KEY POINTS

ACTUAL EXPENDITURE (VOLUME TERMS)

- The trend volume estimate for total new capital expenditure rose 4.3% in the March quarter 2012 while the seasonally adjusted estimate rose 6.1%.
- The trend volume estimate for buildings and structures rose 6.4% in the March quarter 2012 while the seasonally adjusted estimate rose 10.5%.
- The trend volume estimate for equipment, plant and machinery rose 0.3% in the March quarter 2012 while the seasonally adjusted estimate fell 0.1%.

EXPECTED EXPENDITURE (CURRENT PRICE TERMS)

- This issue includes the sixth estimate (Estimate 6) for 2011-12 and the second estimate (Estimate 2) for 2012-13.
- Estimate 6 for 2011-12 is \$158,028m. This is 27.5% higher than Estimate 6 for 2010-11. Estimate 6 is 2.3% lower than Estimate 5 for 2011-12.
- Estimate 2 for 2012-13 is \$172,982m. This is 23.5% higher than Estimate 2 for 2011-12. Estimate 2 is 4.3% higher than Estimate 1 for 2012-13.
- See pages 6 to 10 for further commentary on expectations data.

INQUIRIES

ACTUAL NEW CAPITAL EXPENDITURE IN VOLUME TERMS

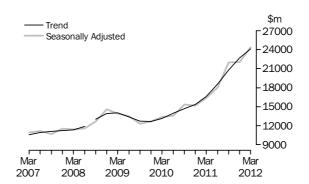

TOTAL CAPITAL EXPENDITURE

The trend estimate for total new capital expenditure rose 4.3% in the March quarter 2012. By asset type, the trend estimate for buildings and structures rose 6.4% and equipment, plant and machinery rose 0.3%. The seasonally adjusted estimate for total new capital expenditure rose 6.1% in the March quarter 2012.

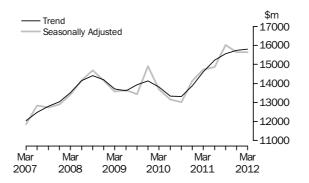

BUILDINGS AND STRUCTURES

The trend estimate for buildings and structures rose 6.4% in the March quarter 2012. Buildings and structures for Mining rose 10.5%, Manufacturing fell 2.8% while Other Selected Industries fell 1.9%. The seasonally adjusted estimate for buildings and structures rose 10.5% in the March quarter 2012. Mining rose 15.6%, while Manufacturing fell 1.0% and Other Selected Industries rose 0.1% in seasonally adjusted terms.

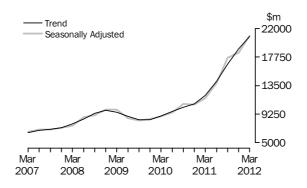

EQUIPMENT, PLANT AND MACHINERY

The trend estimate for equipment, plant and machinery rose 0.3% in the March quarter 2012. Equipment, plant and machinery for Mining rose 3.5%, Manufacturing fell 2.3% and Other Selected Industries fell 0.4%. The seasonally adjusted estimate for equipment, plant and machinery fell 0.1% in the March quarter 2012. Mining rose 7.1%, while Manufacturing fell 1.9% and Other Selected Industries fell 2.2% in seasonally adjusted terms.

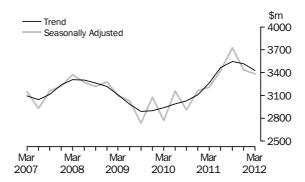

MINING

The trend estimate for Mining rose 10.0% in the March quarter 2012. Buildings and structures rose 10.5% and equipment, plant and machinery rose 3.5%. The seasonally adjusted estimate for Mining rose 14.0% in the March quarter 2012. Buildings and structures rose 15.6% and equipment, plant and machinery rose 7.1% in seasonally adjusted terms.

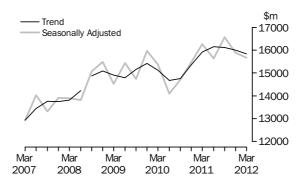

MANUFACTURING

The trend estimate for Manufacturing fell 2.5% in the March quarter 2012. Buildings and structures fell 2.8% and equipment, plant and machinery fell 2.3%. The seasonally adjusted estimate for Manufacturing fell 1.5% in the March quarter 2012. Buildings and structures fell 1.0% and equipment, plant and machinery fell 1.9% in seasonally adjusted terms.

OTHER SELECTED INDUSTRIES

The trend estimate for Other Selected Industries fell 1.0% in the March quarter 2012. Buildings and structures fell 1.9% and equipment, plant and machinery fell 0.4%. The seasonally adjusted estimate for Other Selected Industries fell 1.3% in the March quarter 2012. Buildings and structures rose 0.1% while equipment, plant and machinery fell 2.2% in seasonally adjusted terms.

ACTUAL AND EXPECTED NEW CAPITAL EXPENDITURE

FINANCIAL YEARS AT CURRENT PRICES

The graphs below show the seven estimates of actual and expected expenditure for each financial year. The estimates appearing below relate to data contained in Tables 5 and 6. Advice about the application of realisation ratios to these estimates is in paragraph 26 to 29 of the Explanatory Notes.

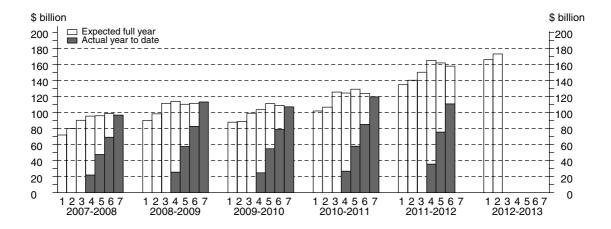

The timing and construction of these estimates are as follows:

| | COM | IPOSITION OF | ESTIMATE | |
|----------|--|---|--|----------------------------------|
| Estimate | Based on data reported at: | Data on long-term expected expenditure | Data on short-term expected expenditure | Data on actual expenditure |
| | | | | |
| 1 | Jan-Feb, 5-6 months before period begins | 12 months | Nil | Nil |
| 2 | Apr-May, 2-3 months before period begins | 12 months | Nil | Nil |
| 3 | Jul-Aug, at beginning of period | 6 months | 6 months | Nil |
| 4 | Oct-Nov, 3-4 months into period | 6 months | 3 months | 3 months |
| 5 | Jan-Feb, 6-7 months into period | Nil | 6 months | 6 months |
| 6 | Apr-May, 9-10 months into period | Nil | 3 months | 9 months |
| 7 | Jul-Aug, at end of period | Nil | Nil | 12 months |

TOTAL CAPITAL EXPENDITURE

Estimate 6 for total capital expenditure for 2011-12 is \$158,028 million. This is 27.5% higher than Estimate 6 for 2010-11. The main contributor to this increase was Mining (66.9%). Estimate 6 is 2.3% lower than Estimate 5 for 2011-12. The main contributor to this decrease was Mining (-7.1%).

