CHANGES IN THIS ISSUE

There are a number of significant changes in this issue. This is the first release of *Australian System of National Accounts* (5204.0) based on the new international standards *System of National Accounts 2008* (SNA08) and *Balance of Payments and International Investment Position Manual, sixth edition* (BPM6), and to the new industry classification *Australian and New Zealand Standard Industrial Classification, 2006* (ANZSIC06) and *Standard Economic Sector Classification of Australia, 2008* (SESCA08). These changes have resulted in revisions to the entire national accounts time-series.

To inform users of these changes, a number of information papers have been released in the lead up to this issue:

- For detail on the new industry classification see *Australian and New Zealand Standard Industrial Classification 2006* (cat. no. 1292.0)
- For discussion of the new standards see *Information Paper: Introduction of revised international standards in ABS economic statistics in 2009, 2007* (cat. no. 5310.0.55.001)
- For indicative impacts of these changes and discussion of new methodologies see *Information Paper: Implementation of new international standards in ABS National and International Accounts, September 2009* (cat. no. 5310.0.55.002)
- Estimates in this issue supersede the indicative estimates in the above paper.
- For the new table structures and identifiers see *Information Paper: Product changes to Australian System of National Accounts following revisions to international standards, 2009* (cat. no. 5204.0.55.005)

Analysis of productivity growth cycles presented in past issues has been excluded temporarily. See page 10 for more details.

The balance sheet estimates for Weapon systems are confidentialised due to the estimates requiring some further quality assurance work. For information on the methodology see Chapter 7, cat. no. 5310.0.55.002 mentioned above. As a consequence of suppressing the balance sheet estimates of Weapon systems it has been necessary to consequentially suppress other series in the affected tables to preserve confidentiality.

The changes in this issue will be reflected in the upcoming releases of the *Australian National Accounts: State Accounts, 2008-09* (cat. no. 5220.0), and the *Australian National Accounts: National Income, Expenditure and Product, Sep 2009* (cat. no. 5206.0) and *Australian National Accounts: Financial Accounts, Sep 2009* (cat. no. 5232.0).

FORTHCOMING NATIONAL ACCOUNTS RELEASES

For information on related national accounts publications and papers to be released in the next three months see the section Related National Accounts Releases on page 15.

NEXT ISSUE

The next issue of this product will be released in November 2010.

Brian Pink
Australian Statistician

ANALYSIS OF RESULTS

OVERVIEW OF AUSTRALIAN ECONOMY IN 2008–09

The Australian economy expanded by 1.1% in 2008–09. Real net national disposable income grew more strongly than GDP (up 3.1% in 2008–09), reflecting strong growth in the Terms of trade (up 6.9%). This is the tenth consecutive year of improvements in the Terms of trade. It has increased 75.1% since 1998–99.

The Household saving ratio was 4.5% for 2008–09, up from 0.5% in 2007–08. The index of Market sector¹ labour productivity increased by 0.3%.

The major contributor to GDP growth in 2008–09 was Gross fixed capital formation, increasing 3.9% and contributing 1.1 percentage points. Final consumption expenditure contributed 0.9 percentage points to GDP growth, with growth of 3.0% in Government final consumption expenditure and 0.8% in Household final consumption expenditure. Total private gross fixed capital formation increased 3.3%, contributing 0.8 percentage points to GDP growth in 2008–09, driven by growth in Machinery and equipment investment (up 5.4%) and Non-dwelling construction (up 7.9%). The major detractor from GDP growth was changes in inventories. The level of inventories fell \$6.4 billion through 2008–09, detracting 1.1 percentage points from GDP growth.

From an industry perspective, declines were recorded in the value added of a number of industries in 2008–09 including Manufacturing (–6.2%), Transport, postal and warehousing (–0.9%), Financial and insurance services (–1.5%) and Administrative and support services (–5.6%). These declines were more than offset by increases in a range of industries including Agriculture, forestry and fishing (16.2%), Mining (2.2%), Electricity, gas, water and waste services (5.0%), Wholesale trade (1.6%) and Retail trade (1.4%).

In the Income components of GDP in 2008–09, there was growth in Compensation of employees of 5.6%, and growth in Gross operating surplus (GOS) of 8.2%. The growth in GOS was driven by growth in Non-financial corporations (9.4%) while Financial corporations GOS growth was relatively weak (1.7%).

The annual movements for the chain price indexes for GDP and Domestic final demand were 4.8% and 3.5% respectively. The gap in price movements is mainly due to changes in the prices paid for imports and the prices received for exports.

The Net worth of Australia is defined as the difference between Total assets and Total liabilities. Australia's Net worth at 30 June 2009 was estimated to be \$6,901.5 billion in current prices, an increase of \$164 billion (2.4%) since 30 June 2008.

GDP

Following the fall in GDP in volume terms in 1990–91 and a flat result in 1991–92, there have been 17 years of consecutive growth. In 2008–09 GDP increased by 1.1%. This is the lowest growth since 1991–92. For some analytical purposes it is important to understand the impact of population growth on movements in GDP. In 2008–09, GDP per capita decreased by 0.8%. This is the first time GDP per capita has declined since 1991–92. Growth rates in GDP and GDP per capita are presented in the following graph.

¹ The market sector of the economy consists of the following industries : Agriculture, forestry & fishing, Mining, Manufacturing, Electricity, gas, water & waste services, Construction, Wholesale trade, Retail trade, Accommodation & food services, Transport, postal & warehousing, Information media and telecommunications, Finance & insurance services, Rental, hiring & real estate services, Professional, scientific & technical services, Arts and recreation services and Other services.

ANALYSIS OF RESULTS *continued*

GDP *continued*

PERCENTAGE CHANGE, Volume measures

RNNDI

Another measure of national economic activity is Real net national disposable income (RNNDI). This measure adjusts the volume measure of GDP for the Terms of trade effect, Real net income from overseas and Consumption of fixed capital (depreciation). In 2008–09, RNNDI (up 3.1%) grew more strongly than GDP, reflecting strong growth of 6.9% in the Terms of trade (see International Trade, page 12).

PERCENTAGE CHANGE, Volume measures

Household saving

The Household saving ratio is another key aggregate in the national accounts. Household saving cannot be measured directly. It is calculated by deducting Household final consumption expenditure from Household net disposable income.

The Household saving ratio began trending downwards in the mid 1970's, and was negative from 2003–04 to 2004–05, implying that households spent more than they earned during that period. In 2005–06 the Household saving ratio became positive again (0.4%) and this has continued to 2008–09, with the ratio at 4.5% in 2008–09.

Caution should be exercised in interpreting the Household saving ratio in recent years, because major components of household income and expenditure may be subject to significant revisions.

ANALYSIS OF RESULTS *continued*

Household saving continued

HOUSEHOLD SAVING RATIO, Current prices

EXPENDITURE ON GDP

Final consumption expenditure increased 1.3% in 2008–09, and contributed 0.9 percentage points to GDP growth.

Household final consumption expenditure (HFCE) increased 0.8% and contributed 0.4 percentage points to GDP growth in 2008–09. In recent years household consumption has contributed between 1.7 percentage points and 3.0 percentage points to GDP growth. The main contributor to growth in HFCE in 2008–09 was Rent and other dwelling services (up 2.7%). See Table 53 for more details.

PERCENTAGE CHANGE, Volume measures

Government final consumption expenditure increased 3.0% in 2008–09. It contributed 0.5 percentage points to growth in GDP. In recent years, Government final consumption has contributed between 0.3 percentage points and 0.7 percentage points to GDP growth.

