*NOTE: This publication contains revisions to all seasonally adjusted series for Australia as well as the State total series as a result of the annual seasonal re-analysis. Some trend series, particularly Department and general stores, have been changed significantly. See paragraphs 23 and 24 of the Explanatory Notes.*

Trend estimates for the most recent months may be revised as data for subsequent months become available. For example, if the July seasonally adjusted estimate shows a 1.0 per cent rise, then the movement in the trend estimate for July would be 0.3 per cent. June and May would be revised upwards by 0.2 percentage points. A 1.0 per cent fall in the seasonally adjusted estimate would produce a growth in the trend estimate for July of 0.0 per cent, and June and May would be revised downwards by 0.1 percentage points. See paragraphs 25 and 26 of the Explanatory Notes.

### SUMMARY OF FINDINGS

**CHART1: TURNOVER OF RETAIL AND SELECTED SERVICE ESTABLISHMENTS, MONTHLY ESTIMATES, AUSTRALIA**

#### Australian Estimates

The turnover for retail (excluding motor vehicle dealers, service stations etc.) and selected service establishments covered by the survey continues to show weak growth, with trend estimates averaging growth of 0.2 per cent per month for the 3 months ending June. Average monthly growth over the past year is 0.5 per cent with the annual growth rate (June 1990 over June 1989) currently being 5.7 per cent.

In seasonally adjusted terms, turnover for June grew 1.1 per cent following a 1.0 per cent fall in May.

After allowing for price changes, seasonally adjusted retail and selected service industry turnover for the June quarter 1990 remained the same as in the March quarter 1990 and the December quarter 1989. Growth over the past 12 months has been 1.3 per cent.

**CHART2: TURNOVER OF RETAIL AND SELECTED SERVICE ESTABLISHMENTS, AUSTRALIA, MONTHLY PERCENTAGE CHANGES IN TREND ESTIMATES, CURRENT PRICES**

### Industry Trends

The largest industries are showing weak to moderate growth over the past 3 months. In summary:

**PERCENTAGE CHANGE IN TREND ESTIMATES**

Industry	Average monthly increase for 3 months to June 1990	Average monthly increase for 12 months to June 1990
Grocers	0.6	0.6
Hotels, liquor stores, licensed clubs	0.5	0.3
Department and general stores	0.6	0.4
Clothing and fabrics stores	0.3	0.0

Of the remaining industries, the majority are displaying weak or declining growth. Only Floorcoverings (a very small industry) is showing strong growth.

**CHART3: TURNOVER OF RETAIL ESTABLISHMENTS, AUSTRALIA, MONTHLY PERCENTAGE CHANGES IN TREND ESTIMATES, CURRENT PRICES**

Analysis of the "retail only" industries in total shows growth averaging 0.4 per cent per month over the last 3 months. Over the past year (June 1990 over June 1989), the "retail only" industries have grown by 5.8 per cent, about the same as for all industries covered in the survey.

### State Trends

Victoria retail trade continues a decline averaging -0.5 per cent per month over the last 3 months compared to average monthly growth over the past year of 0.2 per cent.

New South Wales and South Australia are showing weak growth averaging 0.5 per cent over the last 3 months (and over the past year).

Queensland and Tasmania are showing moderate growth averaging 0.6 per cent over the last 3 months (and 0.6 per cent for Queensland, 0.7 per cent for Tasmania over the past year).

Please note that the annual seasonal adjustment reanalysis will be applied to the State by Industry series next month. Care should be taken in analysing State by Industry trends (particularly Department Stores) until then.

NOTE: Explanatory Notes are at the back of this publication.

February	40.5	-1.2	17.4	-6.5	57.9	-2.7
March	45.0	11.1	21.2	21.8	66.1	14.2
April	44.9	-0.2	20.4	-3.8	65.2	-1.4
May	49.1	9.4	23.6	15.7	72.5	11.2
June	50.3	2.4	24.3	3.0	74.5	2.8
Standard error (c) of						
Level	2.1		0.9		2.3	
Change	1.9		0.7		2.0	

Note: Series is not long enough to provide sufficient information to allow reliable seasonal adjustment estimates. (a) Excludes motor vehicle dealers, petrol stations, etc. (b) Includes Grocers, confectioners and tobacconists, Butchers, Other food stores, Hotels, liquor stores, licensed clubs, Cafes and restaurants. (c) The standard error of the estimates for the latest month and of the latest month from the preceding month — see paragraphs 9 to 13 of Explanatory Notes.

## EXPLANATORY NOTES

### Introduction

This publication presents monthly retail trade series based on estimates of the value of turnover of retail establishments classified by industry, and by State. These series replace the statistics based on the value of retail sales published up to June 1988.

2. From June 1988 the series in this publication are based on turnover data obtained from a sample of retail establishments. For the period until June 1988 the series have been adjusted to a turnover basis using movements in the previous retail sales series. Linked historical data are available on AUSSTATS, or can be provided by the ABS. More information on the survey methodology and the procedures used to link statistics for the new series with those for months prior to June 1988 are contained in the Information Paper: *Introduction of Improved Monthly Retail Trade Statistics (8511.0)*.

