NOTE. Because of the effects of cyclone Tracy the population survey was not conducted in Darwin in February 1975. The estimates for this period therefore exclude Darwin. It is estimated that at the time of the survey about 12,000 males and 5,000 females aged 15 years and over were living in Darwin.

SUMMARY OF RESUL	TS, FEBR	UARY 19	975 (a)
	Males	Females	Persons
NUMB	ER ('000)		
Civilian population aged 15			
years and over	4,832.6	4,903.0	9,735.6
Not in the labour force	890.5	2,848.7	3,739.3
In the labour force	3,942.1	2,054.2	5,996.3
Employed	3,797.2	1,925.9	5,723.1
In full-time jobs	3,651.9	1,326.6	4,978.5
In part-time jobs	145.3	599.3	744.6
Unemployed (b)	144.9	128.3	273.2
Looking for full-time work	138.1	94 <b>.</b> 9	233.0
Looking for part-time work	6.9	33.3	40.2
RATES	(Per cent)	<u> </u>	
Labour force participation			
rate (c)	81.6	41.9	61.6
Unemployment rate (b) (d) -			
Original	3.7	6.2	4.6
Seasonally adjusted	3.3	5.0	3.9

(a) For a note on persons excluded see paragraph 6. Definitions of the categories of the population shown in the table are given on pages 2 and 3. (b) Answers to questions asked for the first time in February 1975 indicate that the number of persons who did no work but would have taken a job during the survey week and who had been actively looking for work at some time in the four weeks before the interview week was approximately 292,700. See the Appendix for further details. (c) The tabour force in each group as a percentage of the civilian population aged 15 years and over in the same group. (d) The unemployed in each group as a percentage of the civilian labour force in the same group.

## EXPLANATORY NOTES

#### Introduction

This bulletin contains estimates of the civilian labour force derived from the results of the population survey, which is carried out on a sample basis throughout Australia in February, May, August and November each year.

2. A summary of results is published each quarter, in advance of this more detailed bulletin, in *The Labour Force : Preliminary Statement* (Reference No. 6.32).

3. This issue includes tables on employed persons classified by occupation and industry (Tables 7 to 10). In addition, the Appendix contains details of questions asked for the first time in February 1975 concerning people looking for work.

4. Although emphasis in the survey is placed on the regular collection, each quarter, 10f data on the demographic and labour force characteristics of the population, supplementary surveys of particular aspects of the labour force or of other subjects are carried out from time to time. Statistics from supplementary surveys are published in mimeographed bulletins which are available free on request. (See page 21 of this bulletin for a list of titles.)

#### The population survey

5. The survey is based on a multi-stage area sample of private dwellings (about 30,000 houses, flats, etc.) and non-private dwellings (hotels, motels etc.), and covers about two-thirds of one per cent of the population of Australia. The information is obtained each quarter from the occupants of selected dwellings by carefully chosen and specially trained interviewers. The interviews are carried out during a period of four weeks, so that there are four survey weeks in each of the months to which the survey relates. These four survey weeks are chosen so as to fall within the limits of the calendar month or with minimum encroachment into the adjacent months.

### Scope

6. The estimates relate to all persons aged fifteen years and over except members of the permanent armed forces and certain diplomatic personnel customarily excluded from census and estimated populations. For February 1975 the estimates also exclude about 17,000 persons aged 15 years and over who were in Darwin at the time of the survey.

### Classification of the labour force

7. The labour force classification used in the surveys conforms closely to that recommended by the Eighth International Conference of Labour Statisticians, 1954. The labour force category to which a person is assigned depends on his *actual activity* (i.e. whether working, looking for work, etc.) during a specified week, known as *survey week*, which is the week immediately preceding that in which the interview takes place. The principal categories of the labour force appearing in the tables in this bulletin are defined in the following paragraphs.

8. The labour force comprises all persons who, during the survey week, were employed or unemployed as defined in paragraphs 9 and 10.

9. Employed persons comprise all those who, during the survey week,

- (a) did any work for pay, profit, commission or payment in kind, in a job or business, or on a farm (including employees, employers and self-employed persons), or
  - (b) worked fifteen hours or more without pay in a family business (or farm), or
  - (c) had a job, business or farm, but were not at work because of illness, accident, leave, holiday, production hold-up due to bad weather, plant breakdown, etc., or because they were on strike.