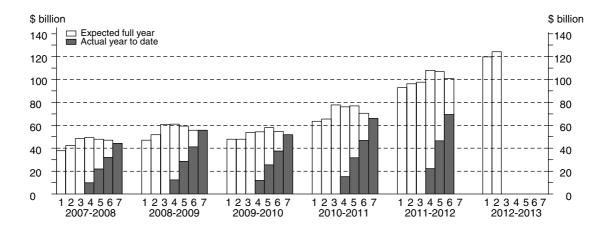

Estimate 2 for total capital expenditure for 2012-13 is \$172,982 million. This is 23.5% higher than Estimate 2 for 2011-12. The main contributor to this increase was Mining (43.9%). Estimate 2 is 4.3% higher than Estimate 1 for 2012-13. The main contributor to this increase was Mining (4.5%).

ACTUAL AND EXPECTED NEW CAPITAL EXPENDITURE continued

BUILDINGS AND STRUCTURES Estimate 6 for buildings and structures for 2011-12 is \$100,859 million. This is 42.9% higher than Estimate 6 for 2010-11. The main contributor to this increase was Mining (75.0%). Estimate 6 for buildings and structures is 5.6% lower than Estimate 5 for 2011-12. The main contributor to this decrease was Mining (-8.1%).

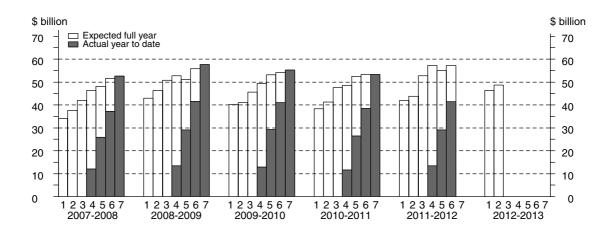

Estimate 2 for buildings and structures for 2012-13 is \$124,336 million. This is 29.1% higher than Estimate 2 for 2011-12. The main contributor to this increase was Mining (46.1%). Estimate 2 is 3.9% higher than Estimate 1 for 2012-13. The main contributor to this increase was Mining (4.6%).

EQUIPMENT, PLANT AND MACHINERY

Estimate 6 for equipment, plant and machinery for 2011-12 is \$57,169 million. This is 7.2% higher than Estimate 6 for 2010-11. The main contributor to this increase was Mining (36.1%). Estimate 6 for equipment, plant and machinery is 4.1% higher than Estimate 5 for 2011-12. The main contributor to this increase was Other Selected Industries (8.3%).

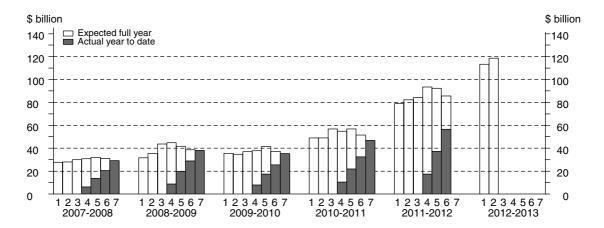

Estimate 2 for equipment, plant and machinery for 2012-13 is \$48,646 million. This is 11.0% higher than Estimate 2 for 2011-12. The main contributor to this increase was Mining (32.4%). Estimate 2 is 5.2% higher than Estimate 1 for 2012-13. The main contributor to this increase was Other Selected Industries (5.3%).

MINING

Estimate 6 for Mining for 2011-12 is \$85,723 million. This is 66.9% higher than the corresponding estimate for 2010-11. Estimate 6 is 7.1% lower than Estimate 5 for 2011-12. Buildings and structures is 8.1% lower and equipment, plant and machinery is 1.7% lower than the corresponding fifth estimates for 2011-12.

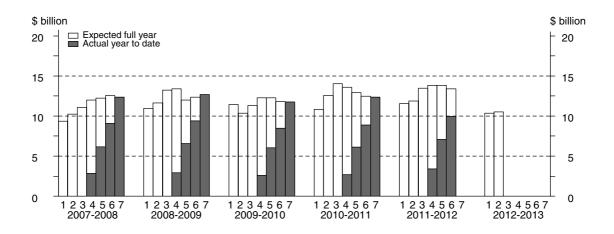

Estimate 2 for Mining for 2012-13 is \$118,547 million. This is 43.9% higher than the corresponding estimate for 2011-12. Estimate 2 is 4.5% higher than Estimate 1 for 2012-13. Buildings and structures is 4.6% higher and equipment, plant and machinery is 4.4% higher than the corresponding first estimates for 2012-13.

MANUFACTURING

Estimate 6 for Manufacturing for 2011-12 is \$13,386 million. This is 7.2% higher than the corresponding estimate for 2010-11. Estimate 6 is 3.1% lower than Estimate 5 for 2011-12. Buildings and structures is 4.0% lower and equipment, plant and machinery is 2.3% lower than the corresponding fifth estimates for 2011-12.

Estimate 2 for Manufacturing for 2012-13 is \$10,531 million. This is 11.3% lower than the corresponding estimate for 2011-12. Estimate 2 is 1.7% higher than Estimate 1 for 2012-13. Buildings and structures is 5.0% lower while equipment, plant and machinery is 6.9% higher than the corresponding first estimates for 2012-13.

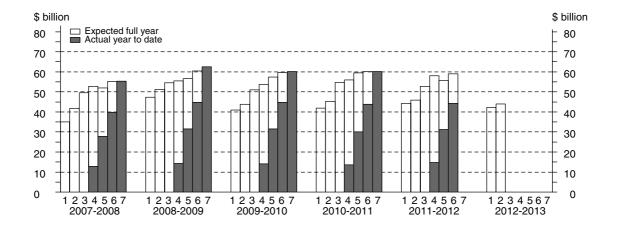

ACTUAL AND EXPECTED NEW CAPITAL EXPENDITURE continued

OTHER SELECTED INDUSTRIES

Estimate 6 for Other Selected Industries for 2011-12 is \$58,919 million. This is 1.9% lower than the corresponding estimate for 2010-11. The main contributor to this decrease was Rental, Hiring and Real Estate Services (-19.6%). Estimate 6 is 5.9% higher than Estimate 5 for 2011-12. Buildings and structures is 2.5% higher and equipment, plant and machinery is 8.3% higher than the corresponding fifth estimates for 2011-12.

Estimate 2 for Other Selected Industries for 2012-13 is \$43,905 million. This is 4.3% lower than the corresponding estimate for 2011-12. The main contributors to this decrease were Transport, Postal and Warehousing (-13.8%) and Rental, Hiring and Real Estate Services (-10.4%). Estimate 2 is 4.2% higher than Estimate 1 for 2012-13. Buildings and structures is 2.8% higher and equipment, plant and machinery is 5.3% higher than the corresponding first estimates for 2012-13.

FEATURE ARTICLE

MINING INVESTMENT IN ABS PUBLICATIONS

INTRODUCTION

Australia is currently experiencing unprecedented levels of investment activity. This is primarily due to the number and size of mining projects currently underway. Investment activity is expected to continue to rise in the coming years as additional mining projects commence. The Australian Bureau of Statistics (ABS) publishes a range of information to assist the Australian community in monitoring this activity over time.

Mining projects tend to be complex in structure and comprise a number of different investment activities including exploration, engineering construction, plant and equipment and buildings. This feature article therefore provides a summary of the conceptual basis of the relevant ABS publications that measure investment in Australia. A hypothetical mining project is then used to illustrate how mining investment activity is reflected in ABS data.

In addition, a central theme of this article is the increasing role of offshore construction to meet the investment demands of Australia's mining businesses. This topic is examined in respect of each ABS publication.