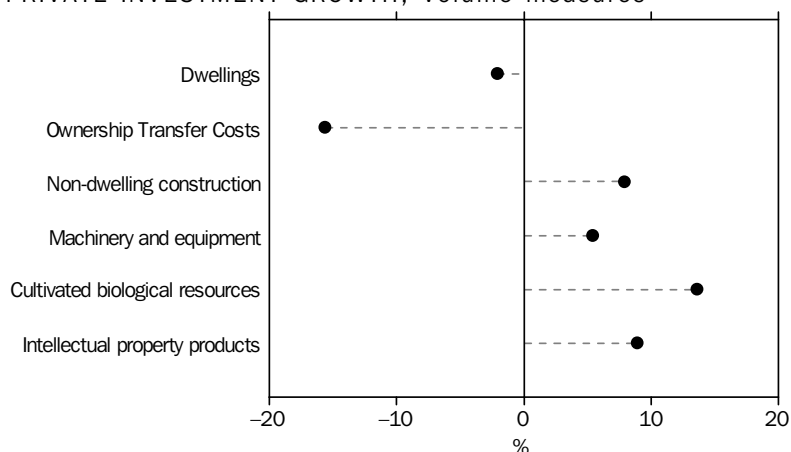

Growth in Private investment increased 3.3% in 2008–09, compared to a 10.7% increase in 2007–08. Private investment contributed 0.8 percentage points to GDP growth, down from 2.4 percentage points in 2007–08. Investment in Machinery and equipment, and Non-dwelling construction increased 5.4% and 7.9%, respectively, and contributed 0.4 and 0.5 percentage points to growth to GDP, respectively.

ANALYSIS OF RESULTS *continued*

EXPENDITURE ON GDP

continued

PRIVATE INVESTMENT GROWTH, Volume measures

Investment in Alterations and additions fell 4.3% in 2008–09, while New and used dwellings fell 0.1%. Total dwelling investment fell 2.1% and detracted 0.1 percentage points from GDP growth.

Public gross fixed capital formation increased 8.7% in 2008–09 after increasing 7.9% in 2007–08. Investment by public corporations rose 18.3% and investment by general government increased by 3.4%. Public investment contributed 0.4 percentage points to GDP growth in both 2007–08 and 2008–09.

Growth in the domestic economy as measured by Gross National Expenditure (GNE)² showed an increase in 2008–09 of 1.1%, the same growth rate as GDP. The total expenditure in 2008–09 by Australian residents on final goods and services showed an increase of 1.1%. Over the past seven years GNE has grown faster than GDP. The difference between GNE and GDP is due to a positive contribution from Net exports and a negative contribution from the Statistical discrepancy. For more information on net exports please refer to the section on International Trade, page 12.

PERCENTAGE CHANGE, Volume measures

² The total expenditure within a given period by Australian residents on final goods and services.

ANALYSIS OF RESULTS *continued*

INDUSTRY

In 2008–09, the industry with the largest share of GDP (at basic prices excluding ownership of dwellings) was Finance and Insurance services with a share of 12%. Manufacturing was the second largest industry with a share of 10%. Prior to 2006–07 Manufacturing was the largest industry. Mining has increased as a share of GDP from 5% throughout the 1990's to 8% in 2008–09, it is now equal with construction as the third largest industry.

INDUSTRY SHARE OF GVA, 1993–94 and 2008–09

GVA at basic prices of market sector industries as a proportion of total GVA basic prices.

INCOME FROM GDP

The wages share of total factor income remained relatively stable during the 1990's. The highest recorded value of the wages share of total factor income was 62.7% in 1974–75. In more recent times, the wages share has been trending down to be 54.3% in 2007–08 and 54.0% in 2008–09.

WAGES SHARE OF TOTAL FACTOR INCOME

The profits share (based on Gross operating surplus for Financial and Non-financial corporations) of Total factor income reached 27.7% in 2008–09 and this represents the highest share recorded since 1959–60. The profits shares recorded since the late 1980's are at a distinctly higher level than those at any time since 1959–60. The profit share measure should not be interpreted as a direct measure of 'profitability' for which it is necessary to relate profits to the level of capital assets employed.

ANALYSIS OF RESULTS *continued*

INCOME FROM GDP

continued

PROFITS SHARE OF TOTAL FACTOR INCOME

National net saving was positive in 2008–09 at \$98.5 billion or 7.9% of GDP. This was the highest proportion of GDP since 1989–90. Household net saving generally increased from 1959–60 to a peak in 1973–74 of 12.2%. The series then gradually decreased, eventually reaching its lowest point at –0.9% in 2004–05 (a net saving level of –\$8.1 billion). Since 2004–05 Household net saving has again been increasing and in 2008–09 household saving was 2.6%, the highest since 1996–97. Household net saving was \$32.8 billion.

When analysing household saving it is useful to consider Household net worth, currently at \$5,100.5 billion at 30 June 2009. For more information please refer to Balance Sheets, page 10.

In 2008–09, Financial corporations net saving was 3.6% of GDP (\$45.5 billion). General government net saving represented –0.6% of GDP (–\$7.86 billion) and net saving for Non-financial corporations represented 2.2% of GDP (\$28.1 million).

NET SAVING, Relative to GDP, Percentage change

Prices in the National Accounts

Chain Price Indexes are used to measure prices changes. The annual movements in GDP and Domestic final demand chain price indexes for 2008–09 were 4.8% and 3.5% respectively. This gap in price movements was mainly caused by changes in prices paid for imports and the prices received for exports. Prices of Exports of goods and services showed an increase of 19.8%, driven by increases in Coal (up 120.1%), Metal Ores (up

ANALYSIS OF RESULTS *continued*

Prices in the National Accounts continued

23.3%) and Non-monetary Gold (up 28.9%) in 2008–09. This was partly offset by a fall in metals (down 18.4%).

Prices of Imports of goods and services showed an increase of 12.1%. Imported consumption goods prices rose 12.0%, driven by Consumption Goods nes (up 11.2%), Clothing and footwear (up 24.5%) and Food & Beverages (up 14.4%). Imported capital goods prices rose 14.3%, driven by Machinery (up 19.1%) and Capital Goods nes (up 13.6%). Imported Intermediate goods prices rose (up 9.9%), driven by Processed Industrial Supplies (up 19.3%), Parts for Other Capital Goods (up 13.3%) and Chemicals (up 30.6%). Offset by a fall in Fuel and lubricants (down 8.0%).

EXPORTS, Chain price indexes, Reference year: 2007–08 = 100.0

The chain price indexes for the other major components of GDP, Household final consumption expenditure and Gross fixed capital formation, showed increases of 4.2% and 1.9% during 2008–09. See Table 7 for more details.

PRODUCTIVITY

The Multifactor productivity (MFP) estimates presented in Table 22 have been produced for the group of 12 ANZSIC06 industries (divisions A to K and R) which is the grouping nearest to the market sector as defined in ANZSIC93 (divisions A to K and P).

This coverage of MFP measurement deviates from the revised definition of 'market sector' which is adopted with this release of ASNA. Expanding the definition of the 'market sector' to include new industries reflects the growing influence of services industries in the Australian economy. Experimental MFP estimates for the expanded market sector definition (Divisions A to N, R and S) will be published in the productivity datacube *Experimental estimates of industry multifactor productivity, 2008-09* (5260.0.55.002), due to be released in January 2010. These indexes will commence from 1994–95, coinciding with the availability of improved output indicators for the four new industry divisions that have been added to the market sector.

The MFP estimates in this issue reflect SNA08 changes. The main SNA08 changes impacting on MFP measures the capitalisation of research and development, cultivated biological resources (comprising orchards, plantations and vineyards combined with livestock fixed assets) and ownership transfer costs related to non-dwelling construction.

ANALYSIS OF RESULTS *continued*

PRODUCTIVITY *continued*

The index of selected industry Multifactor productivity (MFP) on an hours worked basis fell 2.7% in 2008–09, reflecting a 0.3% decrease in Gross value added for the selected industries and an increase of 2.5% in total labour and capital inputs. Hours worked in the selected industries fell 0.1% in 2008–09, resulting in a labour productivity decline of 0.3%. Capital services continued to grow strongly in 2008–09, recording a growth rate of 5.2%. The increase in Capital services, combined with a decrease in Gross value added, resulted in a fall of 5.3% in capital productivity.

