics.

In recent years this item has been significantly affected by the growth in overseas visitors arriving in Australia as a result of, amongst other things, the Bicentennial celebrations and Expo 88. In addition the latest quarters may have been affected by the recent pilots' dispute.

Government final consumption expenditure

The current price value for this aggregate is estimated using data from public authority accounts which predominantly record cash flows. Expenditure is recorded for some authorities at the time a transfer is made from consolidated revenue rather than when expenditure actually occurs. For these reasons this series tends to be somewhat volatile, even on a seasonally adjusted basis, and caution should be exercised when interpreting movements for individual quarters (both from the previous quarter and from the corresponding quarter of the previous year).

Private gross fixed capital expenditure - non-dwelling construction

In recent years several significant second-hand transactions have occurred involving the public sector. Therefore, in order to provide an indication of new work done on private non-dwelling construction, separate details are provided in the following table.

**PRIVATE GROSS FIXED CAPITAL EXPENDITURE
NON-DWELLING CONSTRUCTION
CURRENT PRICES, ORIGINAL
(\$ million)**

	New Work Done — Private	Net Second-hand Purchases from the Public Sector	Total
1986-87	9487	24	9511

Terms of trade

Initial estimates indicate that Australia's terms of trade rose by 0.6 per cent in December quarter 1989, reflecting a fall in import prices of 2.6 per cent and a fall of 2.0 per cent in export prices.

Movements in Australia's terms of trade are shown in the graph below.

**TERMS OF TRADE
(1984-85 = 100)
SEASONALLY ADJUSTED**

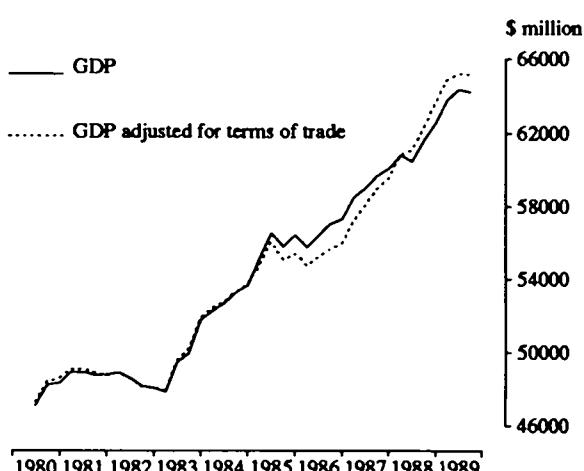

Gross domestic product (GDP) at constant prices, adjusted for the terms of trade

Changes in the aggregate 'gross domestic product at constant prices' provide an indication of changes in the volume of goods and services produced within Australia. If, however, the terms of trade have changed significantly over the period of comparison the aggregate will not provide an accurate reflection of the change in the real purchasing power of the income generated by domestic production.

The following graph shows constant price GDP before and after adjustment for the terms of trade effect.

**GDP AT AVERAGE 1984-85 PRICES
(ADJUSTED FOR TERMS OF TRADE EFFECT)
SEASONALLY ADJUSTED**

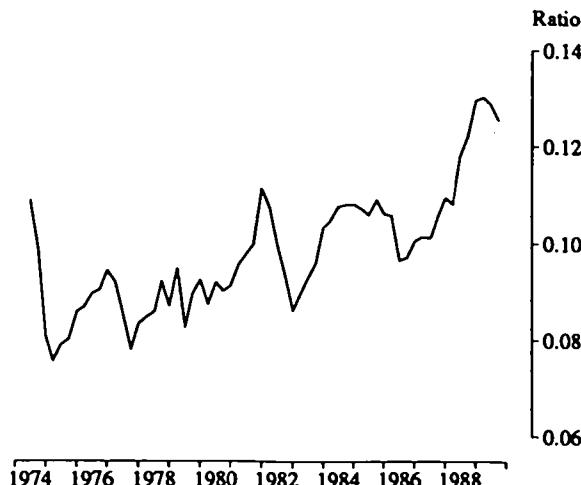

Imports to sales ratio

The imports to sales ratio (see paragraph 22 of the 'Explanatory Notes') fell to 0.125 in December quarter 1989 from 0.129 in the previous quarter. This was associated with a decrease in endogenous imports of 2.3 per cent and an increase in sales of 0.3 per cent - both measured in seasonally adjusted constant price terms.

The ratio of imports to sales is graphed below.

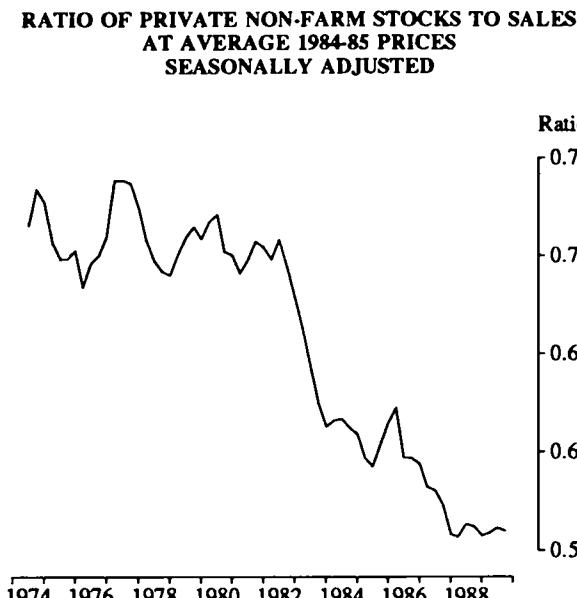

**RATIO OF IMPORTS TO SALES
AT AVERAGE 1984-85 PRICES
SEASONALLY ADJUSTED**

Stocks to sales ratio

In seasonally adjusted constant price terms, private non-farm stocks increased by \$23 million (or 0.1 per cent) during December quarter 1989, while sales (see paragraph 21 of the 'Explanatory Notes') increased by \$240 million (or 0.3 per cent). Consequently, the stocks to sales ratio fell slightly to 0.560.

