EXPLANATORY NOTES

Introduction

In August 1977 a sample household survey, based on the quarterly population survey, was conducted throughout Australia in order to obtain information about the weekly earnings of wage and salary earners. For the sake of brevity, wage and salary earners are referred to in the tables as "employees".

- 2. Preliminary results of the survey were published on 24 November 1977 in Weekly Earnings of Employees (Distribution), August 1977 (Preliminary), (6309.0). This bulletin contains final and more detailed information.
- 3. Similar surveys were conducted in August 1975 and 1976. However, care must be taken in making comparison from one survey period to another as the 1975 survey data related to earnings from all jobs and hours worked, whereas subsequent survey publications contain tables on earnings from the main job as well as all jobs and statistics of hours paid for as well as hours worked.
- 4. The survey was based on a multi-stage area sample of private dwellings (about 30,000 houses, flats, etc.) and covered about two-thirds of one per cent of the population of Australia. The information was obtained from the occupants of selected dwellings by carefully chosen and specially trained interviewers, the interviews being carried out during a four-week period.
- 5. The estimates relate to all persons aged 15 years and over who were employed as wage or salary earners in their main job, except members of the permanent defence forces, persons on workers' compensation, certain diplomatic personnel customarily excluded from census and estimated populations, and persons who were patients in hospitals and sanatoria, or inmates of gaols, reformatories, etc., and for whom, for the purposes of the survey, the institution was regarded as their dwelling.

Interpretation of results

- 6. Since the estimates are based on a sample, they are subject to sampling variability. (See Technical Note, page 29, for further details.) In addition, they are subject to errors of response and reporting. In many cases the answer to the question on earnings was based on the knowledge of one person (generally the housewife). It is considered that there may be some understatement in the estimates because of imperfect recall of minor or irregular sources of earnings. Other errors may be due to genuine misunderstanding.
- 7. Other points which should be kept in mind in interpreting the results of this survey are as follows:
 - (i) In making comparisons of earnings between groups of employees it must be remembered that there will be differences arising from the different age and occupation structures of these groups. This is particularly important, for

- example, when interpreting results in Tables 16, 19 and 21 which show earnings according to birthplace.
- (ii) Because employers and self-employed persons were excluded from the survey the results should not be taken as representative of the earnings of all employed persons. In particular, earnings of employees in some occupation groups in Table 18 may not reflect the earnings of all persons in those occupations.

Definitions

- 8. Weekly earnings refers to gross weekly wages and salaries (i.e. before taxation and other deductions have been made). For persons paid other than weekly, earnings were converted to a weekly equivalent.
- 9. Median weekly earnings is the amount which divides the distribution of individuals into two equal groups, one having earnings above and the other below that amount. Medians were calculated from grouped data, the class intervals in some cases being finer than those published in the tables. Linear interpolation was used within the class interval in which the median fell.
- 10. Mean weekly earnings is the amount obtained by dividing the total earnings of a group by the number of units in that group.
- 11. The main job was defined as the job at which most hours were worked during the survey week. The second job was defined to include all remaining jobs, in which some hours were worked during the survey week.
- 12. Hours paid for refers to the number of hours for which an employee was paid and not necessarily to the number of hours actually worked (e.g., an employee on paid leave for the week was asked to report the number of hours for which he was paid).
- 13. Hours worked refers to actual hours worked during the survey week, not necessarily hours paid for. Thus, if a person had been on leave for the whole week, hours worked would have been recorded as nil.
- 14. Full-time employees are those who usually work 35 hours a week or more (in all jobs) and others who, although usually part-time employees, worked 35 hours or more during the survey week. Part-time employees are those who usually work less than 35 hours a week and who did so during the survey week. When recording hours of work, fractions of an hour were disregarded.
- 15. Occupations shown are the major groups as published in Classification and Classified List of Occupations, June 1971. A person who held more than one job as an employee was classified to the occupation of the main job.

- 16. For the purposes of the survey persons were classified as having a second job if, during the survey week, they:
 - (a) worked in a second job; and
 - (b) were employed as a wage or salary earner in both of their jobs. Service in the reserve defence forces was not regarded as a second job. Persons who by the nature of their employment worked for more than one employer, e.g. domestics, odd-job men, baby-sitters, etc., were not counted as multiple jobholders unless they also held another job of a different kind; nor were those who worked for more than one employer solely by reason of changing jobs during the survey week.
- 17. For a detailed description of industries shown in Tables 10 and 17 refer to Australian Standard Industrial Classification, Preliminary Edition, Volume 1 The Classification, 1969.
- NOTE. Any discrepancies between totals and sums of components in tables are due to rounding.

