The most commonly used measure of economic growth is the income-based estimate of constant price gross domestic product (referred to as GDP(I)). In seasonally adjusted terms it rose by 0.1 per cent in March quarter.

All four components of private gross fixed capital expenditure fell in March quarter 1991. As a result, total private gross fixed capital expenditure declined by 6.9 per cent in constant price, seasonally adjusted terms.

There was a 20.5 per cent decline in seasonally adjusted constant price gross fixed capital expenditure by public enterprises. The major reason was that several second-hand aircraft were sold overseas by Qantas. (These sales had no effect on GDP, because they were offset by a corresponding rise in exports of transport equipment.)

The volume of exports of goods and services rose by 1.6 per cent in seasonally adjusted terms in March quarter.

Excluding the sale of aircraft by Qantas (see previous paragraph), the volume of exports of goods and services would have fallen by 0.5 per cent rather than rising by the 1.6 per cent actually recorded.

There was a small positive contribution (0.3 percentage points) from total stocks to the seasonally adjusted real growth in GDP. However, this net result was the outcome of large, approximately offsetting contributions from two of the components. A contribution of 1.2 percentage points to GDP growth from private non-farm stocks was almost counterbalanced by a negative contribution (-1.0 percentage points) from public marketing authority stocks. (An article on how contributions to growth are calculated was included in the April 1991 issue of *Australian Economic Indicators* (1350.0).)

The trend estimate of GDP(I) fell by 0.2 per cent in March quarter 1991.

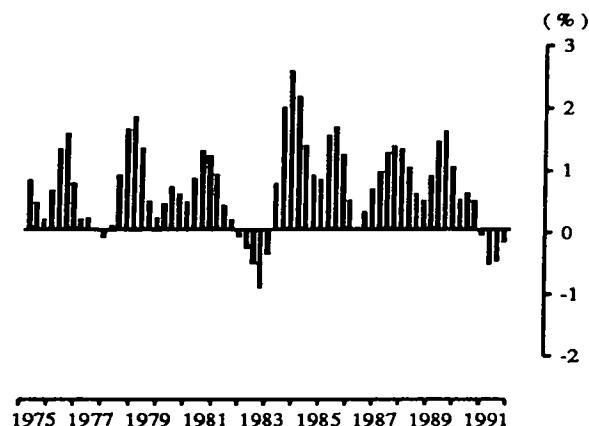

NOTES ON THE ESTIMATES

Trend estimates

A trend estimate is obtained by removing the irregular component from the seasonally adjusted series. In practice, it is calculated for estimates in this publication by applying a centred 7-term Henderson moving average to the seasonally adjusted series. Estimates for the three most recent quarters cannot be calculated by this method and an asymmetric average is used instead.

The following graph shows percentage changes from 1975 onwards in trend estimates of gross domestic product (GDP(T)) at constant prices.

**GDP(T) AT AVERAGE 1984-85 PRICES
TREND ESTIMATE
CHANGE FROM PREVIOUS QUARTER**

Government final consumption expenditure

In seasonally adjusted constant price terms, government final consumption expenditure increased by 3.5 per cent during March quarter 1991. The increase was entirely due to an increase of 5.6 per cent in State and local, which more than offset a fall of 1.3 per cent in Commonwealth.

When analysing these estimates, it should be noted that they largely reflect the cash payments made by government (rather than the desired measure, which is the actual flow of services consumed by government). As such the estimates tend to be 'lumpy'. Seasonal adjustment removes regular fluctuations and a pay-day correction removes the effect of the varying number of pays received by a large proportion of Commonwealth employees during a quarter. Nevertheless, after these adjustments have been made, the estimates are still subject to large irregular fluctuations.

Gross fixed capital expenditure - public enterprises

The 20.5 per cent fall in seasonally adjusted constant price gross fixed capital expenditure by public enterprises was attributable to the sale of several second-hand Qantas aircraft to overseas buyers (gross fixed capital expenditure is measured as purchases less sales of fixed assets).

Largely as a consequence of the sale of these aircraft, the implicit price deflator (IPD) for gross fixed capital expenditure by public enterprises increased by 3.7 per cent in March quarter. The price deflator for aircraft is at a relatively low level and, in combination with a decreased weight being applied to it in March quarter, results in the rise observed in the overall IPD for this aggregate.