Productivity growth cycles

The analysis of productivity growth cycles (see Glossary) presented in past issues of the ASNA has been excluded temporarily. The main reason is that some historical ANZSIC93 movement indicators are not suitable for industries that are growing or declining at different rates according to the new industry classifications. The ABS is currently improving these indicators so that MFP growth cycles can be reinstated in the next release. In the interim, users interested in the long time span productivity measures commencing 1964–65 can access these from the ABS web in the 'Past and future releases' tab for this issue.

BALANCE SHEETS

Australia's Net worth at the end of June 2009 was estimated to be \$6,901.5 billion in current prices, an increase of \$164.0 billion (up 2.4%) since 30 June 2008. Major contributions to this increase came from Subsoil assets (up \$224.2 billion) and Machinery and equipment (up \$77.9 billion). These were offset by holdings of Shares and other equity (down \$75.7 billion), and value of Land (down \$140.2 billion). Transactions in assets (both capital and financial) and liabilities contributed \$117.8 billion to the change in Net worth, compared to almost no change in holding gains. The last time transactions were greater than holding gains was in 1991–92.

Australia's Net international investment position as at 30 June 2009 was a Net foreign liability of \$714.2 billion, up \$52.2 billion (up 7.9%) on the position a year earlier.

Australia's real net worth rose 2.3% over the year ended 30 June 2009, from 2.8% growth for the previous year.

PERCENTAGE CHANGE IN REAL NET WORTH—as at 30 June

ANALYSIS OF RESULTS *continued*

BALANCE SHEETS *continued*

Balance sheets are produced in current prices for each institutional sector in the economy. Of these, the household sector had the highest net worth at \$5,100.5 billion at 30 June 2009, a decrease of \$238.5 billion (down 4.5%) from the previous year. Transactions in assets and liabilities during 2009 were \$85.2 billion, compared to a loss on holding gains of \$347.9 billion.

INVESTMENT AT CURRENT PRICES

The level of Investment is about a quarter of the level of the annual GDP. Understanding which sectors are investing and expanding their future economic capacity provides an insight into the underlying dynamics within the economy.

As a proportion of GDP, investment by Non-financial corporations fell during the 1970's and was reasonably stable up to the 1990's. It has generally been above 10% and in 2008–09 investment by Non-financial corporations was 15.2% of GDP. Household investment as a proportion of GDP declined steadily between 1959–60 and 1973–74 but has since remained steady at around 10% of GDP. In 2008–09 the ratio to GDP was 9.8%. General government investment as a proportion of GDP peaked at 5.4% in 1967–68 and has generally fallen since then. It was 3.2% of GDP in 2008–09. The highest ever level of Financial corporations investment, expressed as a proportion of GDP, was recorded in 1988–89 (2.0%). It has generally fallen since then and was 0.7% of GDP in 2008–09.

LEVEL OF INVESTMENT, Relative to GDP, Percentage change

In terms of the different asset types, in 2008–09 private Machinery and equipment investment represented the largest percentage share at 25.5% of total gross fixed capital formation, compared to 23.8% for private Non-dwelling construction.

ANALYSIS OF RESULTS *continued*

INVESTMENT AT CURRENT PRICES *continued*

PRIVATE INVESTMENT, By type of asset, Relative to GFCF

Over the last 10 years, private Machinery and equipment has fallen from around 27% to 25.5% in 2008–09 as a share of total gross fixed capital formation (GFCF). The relative shares of investment in other asset types have remained relatively stable over the last 10 years, except non-dwelling construction which increased from 18.5% to 23.8% and dwellings which decreased from 21.9% to 19.1%.

INTERNATIONAL TRADE

The growing importance of international trade to the Australian economy is illustrated by the following graph which shows the ratios of exports and imports of goods and services to GDP in current prices since 1959–60. In 2008–09 the imports ratio was 22.3% and the exports ratio was 22.7%.

PERCENTAGE CHANGE, Current prices, Relative to GDP

Since 2000–01 volumes of Imports have grown more strongly, up 88.8%, compared to 16.5% growth in volume of Exports. The slower growth in Exports was mainly driven by weak growth in rural goods exported. Over the past eight years, rural goods exported decreased by 9.7%. The decrease was largely driven by a fall in exports of cereal grains and cereal preparations, down 14.1%.

ANALYSIS OF RESULTS *continued*

INTERNATIONAL TRADE

continued

While in volume terms Imports have been growing faster than Exports, the prices received for Exports have been growing faster than the prices paid for Imports. The Terms of trade represents the relationship between the prices of exports and imports. An increase (decrease) in the Terms of trade reflects Export prices increasing (decreasing) at a faster rate than Import prices.

The strong growth in Terms of trade over the past eight years reflected over 61.1% growth in Export prices and a fall in Import prices of 1.6%. See Prices in National Accounts on page 8 for more details on Export and Import prices. In 2008–09, the Terms of trade increased by 6.9%.

TERMS OF TRADE, (2007–08 = 100.0)

Net exports represent the difference between Exports and Imports. Net exports detract from GDP growth when the change in the volume of Imports has been greater than the change in the volume of Exports. Since 2000–01 Net exports have detracted around 7.1% from GDP growth, in most part from increasing Imports.

Since 2000–01, when the contribution of Net exports to GDP growth was 1.8%, the contribution of Net exports has been slowly trending downwards, reaching –2.0% in 2007–08, with a turnaround in 2008–09 of a positive contribution of 1.1%.

NET EXPORTS CONTRIBUTION TO GROWTH, Chain volume measures

ANALYSIS OF RESULTS *continued*

INTERNATIONAL TRADE

continued

In addition to the trade in goods and services, the flow of funds between Australia and overseas is an important component of the relationship with the rest of the world. Australia has generally been a net borrower of funds from overseas. In the national accounts, this situation is reflected by a negative value for net lending to non-residents. The last time Australia was a net lender of funds to the rest of the world was in 1972–73. The ratio of net borrowing from overseas to GDP in 2008–09 was 3.0%, down from 6.2% in 2007–08.

NET LENDING TO OVERSEAS, Relative to GDP, Percentage change

RELATED NATIONAL ACCOUNTS PRODUCTS

RECENTLY RELEASED

*Australian National
Accounts: Input-Output
Tables - Electronic
Publication (cat. no.
5209.0.55.001)*

The 2005–06 (final) issue of Australian National Accounts: Input-Output Tables, was released on 18 November 2009. Input-Output tables provide a detailed articulation of the structure of economic production by detailing the flows of products into and between industries and their use for consumption, investment or export. They also provide information on the allocation of the value of transactions between taxes and transport, wholesale and retail margins. Input-Output tables are released as Microsoft Excel workbooks.

UPCOMING RELEASES

*Australian National
Accounts: State Accounts
(cat. no. 5220.0)*

The 2008–09 issue of the Australian National Accounts: State Accounts, will be released on 11 December 2009. It provides detailed, annual estimates of gross domestic product (referred to as gross state product - GSP) for all states and territories. These are estimated using the expenditure, income and production approaches. Also published are estimates of household and agricultural incomes. Many, but not all, estimates are available as chain volume measures as well as in current prices. This issue will introduce the changes outlined in *Information paper: Product changes to State Accounts following revisions to international standards* (cat. no. 5220.0.55.004).

*Australian National
Accounts: National
Income, Expenditure and
Product (cat. no. 5206.0)*

The September quarter 2009 issue of National Income, Expenditure and Product, will be released on 16 December 2009. It provides quarterly and annual estimates of Australia's National and State Accounts. At a national level, this includes expenditure, income and production approaches to estimating of gross domestic product (GDP), and income and capital accounts for selected sectors (for households, general government and the rest of the world). This product also provides estimates of state final demand for each state and territory, but not gross state product. Many, but not all, estimates in this product are available as chain volume measures as well as in current prices, and in original, seasonally adjusted and trend terms. This issue will introduce the changes outlined in *Information paper: Product changes to National Income, Expenditure and Product following revisions to international standards* (cat. no. 5206.0.55.002).