UTILISING ABS
PUBLICATIONS TO
MONITOR INVESTMENT IN
AUSTRALIA

The Australian mining industry is currently investing in a number of high-value projects to develop new sites and expand the productive capacity of existing ones. These include several large scale liquefied natural gas (LNG) and iron ore projects in Western Australia, Queensland and the Northern Territory.

Several ABS publications measure aspects of Australian investment including expenditure on capital goods produced in Australia or imported from overseas. However, there can be significant variations in the timing and manner by which each publication captures expenditure due to differences in their underlying framework.

This section provides a brief summary of the conceptual basis of the relevant ABS publications that measure investment and explains how each publication records different aspects of mining capital expenditure, including where applicable the acquisition of imported capital goods.

Mineral and Petroleum
Exploration (ABS Cat. No. 8412.0)

Mineral and petroleum exploration expenditure is published quarterly in *Mineral and Petroleum Exploration*, *Australia* (ABS Cat. No. 8412.0). Data are collected from private enterprises known to be engaged in exploration activities inside Australia, as well as in Australian waters including the Joint Petroleum Development Area (JPDA). All expenditures (capitalised and non-capitalised) incurred during the exploratory or evaluation stages of a mining project, up until development for the purposes of production takes place, are included in this publication and may include items such as engineering and economic feasibility studies, land access and legal fees, license fees, seismic studies, environmental evaluations and exploratory drilling.

Private New Capital
Expenditure and Expected
Expenditure (ABS Cat. No. 5625.0)

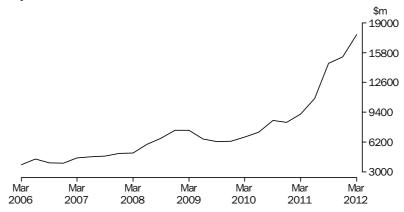

Capital expenditure (Capex) as reported by businesses on new 'plant and equipment' and 'building and structures' is published quarterly in *Private New Capital Expenditure and Expected Expenditure* (ABS Cat. No. 5625.0). Businesses are asked to report the value of their capital expenditure on a change of ownership basis.¹ This concept is relatively

¹ See System of National Accounts 2008, 10.53-10.55.

Private New Capital
Expenditure and Expected
Expenditure (ABS Cat. No.
5625.0) continued

simple to implement when purchasing new plant and equipment. However, some assets are constructed over a number of accounting periods. In these situations, such as in the case of buildings and structures, including imports, constructed under a contract of sale, the change of ownership occurs progressively as construction is taking place. The Capex on the asset under construction is approximated by the progress payments made during the quarter. As a result, the Capex series of building and structures is relatively smooth (as seen in the graph below), with significant short-term variations and level shifts driven only by projects commencing, projects ending or significant ramping up of existing projects.

MINING BUILDINGS AND STRUCTURES, Current Price, Seasonally Adjusted

Source: Private New Capital Expenditure and Expected Expenditure, ABS cat no. 5625.0

Australian mining businesses have a number of avenues to meet their investment demands. One of these avenues is to utilise international supply and procurement networks, including those for the construction of what *Private New Capital Expenditure* and *Expected Expenditure* classifies as 'buildings and structures'.

The buildings and structures category covers non-residential building, other structures and land improvements, and includes fixtures, facilities and equipment integral to the structure/building, as well as any associated site preparation costs. Some examples of mining buildings and structures included in this asset category are LNG and iron ore processing equipment, floating production storage and offloading vessels (FPSOs), offshore platforms and drilling rigs, railway lines, port construction, pipelines and mining accommodation. These items classified as 'buildings and structures' represent an increasing proportion of capital expenditure by Australian mining businesses.

Traditionally, equipment such as trucks, bulldozers and other mobile equipment have represented the great bulk of capital imports by mining companies. In recent years this has been augmented by large modular structures built overseas. This shift is thought to have been driven by a number of factors, including innovations in mining infrastructure design and construction, a high Australian dollar, and access to overseas construction yards that specialise in the fabrication of mining structures.³

² Per System of National Accounts 2008, 10.73-Other buildings and structures.

³ As documented by the Reserve Bank of Australia in Statement of Monetary Policy, November 2011 - Box B:The Mining Sector and the External Accounts.

Engineering Construction Activity (ABS Cat. No. 8762.0) The value of Australian engineering construction activity (ECA) is published quarterly in *Engineering Construction Activity* (ABS Cat. No. 8762.0). Data collected include: the 'value of work done in the quarter'; 'the total value of new projects commenced in the quarter'; and the 'value of work yet to be completed'. Data are classified according to the type of construction taking place. Mining-related engineering construction is captured in several categories, including railways, harbours (dredging work), pipelines, heavy industry and oil, gas, coal and other minerals. The value of engineering construction work undertaken in a quarter includes the value of the actual work done by the reporting unit and the value of purchases of machinery and equipment that are integral to the structure.

Imported structures, such as LNG and iron ore processing equipment that have been fabricated overseas, are only included in the work done figures once the item is fixed into place. The value of these imports are included in the 'value of work commenced' data in the quarter that work begins on the project's domestic site. The 'value of work yet to be done' category also records the total value of the structures to be imported up until the time when the items are transported and installed. In the quarter of installation, this amount will be transferred to 'work done' for the quarter. As a result, the ECA work done series can be quite volatile.

The ECA is not directly comparable to the Capex series due to differences in data classifications (industry versus type of construction) and the fact that the Capex series is collected on a change of ownership basis (which includes progress payments for overseas construction of imported structures), whereas the ECA measures the value of activity that has occurred in the period.

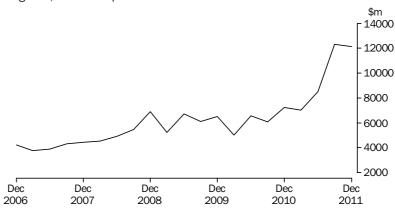

Building Activity (ABS Cat. No. 8752.0)

The value of construction of new buildings and the alteration of and/or additions to exisiting buildings is published quarterly in *Building Activity* (ABS Cat. No. 8752.0). Mining-related building activity may include the construction of accommodation and facilities for workers, offices, and other buildings. In line with the ABS Engineering Construction Activity publication, this activity is captured on a 'work done' basis. In the case of imported building structures, the ABS Building Activity publication will record the full value of the building once it has been imported and installed.

Both the Engineering Construction Activity publication and the Building Activity (BA) publication capture data via the businesses directly involved in the production of the assets (contractors for construction projects). Thus buildings and structures as reported by Capex are represented in both the ECA and BA publications.

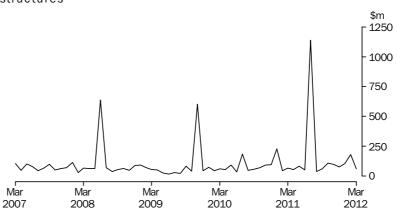

International Merchandise Imports (ABS Cat. No. 5439.0) International Merchandise Imports (ABS Cat. No. 5439.0) recognises the full value of an imported capital good on a recorded trade basis and is published monthly. That is, when the record for the item has been cleared by Australian Customs & Border Protection. Engineering construction activity and merchandise trade data are therefore conceptually comparable in tracking imported capital structures. There may, however, be slight differences in timing due to a lag between the time of import and installation if this occurs between quarters. The graphs below show spikes in 2011 due to the import and installation of large capital items.