Private gross fixed capital expenditure - non-dwelling construction and equipment

In recent years there have been several significant transactions in second-hand assets between the private and public sectors. Details are provided in the following tables of new work done on private non-dwelling construction and purchases of new items of equipment.

Note: The sales of Qantas aircraft in March quarter 1991 are not included in this table because they were not sold to Australian residents. They are included in exports of goods.

Stock valuation adjustment

The stock valuation adjustment (SVA) for private non-farm stocks in March quarter 1991 is negative (-\$50 million) compared with an average level of about \$600 million per quarter during 1989 and 1990. Changes in the size of the SVA are largely a function of changes in the rate of inflation of the goods held in stock. Therefore, it is generally the case that a lower SVA will be associated with a fall in the rate of price increase, and a negative SVA will be caused by an actual fall in prices. A major contributor to the negative SVA recorded in March quarter 1991 was the large fall in petroleum prices from the December quarter 1990 peak caused by the Gulf Crisis.

The methodology underlying the estimate of the SVA is based on the following series of assumptions:

- (a) book value levels reported by businesses are based on accounting valuations at historical cost assigned by the FIFO (first in, first out) method;

- (b) within most sectors, sales price movements can be used to adjust stock levels valued at cost; that is, the selling price of finished goods is established as a fixed mark-up on the costs incurred in the current period;
- (c) the commodities in stock have a fixed turnover period; that is, the ratios *stock level of materials/value of purchases* and *stock level of finished goods/value of sales* remain constant;
- (d) the commodity composition of each estimation cell remains fixed; and
- (e) within each estimation cell, the rate of physical increase (or decrease) in stocks is constant throughout each quarter.

At times when prices change markedly from one quarter to the next, discrepancies can arise between this methodology and actual business practice. Should this happen, the most likely effect would be a distorted estimate of the SVA. A problem of this nature would apply mainly in the short term, as it is expected that such distortions would be largely offsetting in the long run.

There have been large price changes during the most recent quarters in some major commodities (such as petroleum, wool, and non-ferrous metals). Special adjustments have been made in an attempt to account for the impact on the SVA of recent changes in wool and petroleum prices. However, it is still possible that the SVA for December quarter 1990 may be overstated (because businesses did not increase the book value of their stocks as much as expected in the light of the price increases in that quarter) and the SVA for March quarter 1991 may be understated (because businesses did not decrease the book value of their stocks as much as expected). If the turnaround recorded in the SVA between December quarter 1990 and March quarter 1991 is exaggerated, then the movement shown for gross domestic product in March quarter 1991 would be too high, while that for December quarter 1990 would be too low. Because the SVA is deducted from both sides of the domestic production account, errors in its measurement have no impact on the size of the statistical discrepancy.

The problem associated with the measurement of the SVA has little impact on the production-based constant price measure of GDP (i.e. GDP(P)), which is due to be released in *Australian National Accounts: Gross Product, Employment and Hours Worked* (5222.0) on 13 June 1991. The average of the three alternative GDP estimates (i.e. GDP(A)) will also be contained in 5222.0.

Stocks to sales ratio

In seasonally adjusted constant price terms, private non-farm stocks increased by \$12 million during March quarter 1991, while sales (see paragraph 23 of the 'Explanatory Notes') decreased by \$883 million (or 1.2 per cent). Consequently, the stocks to sales ratio increased slightly, going from 0.549 to 0.555.

The graph at the top of the following page presents this ratio from 1975 onwards.

**RATIO OF PRIVATE NON-FARM STOCKS TO SALES
AT AVERAGE 1984-85 PRICES
SEASONALLY ADJUSTED**

Household saving ratio

Present estimates indicate that, on a seasonally adjusted basis, the proportion of household disposable income devoted to consumption in the March quarter was 96.0 per cent while household saving, which is derived as a balancing item, represented 4.0 per cent. The main reasons for the low level of saving are the very depressed level of farm unincorporated enterprise income and the lower receipts of property income due to falling interest rates.