The following graph shows this ratio from September quarter 1974 onwards.

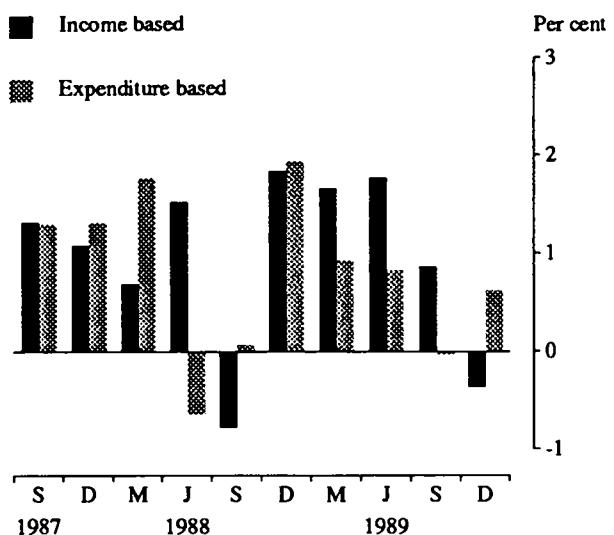

Statistical discrepancy

The statistical discrepancy represents the difference between the sum of the estimates of gross domestic product (GDP) and imports of goods and services on the one hand and the estimate of components of gross national expenditure and exports of goods and services on the other hand. Conceptually, these two totals are the same. The inclusion of the statistical discrepancy on the expenditure side of the domestic production account is a convention and does not necessarily imply that the sum of the income components more accurately measures GDP than the sum of the expenditure components.

The aspect of the statistical discrepancy which is of most concern in the quarterly context is the magnitude of change from one quarter to the next. In some quarters there are quite significant movements in the seasonally adjusted constant price statistical discrepancy. A useful way of examining the significance of the statistical discrepancy is to compare the change in gross non-farm product as published, with the result which would be obtained using the expenditure aggregates excluding the statistical discrepancy.

The following chart shows such a comparison for the last 10 quarters.

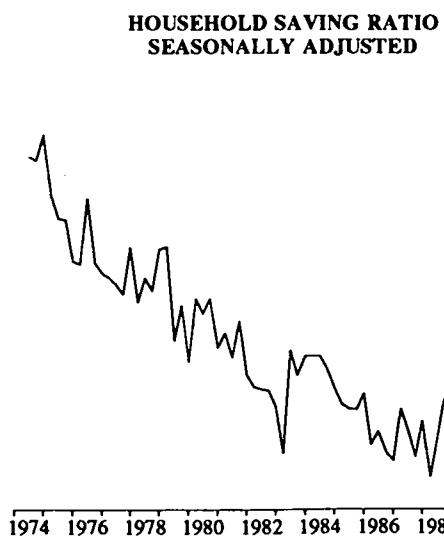

PERCENTAGE CHANGES IN GNFP AT AVERAGE 1984-85 PRICES SEASONALLY ADJUSTED

Household saving ratio

Present estimates indicate that, on a seasonally adjusted basis, the proportion of household disposable income devoted to consumption in the December quarter was 90.7 per cent while household saving, which is derived as a balancing item, represented 9.3 per cent. Both of these ratios are affected by any deficiencies or inconsistencies in the estimation and seasonal adjustment of household income and expenditure. Particular caution should be exercised in interpreting this ratio for recent years because major components may still be subject to significant revisions. The impact of such revisions on the saving ratio can be quite marked and can cause changes in the apparent direction of the trend.

The following graph presents this ratio from September quarter 1974.

Release date for March Quarter 1990 issue

The expected release date for the March quarter 1990 issue of *Australian National Accounts: National Income and Expenditure* (5206.0) is 30 May 1990.

EXPLANATORY NOTES

Introduction

This publication provides estimates of the components of gross domestic product and national expenditure and supporting tables for the December quarter 1989, together with comparative estimates for the eight previous quarters and the four years 1985-86 to 1988-89. In addition, seasonally adjusted estimates of the major aggregates and some selected series are provided for the December quarter 1989, together with comparative estimates for the twelve previous quarters. Tables 37-42 show revisions that have been made to major aggregates since the previous publication. Tables 43-55 provide time series, in both original and seasonally adjusted terms, for the period from September quarter 1974 for the aggregates contained in the domestic production account (at both current and average 1984-85 prices), some income aggregates, implicit price deflators and some other selected series.

Concepts, definitions, sources and methods

2. A basic guide to the Australian national accounts entitled *Australian National Accounts: Concepts, Sources and Methods* (5216.0) is available. It outlines major concepts and definitions, describes sources of data and methods used to derive annual and quarterly estimates for major aggregates at both current and constant prices and discusses the accuracy and reliability of the national accounts. The concepts, definitions, sources and methods applicable to the current price estimates contained in this publication are as described in 5216.0 but with the changes outlined in Appendix A of *Australian National Accounts: National Income and Expenditure, 1986-87* (5204.0). An updated issue of 5216.0 will be released shortly and will contain information about the rebased constant price estimates (now compiled on a base year of 1984-85).