*Australian National
Accounts: Financial
Accounts (cat. no.
5232.0)*

The September quarter 2009 issue of Australian National Accounts: Financial Accounts, will be released on 24 December 2009. It provides quarterly estimates of the financial flows between sectors of the domestic economy and with the rest of the world. In addition, the product provides estimates of the financial assets and liabilities owned by each sector and various sub-sectors at the end of each quarter. Other key estimates within the product include the demand for credit by non-financial domestic sectors during the quarter, and their corresponding levels of credit outstanding. This issue will introduce the changes outlined in *Information paper: Product changes to Financial Accounts following revisions to international standards* (cat. no. 5232.0.55.003).

— nil or rounded to zero (including null cells)

(a) At basic prices.

(b) Reference year for chain volume measures is 2007-08.

(c) Percentage change on preceding year.

(d) Includes water transport.

(e) Excludes ownership of dwellings.

EXPLANATORY NOTES

INTRODUCTION

1 This publication contains detailed national accounts estimates for the latest nine financial years. Estimates are provided for gross domestic product (GDP) and its components, the national income account, the national capital account, the national financial account and the national balance sheet. Income, capital and financial accounts and a balance sheet are provided for each sector of the economy. Also provided is a range of information classified by industry, details of capital formation (including capital stocks) and productivity statistics. For a list of the statistics included in this publication, see List of Tables, Appendix 1. For information about the conceptual framework of the national accounts and about the structure of the Australian system of national accounts, see Appendix 2. For a list of other sources of national accounts information, see the national accounts theme page on the ABS web site. For brief definitions and description of items in the national accounts, see Glossary.

CONCEPTS, SOURCES AND METHODS

2 Australia's national accounts statistics are compiled in accordance with international standards contained in the *System of National Accounts*. These standards have recently been updated and are presented in the *System of National Accounts, 2008* (SNA08). Australia's application of these SNA standards is described in *Australian System of National Accounts: Concepts, Sources and Methods* (cat. no. 5216.0). The current version of this product reflects the System of National Accounts, 1993 (SNA93) concepts and a number of references to data sources and methods are out of date. A revised Concepts, Sources and Methods product updated to include SNA08 is scheduled for release in 2010. It is available on the ABS web site <<http://www.abs.gov.au>>. This publication outlines major concepts and definitions, describes sources of data and methods used to derive annual and quarterly estimates for major aggregates at current prices and in chain volume terms, and discusses the accuracy and reliability of the national accounts. In addition, it includes documentation on input-output tables, financial accounts, capital stock, productivity measures, balance sheets, and state accounts.

3 National estimates are based on the concepts and conventions embodied in SNA08. In the main, the national concepts are applicable to state accounts, but there are a number of conceptual and measurement issues that do not apply. Information on some of the more important conceptual, methodological and data issues relating to annual and quarterly estimates by state is provided in Chapter 28 of the *Australian System of National Accounts: Concepts, Sources and Methods* (cat. no. 5216.0).

GROSS DOMESTIC PRODUCT (GDP)

4 GDP can be derived by three broad approaches: the income approach (I), the expenditure approach (E) and the production approach (P). A description of each approach is provided in the following paragraphs. While each measure should, conceptually, deliver the same estimate of GDP, if the three measures are compiled independently using different data sources then different estimates of GDP result. Where estimates have been derived from balanced supply-use tables, annual estimates using the I, E and P approaches are identical.

5 Prior to 1994–95 the estimates using each approach are based on independent sources, and there are usually differences between the I, E and P estimates. Nevertheless, for these periods, a single estimate of GDP has been compiled. In chain volume terms, GDP is derived by averaging the chain volume estimates obtained from each of the three independent approaches. The current price estimate of GDP is obtained by inflating the average chain volume estimate by the implicit price deflator derived from the expenditure-based estimates.

6 As a result of the above methods:

- There is no statistical discrepancy for annual estimates from 1994–95 up to the year prior to the latest complete financial year, in either current price or volume terms

EXPLANATORY NOTES *continued*

GROSS DOMESTIC PRODUCT (GDP) *continued*

- For years prior to 1994–95, and the latest year, statistical discrepancies exist between estimates based on the I, E and P approaches and the single estimate of GDP, in both current prices and volume terms. These discrepancies are shown in the relevant tables.

Income approach (I)

7 GDP using the income approach is derived as the sum of compensation of employees, gross operating surplus, gross mixed income and taxes less subsidies on production and imports

Expenditure approach (E)

8 GDP using the expenditure approach is derived as the sum of all final expenditures, changes in inventories and exports of goods and services less imports of goods and services. Volume estimates are derived for each of the components as well as for their sum.

Production approach (P)

9 GDP using the production approach is derived as the sum of gross value added for each industry, at basic prices, plus taxes less subsidies on products. Basic values represent the amounts received by producers, including the value of any subsidies on products, but before any taxes on products. The difference between the sum over all industries of gross value added at basic prices, and GDP at market (or purchasers) prices, is the value of taxes less subsidies on products.

FINANCIAL INTERMEDIATION SERVICES

10 In the national accounts, estimates are made for the output of banks and similar institutions who produce services through the provision of deposit and loan services. Often there is no single explicit charge for these services and instead the relevant financial institutions set interest rates such that a service margin can be earned. Thus, interest rates on loans are higher than would otherwise be the case if there were no service element provided and interest rates on deposits are lower than would otherwise be the case.

11 In order to appropriately account for this service component the output produced by these financial institutions is shown as being consumed by all sectors (households, corporations, NPISH and general government). In the sector income accounts the effect of allocating the output to consuming sectors is that part of the interest flow is deemed a payment for a service and the balance is shown as interest.

12 In interpreting the income accounts it is therefore necessary to regard the interest flow series as being a flow without a service element – i.e. a pure interest flow. In the case of loans the interest flow that is shown will be less than the observed interest payment made to the financial institution. In the case of deposits the interest flow that is shown will be greater than the observed interest payment made by the financial institution. For further information users should consult Chapter 22 of the *Australian System of National Accounts: Concepts, Sources and Methods* (cat. no. 5216.0).

INDUSTRY CLASSIFICATION

13 The industry statistics in this publication are based on the *Australian and New Zealand Standard Industrial Classification (ANZSIC), 2006* (cat. no. 1292.0).

RELIABILITY AND FUTURE REVISIONS

14 National accounts estimates are prepared from a wide range of statistical sources, some of which are available quickly and some only with a delay of several years. Some are closely related to the desired national accounting basis, but others are not completely satisfactory in various respects, including coverage, concepts and timing. Most of the basic data derive from the general system of statistical surveys or as a by-product of government administrative processes. The frequency, detail and timeliness of these data sources are constrained by many factors, including the other purposes which they must serve. Any increase in timeliness of data is usually at the expense of detail, reliability or additional resources. Therefore, estimates for recent years may be subject to considerable revision as firmer data become available.

EXPLANATORY NOTES *continued*

OTHER NATIONAL ACCOUNTS STATISTICAL PUBLICATIONS

15 This publication is part of a regular sequence of national accounts publications. The key national accounts publication is the quarterly national accounts released as *Australian National Accounts: National Income, Expenditure and Product* (cat. no. 5206.0) every three months approximately two months after the end of the reference period. The first estimates of national accounts for a particular financial year are released in the June quarter issue of cat. no. 5206.0, generally released in early September.

16 State estimates are compiled on a quarterly basis for the aggregate State final demand and its components. These results are published in cat. no. 5206.0. On an annual basis estimates of Gross state product (GSP) and other relevant state data are made for each state and territory. These are released in the publication *Australian National Accounts: State Accounts* (cat. no. 5220.0) shortly after the release of this publication and are fully consistent with the Australian level estimates contained in this publication.

17 Input-output tables are compiled periodically. Input-output tables are available in *Australian National Accounts: Input Output Tables* (cat. no. 5209.0.55.001). Related to this release is the detailed commodity information contained in *Australian National Accounts: Input-Output Tables (Product Details)* (cat. no. 5215.0.55.001). As part of the supply use framework for compiling a set of national accounts, supply and use (S-U) tables are also compiled annually.