### Scope and coverage

3. The estimates of turnover are derived from a survey covering all States and the two Territories. It includes in its scope all retail trade establishments classified to ASIC subdivision 48, *except* motor vehicle dealers, service stations, etc (ASIC classes 4861-4868); milk and bread vendors (4878-4879); shoe repairers (4846); and electrical appliance repairers n.e.c. (4857). *Also included* are cafes and restaurants (9231); hotels, etc. (mainly drinking places) (9232); licensed clubs (9241-9243); and hairdressers (9351-9352).

4. Retail establishments which do not have employees are excluded from the coverage of the survey.

### Definition of Turnover

5. Turnover includes retail sales; wholesale sales; takings from repairs, meals and hiring of goods (except for rent, leasing and hiring of land and buildings); and commissions from agency activity (e.g. commissions received from collecting dry cleaning, selling lottery tickets, etc).

### Industry Detail

6. The names of the industries for which statistics are published in this bulletin align with the titles given in ASIC, except for the following groupings:

Other food stores: ASIC classes 4883, 4885, 4886

Hotels, liquor stores, licensed clubs: ASIC classes 9232, 4884, 9241, 9242, 9243

Clothing and fabrics stores: ASIC classes 4843, 4844, 4847

Electrical goods stores: ASIC classes 4855, 4856

Other stores: ASIC classes 4892, 4893, 4895, 4896, 4897, 9351, 9352

### Constant Price Statistics

7. To enable analysis of the movement of retail activity in 'real' terms, estimates of retail turnover at constant (average 1984-85) prices are compiled each quarter. Constant price retail turnover series are derived by deflating the original current price series of retail turnover by specially compiled indexes of price change.

### Reliability of Estimates

8. Retail trade statistics may be subject to error from various sources, which are usually classified as either sample or non-sample error.

### Sample error

9. Since retail turnover is estimated from a survey which includes a sampled component, the estimates are subject to sampling error. That is, they may differ from figures that would have resulted if all enterprises with retail establishments were included in the survey. One measure of the likely difference is given by the standard error. There are about two chances in three that a sample estimate will differ by less than one standard error from the figure that would have been obtained if all in-scope units had been included, and about nineteen chances in twenty that the difference will be less than two standard errors.

10. Standard errors of estimates for the latest month and of estimates of change since the preceding month are shown in the tables. An example of the use of these standard errors is given below:

The *estimated change* of -\$141.7 million (-2.0 per cent) in the total value of turnover between May 1990 and June 1990 has a standard error of about \$36.7 million (0.5 per cent). Therefore, there are two chances in three that the change which would have been obtained if all units had been included in the survey would be within the range -\$105.0 million to -\$178.4 million (-1.5 per cent to -2.5 per cent) and nineteen chances in twenty that the change would be within -\$68.3 million to -\$215.1 million (-1.0 per cent to -3.0 per cent).

11. The standard errors for some industries in some States are relatively high and users are advised to exercise caution in interpreting movements for such series. Some users may wish to combine such industries to obtain an estimate of the combined group which is more accurate than the components. 1

1. The standard error of level of any such combination of industries may be calculated by squaring the standard error for each of the component industries, adding the squared standard errors together, and taking the square root of that sum. For example, suppose the standard error of level for Industry A is \$1.5 million and the standard error for Industry B is \$2.0 million. Then the standard error for the combination of Industries A and B is  $\sqrt{(1.5)^2 + (2.0)^2} = \$2.5$  million.

12. Standard errors of estimates of change between non-consecutive months are not shown in publication tables. These standard errors are generally much higher than the standard errors of change between consecutive months. For example, the standard error of change between the latest month and the corresponding month of the previous year is, on average, approximately 1.4 times the standard error of level of the latest month.

13. Seasonally adjusted, trend and constant price estimates are also subject to sampling variability. For seasonally adjusted estimates, the standard errors are approximately the same percentage of the estimate as for the unadjusted series. For trend estimates, the standard errors are generally not larger than for the seasonally adjusted estimates and are likely to be smaller. For constant price estimates, the standard errors may be up to 10 per cent higher than those for the corresponding current price estimates because of the sampling variability contained in the prices data used to deflate the current price estimates.

#### Non-sample error

14. This category includes a number of possible errors that arise in any type of collection, whether or not sampling of units is undertaken. The most significant of these errors are: misreporting of data items; deficiencies in coverage; non-response; and processing errors. In some cases the presence of these errors would, at least in part, be reflected in the size of the standard error.

15. *Reporting error.* Such error may arise because of poor form design, inability by survey respondents to provide requested data, or simply because of clerical error. Every effort is made to minimise reporting error by the careful design and testing of forms, and by examining inconsistencies both between different respondents and between the reports in successive months for each respondent.

16. Turnover is a relatively simple data item to collect accurately because it corresponds closely to total takings by respondents. While some reporting errors will be random and thus cancel out, others may be consistently in one direction and lead to bias in the results.