Interpretation of quarterly estimates

3. Estimating for a period of less than one year presents special problems in that it is often difficult to adhere strictly to the definitions and concepts used in annual estimates. The measurement of income for a quarterly period is particularly difficult since it is not always possible to match the value of production for a quarter with the cost incurred in that production. This problem occurs, for example, in estimating the income of farm unincorporated enterprises in each quarter and results in considerable variation in estimates for this series, and for gross farm product, from quarter to quarter. Difficulties are also experienced in obtaining detailed data for short periods and in preparing consistent estimates from various sources where different accounting procedures and periods are used.

4. These problems inevitably affect the consistency and reliability of the current price estimates, and similarly affect the constant price estimates based on the current price estimates. Accordingly, these factors as well as the approximations and assumptions necessarily made in the revaluation of flows to constant prices should be

taken into account when interpreting or using the estimates (for example, in attempting to draw precise quantitative inferences relating to quarter-to-quarter changes in gross domestic product or its components, or in measuring productivity).

5. Analysis of trends requires allowance for these uncertainties in estimation. To some extent, the effects are indicated by the changes in the statistical discrepancy for corresponding periods. Uncertainty in trends arises also from the likelihood of revisions as more information becomes available and from the irregularity of short-term movements. The inclusion of the statistical discrepancy on the expenditure side of the accounts is a convention and does not necessarily imply that the sum of income components more accurately measures GDP than the sum of the expenditure components (plus exports less imports). As household and other saving are estimated as balancing items in their respective accounts, care should be exercised in their interpretation.

6. Estimates of national income and expenditure are necessarily prepared from a wide range of statistical information, some of which is available quickly and some only with a delay of several years. For this reason most figures should be regarded as subject to revision as more complete and more accurate information becomes available. The revisions will be of two main types - those made to the most recent quarters as firmer quarterly or monthly data come to hand and those which are a consequence of revisions to annual totals and distributed to the quarters approximately in accordance with existing quarterly patterns.

7. No simple measure is available of the accuracy of the major summary national accounting aggregates. However, the following example illustrates the sensitivity of quarter-to-quarter growth to the timing of recording a transaction. If, in the latest year, the timing of recording a transaction were delayed by one quarter and if the transaction had an impact on constant price gross domestic product of +\$64 million then the measure of the rate of growth would be affected in the three adjoining quarters (centred on the quarter in which the transaction was recorded) by -0.1, +0.2, and -0.1 percentage points respectively. Of course the percentage impact of such a timing delay on relevant sub-aggregates would be greater.

8. The quarterly implicit price deflators (IPDs) shown in Table 9 are derived by dividing seasonally adjusted current price estimates by the corresponding seasonally adjusted constant price estimates. Movements in the levels of individual implicit price deflators can be greatly affected by changes in the physical composition of the aggregates and their components. Generally, it is considered that IPDs derived from seasonally adjusted data are more reliable than those obtained by using original (i.e. unadjusted) series, because the former are less likely to be affected by compositional change than are the latter. However the seasonal adjustment process

is itself a source of possible distortion, especially to the extent that it is not possible to identify, in a fully consistent way, the seasonality of the current price estimates and of the constant price estimates. A discussion of the limitations involved in using IPDs as measures of pure price change is contained in Appendix B of *Australian National Accounts: Concepts, Sources and Methods* (5216.0).

Seasonal adjustment

9. As most series are affected to some extent by seasonal factors, allowance should be made for normal seasonal variation. In a number of tables, *seasonally adjusted* values are presented for selected series. Series which show substantial irregularities in the original or adjusted series should be treated with some reserve. As different methods of seasonal adjustment tend to produce different results, it is necessary to take into account the methods by which seasonally adjusted estimates have been derived and the limitations to which those methods are subject. It should also be noted that the methods of seasonal adjustment used by the ABS do not force the sum of the seasonally adjusted estimates for each quarter of a financial year to equal the original annual total.

10. The general methods used in the ABS for making seasonal adjustments are described in *Seasonally Adjusted Indicators, Australia 1983* (1308.0). However, special methods have been used to adjust some of the components of gross farm product which were not amenable to seasonal adjustment by the usual methods. To obtain these seasonally adjusted estimates, the estimated values of production of wheat, other grain and sugar cane, for any financial year, are distributed equally over the four quarters of the year ended June. One effect of this method is that changes in the annual production of these commodities enter into the seasonally adjusted figures in the September quarter.

11. Where there is no apparent seasonality in their implicit price deflators, constant price estimates are seasonally adjusted using the same factors as are used for adjusting the corresponding current price estimates. As far as possible the remaining constant price estimates have been adjusted using methods similar to those for corresponding current price estimates.

12. Seasonally adjusted estimates of private final consumption expenditure for each State and Territory at current and average 1984-85 prices are shown in Tables 34 and 36 of this publication. Due to the relatively short span of data available for analysis, no Easter or trading-day correction factors have been applied in the seasonal adjustment of these series. The State and Territory series have been adjusted at a more aggregated level than the Australian series and independently of them (although as far as possible similar methods have been used). For these reasons the sum of the seasonally adjusted State and Territory series do not generally equal the seasonally adjusted Australian series.

13. Trend estimates are included in this publication. Smoothing seasonally adjusted series to create trend

estimates is a means of reducing the impact of the irregular component of the series. Users may wish to refer to the ABS Information Papers *A Guide to Smoothing Time Series - Estimates of 'Trend'* (1316.0) and *Time Series Decomposition - An Overview* (1317.0) for more detailed information on smoothing seasonally adjusted time series data.