18 Tourism satellite accounts, which estimate the contribution of tourism to the Australian economy, are compiled annually. They are released in the publication *Australian National Accounts: Tourism Satellite Account* (cat. no. 5249.0), around 6 months after the release of cat. no. 5204.0, and are fully consistent with the estimates contained in cat. no. 5204.0.

OTHER SOURCES OF NATIONAL ACCOUNTS INFORMATION

19 Most commonly national accounts information (in the form of feature articles and technical notes) is released in either the quarterly publication or this annual publication. Where there is wider interest, other publication vehicles are used, including *Spotlight on National Accounts* (cat. no. 5202.0), information papers, occasional papers, and the compendium publications *Australian Economic Indicators* (cat. no. 1350.0) and *Year Book Australia* (cat. no. 1301.0), is included in the national accounts theme page.

20 A National Accounts home page is available on the ABS web site <<http://www.abs.gov.au>> select: Themes – Economy – National Accounts. This page provides direct links to all national accounts related data and publications, recent national accounts changes and forthcoming events, a full listing of feature articles published since December 1988, together with a listing of all occasional and information papers and links to relevant web sites and a range of other information about the Australian National Accounts.

OTHER ABS PUBLICATIONS

21 Current publications and other products released by the ABS are freely available from the ABS web site <<http://www.abs.gov.au>>. The ABS also issues a daily Release Advice on the web site which details products to be released in the week ahead.

EXPLANATORY NOTES *continued*

ABBREVIATIONS

ABR	Australian Business Register
ABS	Australian Bureau of Statistics
ANZSIC06	<i>Australian and New Zealand Standard Industrial Classification, 2006 Edition</i>
ASNA	Australian System of National Accounts
COICOP	Classification of Individual Consumption by Purpose
GDP	gross domestic product
GFCF	gross fixed capital formation
GNI	gross national income
GNP	gross national product
GOS	gross operating surplus
GPC	Government Purpose Classification
IMF	International Monetary Fund
MFP	multifactor productivity
OECD	Organisation for Economic Co-operation and Development
SNA	System of National Accounts
SNA08	System of National Accounts 2008 version
TAU	type of activity unit

APPENDIX 1 LIST OF ELECTRONIC TABLES

<i>Table</i>	<i>Type of data</i>
Summary tables and productivity estimates	
1. Key National Accounts Aggregates	Key aggregates including percentage changes and indexes
2. Expenditure on Gross Domestic Product (GPI)	Volume and current price data, percentage changes, contribution to growth (volume) and revisions to growth (volume)
3. Expenditure on Gross Domestic Product, Chain price indexes	Chain price indexes and percentage changes
4. Expenditure on Gross Domestic Product (GDP), Implicit price deflators	Implicit price deflators and percentage changes
5. Gross Value Added (GVA) by Industry	Volume and current price data, percentage changes (volume), industry share (current prices)
6. Income from Gross Domestic Product (GDP), Current prices	Current price data and percentage changes
7. National Income Account, Current prices	Current prices
8. National Capital Account, Current prices	Current prices
9. National Financial Account, Current prices	Current prices
10. National Balance Sheet, Volume/Real and current prices - as at 30 June	Volume and current price data
11. Balance Sheet Accounts and Accumulation Accounts, Current prices	Current prices
12. Analytical Measures of National Income, Saving and Wealth, Current prices	Current prices
13. Productivity in the Market Sector	Indexes, percentage changes and contributions to growth
14. Productivity in the Market Sector, Growth cycle analysis	Percentage changes and contributions to growth for identified growth cycles
15. Labour Productivity and Input, Hours worked and Gross Value Added (GVA) per hour worked - by industry	Indexes of hours worked and gross value added per hour worked
16. Selected Analysis Series	Volume and current price data
72. Unit Labour Costs	Indexes of unit labour costs and non-farm GDP per hour worked
Non-Financial corporations sector	
17. Non-Financial Corporations Income Account, Current prices	Current prices income account for the non-financial corporations sector
18. Non-Financial Corporations Capital Account, Current prices	Current prices capital account for the non-financial corporations sector
19. Non-Financial Corporations Financial Account, Current prices	Current prices financial account for the non-financial corporations sector

APPENDIX 1 LIST OF ELECTRONIC TABLES *continued*

Table	Type of data
Non-Financial corporations sector <i>cont.</i>	
20. Non-Financial Corporations Balance Sheet, Current prices - as at 30 June	Current prices balance sheet for the non-financial corporations sector
21. Private Non-Financial Corporations Income Account, Current prices	Current prices income account for the private, non-financial corporations sector
22. Public Non-Financial Corporations Income Account, by Level of government, Current prices	Current prices income account for the public, non-financial corporations sector (commonwealth, state and local, and total public)
23. Private Non-Financial Corporations Capital Account, Current prices	Current prices capital account for the private, non-financial corporations sector
24. Public Non-Financial Corporations Income Account, by Level of government, Current prices	Current prices capital account for the public, non-financial corporations sector (commonwealth, state and local, and total public)
Financial corporations sector	
25. Financial Corporation Income Account, Current prices	Current prices income account for the financial corporations sector
26. Financial Corporation Capital Account, Current prices	Current prices capital account for the financial corporations sector
27. Financial Corporation Financial Account, Current prices	Current prices financial account for the financial corporations sector
28. Financial Corporation Balance Sheet, Current prices - as at 30 June	Current prices balance sheet for the financial corporations sector
29. Life Insurance Offices and Superannuation Funds, Current prices	Current prices
General government sector	
30. General Government Income Account, by Level of government, Current prices	Current prices income account for the general government sector (commonwealth, state and local, and total public)
31. General Government Adjusted Disposable Income Account, Current Prices	Current prices income account for the general government sector, adjusted for social assistance transfers
32. General Government Capital Account, by Level of government, Current prices	Current prices capital account for the general government sector (commonwealth, state and local, and total public)
33. General Government Finance Account, Current Prices	Current prices financial account for the general government sector
34. General Government Balance Sheet, Current prices - as at 30 June	Current prices balance sheet for the general government sector
35. Government Final Consumption Expenditure, by Level of government and purpose, Current price	Current prices (National, state and local, and total general government)

APPENDIX 1 LIST OF ELECTRONIC TABLES *continued*

<i>Table</i>	<i>Type of data</i>
Household sector	
36. Household Income Account, Current prices	Current prices income account for the household sector
37. Household Adjusted Disposable Income Account, Current prices	Current prices income account for the household sector, adjusted for social assistance transfers
38. Analytical Measures of Household Income, Current prices	Current prices
39. Household Capital Account, Current prices	Current prices capital account for the household sector
40. Household Financial Account, Current prices	Current prices financial account for the household sector
41. Household Balance Sheet, Current prices - as at 30 June	Current prices balance sheet for the household sector
42. Household Final Consumption Expenditure	Volume and current price data, by purpose of expenditure
Rest of the world	
43. External Accounts, Current prices	Current prices income and capital accounts
44. External Financial Account, Current prices	Current prices financial account
45. External Balance Sheet, Current prices - as at 30 June	Current prices financial account
Industry estimates	
46. Total Factor Income, by Industry and principal components - Current prices	Current prices
47. Consumption of Fixed Capital, by Industry and institutional sector - Current prices	Current prices, by industry, and by sector (but not cross classified)
48. Compensation of Employees, by Industry - Current prices	Current prices (wages and salaries, employers' social contributions, and total compensation of employees)
49. Income from Dwelling Rent, Current prices	Current prices
50. Agricultural Income, Current prices	Current prices
Balance sheet estimates	
59. Consolidated Balance Sheet and Accumulation Accounts, Current prices	Current prices
60. Livestock, Value and number of Fixed Assets and Inventories - as at 30 June	Value and number of livestock
61. Value of Land, by Land use by State/Territory - as at 30 June, Current prices	Current prices, by land use (residential, commercial, rural, other uses, total)