A person who had a job but was temporarily laid off by his employer for the whole week without pay is excluded, and is classified in the tables as unemployed. A person who did some work during the week, however, before he either lost his job or was laid off, is classified as employed. A person who held more than one job is counted only once, in the job at which he worked most hours during the survey week.

10. Unemployed persons comprise all those who, during the survey week, did no work at all, and who either

- (a) did not have a job or business and were actively looking for full-time or part-time work (including those who stated that they would have looked for work if they had not been temporarily ill or believed no work was available, or had not already made definite arrangements to start work in a new job after the survey week), or
- (b) were laid off from their jobs without pay for the whole week.

A person who either lost his job or was laid off *during* the survey week, but did some work at his job during the survey week, is classified as employed.

11. Full-time workers are those who usually work 35 hours a week or more and others who, although usually part-time workers, worked 35 hours or more during the survey week. Part-time workers are those who usually work less than 35 hours a week and who did so during the survey week. When recording hours of work, fractions of an hour are disregarded.

12. Persons not in the labour force are those who, during the survey week, were not in the categories 'employed' or 'unemployed' as defined. This category therefore includes persons without a job, business or farm who were not actively looking for work, and who, during the survey week, were either keeping house (unpaid), attending an educational institution (e.g. school or university), retired or voluntarily idle, permanently unable to work or inmates of institutions. A person who worked less than fifteen hours without pay in a family business during the survey week is also classified as not in the labour force.

## Industry classification

13. In quarterly and annual Labour Force bulletins prior to November 1972 the industry estimates were based on the Classification of Industries used at the 1961 and 1966 population censuses. As from November 1972 industry has been classified according to the Australian Standard Industrial Classification (ASIC). Estimates for particular industries for November 1972 and later periods are not, therefore, directly comparable with those for August 1972 and earlier periods.

14. During the changeover to the use of the Australian Standard Industrial Classification the industry of persons in the labour force was classified according to both ASIC and the 1966 Population Census Classification for five consecutive surveys. An indication of the relationship between the two classifications was given by Tables 8 and 9 in the combined November 1972 and February 1973 issue of this bulletin, in which employed persons were classified by industry on both bases for the period August 1971 to August 1972. Unemployed persons classified by their last job according to ASIC were shown in Tables 21 and 22 for the period August 1971 to February 1973.

#### Birthplace and year of arrival in Australia

15. A summary of the principal statistics of birthplace and year of arrival is given in Table 3. Very small estimates shown in this and other tables should be used with caution as they are subject to high relative standard errors. It is particularly important that the likely standard errors of such estimates be kept in mind. For example, although the number of persons who had arrived in Australia in the period January 1974 to February 1975 and who were unemployed in February 1975 is given as 10,200 this is not a precise measure; the approximate standard error of this estimate suggests that there are about nineteen chances in twenty that the figure obtained from a complete enumeration would have been within the wide range of 7,800 to 12,600. The corresponding estimated percentage (12.3) is subject to almost the same relative sampling variability as is the estimate of the number unemployed. For further details concerning standard errors see the Technical Note, page 18.

#### **Revision of present estimates**

16. The survey estimates are calculated in such a way as to conform to the independently estimated distribution of the population by age and sex. As a

consequence, when the population estimates are revised it becomes necessary to revise the labour force estimates also.

17. Estimates of total population, revised on the basis of the 1971 population census, indicate that the estimates used for the population surveys in mid-1971 were, overall, some 55,000 persons too high. Revised estimates of the labour force are now being prepared and are expected to be published shortly. In the meantime, the estimates in this bulletin will continue to be published on the present basis, since they are regarded as sufficiently accurate for the measurement of short-term movements. However, caution should be exercised if they are used as indicators of long-term change.

18. A preliminary assessment of the effect of the revised population estimates indicates that it will be necessary to reduce the level of the estimated labour force from August 1971 onwards by about 26,000 persons (mostly males). Successively smaller revisions will be made to the estimates for earlier periods back to August 1966.

## Differences between population census and population survey estimates

19. Results of the 1971 population census have been published in a series of bulletins entitled *Summary* of Population (Reference No. 2.83). The labour force estimates from the June 1971 census differ from the corresponding estimates derived from the population surveys of May and August 1971. Even when, as explained in paragraphs 16 to 18 above, the labour force estimates from the survey have been revised, this difference will still be substantial.