OIL, GAS, COAL AND OTHER MINERALS - ENGINEERING WORK DONE, Original, current prices

Source: Engineering Construction Activity, ABS cat no. 8762.0

CAPITAL GOOD IMPORTS, SITC 793 - Ships, boats and floating structures

Source: International Merchandise Imports, ABS cat no. 5439.0

International Trade in Goods and Services (ABS Cat No. 5368.0) and Balance of Payments and International Investment Position (ABS Cat. No. 5302.0) Imports of capital goods are also reported in the monthly ABS publication *International Trade in Goods and Services* (ABS Cat. No. 5368.0) and the quarterly ABS publication *Balance of Payments and International Investment Position* (ABS Cat. No. 5302.0). The monthly International Trade publication presents estimates of trade in goods and services on both a recorded trade basis (merchandise import and export statistics) and also a balance of payments basis (accounting for progressive ownership changes). In line with national accounting conventions, merchandise trade data from Customs (as presented in the ABS catalogue 5439.0) are adjusted to a Balance of Payments basis using Capex data. This adjustment accounts for progress payments made on structures to be imported, to capture the real economic transfer of ownership.

The quarterly Balance of Payments publication captures economic transactions between Australian residents and the rest of the world, and its Goods and Services component is simply an aggregation of the monthly International Trade data (on a balance of payments basis).

Australian National
Accounts: National
Income, Expenditure and
Product (ABS Cat. No.
5206.0)

Finally, the quarterly ABS publication *Australian National Accounts: National Income, Expenditure and Product* (ABS Cat. No. 5206.0) captures mining investment activity in Australia as part of private gross fixed capital formation (GFCF). Mineral and petroleum exploration expenditure is treated as an acquisition of an intellectual property product and is therefore included in GFCF. The data from the Engineering Construction and Building Activity publications is the direct source for the non-dwelling construction component of GFCF, to account for the value of work done on construction projects as it is put into place. Balance of Payments data is then used to adjust for the progressive change in ownership of structures to be imported. GFCF includes all the costs of acquiring fixed assets, including all the costs of transporting imported capital goods. Imports of goods and services data appearing in ABS publications 5302.0 and 5206.0 are entirely consistent.

EXAMPLE - LNG PROJECT

A hypothetical mining project is now used to illustrate how mining investment activity is reflected in ABS data.

Consider an LNG project which will be developed off the coast of Australia. The project will be operated by a resident entity of an international LNG company. Downstream components of the project include; an LNG liquefaction and purification plant consisting of 2 LNG trains; condensate handling facilities; loading facilities for exportation; and a pipeline to transport the gas onshore. A modularisation technique will be used, whereby the bulk of structural components will be preassembled overseas and transported for installation onto the site. Progress payments will be made throughout construction, with the company recognising ownership of the assets during construction. Prefabricated accommodation units to house workers will also be constructed overseas as part of the project.

Components of capital expenditure

INITIAL EXPLORATION AND EVALUATION WORKS

All of the expenses incurred by the company in identifying, exploring and evaluating the LNG deposit are captured in the Mineral and Petroleum Exploration publication, in the quarter that they are incurred. Such expenditures include economic and engineering feasibility studies, seismic studies, map preparation fees, payments to employees and contractors, land access and license fees, legal fees, and costs incurred to drill exploratory gas wells. This exploration spending will be reflected in the GFCF component of the National Accounts in the same quarter that it is undertaken by the company.

PRE-FINAL INVESTMENT DECISION

Pre-final investment decision (FID) spending includes front-end engineering design (FEED) costs incurred in the development phase of the project. These costs may be paid to domestic or foreign contractors. The Capex publication captures these costs in the quarter that they are capitalised by the company (with the assumption that this reflects the period in which these costs were incurred). This is the case regardless of whether FEED is conducted by a domestic or foreign company. If conducted by a foreign company, these FEED costs are also recognised by Balance of Payments and International Trade in Goods and Services as an import of engineering services in the quarter that the spending occurred. This pre-FID spending is also reflected in the GFCF component of the National Accounts.

Engineering Construction Activity recognises the total value of FEED expenditure in the first quarter that works begin on the actual project site (for example, site preparation activities, commencement of physical construction). This is despite the fact that FEED spending may have occurred over a number of quarters.

Components of capital expenditure continued

DURING CONSTRUCTION

Expenditure reported to the Capex survey includes domestic activity on-site plus progress payments made for construction of the engineering and accommodation modules during the quarter. In this way, the entire value of the modular construction component is progressively accounted for over the entire construction period.

Balance of Payments and International Trade in Goods and Services also use progress payments to reflect change of ownership for offshore construction of physical assets and engineering services over the construction period. Balance of Payments and International Trade in Goods and Services obtain the value of progress payments from the Capex survey. As a result, and due to differences in the timing of the ABS surveys, incorporating progress payments data into Balance of Payments and International Trade in Goods and Services data may occur in the following quarter if this information is not available in time for publishing.

Engineering Construction Activity and Building Activity only record the domestic work undertaken in the quarter on a 'work done' basis. The full value of the items yet to be imported is reflected in the 'work to be done' figure.

The full value of domestic work done plus the progress payments made in the quarter are included in GFCF, a component of the expenditure measure of GDP and published in the Quarterly National Accounts.

IMPORT AND INSTALLATION

Capex records the value of the final progress payment made for the completion of work overseas, plus any additional transportation costs, and any installation costs incurred in fixing the structure into place. Balance of Payments will likewise record the value of the final progress payment.

Merchandise trade data, as presented in ABS catalogue number 5439.0, will record the full value of the module when it is registered as an import into Australian waters by Customs (on a 'recorded trade' (cif) basis).

At the time of installation of a complete LNG module, Engineering Construction Activity records the total value of the imported structure plus the installation costs, causing a spike in the Engineering Construction Activity series. Therefore, in this particular quarter, the Engineering Construction Activity and Capex figures show an obvious timing discrepancy. Engineering Construction Activity also shows a corresponding fall in the 'work yet to be done' value from the previous quarter. The same applies for Building Activity in the recording of the imported accommodation modules.

The full value of domestic work, any final progress payments made in the quarter, and the transport and installation costs to fix the structures into place are included in GFCF, a component of the expenditure measure of GDP and published in the Quarterly National Accounts. The recording of the import of the capital products is exactly the same in the Balance of Payments and the National Accounts, and every effort is made to ensure that the recording of the GFCF of the imported capital goods and the corresponding import data are consistent.

SUMMARY

Australia is experiencing a period of unprecedented investment activity, primarily due to Australian mining projects. These mining projects are complex in nature and therefore the ABS plays a crucial role to assist policy makers, analysts and the community generally to understand the size and impact of these projects on the Australian economy. The ABS fulfils this role by producing a range of relevant, high quality data series over time.

This feature article provides a summary of ABS data series that can be used by the Australian community to monitor investment. Included in this group are those series that monitor the increasing role of offshore construction activity to meet the investment demands of Australia's mining businesses. Understanding the role and size of offshore construction activity in this context, and how it is reflected in ABS data, will assist data users to have a complete picture of current investment activity in Australia as well as the likelihood of planned investment activity being realised in the future.

A summary of the ABS publications which capture mining investment is available in the Appendix.