APPENDIX 1 LIST OF ELECTRONIC TABLES *continued*

Table	Type of data
Capital estimates	
51. Gross Fixed Capital Formation, by Type of Asset	Volume and current price data, by type of asset by sector (private, public corporations, general government, and total)
52. Private Gross Fixed Capital Formation, by Industry - Current prices	Current prices
53. General Government Gross Fixed Capital Formation, by Level of government and purpose - Current prices	Current prices, by level of government (national, state and local, and total general government)
54. Public Corporations Gross Fixed Capital Formation, by Level of government and industry - Current prices	Current prices, by level of government (national, state and local, and total public corporations)
55. Changes in Inventories	Volume and current price data
56. Capital Stock, by Type of asset	Volume and current price data, and end-year average age of gross stock
57. Capital Stock, by Institutional sector	Volume and current price data, and end-year average age of gross stock
58. Capital Stock, by Industry	Volume and current price data, capital services index, and end-year average age of gross stock
63. Net Capital Stock, by Industry by type of asset	Volume and current price data
64. Gross Fixed Capital Formation, by Industry by type of asset	Volume and current price data
65. Consumption of Fixed Capital, by Industry by type of asset	Volume and current price data
66. Machinery and Equipment Net Capital Stock, by Industry	Volume and current price data
67. Machinery and Equipment Gross Fixed Capital Formation, by Industry	Volume and current price data
68. Machinery and Equipment Consumption of Fixed Capital, by Industry	Volume and current price data
69. Information Technology Net Capital Stock, Selected items by Industry	Volume and current price data, by selected items (computers and peripherals, electrical and electronic equipment, and computer software)
70. Information Technology Gross Fixed Capital Formation, Selected items by Industry	Volume and current price data, by selected items (computers and peripherals, electrical and electronic equipment, and computer software)
71. Information Technology Consumption of Fixed Capital, Selected items by Industry	Volume and current price data, by selected items (computers and peripherals, electrical and electronic equipment, and computer software)

APPENDIX 2 THE AUSTRALIAN NATIONAL ACCOUNTS

INTRODUCTION

National accounts are designed to provide a systematic summary of economic activity and have been developed to facilitate the practical application of economic theory. At their summary level, the accounts reflect key economic flows: production, income, consumption, investment and saving. At their more detailed level, they are designed to present a statistical picture of the structure of the economy and the detailed processes that make up domestic production and its distribution.

The purpose of this Appendix is to outline the historical developments in the Australian national accounts, the basic structure of the Australian national accounting system, and the theoretical concepts that the system embodies.

HISTORICAL BACKGROUND

Official estimates of national income and expenditure have been compiled by the ABS since 1945, when estimates were published for the years 1938–39 to 1944–45. Until 1963 they were published annually as papers entitled *National Income and Expenditure* issued by the Treasurer with the Commonwealth Government Budget Papers.

In 1963 a number of important changes in the structure and presentation of the national accounts and in the conceptual basis and definitions of the principal aggregates were introduced in a new annual publication entitled *Australian National Accounts: National Income and Expenditure, 1948–49 to 1961–62* (cat. no. 5204.0). Constant price estimates of the principal expenditure aggregates were presented for the first time.

In *Australian National Accounts: National Income and Expenditure, 1971–72* (cat. no. 5204.0), published in 1973, the structure of the accounts was revised to accord more closely to the international standard described in the United Nations publication *A System of National Accounts* (1968).

In the 1997–98 issue of cat. no. 5204.0, which was renamed the *Australian System of National Accounts*, a number of changes were introduced, including the implementation of a revised international standard for national accounting (entitled *System of National Accounts, 1993* (SNA93)), the replacement of constant price estimates by chain volume measures and the integration of the national income, expenditure and product accounts with the input-output tables. Also, the scope of the publication was expanded to include balance sheets, capital stock and multifactor productivity statistics. Previously, these statistics had been published in separate publications.

The international standards for national accounts was updated in 2008. The new standards are presented in the *System of National Accounts 2008* (SNA08). The revised standards are not radical departures from their former edition. They represent an incremental change in the development of national accounting to reflect changing economic behaviour and new policy concerns, as well as an improved understanding of the accounts, their international comparability and harmonisation with other international statistical standards. There have been incremental changes to concepts, classifications and definitions. Some of these represent changes in terminology and presentation, while others impact on the measurement of major summary aggregates such as Gross Domestic Product (GDP) and saving. For a discussion of the major changes implemented and the concepts, sources and methods of the more significant changes, see the *Information Paper: Implementation of new international statistical standards in ABS and International Accounts, September 2009* (cat. no. 5310.0.55.002). The 2008–09 issue of the *Australian System of National Accounts* (cat.no.5204.0) is the first issue that is on a SNA08 basis.

INTERNATIONAL STANDARDS

The SNA08 was produced by five international organisations involved in the use of economic statistics and the promotion of international statistical standards: United Nations, Organisation for Economic Co-operation and Development, International Monetary Fund, World Bank and Commission of the European Communities.

APPENDIX 2 THE AUSTRALIAN NATIONAL ACCOUNTS *continued*

INTERNATIONAL STANDARDS

continued

The SNA08 brings together, within the one integrated framework, the various streams of economic accounts, including estimates of national income, expenditure, and product, input-output tables, financial accounts and national and sector balance sheets. It is designed to provide international guidance to national statistical authorities in the compilation and presentation of national accounts, and to serve as a basis for standardised reporting to the United Nations and other international bodies such as the Organisation for Economic Cooperation and Development (OECD). SNA08 provides definitions and classifications which form the basis for the collection of integrated economic statistics in general.

The international standards for international accounts were updated concurrently with the SNA08 and the standards are compatible. The new standard for the international accounts is presented in the *Balance of Payments Manual and International Investment Position Manual sixth edition (BPM6)*. The International Monetary Fund's *Government Finance Statistics Manual 2001* will be revised in the future. Amongst all these international standards, the SNA08 has the central position in economic statistics standards. Considerable effort has been devoted in the international arena to the elimination of inconsistencies between the SNA08 and the other standards.

THE AUSTRALIAN SYSTEM OF NATIONAL ACCOUNTS

The Australian System of National Accounts (ASNA) includes not only the traditional annual and quarterly estimates of national income, expenditure and product, but also input-output tables, State estimates, estimates of capital stock, financial accounts, balance sheets and reconciliation accounts and productivity estimates. The system could also be defined more widely to include balance of payments and government finance statistics. However, these are documented in detail elsewhere and are not considered further in this Appendix except to the extent that they provide data items for elements of the ASNA. For detail see *Balance of Payments and International Investment Position: Concepts, Sources and Methods* (cat. no. 5331.0). The current version of this product reflects the Balance of Payments Manual and International Investment Position Manual fifth edition (BPM5) concepts and a number of references to data sources and methods are out of date. A revised Concepts, Sources and Methods product updated to include BPM6 is scheduled for release in 2010. For government finance statistics see *Australian System of Government Finance Statistics: Concepts, Sources and Methods, 2005* (cat. no. 5514.0).

A full discussion of the SNA08 recommendations and their implementation in the ASNA is contained in the *Information Paper: Implementation of new international statistical standards in ABS and International Accounts, September 2009* (cat. no. 5310.0.55.002). Although there are some areas where the ASNA does not follow SNA08 treatments precisely, the ASNA can now be considered to be on an SNA08 basis. The main reasons for not implementing all SNA08 recommendations are that the data required to support a recommendation are unavailable or that a recommendation is not significant in the Australian context. These issues are described in the information paper above.

The remainder of this appendix discusses the various elements that make up the complete ASNA covering both conceptual and practical issues as appropriate. More detail on the ASNA is contained in the publication *Australian System of National Accounts: Concepts, Sources and Methods* (cat. no. 5216.0). The current version of this product reflects the *System of National Accounts, 1993* (SNA93) concepts and a number of references to data sources and methods are out of date. A revised Concepts, Sources and Methods product updated to include SNA08 is scheduled for release in 2010.