Analysis of contributions to growth table

14. Table 3 presents an analysis of the contribution provided by each major aggregate to the percentage change in seasonally adjusted gross domestic product at constant prices. The formula used to calculate the contribution of each aggregate to the growth in GDP is:

$$\frac{A(t) - A(t-1)}{GDP(t-1)} \times 100.0$$

where $A(t)$ = value of aggregate A in quarter under consideration

$A(t-1)$ = value of aggregate A in preceding quarter

$GDP(t-1)$ = value of GDP in preceding quarter.

All these values are seasonally adjusted constant price estimates. It should be noted that the figures in this table are additive within each quarter, unlike the percentage changes shown in other tables in this publication.

Terms of trade

15. There are several ways of measuring the terms of trade. A common means of doing so is by calculating an index of the form:

$$\frac{\text{Price index of exports}}{\text{Price index of imports}} \times 100.0$$

16. In this publication the price indexes used in calculating the terms of trade are the implicit price deflators for exports of goods and services and for imports of goods and services. They take into account not only the changes in the prices of exports and imports, but also the effects of changes in the composition of exports and imports on total recorded price movements. The terms of trade is presented as a memorandum item in Tables 4 and 9.

Gross domestic product (GDP) at constant prices, adjusted for the terms of trade

17. Changes in the aggregate 'gross domestic product at constant prices' provide an indication of changes in the volume of goods and services produced within Australia. If, however, the terms of trade have changed significantly over the period of comparison this aggregate will not provide an accurate reflection of the change in the real purchasing power of the income generated by domestic production.

18. As with the terms of trade, no single agreed measure of the effect of the terms of trade on movements in GDP at constant prices is available, and the available methods will generally produce different results.

19. In this publication the adjustment has been calculated by first revaluing exports of goods and services by the implicit price deflator of imports of goods and services (thereby providing a measure of the purchasing power of exports over imports). The actual constant price value of exports of goods and services has then been deducted from this value to provide the terms of trade adjustment which has been added to GDP at constant prices to obtain the required result. The series is presented as a memorandum item in Tables 2 and 8.

Expenditure-based estimate of gross non-farm product

20. The published measure of GDP is the sum of the income components in the domestic production account. Alternatively, expenditure-based estimates of GDP and gross non-farm product can be produced by subtracting the statistical discrepancy from the published estimates. Expenditure-based estimates of gross non-farm product are presented as a memorandum item in Tables 2 and 8.

Private non-farm stocks to sales ratio

21. The denominator of this ratio is defined as gross non-farm product *plus* endogenous imports (imports of goods *excluding* imports of fuel, imports of certain large items of equipment by both the public and private sectors and certain other government imports) *plus* imports of services *less* changes in private non-farm stocks. All of these variables are at constant prices. The ratio is presented as a memorandum item in Table 8.

Imports to sales ratio

22. The ratio is endogenous imports to sales (both as defined for the private non-farm stocks to sales ratio - see paragraph 21). It is presented as a memorandum item in Table 8.

Household saving ratio

23. This is defined as the ratio of household saving to household disposable income, where household saving is a balancing item derived as the difference between household disposable income and private final consumption expenditure. The ratio is presented as a memorandum item in Table 23.

Data on floppy disk

24. All quarterly series included in this publication, with the exception of those included in the overseas trade tables, are available on floppy disk (*Australian National Accounts: Quarterly Data on Floppy Disk* (5228.0)). These data generally run from September quarter 1959 for current price estimates and from September quarter 1974 for constant price estimates. The cost is currently \$75 per release for most customers. Order forms for the service can be obtained by telephoning (06) 252 6684.

Related publications

25. In addition to those mentioned above, other ABS publications which may be of interest include:

Australian National Accounts: Historical Estimates (5207.0) - issued for December quarter only

Budget Related Paper No. 2, National Income and Expenditure (5213.0) - issued annually

Australian National Accounts: State Accounts (5220.0) - issued annually

Australian National Accounts: Capital Stock (5221.0) - issued annually

Australian National Accounts: Gross Product, Employment and Hours Worked (5222.0) - issued quarterly.

Australian National Accounts: Gross Product, Employment and Hours Worked (5211.0) - issued annually

Development of Multifactor Productivity Estimates for Australia, 1974-75 to 1987-88, Information Paper (5229.0)

26. Current publications produced by the ABS are listed in the *Catalogue of Publications, Australia* (1101.0). The ABS also issues, on Tuesdays and Fridays, a *Publications Advice* (1105.0) which lists publications to be released in the next few days. The Catalogue and Publications Advice are available from any ABS office.

Electronic services

VIATEL. Key *656# for selected current economic, social and demographic statistics.

AUSSTATS. Thousands of up-to-date time series are available on this ABS on-line service through CSIRONET. Further information can be obtained by calling the AUSSTATS Help Desk on (06) 252 6017.

TELESTATS. This service provides:

- foreign trade statistics tailored to users' requirements.
Further information is available on (06) 252 5404.
- text and tables for selected Main Economic Indicator publications
Further information is available on (06) 252 5405.

Floppy disk service

Selected ABS statistics are available on floppy disk. Further information is available on (06) 252 6684.

(a) Quarterly figures are derived from seasonally adjusted data. (b) Derived from data at average 1984-85 prices. (c) Annual ratios derived as simple averages of quarterly ratios. (d) Annual figures derived from annual data. (e) Annual figures derived as sum of original quarterly figures.