EFFECT OF NEW SEASONALLY ADJUSTED ESTIMATES ON TREND ESTIMATES

TREND REVISIONS

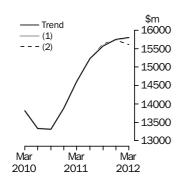

Recent seasonally adjusted and trend estimates are likely to be revised when original estimates for subsequent quarters become available. The approximate effects of possible scenarios on trend estimates for capital expenditure in chain volume terms are presented below by illustrating the impact if next quarter's seasonally adjusted estimate rises or falls by a specified percentage (based on the historical average of movements in seasonally adjusted estimates). For further information, see paragraphs 41 and 42 in the Explanatory Notes.

EXPLANATORY NOTES

INTRODUCTION

1 This publication contains estimates of actual and expected new capital expenditure by private businesses for selected industries in Australia. The series have been compiled from data collected by the Australian Bureau of Statistics (ABS) in its quarterly Survey of New Capital Expenditure.

SCOPE OF THE SURVEY

2 The Survey of New Capital Expenditure includes the following industries classified according to the Australian and New Zealand Standard Industrial Classification, ANZSIC, 2006:

Mining (Division B)

Manufacturing (Division C)

Other selected industries:

Electricity, Gas, Water and Waste Services (Division D)

Construction (Division E)

Wholesale Trade (Division F)

Retail Trade (Division G)

Transport, Postal and Warehousing (Division I)

Information Media and Telecommunications (Division J)

Finance and Insurance (Division K, excluding ANZSIC class 6330,

Superannuation Funds)

Rental, Hiring and Real Estate Services (Division L)

Professional, Scientific and Technical Services (Division M)

Other selected services:

Accommodation and Food Services (Division H)

Administrative and Support Services (Division N)

Arts and Recreation Services (Division R)

Other Services (Division S)

3 The survey excludes the following industries:

Agriculture, Forestry and Fishing (Division A)

Public Administration and Safety (Division O)

Education and Training (Division P)

Health Care and Social Assistance (Division Q)

Superannuation Funds (Class 6330)

- **4** The scope excludes public sector business units (i.e. all departments, authorities and other organisations owned and controlled by Commonwealth, State and Local Government).
- **5** The Survey of New Capital Expenditure, like most ABS economic collections, takes its frame from Employing and Non-Employing Units on the ABS Business Register which is primarily based on ABN registrations to the Australian Business Register, which is managed by the Australian Taxation Office (ATO). The frame is updated quarterly to take account of new businesses and changes in the characteristics of businesses, such as industry and size.
- **6** Businesses which have ceased employing are identified when the Australian Taxation Office (ATO) cancels their Australian Business Number (ABN) registration. In addition, businesses which do not remit for Goods and Services Tax and/or Income Tax Withholding purposes for the previous five quarters, are removed from the frame.
- **7** As noted, the Survey frame includes Employing and Non-Employing Units on the ABS Business Register. However, micro non-employing businesses are excluded. These are very small units on the ABS Business Register, by standard measures of size. While there are a substantial number of these businesses, it is expected that they would not contribute significantly to the estimates, although the impact would vary from industry to industry.

EXPLANATORY NOTES continued

STATISTICAL UNIT

- **8** In the Survey of New Capital Expenditure, the statistical unit used to represent businesses, and for which statistics are reported, is the Australian Business Number (ABN) unit, in most cases. The ABN unit is the business unit which has registered for an ABN, and thus appears on the ATO administered Australian Business Register. This unit is suitable for ABS statistical needs when the business is simple in structure.
- **9** For more significant and diverse businesses where the ABN unit is not suitable for ABS statistical needs, the statistical unit used is the Type of Activity Unit (TAU). A TAU is comprised of one or more business entities, sub-entities or branches of a business entity within an Enterprise Group that can report production and employment data for similar economic activities. When a minimum set of data items is available, a TAU is created which covers all the operations within an industry subdivision (and the TAU is classified to the relevant subdivision of the Australian and New Zealand Standard Industrial Classification (ANZSIC)). Where a business cannot supply adequate data for each industry, a TAU is formed which contains activity in more than one industry subdivision and the TAU is classified to the predominant ANZSIC subdivision. Further details about the ABS economic statistical units used in this survey, and in other ABS economic surveys (both sample surveys and censuses), can be found in Chapter 2 of the Standard Economic Sector Classifications of Australia (SESCA) 2002 (cat. no. 1218.0).

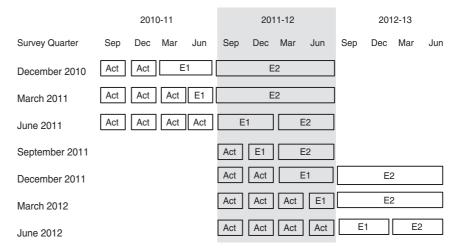

SURVEY METHODOLOGY

- **10** The survey is conducted by mail on a quarterly basis. It is based on a random sample of approximately 8,000 units which is stratified by industry, state/territory and derived employment size. The figures obtained from the selected units are supplemented by data from units which have large capital expenditure and are outside the sample framework, or not adequately covered by it.
- **11** Respondents are asked to provide data on the same basis as their own management accounts. Where a selected unit does not respond in a given survey period, a value is estimated. If data are subsequently provided, the estimated value is replaced with reported data. Aggregates are calculated from all data using the 'number raised' estimation technique. Data are edited at both individual unit level and at aggregate level.

TIMING AND CONSTRUCTION
OF SURVEY CYCLE

- **12** Surveys are conducted in respect of each quarter and returns are completed in the 8 or 9 week period after the end of the quarter to which the survey data relate (e.g. June quarter survey returns are completed during July and August).
- **13** Businesses are requested to provide 3 basic figures each survey:
 - Actual expenditure incurred during the reference period (Act)
 - A short term expectation (E1)
 - A longer term expectation (E2).

Period to which reported data relates

EXPLANATORY NOTES continued

TIMING AND CONSTRUCTION
OF SURVEY CYCLE continued

- **14** This survey cycle facilitates the formation of estimates of expenditure for financial years (12 months ending 30 June) which are presented in tables 5 and 6 of this publication. For example, as the previous table shows for 2011-2012:
 - the first estimate was available from the December 2010 survey as a longer term expectation (E2)
 - the second estimate was available from the March 2011 survey (again as a longer term expectation)
 - the third estimate was available from the June 2011 survey as the sum of two expectations (E1 + E2)
 - in the September 2011, December 2011 and March 2012 surveys the fourth, fifth and sixth estimates, respectively, are derived from the sum of actual expenditure (for that part of the year completed) and expected expenditure (for the remainder of the year) as recorded in the current quarter's survey
 - the final (or seventh) estimate from the June quarter 2012 survey is derived from the sum of the actual expenditure for each of the four quarters in the 2011–12 financial year.
- **15** Businesses are requested to provide actual expenditure data by state/territory each quarter. Prior to 2002, businesses were also asked to provide expected expenditure data by state/territory each December quarter. Since 2002 state/territory expectations data have been directly collected each December quarter only from selected businesses contributing significantly to data for a particular state or territory. Expectations data for the remaining businesses which operate in more than one state or territory are pro-rated to states/territories based on actual expenditure for the December quarter in each state or territory. Expectations data for businesses operating within a single state/territory are allocated to that state/territory.
- **16** These expectations data by state/territory are not included in this publication but are released on the ABS Website.