20. The definition of the labour force used in the population census is similar to that used in the survey (see paragraphs 7 to 10). However, evidence from census post-enumeration surveys indicates that the personal interview approach, as used in the quarterly survey, tends to identify a larger number of persons as being in the labour force than does the filling in of the questions on the census schedule by the householder, and that this tendency increased between the 1966 and 1971 censuses.

21. These considerations should be borne in mind if comparisons of the total labour force or of labour force participation rates are made between the 1971 census and the 1971 labour force survey estimates.

### Estimates for earlier periods

22. The principal items in this bulletin are shown for the six latest quarters. Greater detail is given for the

latest quarter only. A wider range of detailed estimates for each quarter from February 1964 to November 1972 has been published in bulletins entitled *The Labour Force* (all Reference No. 6.22) covering the period 1964 to 1968 and single years to 1972.

### **Discontinuity of series**

23. The survey periods for February in the years 1971, 1972 and 1974 were later than in other years, and as a consequence the estimates of the proportion of the population 15 years and over who "went to school" are correspondingly higher. No exact estimates of this effect are available; however, it may be conjectured that had these survey periods been one week earlier approximately 20,000 fewer persons would have been classified in the "went to school" category. In addition, in February 1974 the survey period in Queensland was delayed by a further week in order to avoid as far as possible the effects of the flood.

24. At the 1971 population census, trainee teachers (enrolled at government teachers colleges and in some cases enrolled also at other institutions) were for the first time classified as *not in the labour force*, and since then they have also been excluded from labour force estimates derived from the population survey. Exclusion of these students constitutes a break in the series between May and August 1971, the numbers of males and females excluded from the labour force in August 1971 being approximately 7,000 and 17,000 respectively.

### Seasonally adjusted series

25. Seasonally adjusted estimates for selected labour force characteristics are shown in Table 4. The method used in seasonally adjusting estimates for unemployed persons is to adjust estimates for unemployed persons aged 15 to 19 years looking for their first job and estimates for the remainder of unemployed persons separately. The two figures are added to obtain estimates for total unemployed persons. Estimates for males and females are treated similarly. The methods of seasonally adjusting all other series are explained in *Seasonally Adjusted Indicators*, 1974 (Reference No. 1.10).