FEATURE ARTICLE

THE FLOW OF FUNDS: MEASURING THE FINANCIAL TRANSACTIONS OF THE AUSTRALIAN ECONOMY

The ABS is shortly to release flow of funds statistics for the first time. These experimental estimates will cover flow of funds for the March and June quarters 1989. Although the Reserve Bank of Australia has compiled annual flow of funds estimates since 1953-54, the ABS estimates will be the first quarterly estimates, and the first estimates fully integrated with the national income and expenditure accounts.

This article describes the flow of funds accounts and their relationship to the national income and expenditure accounts. It also briefly outlines the sources and methods used in compiling the estimates. Readers interested in receiving a copy of the first flow of funds publication (Catalogue No. 5232.0) who have not already ordered a copy can do so by phoning Derick Cullen on (06) 2526244; or by facsimile on (06) 2531051; or by writing to: Flow of Funds Section, ABS, PO Box 10, Belconnen, ACT 2616.

This introductory issue of *Australian National Accounts: Flow of Funds* (5232.0) is being made available free of charge.

Description

1 The four consolidated accounts of the nation, the domestic production account, the national income and outlay account, the national capital account and the overseas transactions account, are sometimes described as 'the national accounts'. However, in addition to these, the Australian System of National Accounts (ANA) includes the Flow of Funds Accounts. The purpose of flow of funds accounts is to provide data, within a national accounting framework, for the analysis of sectoral saving flows and investment behaviour, the relationships between the financial and 'real' sides of the economy and the inter-sectoral financial claims. National and sector balance sheet accounts (which are not available for Australia at present) provide the stock of real and financial assets and liabilities by sector at the end of each accounting period. They represent the next major development to be undertaken within the Australian System of National Accounts.

2 When the income and outlay, capital and flow of funds accounts are taken together with the overseas transactions account and the capital account of the balance of payments, they constitute a complete statement of sources and application of funds for each sector of the economy as well as for the economy as a whole. By juxtaposing the saving and non-financial investment estimates from the capital account of the domestic sectors (from the national income and expenditure accounts) with changes in financial assets and liabilities classified by financial instrument, the flow of funds accounts provide a framework to analyse how saving flows are channelled from the surplus to the deficit sectors. The flow of funds accounts highlight the important role of financial intermediation in the economy, a role that is not evident from the production account.

3 An outline of the flow of funds accounts is shown in matrix form in the attached table¹. It can be divided into two sections: the capital account from the national income and expenditure accounts, and the financial transactions account.

4 The top portion of the table is a summary capital account which shows for each sector:

- line 1 – *Finance of gross accumulation* (the excess of income over expenditures of a current nature, *plus* consumption of fixed capital, *plus* net capital transfers, such as capital grants);
- line 2 – *Gross accumulation* (gross fixed capital expenditure, *plus* increase in stocks and net transactions in land and intangible assets);
- line 3 – *Net lending or borrowing*.

5 Saving and investment in physical assets are always equal for the economy when taking into account the transactions with the rest of the world, but this does not necessarily hold true for the individual sectors. Sectors with an excess of saving over investment transfer that excess through net lending (line 3) to sectors which have investment expenditure in excess of saving and which are therefore net borrowers.

6 The remainder of the table shows the financial transactions which are the counterparts of the capital account's net lending/borrowing. Financial transactions occur between economic agents (enterprises, households) when there is a change in claims for payment between them. For example, a deposit by a household in a bank is an increase in the household claims (financial assets) on that bank. The change in financial assets is balanced exactly by a change in liabilities (in this example, liabilities of the bank to the household). The financial transactions portion of the table thus represents a 'balance of financial claims' between sectors. Financial claims in this context include equity in corporations (i.e. claims of the shareholders on the corporation) and the notional claim of holders of Australian banknotes on the issuer of the banknotes (the Reserve Bank of Australia).

7 The change in financial assets for each sector and the change in liabilities for each sector are analysed by financial instrument (type of asset/liability). These financial instruments are described below (see paragraphs 27 to 36).

8 Change in financial position (line 5) is the excess of net acquisition/reduction of financial assets (line 6) over net incurrence/reduction of liabilities (line 15). In principle, change in financial

¹ The attached table contains only illustrative data. The main table of the ABS flow of funds publication (Cat. No. 5232.0) will be similar in format to the attached table with the addition of sub-sectors of three of the sectors: Financial Enterprises will be broken down into the four sub-sectors shown in paragraph 25 below; Corporate Trading Enterprises will be sub-divided into Private, Commonwealth Government and State and Local Government; and General Government will be broken down between the Commonwealth Government and State and Local Government. The main table will be supported by a capital market summary and tables for each sector and sub-sector of the economy.

position is the same as net lending/borrowing (line 3) of the capital account, because the change in the balance of financial claims between sectors is the mechanism for transferring funds from surplus sectors to the deficit sectors (as a general rule, transactions between economic entities in the same sector are consolidated out). This is demonstrated as:

$$S + \Delta L = I + \Delta FA$$

where S = saving

ΔL = change in liabilities

I = investment in non-financial assets (i.e. gross fixed capital expenditure plus change in stocks plus net purchases of land and intangible assets)

and ΔFA = change in financial assets.