- 17 The survey frames and samples are revised each quarter to ensure that they remain representative of the survey population. The timing for creating each quarter's survey frame is consistent with that of other ABS business surveys. This provides for greater consistency when comparing data across surveys.
- **18** Additionally, with these revisions to the sample, some of the units from the sampled sector are rotated out of the survey and are replaced by others to spread the reporting workload equitably.
- **19** Adjustments are included in the estimates to allow for lags in processing new businesses to the ABS Business Register, and the omission of some businesses from the register. The majority of businesses affected and to which adjustments apply are small in size. As an indication of the size of these adjustments, in the March quarter 2012 they represented about 0.2% of the total estimate of new capital expenditure.

CLASSIFICATION BY INDUSTRY

SAMPLE REVISION

- **20** The Australian and New Zealand Standard Industrial Classification (ANZSIC) has been developed for use in both countries for the production and analysis of industry statistics. For more information, users are referred to *Australian and New Zealand Standard Industrial Classification (ANZSIC), 2006* (cat. no. 1292.0).
- **21** In order to classify new capital expenditure by industry, each statistical unit (as defined above) is classified to the (ANZSIC) industry in which it mainly operates.

CHAIN VOLUME MEASURES

22 The chain volume measures appearing in this publication are annually reweighted chain Laspeyres indexes referenced to current price values in the chosen reference year (currently 2009-10). The current price values may be thought to be the product of a price and quantity. The value in chain volume terms can be derived by linking together movements in volumes, calculated using the average prices of the previous financial year

EXPLANATORY NOTES continued

CHAIN VOLUME MEASURES continued

and applying compound movements to the current price estimates of the reference year. Each year's quarter-to-quarter growth rates in the chain volume series are based on the prices of the previous financial year, except for those quarters of the latest incomplete year which are based upon the second most recent financial year. Quarterly chain volume estimates for a financial year sum to the corresponding annual estimate.

- **23** With each release of the September quarter issue of this publication, a new base year is introduced and the reference year is advanced one year to coincide with it. With this release of the September quarter 2011 issue of this publication, the chain volume measures for 2010-11 now have 2009-10 (the previous financial year) as their base year rather than 2008-09, and the reference year is 2009-10.
- **24** A change in the reference year changes levels but not growth rates for all periods. A change in the base year can result in revisions, small in most cases, to growth rates for the last year.
- 25 Chain volume measures are not generally additive. In other words, component chain volume measures do not, in general, sum to a total in the way original current price components do. For capital expenditure data, this means that the original chain volume estimates for the states will not add to total capital expenditure for Australia. In order to minimise the impact of this, the ABS uses the latest base year as the reference year. By adopting this approach, additivity does exist for the quarters following the reference year and non-additivity is relatively small for the quarters in the reference year and those immediately preceding it. For further information on chain volume measures refer to Information Paper: Introduction of Chain Volume Measures in the Australian National Accounts (cat. no. 5248.0)

DERIVATION AND
USEFULNESS OF
REALISATION RATIOS

- **26** Once actual expenditure for a financial year is known, it is useful to investigate the relationship between each of the prior six estimates of expenditure for that financial year and the actual expenditure (see page 6 for an explanation of the derivation of the seven estimates). The resultant realisation ratios (subsequent actual expenditure divided by expected expenditure) then indicate how much expenditure was actually incurred against the amount expected to be incurred at the various times of reporting. Realisation ratios can also be formed separately for three or six month expectations as well as the 12 month E2 estimates or combinations of estimates containing at least some expectation components (e.g. six months actual and six months expected expenditure).
- 27 Realisation ratios provide an important tool in understanding and interpreting expectation statistics for future periods. The application of realisation ratios enables the adjustment of expectation data for known under (or over) realisation patterns in the past and hence provides a valid basis for comparison with other expectation data and actual expenditure estimates. Once this has been done the predictions can be more validly compared with each other and with previously derived estimates of actual expenditure for earlier years. For example, if one wished to make a prediction about actual expenditure for 2011–12 based on the June 2011 survey results and compare this with 2010-11 expenditure, it is necessary to apply the relevant realisation factors to the expectation to put both estimates on the same basis.
- **28** There are many ways in which realisation ratios can be applied to make predictions of actual expenditure for a future period. A range of realisation ratios for both type of asset and industry estimates is provided in tables 5 and 6.
- 29 In using realisation ratios to adjust expectations data, attention should be paid to the range of values that has occurred in the past. A wide range of values is indicative of volatility in the realisation patterns and hence greater caution should be exercised regarding the predictive value of the expectation, even after adjustment by application of realisation ratios. This is particularly the case with the early 12 month expectations for the following financial year collected in the December and March surveys.

RELIABILITY OF THE ESTIMATES

- **30** Estimates provided in this publication are subject to non-sampling and sampling errors. The most common way of quantifying sampling error is to calculate the standard error for the published estimate. Details of standard errors are on pages 35 and 36 of this publication.
- **31** Estimates that have an estimated relative standard error between 10% and 25% are annotated with the symbol '^'. These estimates should be used with caution as they are subject to sampling variability too high for some purposes. Estimates with an RSE between 25% and 50% are annotated with the symbol '*', indicating that the estimate should be used with caution as it is subject to sampling variability too high for most practical purposes. Estimates with an RSE greater than 50% are annotated with the symbol '**' indicating that the sampling variability causes the estimates to be considered too unreliable for general use. These annotations have only been applied to estimates from the March quarter 2009.
- **32** Non-sampling errors may arise as a result of errors in the reporting, recording or processing of the data and can occur even if there is a complete enumeration of the population. These errors can be introduced through inadequacies in the questionnaire, treatment of non-response, inaccurate reporting by respondents, errors in the application of survey procedures, incorrect recording of answers, and errors in data entry and processing.
- **33** Estimates for the latest quarter presented in this publication are considered preliminary and revised estimates will be released with the next issue. As discussed in Paragraphs 37 to 42 below, seasonally adjusted and trend estimates are also subject to revision as data are revised and more data become available.
- **34** It is difficult to measure the size of non-sampling errors. However, every effort is made in the design of the survey and development of survey procedures to minimise their effects. In addition, respondents may have difficulties in allocating to the appropriate state(s) expenditure on some equipment items such as mobile assets (e.g. aircraft, bulk oil carriers, satellites, off-shore drilling platforms and large computer installations supporting a national network). Where such difficulties exist expenditure is allocated to the state of the businesses' head office or, in the case of aircraft, is allocated across states in proportion to the likely use of the asset.
- 35 The Australian equivalents to International Financial Reporting Standards (AIFRS) were progressively implemented in Australia from 1 January 2005. As a result, a number of items in the financial accounts of Australian businesses were affected by changed definitions which in turn impacted upon both Income Statements and Balance Sheets. A range of ABS economic collections source data from financial accounts of businesses and use those data to derive economic statistics. There have been no changes in the associated economic definitions.
- **36** After monitoring data items in the immediate years following March quarter 2005 it was concluded that most affected published data series were impacted by data breaks but that the magnitude of such breaks could not be determined without imposing disproportionate load upon data providers to ABS surveys and other administratively collected data.