DESCRIBING THE ECONOMIC STRUCTURE

Economic sectors

Transactor units are grouped into institutional sectors according to their roles in the economy. The domestic institutional sectors are:

- Non-financial corporations (including public non-financial corporations)
- Financial corporations

Economic sectors continued

- General government
- Households (including unincorporated enterprises and private non-profit institutions serving households)

The SNA08 delineates a fifth domestic sector for 'private non-profit institutions serving households'. In the ASNA these units are included with the household sector. In addition, there is an external sector which encompasses non-resident governments, persons and businesses that engage in transactions with Australian residents.

One feature of both the non-financial corporations sector and the financial corporations sector is that they are designed to cover businesses which are legally, or clearly act as, entities independent of their owners with regard to their incomes, outlays and capital financing transactions, and by virtue of this are required to maintain separate profit and loss and balance sheet accounts. Private enterprises classified to these sectors are mainly companies registered under the *Companies Act* or by other Acts of Parliament, but in principle, large, important unincorporated enterprises which maintain complete independent financial records (termed quasi-corporate enterprises) should also be included. In practice, private unincorporated enterprises included in these sectors are classified as quasi-corporate only if they are unincorporated financial enterprises, or unincorporated partnerships of companies, or unincorporated enterprises owned by non-residents, or unincorporated enterprises assessable for income tax as companies.

Public non-financial corporations include government owned or controlled enterprises which are mainly engaged in the production of goods and services for sale in the market with the intention of substantially covering their costs. These units may be incorporated under company or other special statutes or be unincorporated units of government enterprises.

Financial corporations are distinguished from non-financial corporations in that they are mainly engaged in both incurring liabilities and acquiring financial assets, i.e. in borrowing and lending money, in providing superannuation, life, health or other insurance cover, in financial leasing or investing in financial assets. Corporations providing services closely related to and designed to facilitate these activities are also classified as financial corporations. The Reserve Bank is included in the financial corporations sector.

Households and unincorporated enterprises are included in the one sector because the owners of ordinary partnerships and sole proprietorships frequently combine their business and personal transactions. Complete sets of accounts in respect of the business activity will often not be available. As mentioned above, large and important unincorporated enterprises and any unincorporated enterprises classified as financial enterprises are regarded in principle as quasi-corporate and included in the non-financial corporations and financial corporations sectors respectively.

The general government sector consists of all departments, offices and other bodies mainly engaged in the production of goods and services for consumption by governments and the general public, whose costs of production are mainly financed from public revenues and which provide goods and services to the general public, or sections of the general public, free of charge or at nominal charges well below costs of production. Included are government enterprises mainly engaged in the production of goods and services for other general government enterprises.

Non-profit institutions serving businesses or households which are mainly financed and controlled by governments are included in the general government sector. Private non-profit institutions serving businesses or households which are not mainly financed and controlled by government are included in the non-financial corporations, financial corporations and households sectors as appropriate.

Economic sectors continued

Although the institutional sector classification does not explicitly include a public sector/private sector dichotomy, the ASNA provide such a dissection of the income, capital and financial accounts and the balance sheets for relevant sectors.

Further information on the classification of institutional sectors generally in ABS statistics, see *Standard Economic Sector Classification of Australia, 2008* (cat. no. 1218.0). The implementation of the SNA08 introduced some new elements to the Standard Economic Sector Classification for Australia, 2008 (SESCA08). The change is mainly from the introduction of money market funds and other investment funds in the Standard Institutional Sector Classification for Australia (SISCA08). Further information on these changes can be found in *Discussion Paper: Proposed Standard Economic Sector Classifications of Australia (SESCA), 2008* (cat. no. 1218.0.55.001).

Industry and purpose classifications

As well as the institutional sector classification, other major classifications used in the national accounts are the industry and purpose classifications. The industry classification is primarily designed to classify establishment units by kind of economic activity (industry) although it may also be used in classifying institutional units. The purpose classifications are used to classify household and government expenditures.

The industry classification employed throughout the ASNA is the *Australian and New Zealand Standard Industrial Classification, 2006* (cat. no. 1292.0) (ANZSIC06). It has been developed as part of an integrated statistical system which allows for the consistent classification of units across a broad spectrum of ABS collections and compilations. Apart from its application in the national accounts, the ANZSIC06 is used in a large number of ABS collections, including the economic surveys.

The structure of the ANZSIC06 comprises four levels, namely Divisions (the broadest level), Subdivisions, Groups and Classes. In the ASNA, data for selected transactions are presented at the Division level; some data are also shown at the Subdivision level.

The classification of Household final consumption expenditure is based upon the Classification of Individual Consumption by Purpose (COICOP). This classification groups together goods and services that serve similar functions - in the sense of purposes or objectives - within households.

The classification of Government final consumption expenditure by purpose uses the Government Purpose Classification (GPC) described in detail in the *Australian System of Government Finance Statistics: Concepts, Sources and Methods, 2005* (cat. no. 5514.0.55.001). The GPC is structured around the following four headings:

- General government services (major groups 01–03)
- Community and social services (major groups 04–08)
- Economic services (major groups 09–13)
- Other purposes (major group 14).

Statistical units

Another feature of a classification of transactors is that rules need to be established for the delineation of the statistical units for which data are to be collected. Transactor units are grouped into two classes: producing units and owning (or financing) units.

- Producing units (or type of activity units (TAUs)) are concerned with the production of goods and services. In analysing production transactions, most interest usually centres on a classification of TAUs according to industry.
- Owning or financing units (enterprises) are the basic legal entities which own the producing units and make the financial decisions regarding their operation. They are grouped into broad sectors which reflect their institutional roles in the economy. These are the institutional sectors discussed above.

APPENDIX 2 THE AUSTRALIAN NATIONAL ACCOUNTS *continued*

Statistical units continued

It follows that any one enterprise may own and control a number of TAUs which may or may not be involved in different types of productive activities and/or operate in different physical locations. As the enterprise is primarily concerned with decisions relating to both current and capital financial flows, it is the relevant unit for income accounts and capital accounts. TAUs on the other hand are the relevant units for production accounts.

TYPES OF TRANSACTIONS

In the national accounts, a major distinction is made between transactions relating to the supply and disposition of goods and services on the one hand, and transfer payments and financial transactions on the other. Only the former payments are concerned with the production of goods and services and therefore affect the level of GDP. Transfer payments represent a transfer of income from one sector to another. Financial transactions are concerned with the acquisition of financial assets and liabilities and are the mechanism whereby surplus saving of one sector can be transferred into the productive investment of another sector. The net outcome of the acquisition of financial assets and liabilities is shown as the net lending item in the capital account of each institutional sector. Components of net lending are shown in the financial accounts for each institutional sector.

The supply of goods and services includes the gross output of resident producers and imports of goods and services. The disposition of goods and services is divided between intermediate use and final uses. Intermediate use consists of the consumption of non-durable goods and services in the process of production. Final uses consist of final consumption expenditure, gross fixed capital formation, changes in inventories and exports of goods and services. The supply and disposition of goods and services can also be viewed as the sum of incomes accruing from production - compensation of employees, gross operating surplus and gross mixed income - and taxes less subsidies on production and imports.

Two types of incomes are distinguished, primary and secondary. Primary incomes accrue to institutional units as a consequence of their involvement in the processes of production or the ownership of assets that may be needed for the purposes of production. They are payable out of the value added created by production. Secondary incomes are all other incomes, such as social assistance benefits and other transfer payments.

A description of the types of transactions used in the ASNA is provided in the Glossary.