This can be rearranged as

$$S - I = \Delta FA - \Delta L.$$

Therefore, since

$$S - I = \text{net lending (NL)}$$

and

$$\Delta FA - \Delta L = \text{change in financial position (CFP)}$$

$$\text{then } NL = CFP.$$

9 In practice, differences will arise because of the differing sources used to construct the estimates. These differences are indicated in Line 4 of the matrix, 'Balancing item', which reflects all net errors and omissions from both sides of the equations. This item is different from the 'statistical discrepancy' (shown in the sixth column of the matrix) which arises in the domestic production account as the difference between the income and expenditure estimates of GDP (see also paragraph 22 below).

10 Working through the illustrative matrix example in Table 1 may assist in understanding the flow of funds.

11 The matrix is divided into the four domestic sectors (financial enterprises, general government, corporate trading enterprises, households), the rest of the world and the discrepancy column (outlined above).

12 These data indicate that financial enterprises have generated internal sources of funds (saving, consumption of fixed capital and net capital transfers) of 5 while spending 3 on non-financial capital acquisition (gross fixed capital expenditure, stocks and net purchases of land and intangible assets). The result is a net lending figure of 2. General government had a gross dissaving of 3 and spent 5 on capital items (such as roads), producing a net borrowing requirement of 8. Corporate trading enterprises had 20 gross saving but their capital expenditures were 45 which meant that they had a borrowing requirement of 25. Households' gross saving amounted to 70 while expenditure on non-financial capital acquisition was 50, leaving net lending of 20.

13 The combined effect of the net lending and borrowings by these domestic sectors (i.e. the sum of the first four columns) was that total domestic gross saving of 92 was 11 short of total investment on non-financial assets (103). Non-residents made up this shortfall. In the example, however, because the measured current account deficit (i.e. saving by the rest of the world) was 10^2 , a statistical discrepancy of 1 resulted.

14 In the financial transactions account, the manner in which surplus funds are applied and the means by which they are sourced is highlighted.

15 Households applied their funds through a net increase of 53 in deposits at banks³, raised their equity in life insurance and superannuation funds by 35 and increased 'other assets' by 3. They also reduced their holdings of shares by 2 (i.e. -2) which meant that their net increase in financial assets was

² By convention, non-residents do not undertake gross accumulation in Australia. Such activity is deemed to be by a domestic sector (i.e. the non-resident is deemed to have a resident component in Australia). Any capital expenditure which that resident component undertakes in Australia is part of the domestic expenditure, even though that expenditure is paid for by a non-resident. The non-resident's claims are considered to be financial and are recorded in the capital account of the balance of payments.

³ The flow of funds measure net movements of funds, not gross. If a person has an opening deposit balance of 100, deposits 25 during the period and withdraws 15, the closing balance will be 110. The flow of funds will record the change of 10, being the closing balance minus the opening. To try to measure gross flows would be very difficult and the resulting figures would be so large they would be almost useless.

89. The increase in their loans from banks of 68 was the only change in their liabilities, which meant that the measured change in their financial position (i.e., net change in financial assets minus net change in liabilities, 89 - 68) was 21. The net lending figure from the capital account was 20, leaving a balancing item of 1.

16 Corporate trading enterprises, while being net borrowers as a whole, will still have some entities that are net lenders. This is reflected in the increases in their deposits at banks of 15 and their purchase of short term instruments of 1. They have also applied funds overseas of 2. Their net increase in financial assets is 18. They have raised funds through loans of 26, short-term instruments of 8, long-term debt of 5, shares worth 5 and 'other liabilities' of 3 which produces a change in their liabilities of 47. Subtracting the net change in financial assets produces a change in financial position of minus 29, a difference of -4 from the net borrowing requirement from the capital account.

17 General government increased its financial assets through deposits at banks of 7 while sourcing its funding needs of 13 through sales of short-term and long-term debt of 3 and 10 respectively. Therefore, the change in financial position was minus 6 (i.e. 7 - 13), leaving a balancing item of 2.

18 The rest of the world's financial transactions account is a rearrangement of the balance of payments capital account.⁴ Non-residents increased their deposits at banks by 5, acquired short-term debt instruments of 7 and long-term debt instruments of 8, and shares of 4, giving a total increase of measured claims on Australia of 24. At the same time, residents increased their investments in assets overseas by 12, which gives a net increase in non-residents' investments in Australia of 12 (i.e. 24 - 12). The measured current account balance (net lending to the domestic sectors) was 10 which leaves a balancing item of 2.

19 The role of financial enterprises in these financial flows can now be understood. They have had their total deposits increase by 80, as a result of the deposits made by the other four sectors. Their life insurance and superannuation liability to households is the counterpart of the amount of 35 indicated in the household application of funds. Financial enterprises have also seen their 'other liabilities' increase by 1. These sources of funds

totalling 116 have been applied to loans (94, which is made up of 26 to corporate trading enterprises and 68 to households), short-term instruments (3, constituting issues by government or trading corporations), long-term debt (7, also by government or trading corporations), an increase of 3 in shares in trading corporations, an increase in assets offshore of 10, while 'other assets' have risen by 1.

20 These figures serve to highlight the importance of financial enterprises in the movement of funds in the economy, even though they have played a limited role in the national income and expenditure accounts. Without financial enterprises, it would be much more difficult to obtain funds. Trying to find funds directly to finance acquisition of physical assets without the intervention of financial institutions would be a very time-consuming exercise. Financial enterprises 'intermediate' by raising funds (e.g. through deposits) and on-lending them (e.g. in loans). They assemble small amounts of funds and package them for borrowers' needs.