The household saving ratio is affected by any deficiencies or inconsistencies in the estimation and seasonal adjustment of household income and expenditure. Particular caution should be exercised in interpreting this ratio for recent years, and particularly for the most recent quarter, because major components may still be subject to significant revisions. The impact of such revisions on the saving ratio can be quite marked and can cause changes in the apparent direction of the trend.

The following graph presents this ratio from March quarter 1975 onwards.

**HOUSEHOLD SAVING RATIO
SEASONALLY ADJUSTED**

Exports and imports of goods and services

Constant price estimates of exports of goods and services continued to increase in seasonally adjusted terms in March quarter 1991 (up 1.6 per cent). The most significant rise was in *transport equipment* (up 72.2 per cent, largely due to the sales of second-hand aircraft by Qantas to overseas buyers). However, increases in *coal* (12.8 per cent) and *machinery* (up 21.1 per cent) also contributed strongly to overall growth. Most categories of rural exports declined, but the largest fall in exports was for *gold* (down 23.6 per cent from the record level in December quarter 1990).

Price falls were recorded in most export commodity groupings in March quarter 1991. The implicit price deflator (IPD) for exports of goods and services fell by 2.2 per cent. The corresponding fall in the fixed-weighted price index (FWI) was 1.3 per cent. The difference between the movements in the IPD and the FWI is due to compositional change.

Seasonally adjusted import volumes declined overall in March quarter 1991. The major contributors were *transport equipment* (down 14.1 per cent) and *machinery* (a fall of 2.4 per cent).

The IPD for imports of goods and services rose by 1.1 per cent despite a fall of 14.9 per cent in the IPD for *fuels* from the high December quarter 1990 level caused by the Gulf Crisis. The main reason for the higher overall IPD was the (lagged) flow-on effect of a depreciation in the Australian dollar during December quarter 1990.

Imports to sales ratio

The imports to sales ratio (see paragraph 24 of the Explanatory Notes) decreased to 0.119 in March quarter 1991 from 0.121 in the previous quarter. This was associated with a decrease of 2.8 per cent in endogenous imports and a decrease in sales of 1.2 per cent, both measured in seasonally adjusted constant price terms.

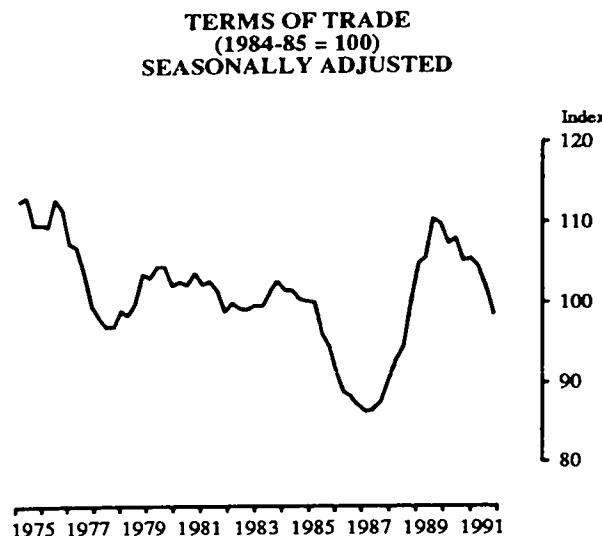

The ratio of imports to sales is presented in the following graph.