#### Symbols used in this bulletin

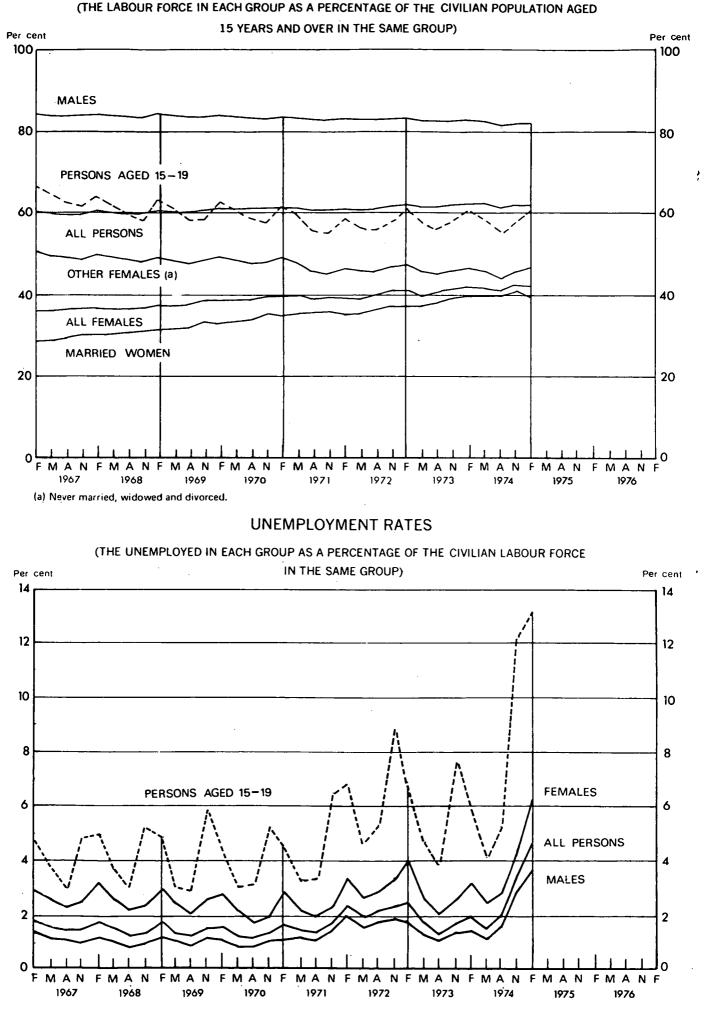

\* Subject to sampling variability too high for most practical uses. See page 18, paragraph 7.

† Affected by industrial dispute.

n.a.Not available

NOTE. Any discrepancies between total and sums of components in tables are due to rounding.

(a) Persons with jobs who did not work during survey week have been included in the calculation of average hours worked. When recording hours worked, fractions of a hour are disregarded. This procedure results in a slight lowering of the average hours figures. (b) Civilians aged 15 years and over. For definition see page 3, paragraph 9. Excludes Darwin. See NOTE on page 2. (c) Never married, widowed and divorced. (d) Classified according to ASIC. See page 3, paragraphs 13 and 14. (e) Comprises health, education, libraries, etc.; welfare and religious institutions; and other community services. (f) In May and August each year estimates are low as average hours worked by school teachers are affected by school holidays. (g) Includes miners, quarrymen and related workers. (h) Employers, self-employed and unpaid family helpers. (i) For definitions see page 3, paragraph 11.

(a) Civilians aged 15 years and over. For definition see page 3, paragraph 12. (b) Comprises inmates of gaols, patients in hospitals, sanatoria, etc., for whom, for the purpose of the survey, the institution was regarded as their dwelling. (c) Excludes Darwin. See NOTE on page 2. (d) Never married, widowed and divorced. (e) See page 4, paragraph 23.

•

\* Less than 4,000. See page 18, paragraph 7.

## Estimation procedure

The estimates are derived from the quarterly population survey by use of a complex ratio estimation procedure, which ensures that the survey estimates conform to an independently estimated distribution of the population by age and sex, rather than to the age and sex distribution within the sample itself.

## Reliability of the estimates

Since the estimates in this bulletin are based on 2. a sample, they may differ from the figures that would have been obtained from a complete census using the same questionnaires and procedures. One measure of the likely difference is given by the standard error, which indicates the extent to which an estimate might have varied by chance because only a sample, and not the whole population, was enumerated. There are about two chances in three that a sample estimate will differ by less than one standard error from the figure that would have comparable from a complete heen obtained enumeration, and about nineteen chances in twenty that the difference will be less than two standard errors.

Space does not allow for the separate 3. indication of the standard errors of all estimates in this bulletin. Standard errors for general application are given in Table A on page 19. These figures will not give a precise measure of the standard error of a particular estimate since they are averages based on calculations for a limited number of past surveys over a wide range of labour force characteristics. However, they will provide an indication of the magnitude of the standard error of any particular estimate for any particular survey. An example of the use of Table A is as follows : if the estimate for Australia obtained from the sample is 100,000 the standard error is 3,000; i.e. there are about two chances in three that the true figure is within the range 97,000 to 103,000 and about nineteen chances in twenty that this figure is between 94,000 and 106,000.

4. The quarter-to-quarter change in the level of an estimate is also subject to sampling variability. The standard error of the change depends on the standard error of the level of the estimate, rather than on the change itself. Final estimates of the standard errors of movement have not yet been calculated, but an indication of the magnitude of standard errors of quarter-to-quarter change in the Australian estimates is given in Table B on page 19. The estimates of standard error of quarter-to-quarter change apply only to estimates of change between two consecutive quarters. Changes between two other non-consecutive quarters, will generally be subject to somewhat greater sampling

variability than is indicated in Table B. Furthermore, changes during the period February to November 1972 will have greater standard error than indicated in Table B, because of the introduction of the revised sample. An example of the use of Table B is as follows : if the estimates for Australia for two successive quarters are 500,000 and 520,000 then from Table A it can be seen that the standard errors of these two estimates are of the order of 6,000 and from Table B that the standard error of the quarter-to-quarter change is 5,000. That is, there are about two chances in three that the quarter-to-quarter change lies between 15,000 and 25,000 and about nineteen chances in twenty that it lies between 10,000 and 30,000.