17. *Under coverage.* Because of limited sources available to identify enterprises with no employees, only enterprises with employees are included in the new survey. Non-employed units are estimated to account for approximately 6% of total turnover but their significance varies substantially from industry to industry. While the exclusion of such units will therefore lead to consistent underestimation of the level of turnover, their exclusion is considered to have a negligible effect on short term movements in Retail Trade.

18. Some error may also arise because of lags in the identification of new businesses. Studies undertaken by the ABS suggest that these lags also have a negligible impact on short term movements but lead to a small consistent underestimation of the level of turnover each month.

19. *Non-response.* The survey of Retail Trade is a monthly survey conducted to tight timetables so that not all forms are received in time for publication. Extensive telephone follow up is undertaken each month to obtain details for respondents who have not returned forms by the due date. Despite this, it is necessary to impute responses for approximately 5% of selected units (which are, in the main, small retailers). The consequences of this imputation for data quality are also reflected, in part, in the size of the standard error.

20. *Processing errors.* Such errors may arise at any stage of processing. Editing procedures should detect significant errors at data entry stage, while all processing systems are thoroughly tested. Published tables are produced directly from 'camera-ready' computer output to avoid the possibility of clerical transcription errors at the tabulation stage.

#### Seasonally Adjusted and Trend Estimates

21. Seasonal adjustment is a means of removing the estimated effects of normal seasonal variation from the series so that the effects of other influences can be more clearly recognised.

22. In the seasonal adjustment of the turnover estimates, account has been taken of both normal seasonal factors and 'trading-day' effects (arising from the varying length of each month and the varying numbers of Sundays, Mondays, Tuesdays, etc. in the month). For total turnover for Australia, adjustment has also been made for the effects of change in the date of Easter and Australia Day holidays. Seasonal adjustment does not remove from the series the effect of irregular influences (e.g. abnormal weather, industrial disputes) and the seasonally adjusted estimates still reflect the sampling and non-sampling errors to which the original estimates are subject.

23. The seasonally adjusted figures in this bulletin have been revised as a result of annual re-analysis of the seasonal adjustment factors for the Retail Turnover series. The re-analysis provides the most up-to-date information on seasonal, trading day and other effects. For information concerning the effects of changes in the timing of school holidays, refer to Information Paper 8511.0.

24. As trend estimates are obtained by smoothing the seasonally adjusted series, the revision of the seasonally adjusted figures has led to some revision of recent trend estimates for the Australia by Industry series and the State total series. Revisions to the State by Industry series as a result of the re-analysis will appear in the July publication.

25. The smoothing of seasonally adjusted series to create trend estimates is a means of reducing the impact of the irregular component of the series. The trend estimates are derived by applying a 13-term Henderson-weighted moving average to the respective seasonally adjusted series. These trend series are used to analyse the underlying behaviour of the series over time.

26. While this smoothing technique enables estimates of trend to be produced for the latest month, it does result in

revisions to the estimates for the most recent months as data for subsequent months become available. Generally, subsequent revisions become smaller and after 3 months have a negligible impact on the series. To illustrate the effect of the seasonally adjusted results on the trend series movement, if the July seasonally adjusted result shows a +1.0% movement, then the trend movement would be 0.3% for July, and 0.4% for June and May. A -1.0% movement would return a trend movement of 0.0% for July. June and May trend estimate would fall by 0.1 percentage points.

27. Users may wish to refer to the ABS Information Papers *A Guide to Smoothing Time Series - Estimates of 'Trend'* (1316.0) and *Time Series Decomposition - An Overview* (1317.0) for more detailed information on smoothing seasonally adjusted time series data.

#### Related publications

28. Current publications produced by the ABS are listed in the *Catalogue of Publications and Products, Australia* (1101.0). The ABS also issues, on Tuesdays and Fridays, a *Publications Advice* (1105.0) which lists publications to be released in the next few days. The Catalogue and Publications Advice are available from any ABS office.

#### Symbols and other usages

n.p. not available for publication, but included in totals

ASIC Australian Standard Industrial Classification

#### Electronic services

DISCOVERY. Key \*656# for selected current economic, social and demographic statistics.

AUSSTATS. Thousands of up-to-date time series are available on this ABS on-line service through PAXUS COMNET. For further information phone the AUSSTATS Help Desk on (06) 252 6017.

TELESTATS. This service provides:

- foreign trade statistics tailored to users' requirements. Further information is available on (06) 252 5404.
- text and tables for selected Main Economic Indicator publications. Further information is available on (06) 252 5405.

#### Floppy disk service

Selected ABS services are available on floppy disk. Further information is available on (06) 252 6684.

IAN CASTLES  
Australian Statistician

Seasonal factors are available for sale.

The combined seasonal factors used to convert original Australian total estimates to the seasonally adjusted estimate are available to interested users. Any business in the field of economic prediction would find these factors extremely useful in assisting their work.

The cost for the full 12 months forward combined factors is \$250 (includes faxing). For more information contact Bill Powell on (06) 252 6132.