**RATIO OF IMPORTS TO SALES
AT AVERAGE 1984-85 PRICES
SEASONALLY ADJUSTED**

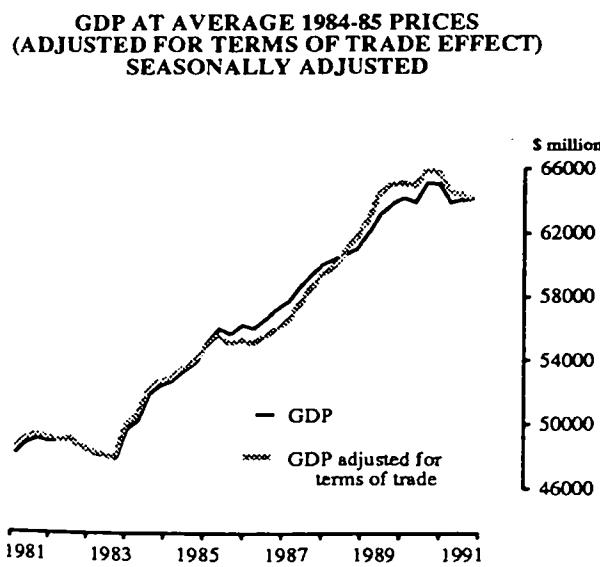

Terms of trade

Initial estimates indicate that Australia's terms of trade fell 3.2 per cent in March quarter 1991, reflecting a rise (1.1 per cent) in import prices combined with a fall (2.2 per cent) in export prices. Australia's terms of trade have now fallen by 10.8 per cent from the peak reached in March quarter 1989. The terms of trade since March quarter 1975 are shown in the graph below.

Gross domestic product (GDP) adjusted for terms of trade effect.

The following graph shows constant price GDP before and after adjustment for the terms of trade effect.

Changes in the aggregate *gross domestic product at constant prices* provide an indication of the volume of goods and services produced in Australia. If, however, the terms of trade have changed significantly over the period of comparison, then this aggregate will not provide an accurate reflection of the changes in the real purchasing power of the income generated by domestic production. A detailed description of the terms of trade effect was included in the *Notes on the estimates* section of the December quarter 1990 issue of this publication.

Revisions in this issue

Details of revisions to previously published estimates of the main aggregates at both current and constant prices, and percentage changes in seasonally adjusted aggregates, are shown in Tables 41-46.

The change in constant price seasonally adjusted gross fixed capital expenditure by public enterprises in December quarter 1990 has been revised from -15.6 per cent to -0.5 per cent. The estimate for purchases of aircraft and parts by Commonwealth public enterprises in December quarter 1990 has been increased by \$410 million.

In recent issues of this publication the revisions made to the book value of private non-farm stocks for previous quarters have been much larger than usual. In this issue, the December quarter 1990 change in book value of stocks has been revised down by \$447 million as a result of more complete response to the survey of stocks.

There have been significant revisions to the December quarter 1990 constant price value of exports, in particular to gold, coal, and metal ores and minerals. These revisions were due to a number of different factors. The major factors were : incomplete quantity data for the December month when the December quarter 1990 accounts were being compiled; a misclassification of a component of gold, which led to the use of an incorrect base year unit value; and a revision to the quantity of coal underlying the December quarter 1990 estimates.

The change in the terms of trade in December quarter 1990 has been revised from -5.6 per cent to -3.2 per cent. The change in the implicit price deflator for exports has been revised up from 0.2 per cent to 2.8 per cent and the import price movement has been revised down from 6.2 per cent to 5.5 per cent. The major reason for the former revision is that the constant price estimates of exports have been revised down (the reasons are described in the previous paragraph). The revisions to the export and import price movements were mainly responsible for an upward revision to the IPD for gross domestic product (GDP) from 0.7 to 1.2 per cent.

Changes in this issue

Details of private gross fixed capital expenditure by State are included in this publication for the first time (see Table 40). The State estimates are consistent with the national estimates shown in the Domestic Production Account (Table 7) and the National Capital Account (Table 14).

Although the estimates are regarded as being of publishable quality, they are still at a relatively early stage of development. In particular, there are some major issues which are not yet fully resolved and so could lead to revisions in future issues. Perhaps the most significant example is the question of how to allocate large items of transport equipment which operate nationally (such as aircraft and coastal tankers).

Estimates of private final consumption expenditure by State and Territory have been reinstated in this issue following analysis of data from surveys of the commodity composition of retail sales for 1987-88 and 1988-89.

Release date for June quarter 1991 issue

In past years, the June quarter estimates of national income and expenditure have usually been released in conjunction with the Commonwealth Budget papers at 7.30pm on Budget night. For a number of years, only the main tables were released at that time with the main publication coming out some time later.

The computer systems used to produce the quarterly estimates have been progressively improved to the point that the national accounts for the June quarter will normally be available for release before Budget night. At this stage, it is expected that the June quarter 1991 issue of *Australian National Accounts : National Income and Expenditure* (5206.0) will be released at 11.30 am on Thursday 15 August 1991.