Related Publications

Users may also wish to refer to the following earnings and income publications which are available on request:

- Weekly Earnings of Employees (Distribution) (Preliminary) (6309.0) see Explanatory Notes, paragraph 3.
- Average Weekly Earnings, Quarterly, (Preliminary) (6301.0), and Final Bulletin (6302.0).
- Earnings and Hours of Employees, Distribution and Composition (Preliminary) (6305.0), and Final Bulletin (6306.0) sample survey conducted annually in May.
- Earnings and Hours of Employees (Preliminary) (6303.0), and Final Bulletin (6304.0) sample survey conducted annually in October.
- Income Distribution 1968-69 Consolidated and Revised Edition (6505.0) sample survey conducted in respect of 1968-69.
- Income Distribution Part I, 1973-74 (6502.0) and Part 2 (6503.0) sample survey conducted in respect of 1973-74.
- Wage Rates Indexes (Preliminary) (6311.0) monthly.
- The Labour Force (6203.0) quarterly.

⁽a) For definitions see page 2. (b) Since part-time employees are defined as those who usually work less than 35 hours and who did so in the survey week, this figure may include school teachers, academic staff in universities, aircrew, etc.

Subject to sampling variability too high for most practical uses. See Technical Note, page 29.

TECHNICAL NOTE

Estimation procedure

Estimates derived from the quarterly population survey are obtained by using a ratio estimation procedure. This procedure ensures that survey estimates conform to the independently estimated distribution of the population by age and sex, rather than the age and sex distribution within the sample itself.

Reliability of the estimates

- 2. Since the estimates in this bulletin are based on information obtained from occupants of a sample of dwellings, they may differ from the figures that would have been produced if the information had been obtained from occupants of all dwellings. One measure of the likely difference is given by the standard error, which indicates the extent to which an estimate might have varied by chance because only a sample of dwellings was included in the survey. There are about two chances in three that a sample estimate will differ by less than one standard error from the figure that would have been obtained if all dwellings had been included in the survey, and about nineteen chances in twenty that the difference will be less than two standard errors.
- 3. Space does not allow for the separate indication of the standard error of all estimates in this bulletin. A table of standard errors for general application is given below. These figures will not give a precise measure of the standard error of a particular estimate but they will provide an indication of its magnitude. An example of the use of the table is as follows: if the estimate for Australia obtained from the sample is 100,000 the standard error is 3,000; i.e. there are about two chances in three that the true figure is within the range 97,000 to 103,000 and about nineteen chances in twenty that this figure is between 94,000 and 106,000.
- 4. The reliability of an estimated percentage, computed by using sample data for both numerator and denominator, depends upon both the size of the

numerator and the size of the denominator. However, the per cent standard error of the estimated percentage will generally be lower than the per cent standard error of the estimate of the numerator. The per cent standard errors of the numerators can be obtained from the table below.

- 5. Means and medians published in this bulletin are, also subject to sampling variability. Standard errors vary depending on the size and distribution of the population for which the mean or median has been obtained. Standard errors on means in this publication could generally be expected to be below 7% and for medians below 8%. For populations of 100,000 the standard errors of the mean and median would both be about 1.5%.
- 6. As the standard errors in the table show, the smaller the estimate the higher is the relative standard error. Very small estimates would thus be subject to such high standard errors (relative to the size of the estimate) as to detract seriously from their value for most reasonable uses. In the tables in this bulletin, estimates below the levels shown in the table below have not been shown. Although figures for these small components can in some cases be derived by subtraction, they should not be regarded as reliable.
- 7. The imprecision due to sampling variability, which is measured by the standard error, should not be confused with inaccuracies that may occur because of imperfections in reporting by interviewers and respondents. Inaccuracies of this kind are referred to as the non-sampling error, and they may occur in any enumeration, whether it be a full count or only a sample. Every effort is made to reduce the non-sampling error to a minimum by careful design of questionnaires, intensive training and supervision of interviewers and efficient operating procedures. See page 2, paragraph 6.