SEASONAL ADJUSTMENT

37 The quarterly original actual new capital expenditure series in this publication are affected in varying degrees by seasonal influences. The seasonal adjustment process estimates and removes the effects of normal seasonal variations from the original series so that the effects of other influences can be more easily recognised.

SEASONAL ADJUSTMENT continued

- **38** In the seasonal adjustment process, account has been taken of normal seasonal factors (e.g. increase in June quarter capital expenditure due to the impending end of the financial year) to produce the seasonally adjusted estimates. Particular care should be taken in interpreting quarterly movements in the seasonally adjusted estimates because seasonal adjustment does not remove the effect of irregular or non-seasonal influences (e.g. change in interest rates) and reflects the sampling and other errors to which the original estimates are subject.
- 39 The revision properties of the seasonally adjusted and trend estimates can be improved by the use of Autoregressive Integrated Moving Average (ARIMA) modelling. The Survey of Private New Capital Expenditure uses ARIMA modelling where appropriate for individual time series. ARIMA modelling relies on the characteristics of the series being analysed to project future period data. The projected values are temporary, intermediate values that are only used internally to improve the estimation of the seasonal factors. The projected data do not affect the original estimates and are discarded at the end of the seasonal adjustment process. The ARIMA model is reassessed each year as part of the annual reanalysis of the seasonal adjustment parameters. Following the most recent annual reanalysis, 80% of eligible series use ARIMA modelling. For more information on the details of ARIMA modelling see Feature article: Use of ARIMA modelling to reduce revisions in the October 2004 issue of *Australian Economic Indicators* (cat. no. 1350.0).
- **40** Seasonally adjusted estimates by asset type for Tasmania, Northern Territory and Australian Capital Territory are not separately available because of the high sampling variability associated with them. They are included in totals for Australia and while a combined residual can be derived, the measure should not be considered reliable.
- **41** The trend estimates are derived by applying a 7-term Henderson moving average to the seasonally adjusted estimates. The 7-term Henderson moving average is symmetric, but as the end of a time series is approached, asymmetric forms of the moving average are applied. The asymmetric moving average has been tailored to suit the particular characteristics of individual series and enable trend estimates for recent quarters to be produced. Estimates of the trend will be improved at the current end of the time series as additional observations become available. This improvement is due to the application of different asymmetric moving averages for the most recent three quarters. As a result of the improvement, revisions to the trend estimates will generally be observed for the most recent three quarters.
- **42** There may also be revisions because of changes in the original estimates. As a result of these revisions, the seasonally adjusted and trend estimates will also be revised. For further information, see *Information Paper: A Guide to Interpreting Time Series Monitoring Trend, An Overview* (cat. no. 1349.0) or contact the Assistant Director, Time Series Analysis on Canberra (02) 6252 6345 or email <time.series.analysis@abs.gov.au>.

DESCRIPTION OF TERMS

TREND ESTIMATES

- **43** A description of the terms used in this publication is given below:
- **44** *New capital expenditure* refers to the acquisition of new tangible assets either on own account or under a finance lease and includes major improvements, alterations and additions. In general, this is expenditure charged to fixed tangible assets accounts excluding expenditure on second hand assets unless these are imported for the first time.

DEGORII III

- **45** Some estimates are dissected by type of asset:
 - Buildings and structures: Includes industrial and commercial buildings, houses, flats, home units, water and sewerage installations, lifts, heating, ventilating and similar equipment forming an integral part of buildings and structures, land development and construction site development, roads, bridges, wharves, harbours, railway lines, pipelines, power and telephone lines. Also includes mine development (e.g. construction of shafts in underground mines, preparation of mining and quarrying sites for open cut extraction and other developmental operations primarily for commencing or extending production). Excludes purchases of land, previously occupied buildings and speculatively built projects intended for sale before occupation:
 - Equipment, plant and machinery: Includes plant, machinery, vehicles, electrical apparatus, office equipment, furniture, fixtures and fittings not forming an integral part of buildings, durable containers, special tooling, etc. Also includes goods imported for the first time whether previously used outside Australia or not.

COMPARISON WITH NATIONAL ACCOUNTS AND OTHER ABS STATISTICS

- **46** The statistics for new capital expenditure shown in this publication differ from estimates of private gross fixed capital expenditure shown in the Australian National Accounts for the following reasons:
- National Accounts estimates incorporate data from other sources as well as information from the new capital expenditure survey. For example, annual estimates for capital expenditure on 'machinery and equipment' are based on the ABS' annual Economic Activity Survey combined with data from the Australian Taxation Office. Quarterly estimates are interpolated between and extrapolated from the annual estimates using a variety of indicators including this survey. The ABS's quarterly Building Activity Survey and Engineering Construction Survey are the main sources for estimating the National Accounts dwellings and other buildings and structures items.
- National Accounts estimates include capital expenditure by all private businesses including units classified to agriculture, forestry and fishing, education, and health and community services industries and capital expenditure on dwellings by households. Data for these sectors are excluded from this publication.
- National Accounts estimates include the value of work done on speculative construction projects as the work is put into place. The statistics in this publication, however, include full value of the speculative projects as new capital expenditure of the purchases (if in scope), when the project is sold.
- National accounts estimates of gross fixed capital formation relate to acquisitions less disposals of new or existing fixed assets, whereas the survey figures are acquisitions of new fixed tangible assets only.
- **47** For a more detailed explanation of the concepts and methods used in compiling the National Accounts estimates see *Australian National Accounts: Concepts, Sources and Methods* (cat. no. 5216.0).
- 48 The estimates of capital expenditure on buildings and other structures will differ with estimates of Construction activity published in Construction Work Done, Australia, Preliminary (cat. no. 8755.0). The latter publication presents estimates of building and engineering construction work collected by the Building Activity Survey and the Engineering Construction Survey. Estimates of construction activity are based on the value of actual work done during the quarter of individual building or construction jobs by builders, and do not necessarily equate to capitalisation of this work by the builders' eventual clients. Estimates of capital expenditure in this publication are based on data reported by businesses (that is, the builders' clients) from their financial or management accounts for purchases of buildings and structures.

RELATED PUBLICATIONS

- **49** Users may also wish to refer the following publications:

- **50** Current publications and other products released by the ABS are available from the Statistics View. The ABS also issues a daily Release Advice on the web site which details products to be released in the week ahead.

ABS DATA AVAILABLE ON REQUEST

51 In addition to the data contained in this publication, more detailed industry and state information may be made available on request, the cost for such a service being dependent upon the amount of data requested. For example, data are generally available at the ANZSIC subdivision (2 digit) level.

ABS WEBSITE

52 The ABS website contains most of the data included in this publication but with a longer time series. In addition to the series in this publication, data for Manufacturing Subdivisions and State by Industry data are also available.

ACKNOWLEDGMENT

53 ABS publications draw extensively on information provided freely by individuals, businesses, governments and other organisations. Their continued cooperation is very much appreciated; without it, the wide range of statistics published by the ABS would not be available. Information received by the ABS is treated in strict confidence as required by the *Census and Statistics Act 1905*.

LEVEL ESTIMATES

INTRODUCTION

The estimates in this publication are based on a sample drawn from units in the surveyed population. Because the entire population is not surveyed, the published estimates are subject to sampling error. The most common way of quantifying such sampling error is to calculate the standard error for the published estimate or statistic.