EXPLANATORY NOTES

Introduction

This publication provides estimates of the components of gross domestic product and national expenditure and supporting tables for the March quarter 1991, together with comparative estimates for the eight previous quarters and the four years 1986-87 to 1989-90. In addition, seasonally adjusted estimates of the major aggregates and some selected series are provided for the March quarter 1991, together with comparative estimates for the twelve previous quarters. Tables 41-46 show revisions that have been made to major aggregates since the previous publication. Tables 47-55 provide time series, in both original and seasonally adjusted terms, for the period from September quarter 1975 for the aggregates contained in the domestic production account (at both current and average 1984-85 prices), some income aggregates, implicit price deflators and some other selected series.

Concepts, definitions, sources and methods

2. An expanded version of *Australian National Accounts: Concepts, Sources and Methods* (5216.0) was released last year. It outlines major concepts and definitions, describes sources of data and methods used to derive annual and quarterly estimates for major aggregates at both current and constant prices and discusses the accuracy and reliability of the national accounts. In addition it now includes documentation on input-output tables, flow of funds tables, capital stock and State accounts.

Interpretation of quarterly estimates

3. Estimating for a period of less than one year presents special problems in that it is often difficult to adhere strictly to the definitions and concepts used in annual estimates. The measurement of income for a quarterly period is particularly difficult since it is not always possible to match the value of production for a quarter with the cost incurred in that production. This problem occurs, for example, in estimating the income of farm unincorporated enterprises in each quarter and results in considerable variation in estimates for this series, and for gross farm product, from quarter to quarter. Difficulties are also experienced in obtaining detailed data for short periods and in preparing consistent estimates from various sources where different accounting procedures and periods are used.

4. These problems inevitably affect the consistency and reliability of the current price estimates, and similarly affect the constant price estimates based on the current price estimates. Accordingly, these factors as well as the approximations and assumptions necessarily made in the revaluation of flows to constant prices should be taken into account when interpreting or using the estimates (for example, in attempting to draw precise quantitative inferences relating to quarter-to-quarter changes in gross domestic product or its components, or in measuring productivity).

5. Analysis of trends requires allowance for these uncertainties in estimation. To some extent, the effects are indicated by the changes in the statistical discrepancy for corresponding periods. Uncertainty in trends arises also from the likelihood of revisions as more information becomes available and from the irregularity of short-term movements. The inclusion of the statistical discrepancy on the expenditure side of the accounts is a convention and does not necessarily imply that the sum of income components more accurately measures GDP than the sum of the expenditure components (plus exports less imports). As household and other saving are estimated as balancing items in their respective accounts, care should be exercised in their interpretation.

6. Estimates of national income and expenditure are necessarily prepared from a wide range of statistical information, some of which is available quickly and some only with a delay of several years. For this reason most figures should be regarded as subject to revision as more complete and more accurate information becomes available. The revisions will be of two main types - those made to the most recent quarters as firmer quarterly or monthly data come to hand and those which are a consequence of revisions to annual totals and distributed to the quarters approximately in accordance with existing quarterly patterns.

7. No simple measure is available of the accuracy of the major summary national accounting aggregates. However, the following example illustrates the sensitivity of quarter-to-quarter growth to the timing of recording a transaction. If, in the latest year, the timing of recording a transaction were delayed by one quarter and if the transaction had an impact on constant price gross domestic product of +\$65 million then the measure of the rate of growth would be affected in the three adjoining quarters (centred on the quarter in which the transaction was recorded) by -0.1, +0.2, and -0.1 percentage points respectively. Of course the percentage impact of such a timing delay on relevant sub-aggregates would be greater.

8. The quarterly implicit price deflators (IPDs) shown in Table 11 are derived by dividing seasonally adjusted current price estimates by the corresponding seasonally adjusted constant price estimates. Movements in the levels of individual implicit price deflators can be greatly affected by changes in the physical composition of the aggregates and their components. Generally, it is considered that IPDs derived from seasonally adjusted data are more reliable than those obtained by using original (i.e. unadjusted) series, because the former are less likely to be affected by compositional change than are the latter. However the seasonal adjustment process is itself a source of possible distortion, especially to the extent that it is not possible to identify, in a fully consistent way, the seasonality of the current price estimates and of the constant price estimates. A discussion of the limitations involved in using IPDs as measures of pure price change is contained in Appendix B of *Australian National Accounts: Concepts, Sources and Methods* (5216.0).