21 On the other hand, despite this importance, it can also be seen that financial enterprises do not cover all transactions in the financial economy. Where funds are likely to be lent or raised in large amounts (such as debt securities and shares) there is more likely to be direct financing between ultimate lender and borrower as there is less need for intermediation.

22 The column headed 'Discrepancy' is to accommodate the statistical discrepancy from the domestic production account via the national capital account, which arises from the difference between income-based and expenditure-based estimates. This discrepancy is shown in the national capital account to ensure that total saving equals total investment.

23 The total of each of the asset items equals the total of each equivalent liability item, so that the total of the net changes in financial assets of 256 equals the total of the net changes of the liabilities. As the $S = I$ identity leaves an equivalent zero balance in the capital account, the system as a whole balances.

24 Taking the flow of funds statement in conjunction with the income and outlay accounts for

⁴ There is a difference of nomenclature between the SNA and the IMF Balance of Payments Manual with regard to 'capital account'. In the national accounts, the capital account shows, on the receipts side, consumption of fixed capital, saving and net capital transfers and, on the payments side, net purchase of non-financial assets and net lending/borrowing. In the supplementary sector capital accounts, some information on financing activity is also shown. In the balance of payments however, because non-residents do not undertake gross accumulation, the capital account only records financial activity.

each sector and for the economy as a whole allows an analysis of 'shocks' to the system. Through the comprehensive statement of sources and applications of funds, the full ramifications of changes in various components can be more easily understood. For example, the effect of a change in the tax regime, a deterioration in the terms of trade, an appreciation of the exchange rate, or a rise in household income, can be observed.

Sectors

25 The sectors presented in Table 1 are the same as those for the national income and expenditure accounts. However, because of the emphasis placed on the role of financial enterprises in the flow of funds accounts, the financial enterprises sector is disaggregated into four sub-sectors (not shown in the illustrative summary matrix). These sub-sectors are as follows:

- *Reserve Bank*
- *Other deposit-taking institutions* – trading, savings and development banks, and non-bank financial intermediaries (corporations registered under the Financial Corporations Act (FCA), categories A to G), and cash management trusts.
- *Life insurance and superannuation funds* – superannuation, pension, life insurance, long service and approved deposit funds, and friendly societies (these all represent repositories of significant long-term savings of households).
- *Other financial institutions* – public unit trusts (other than property, trading and cash management trusts), third party and general and health insurance institutions (including government insurance agencies such as State Government Insurance Offices), the Export Finance Insurance Corporation, economic development corporations and common funds.

26 Excluded from the Financial Enterprises sector are the central borrowing authorities of State governments, which are included in the General Government sector.

Financial instruments

27 The financial asset and liability instruments shown in the Table 1 are as follows.

Cash and deposits

28 By convention deposits can only appear as liabilities of *deposit-taking institutions* i.e. those institutions whose deposits constitute the Reserve Bank's 'broad money' aggregate. These include banks, FCA corporations (except categories H, I and

J) and cash management trusts. Apart from conventional deposits, deposits in the flow of funds include units on issue by cash management trusts, and withdrawable share capital issued by building societies and credit unions. Currency on issue (i.e. notes and coin) is also treated as deposits.

29 Deposits accepted by entities other than the *deposit-taking institutions* are treated as 'loans and placements' for flow of funds purposes.

Loans and placements

30 Loan instruments include non-deposit claims that are not the result of the issue of a security or equity. No distinction is drawn between the various types of loan, whether secured or unsecured, or term. Financial lease agreements and repurchase agreements (where identified) are treated as loans.

Short-term securities

31 These securities are tradeable or transferable securities with an original term to maturity of one year or less. As such, these instruments form the major means for money market trading. Measurement difficulties arise with these instruments because their holders may not record the sector of issuer (nor may the issuer know who holds the security). In addition, because many of these instruments are issued at a discount, the issuer is likely to record the liability at face value while the purchaser may use a variety of valuation methods (such as purchase price, amortised value, market value, or face value). The main instruments are bank certificates of deposit (both negotiable and transferable), bills of exchange, Treasury Notes and promissory notes.

Long-term securities

32 These are tradeable or transferable securities which involve eventual obligation for repayment or conversion to another type of security by the issuer, for which the original term to maturity was more than one year. Instruments included are debentures, unsecured notes, and bonds. For the purposes of the flow of funds, convertible notes (prior to conversion to equity) are treated as debt rather than equity instruments. Mortgage-backed bonds are also treated as debt securities, rather than loan agreements – the 'underlying' asset for the security is recorded separately under the appropriate instrument category.

Insurance technical reserves

33 This instrument records the accounting obligation of life and pension funds to the policyholders/participants. It is not an actuarial assessment of the liability of life and pension funds

to beneficiaries but is equivalent to the net assets of life and pension funds (i.e. value of total assets less borrowings and creditors).

Equities

34 For flow of funds purposes, equities represent 'liabilities' of a non-repayable nature (or a financial asset that can only be realised by sale). As such, they include ordinary shares, non-redeemable preference shares, units in unit trusts (other than cash management trusts) and rights issues. Excluded are perpetual notes and convertible notes (prior to conversion to shares); these are included in long-term debt. Units in cash management trusts and withdrawable share capital of building societies are included in deposits.

Other claims

35 The main instruments included here are sundry creditors/debtors, including trade credit extended by trading enterprises, and accruals items not yet payable/receivable such as interest and prepayments.

Claims on non-residents

36 The asset line records changes in each domestic sector's total claims (including equity in physical assets) on non-residents. The rest of the world column shows non-residents' claims on resident sectors by instrument. The liability line shows the sum of the domestic sectors' claims on non-residents.