EXAMPLE OF USE

The following example illustrates how to use the standard error to interpret a level estimate.

Let us say that the published level estimate for total capital expenditure is \$35,170m and the calculated standard error in this case is \$393m. The standard error is then used to interpret the level estimate of \$35,170m.

For instance, the standard error of \$393m indicates that:

- There are approximately two chances in three that the real value falls within the range \$34,777m to \$35,563m ($35,170m \pm $393m$)
- There are approximately 19 chances in 20 that the real value falls within the range \$34,384m to \$35,956m (35,170m \pm \$786m)

The real value in this case is the result we would obtain if we could enumerate the total population.

The following table shows the standard errors for March Quarter 2012 estimates.

| | Buildings and Structures | Equipment, Plant and Machinery | Total |
|---|--------------------------------|--------------------------------------|-------|
| | \$m | \$m | \$m |
| Mining | 38 | 65 | 75 |
| Manufacturing | 52 | 87 | 99 |
| Electricity, Gas, Water and Waste Services | 1 | 76 | 75 |
| Construction | 7 | 191 | 191 |
| Wholesale Trade | 62 | 56 | 82 |
| Retail Trade | 9 | 47 | 50 |
| Transport, Postal and Warehousing | 60 | 84 | 112 |
| Information Media and Telecommunications | _ | 11 | 11 |
| Financial and Insurance Services | 8 | 21 | 24 |
| Rental, Hiring and Real Estate Services | 167 | 172 | 226 |
| Professional, Scientific and Technical Services | 80 | 72 | 112 |
| Other Selected Services | 67 | 90 | 114 |
| Total | 206 | 332 | 393 |
| New South Wales | 79 | 126 | 153 |
| Victoria | 82 | 93 | 120 |
| Queensland | 151 | 208 | 252 |
| South Australia | 4 | 77 | 78 |
| Western Australia | 102 | 150 | 196 |
| Tasmania | 12 | 32 | 37 |
| Northern Territory | 10 | 17 | 20 |
| Australian Capital Territory | 5 | 6 | 8 |
| Australia | 206 | 332 | 393 |

nil or rounded to zero (including null cells)

MOVEMENT ESTIMATES

EXAMPLE OF USE

The following example illustrates how to use the standard error to interpret a movement estimate.

Let us say that one quarter the published level estimate for total capital expenditure is \$40,012m and the next quarter the published level estimate is \$35,170m.

In this example the calculated standard error for the movement estimate is \$424m. The standard error is then used to interpret the published movement estimate of -\$4,842m.

For instance, the standard error of \$424m indicates that:

- There are approximately two chances in three that the real movement over the two quarter period falls within the range -\$5,266m to -\$4,418m (- $$4,842m \pm $424m$)
- There are approximately nineteen chances in twenty that the real movement falls within the range -\$5,672m to -\$3,976m (-\$4,824m \pm \$848m)

The following table shows the standard errors for March Quarter 2012 movement estimates.

| | 5 " " . | | |
|---|------------------|-------------------------|-------|

APPENDIX 2 FEATURE ARTICLE

ATTACHMENT TO FEATURE
ARTICLE

A summary of the ABS Publications 4 which capture mining investment is documented below:

| Publication | Summary | Scope |
|--|---|--|
| 8412.0 – Mineral and Petroleum Exploration | Quarterly estimates of capitalised and non-capitalised mineral and petroleum exploration expenditure, including information about metres drilled for mineral exploration. Data is collected on the exploration and evaluation activities of both new and existing deposits. | Sample of private enterprises engaged in exploration activity within Australia, Australian waters or in the Joint Petroleum Development Area (JPDA). |
| 5625.0 – Private New Capital Expenditure and Expected Expenditure (Capex) | Quarterly estimates of actual and expected capital expenditure on equipment, buildings and structures, reported on a change of ownership basis. Structures and fixed equipment deemed integral to the structure are classified as buildings while all other equipment (mobile equipment) is classed under machinery and equipment. | Sample of private businesses who report capital expenditure for all Australian-based activities. |
| 5302.0 – Balance of Payments and International Investment Position (BoP) | Quarterly estimates of imports of capital goods: equipment, buildings and structures, are included in the Balance of Goods Debits component 'Capital Goods n.e.s'. Adjustments are made to take account of any progress payments for equipment, buildings and structures being constructed overseas and to be imported in future quarters, in line with asset recognition on a change of ownership basis. | Goods and services components are an aggregation of the monthly figures as released in the 5368.0 publication (last month of quarter). There should not be any discrepancies. However, due to timing issues, preliminary estimates for adjusted mining programs cannot typically be captured and reported by the release of the last month of quarter 5368.0, which therefore requires revisions to the goods debits estimates during processing of the quarterly figures. |
| 5439.0 – International Merchandise Imports (Imports) | Monthly statistics produced using Customs data. The full value of imported capital equipment is captured as it is imported into Australia on a merchandise trade (i.e. cif) basis. 5439.0 provides a preliminary estimate of BoP basis goods debits figures and is a useful indicator for the monthly trade figures. However, the estimates are subject to revision before the release of the 5368.0. | Monthly import records are provided as administrative data from the Customs and Border Protection Service. Reported data in the tables are on a 'merchandise trade' basis, i.e. included at the time of clearance of import declarations. Capital imports, buildings, structures, etc. will therefore not be reported until items are physically imported and processed by Customs. |

APPENDIX 2 FEATURE ARTICLE continued

| Publication | Summary | Scope |
|--|--|--|
| 8762.0 – Engineering Construction Activity (ECA) | Quarterly estimates of the value of engineering construction activity undertaken in Australia, for work done on prime contract or own use only. The value of an imported structure is captured in the 'work to be done' figures until it is imported and installed, at which point the full value plus installation costs are recognised in the 'work done' figure for the quarter. This can result in significant volatility in the ECA series as opposed to Capex and BoP. | Data are collected from both the public and private sector. Information is obtained from the contractors involved in the project. |
| 8752.0 – Building Activity Survey (BAS) | Quarterly estimates of building activity including the construction of new buildings and alterations and/or additions to existing buildings. Buildings are classified according to their intended major function, and the type of work involved. | Data are collected from the public and private sectors. Non-building activity is captured in the Engineering Construction Activity publication. Information is obtained from the contractors involved in the project. |
| 5368.0 – International Trade in Goods and Services (ITGS) | Monthly estimates of progressive payments accounting for capital expenditure on large-scale mining programs are included in the Balance of Payments goods debits component capital goods n.e.s. Progressive payments attempt to capture the actual transfer of ownership between residents and non-residents. | Monthly estimates are compiled using merchandise trade data and adjusted to meet BoP standards, primarily the recognition of change of ownership. |
| 5206.0 – Australian National Accounts: National Income, Expenditure and Product (National Accounts) | This quarterly publication includes estimates of gross fixed capital formation (GFCF) as part of total expenditure. GFCF measures the value of acquisitions less disposals of new or existing fixed assets. Most capital expenditure is recorded under private non-dwelling construction and machinery and equipment. | The quarterly estimates are extrapolated from the annual National Accounts estimates (5204.0), using various indicators. The quarterly machinery and equipment figures are estimated using data from Capex; while buildings and structures data is based on ECS and BACS information, adjusted using BoP data to account for progressive change in ownership of structures to be imported. |