Seasonal adjustment

9. As most series are affected to some extent by seasonal factors, allowance should be made for normal seasonal variation. In a number of tables, *seasonally adjusted* values are presented for selected series. Series which show substantial irregularities in the original or adjusted series should be treated with some reserve. As different methods of seasonal adjustment tend to produce different results, it is necessary to take into account the methods by which seasonally adjusted estimates have been derived and the limitations to which those methods are subject. It should also be noted that the methods of seasonal adjustment used by the ABS do not force the sum of the seasonally adjusted estimates for each quarter of a financial year to equal the original annual total.

10. The general methods used in the ABS for making seasonal adjustments are described in *Seasonally Adjusted Indicators, Australia 1983* (1308.0). However, special methods have been used to adjust some of the components of gross farm product which were not amenable to seasonal adjustment by the usual methods. To obtain these seasonally adjusted estimates, the estimated values of production of wheat, other grain and sugar cane, for any financial year, are distributed equally over the four quarters of the year ended June. One effect of this method is that changes in the annual production of these commodities enter into the seasonally adjusted figures in the September quarter.

11. Where there is no apparent seasonality in their implicit price deflators, constant price estimates are seasonally adjusted using the same factors as are used for adjusting the corresponding current price estimates. As far as possible the remaining constant price estimates have been adjusted using methods similar to those for corresponding current price estimates.

12. Seasonally adjusted estimates of private final consumption expenditure for each State and Territory at current and average 1984-85 prices are shown in Tables 37 and 39 of this publication. Due to the relatively short span of data available for analysis, no Easter or trading-day correction factors have been applied in the seasonal adjustment of these series. The State and Territory series have been adjusted at a more aggregated level than the Australian series and independently of them (although as far as possible similar methods have been used). For these reasons the sum of the seasonally adjusted State and Territory series do not generally equal the seasonally adjusted Australian series.

Trend estimates

13. Trend estimates of two aggregates - GDP and gross non-farm product (GNFP) - are presented in Table 10. They are been derived by applying a 7-term Henderson moving average to the quarterly seasonally adjusted constant price estimates. The weights of the 7-term average are as follows: -0.059, 0.059, 0.294, 0.412, 0.294, 0.059, -0.059.

14. As a moving average approaches the end of a time series and begins to run out of observations, asymmetric averages have to be used. Unlike the asymmetric weights of the standard 5-term and 7-term Henderson moving averages, the weights employed here have been tailored to suit the particular characteristics of GDP and GNFP.

15. Users may wish to refer to the ABS Information Papers *A Guide to Smoothing Time Series - Estimates of Trend* (1316.0) and *Time Series Decomposition - An Overview* (1317.0) for more detailed information on smoothing seasonally adjusted time series data.

Analysis of contributions to growth table

16. Table 5 presents an analysis of the contribution provided by each major aggregate to the percentage change in seasonally adjusted gross domestic product at constant prices. The formula used to calculate the contribution of each aggregate to the growth in GDP is:

$$\frac{A(t) - A(t-1)}{GDP(t-1)} \times 100.0$$

where $A(t)$ = value of aggregate A in quarter under consideration

$A(t-1)$ = value of aggregate A in preceding quarter

$GDP(t-1)$ = value of GDP in preceding quarter.

All these values are seasonally adjusted constant price estimates. It should be noted that the figures in this table are additive within each quarter, unlike the percentage changes shown in other tables in this publication.

Terms of trade

17. There are several ways of measuring the terms of trade. A common means of doing so is by calculating an index of the form:

$$\frac{\text{Price index of exports}}{\text{Price index of imports}} \times 100.0$$

18. In this publication the price indexes used in calculating the terms of trade are the implicit price deflators for exports of goods and services and for imports of goods and services. They take into account not only the changes in the prices of exports and imports, but also the effects of changes in the composition of exports and imports on total recorded price movements. The terms of trade is presented as a memorandum item in Tables 6 and 11.

Gross domestic product (GDP) at constant prices, adjusted for the terms of trade

19. Changes in the aggregate 'gross domestic product at constant prices' provide an indication of changes in the volume of goods and services produced within Australia. If, however, the terms of trade have changed significantly over the period of comparison this aggregate will not provide an accurate reflection of the change in the real

purchasing power of the income generated by domestic production.