5. The standard errors of estimates relating to agricultural employment are generally somewhat higher than the standard errors of other estimates of the same magnitude. Estimates for females also tend to have higher standard errors than estimates of equivalent size for males in similar employment categories.

6. The reliability of an estimated percentage, computed by using sample data for both numerator and denominator, depends upon both the size of the numerator and the size of the denominator. However, the percent standard error of the estimated percentage will generally be lower than the per cent standard error of the estimate of the numerator. The per cent standard errors of the numerators can be obtained from Table A.

7. As the standard errors in Trole A show, the smaller the estimate the higher is the relative standard error. Very small estimates are thus subject to such high standard errors (relative to the size of the estimate) as to detract seriously from their value for most reasonable uses. In the tables in this bulletin, estimates below the levels shown in Table A have not been included. Although figures for these small components can in some cases be derived by subtraction, they should not be regarded as reliable.

8. The imprecision due to sampling variability, which is measured by the standard error, should not be confused with inaccuracies that may occur because of imperfections in reporting by interviewers and respondents. Inaccuracies of this kind are referred to as the *non-sampling error*, and they may occur in any enumeration, whether it be a full count or only a sample. Every effort is made to reduce the non-sampling error to a minimum by careful design of questionnaires, intensive training and supervision of interviewers and efficient operating procedures.

TABLE A					
STANDARD	ERRORS	OF	ESTIMATES		

Size of estimate (persons)	N.S.W. No.	Vic. Na	Qld No,	S.A. Na.	W.A. No.	Tas. No.	N. T. No.	A.C.T. No.	Australia	
									No.	Per cent of estimate

200,000	4,000	4,000	2,000	1,200	2,000				4,000	2.0
500,000	5,000	5,000	3,500	1,500	3,000				6,000	1.2
1,000,000	8,000	8,000							8,000	0.8
2,000,000									10,000	0.5

- Estimates below the levels indicated have not been published - see page 18, paragraph 7.

### TABLE B STANDARD ERRORS OF ESTIMATES OF QUARTER-TO-QUARTER CHANGE : AUSTRALIA (Persons)

Standard error of quarterly level	Standard error of quarter-to-quarter change	Standard error of quarterly level	Standard error of quarter-to-quarter change	
1,000	1,300	5,000	4,700	
2,000	2,500	6,000	5,000	
3,000	3,600	7,000	5,200	
4,000	4,300	8,000	5,300	

## APPENDIX

## Additional questions concerning persons looking for work

Estimates in tables in the main body of this publication are based on actual activity during the survey week, that is, the week prior to the interview week. For detailed definitions see paragraphs 7 to 12 on pages 2 and 3. In February 1975 some additional questions were asked for the first time. Persons who were not employed and had not looked for work during the survey week were asked whether they had been looking for work during the three weeks prior to the survey week. In addition, all persons who stated that they had been looking for work in the survey week or in the three weeks prior to the survey week were asked whether there was any reason why they could not have started work (if they had found work) during the survey week. The additional questions will be asked in future surveys and when the results have been evaluated consideration will be given to the desirability of revising the definition of unemployed persons.

The following table has been compiled from data obtained from the February 1975 survey.

## PERSONS ACTIVELY LOOKING FOR WORK AT SOME TIME IN THE FOUR WEEKS TO THE END OF SURVEY WEEK WHO COULD HAVE TAKEN A JOB IN SURVEY WEEK, FEBRUARY 1975

	Males	Females	Persons
Looking for —			
Full-time work	142.3	99.2	241.5
Part-time work	10.6	40.6	51.2
Aged —		52.4	
15–19 years	45.9	53.4	99.4
20 years and over	107.0	86.3	193.3
Total	152.9	139.8	292.7

('000)

## POPULATION SURVEY REPORTS

Although emphasis in the population survey is placed on the regular collection, each quarter, of data on demographic and labour force characteristics, supplementary surveys of particular aspects of the labour force or of other subjects are carried out from time to time. The results of these surveys are published separately. Copies of the following publications are available free on request.

Title	Reference No.	
Assisted and Unassisted Migrants, August 1972	17.9