Sources and methods

Sources

37 Most of the data feeding into the financial transactions account are drawn from quarterly surveys of balance sheet information. These balance sheet surveys provide data on the type of instrument held and, where possible, the sector that issued the instrument. Details of the sources used for each sector are presented below.

The Reserve Bank and other deposit-taking institutions

38 The sources used to compile estimates for this group of institutions are ABS balance sheet surveys (Reserve Bank, banks and cash management trusts) and balance sheet surveys conducted by the Reserve Bank of corporations registered under the FCA.

39 Since more information is available from banks than from other sectors, this information will often be used as 'counterpart' information for those sectors (i.e. to replace or enhance data reported by other sectors – see paragraph 53 below).

Life insurance offices and superannuation funds

40 The sources used for this group of institutions are:

- ABS balance sheet surveys (friendly societies and approved deposit funds);
- quarterly collections by the ABS of the largest superannuation funds (which account for approximately 90% of all assets in the industry), supplemented by information from professional fund managers which invest on behalf of the funds and by annual benchmark information from the Insurance and Superannuation Commissioner; and
- balance sheet information collected from the larger private life offices by the ABS supplemented by data from the Insurance and Superannuation Commissioner and ABS collections of life insurance activity of State Government Insurance Offices.

Other financial institutions

41 All private general insurance companies are required to provide a quarterly statement of assets and liabilities to the Insurance and Superannuation Commissioner. These data are used, supplemented by a quarterly ABS survey of government-owned insurance offices.

42 Data for listed and unlisted unit trusts which are open to the public and which are not cash management trusts, trading or property trusts are obtained from an ABS collection of all public unit trusts.

43 The various government-owned financial institutions included in this sector such as economic development corporations, the Export Finance and Insurance Corporation, and the Australian Industry Development Corporation, provide quarterly balance sheet information to the ABS.

44 Credit union leagues report quarterly to the Reserve Bank, which provides this information in aggregate form to the ABS.

General government

45 *Commonwealth general government.* The Commonwealth Department of Finance provides data for the Commonwealth Public Account (comprising the Consolidated Revenue Fund, Trust Fund and Loan Fund) and the National Debt Sinking Fund.

46 *State and local general government.* Data for the State governments are obtained from the State treasuries and their central borrowing authorities. Some difficulty has been encountered in obtaining all the information in the format and with the

frequency required. To overcome these problems, official publications (such as budget documents) and other sources of information (such as foreign investment statistics and press advertisements) are used.

47 No data are collected for local governments, universities or other educational institutions as most of their funding comes from other levels of government and estimates can be derived using counterpart information.

Corporate trading enterprises

48 The main source for the corporate trading enterprises sector is ABS balance sheet surveys. The largest private sector corporations report balance sheet data quarterly. Information is drawn from other sources for the rest of the sector (which is very large numerically but accounts for a relatively small part of total assets).

Households

49 Estimates for the household sector are derived in part from counterpart information (e.g. data on deposits at banks are drawn from the banking collection) and other estimates are derived residually. The quality of these data varies considerably. For the major household assets and liabilities (deposits, equity in superannuation funds, holdings of Australian Savings Bonds, housing and other loans) the quality will be high because there is usually a direct counterpart. However, in other items – mainly holdings of securities – the data are residually derived and will include net errors and omissions in the estimates for the other sectors.

Rest of the world

50 The 'Rest of the world' sector is the balance of payments capital account data reordered into flow of funds categories and presented from the point of view of non-residents.

Methods

Flow derivation

51 First differences between balances reported in balance sheet collections are taken to derive an 'apparent flows' estimate for each sector/instrument cell, thus

$$\text{Apparent flow} = \text{Balance (end quarter 2)} \text{ less} \\ \text{Balance (end quarter 1).}$$

52 Appropriate adjustments are made to overcome some of the difficulties inherent in trying to derive flows from balances. The major area of difficulty concerns changes on the balance sheet that are not the result of transactions.⁵ These include foreign currency revaluation, consolidation and unrealised capital gains and losses. The collections have been designed to try to capture this information in supplementary questions so that only 'true' flows are measured. The general method for each sector/instrument then becomes:

$$\text{Apparent flow} = \text{Balance (end quarter 2)} \text{ less} \\ \text{Balance (end quarter 1)} \text{ less} \\ \text{valuation adjustments.}$$

Counterparts

53 'Counterpart' information is used where information provided by one sector on its financial relationship with another sector is taken to be of a higher quality than the equivalent information provided by the other sector, or where no information has been obtained from the other sector. For example, bank deposits of trading enterprises are reported as an asset of trading enterprises and a liability of banks. However, given the limited coverage of trading enterprises, deposits reported by trading enterprises are likely to be less reliable than the corresponding liability reported by banks, hence the 'counterpart' bank report is more likely to be used.

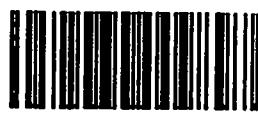

⁵ In the flow of funds, there is a basic rule that there must be four balance sheet entries for a flow to have occurred, that is, two on the books of one party and two on the books of the other. For example, if a corporation issues shares it increases its share capital outstanding and its cash. The purchaser of the shares does the reverse: reduces cash and increases shares held. If one party revalues an item in its balance sheet, only two entries are involved and so there is no flow as the books of the other party are unchanged.

TABLE 1 FLOW OF FUNDS ACCOUNTS