20. As with the terms of trade, no single agreed measure of the effect of the terms of trade on movements in GDP at constant prices is available, and the available methods will generally produce different results.

21. In this publication the adjustment has been calculated by first revaluing exports of goods and services by the implicit price deflator of imports of goods and services (thereby providing a measure of the purchasing power of exports over imports). The actual constant price value of exports of goods and services has then been deducted from this value to provide the terms of trade adjustment which has been added to GDP at constant prices to obtain the required result. The series is presented as a memorandum item in Tables 2 and 10.

Expenditure-based estimate of gross domestic product

22. The published measure of GDP is the sum of the income components in the domestic production account. Alternatively, expenditure-based estimates of GDP can be produced by subtracting the statistical discrepancy from the published estimates. Expenditure-based estimates of gross domestic product are presented as a memorandum item in Tables 2 and 10.

Private non-farm stocks to sales ratio

23. The denominator of this ratio is defined as gross non-farm product *plus* endogenous imports (imports of goods *excluding* imports of fuel, imports of certain large items of equipment by both the public and private sectors and certain other government imports) *plus* imports of services *less* changes in private non-farm stocks. All of these variables are at constant prices. The ratio is presented as a memorandum item in Table 10.

Imports to sales ratio

24. The ratio is endogenous imports to sales (both as defined for the private non-farm stocks to sales ratio - see paragraph 23). It is presented as a memorandum item in Table 10.

Household saving ratio

25. This is defined as the ratio of household saving to household disposable income, where household saving is a balancing item derived as the difference between household disposable income and private final consumption expenditure. The ratio is presented as a memorandum item in Table 25.

Data on floppy disk

26. All quarterly series included in this publication are available in spreadsheet format on floppy disk (*Australian National Accounts: Quarterly Data on Floppy Disk* (5228.0)). These data generally run from September quarter 1959 for current price estimates and from September quarter 1974 for constant price estimates. The cost is currently \$86.50 per release for most customers. Order forms for the service can be obtained by telephoning (06) 252 6684.

Related publications

27. In addition to those mentioned above, other ABS publications which may be of interest include:

Budget Related Paper No. 2, National Income and Expenditure (5213.0) - issued annually

Australian National Accounts: State Accounts (5220.0) - issued annually

Australian National Accounts: Capital Stock (5221.0) - issued annually

Australian National Accounts: Gross Product, Employment and Hours Worked (5222.0) - issued quarterly.

Australian National Accounts: Gross Product, Employment and Hours Worked (5211.0) - issued annually

Estimates of Multifactor Productivity, Australia, Occasional Paper (5233.0)

A Guide to the Australian National Accounts (5235.0)

27. Current publications produced by the ABS are listed in the *Catalogue of Publications and Products* (1101.0). The ABS also issues, on Tuesdays and Fridays, a *Publications Advice* (1105.0) which lists publications to be released in the next few days. The Catalogue and Publications Advice are available from any ABS office.

Natural resource and environmental accounting in the national accounts	Mar. qtr 1990	63
Which is the best short-term measure of gross domestic product?	June qtr 1990	57

For more information ...

The ABS publishes a wide range of information on Australia's economic and social conditions. A catalogue of publications and products is available from any of our Offices (see below for contact details).

Information Consultancy Service

Special tables or in-depth data investigations are provided by the ABS Information Consultancy Service in each of our Offices (see below for contact details).

Electronic Data Services

A growing range of our data are available on electronic media. Selections of the most frequently requested data are available, updated daily, on DISCOVERY (Key *656#). Our TELESTATS service delivers major economic indicator publications ready to download into your computer on the day of release. Our AUSSSTATS service enables on-line access to a data base of thousands of up-to-date time series. Selected datasets are also available on diskette or CD-ROM. For more details on our electronic data services, contact Information Services in any of our Offices on the numbers below.

Bookshops and Subscriptions

There are over 500 titles available from the ABS Bookshops in each of our Offices. You can also receive any of our publications on a regular basis. Join our subscription mailing service and have your publications mailed to you in Australia at no additional cost. Telephone our Publications Subscription Service toll free on 008 02 06 08 Australia wide.