THE CONCEPT OF PRODUCTION

The central concept in a national accounting system is economic production. Production is a physical process, carried out under the management of an institutional unit, whereby labour, accumulated capital assets and knowledge are used to transform inputs of goods and services into outputs of other goods and services. Production is not confined to the production of goods by farms, mines, factories, etc. It also includes the provision of services of all kinds which either add to the value of goods (such as transport and merchandising services), or are directly bought and sold in the market in their own right (such as the services of doctors, teachers and entertainers). The SNA08 defines the 'production boundary' to include:

"All goods and services that are produced as outputs must be such that they can be sold on markets or at least be capable of being provided by one unit to another, with or without charge. The SNA includes within the production boundary all production actually destined for the market, whether for sale or barter. It also includes all goods and services provided free to individual households or collectively to the community by government units or non-profit institutions serving households." (Para.,1.40)

In principle, production should be valued at market prices, which are generally transaction prices. In the absence of market transactions, valuation is made according to costs incurred or by reference to market prices for analogous goods or services.

THE CONCEPT OF PRODUCTION *continued*

Most goods and services provided by general government bodies (as distinct from public enterprises such as government railways) are not normally sold but are nevertheless regarded as part of production. In practice, they are valued at a cost comprising the total of the wages and salaries paid to the employees of general government bodies and the cost of purchased goods and services used including an allowance for the consumption of fixed capital. Similar considerations apply to non-profit institutions serving households - for example, churches and charities - whose costs are largely or wholly met by members and benefactors so that the goods and services produced need not be sold at a commercially determined price. As with general government bodies, the production of non-profit institutions is valued at cost in the national accounts.

The Australian Bureau of Statistics (ABS) has developed a non-profit institutions satellite account for Australia in response to demand for information on the size, structure and economic contribution of non-profit institutions. The Australian National Accounts: Non-profit Institutions Satellite Account, 2006-07 (cat.no. 5256.0) publication released in September 2009, presents estimates of the direct contribution that non-profit institutions make to the Australian economy, and in particular, the contribution of non-profit institutions to key macroeconomic variables such as gross value added and gross domestic product. As this satellite account is an integrated set of statistics on non-profit institutions within the SNA08 framework, it provides a valuable policy and research resource with a wide range of applications.

Imputations are made for some goods and services which are not sold in the market place and therefore are not amenable to direct measurement. Imputation is confined to a small number of cases where a reasonably satisfactory basis for the valuation of the implied transaction is available, and where their exclusion could result in distortions in the accounts. In the ASNA, imputations are made for the following:

- *Rent of owner-occupied dwellings.* The imputation of rent to owner-occupied dwellings enables the services provided by dwellings to their owner-occupiers to be treated consistently with the marketed services provided by rented dwellings to their tenants. This treatment is considered necessary because, if a large number of rented houses were sold to their occupiers and if estimates of imputed rent were not calculated for owner-occupied dwellings, then there would be an apparent decrease in gross domestic product without any decrease in the provision of housing services. In effect, owner-occupiers (like other owners of dwellings) are regarded as operating businesses; they receive rents (from themselves as consumers), pay expenses, and make a net contribution to the value of production which accrues to them as owners.
- *Income received in the form of imputed contributions by government employers to unfunded superannuation schemes and imputed property income on the accumulated financial assets of households in those schemes.*
- *Income received in kind.* Fringe benefits provided by businesses to their employees include the private use of company cars, rent subsidies, low interest loans, etc.
- *Value added by owner-builders in the construction of dwellings* and alterations and additions to dwellings that are within the scope of building work covered by the ABS Building Activity Collection.
- *Goods and services produced by persons in the course of their normal occupation and consumed by them* are included where practicable (e.g. an estimate is made for farm production consumed on the farm).
- *Goods produced by persons outside their normal occupations and consumed by them*, that is, 'backyard production'.
- *Services provided by financial institutions over and above explicit charges made.*
- Goods and services provided in the 'cash economy' where no record of the transaction is available

APPENDIX 2 THE AUSTRALIAN NATIONAL ACCOUNTS *continued*

THE CONCEPT OF PRODUCTION *continued*

- *Reinvested Earnings from foreign direct investment.* The retained earnings from foreign direct investment are deemed to be distributed and reinvested in the corporations on the grounds that direct investor share control of the corporations and can therefore influence distribution decisions.
- *Reinvested Earnings from foreign and domestic investment funds.* The undistributed earnings are treated distributed and reinvested on the grounds that investors are able to withdraw and reinvest the equity from the investment funds equity.

Production, and associated income flows should conceptually be measured on an accruals basis. Under this basis, transactions between institutional units are recorded when something of economic value is provided by one party to the other. This may or may not coincide with a cash transaction. Transactions internal to one institutional unit are equivalently recorded when economic value is created or transformed. For the most part, transactions in the ASNA are recorded on an accrual basis. However, in some areas, it is only possible to record transactions on a cash basis.

THE CONCEPT OF GDP

An important objective of the ASNA is to measure the value of economic production in Australia in a given period. In doing so, care must be taken to avoid double counting. Many goods and services are bought by enterprises for use in their own productive activities. If the value of all goods and services produced were added together there would be serious duplication because some goods and services would be added in several times at successive stages of production. In the national accounts it is the value added in production which is important. This is the essence of the concept of gross domestic product (GDP) which is defined in the ASNA as

'...the total market value of goods and services produced in Australia after deducting the cost of goods and services used up in the process of production (intermediate consumption), but before deducting consumption of fixed capital.'

GDP is the value added of production in the economic territory of Australia regardless of whether the factors of production are owned by Australians or by non-residents.

The definition of economic territory in BPM6 is the area under the effective control of the Australian government. Economic territory includes the land area, airspace, territorial waters, including jurisdiction over fishing rights and rights to fuels and minerals of these territories. Australian economic territory includes territorial enclaves in the rest of the world. These are clearly demarcated areas of land, located in other countries, which are owned or rented by the Australian government for diplomatic, military, scientific or other purposes. The economic territory of Australia consists of:

- Geographic Australia which includes Cocos (Keeling) Islands and Christmas Island
- Norfolk Island
- Australian Antarctic Territory
- Heard Island and McDonald Islands
- Territory of Ashmore Reef and Cartier Island
- Coral Sea Islands
- Australia's territorial enclaves overseas.

The Joint Petroleum Development Area (JPDA) is considered joint territory between Australia and Timor-Leste.

Due to administrative complexities and measurement difficulties, Norfolk Island transactions will not always be captured in all relevant ABS economic statistics. Most of the transactions involving Norfolk Island are not material to Australia's overall economic performance and not capturing these transactions should not distort the economic statistics. However, any significant transactions will be identified and included in the relevant statistics.

APPENDIX 2 THE AUSTRALIAN NATIONAL ACCOUNTS *continued*

THE CONCEPT OF GDP

continued

An alternative aggregate measure is gross national income (GNI), which is equal to GDP less primary incomes payable to non-residents plus primary incomes receivable from non-residents. Thus GNI is equal to primary incomes receivable by resident institutional units, regardless of where the production takes place.

To ensure that GDP is a measure of economic production that is free of duplication, national accountants draw a distinction between intermediate and final purchases. All goods and services which are used up in the course of production by resident producers are intermediate purchases (and are referred to as intermediate consumption). Purchases of capital goods and finished goods and work in progress going into inventories are the only purchases of goods by resident producers that are regarded as parts of final demand.

The 'gross' in GDP indicates that no deduction is made for consumption of fixed capital; in other words, the gradual using-up of the economy's productive assets is not accounted for in GDP. A product figure net of capital consumed (i.e. net domestic product) would recognise capital consumption as a necessary cost of producing the economy's goods and services and would therefore be a purer measure of production. However, because of the difficulties involved in measuring capital consumption (and more particularly variations in methods used between countries), GDP has remained the major summary measure of economic activity.

MEASURING GROSS DOMESTIC PRODUCT (GDP)

GDP can be derived by three broad approaches: the income approach (I), the expenditure approach (E) and the production approach (P). A description of each approach is provided in the following paragraphs. While each measure should, conceptually, deliver the same estimate of GDP, if the three measures are compiled independently using different data sources then different estimates of GDP result. However, the Australian national accounts estimates have been integrated with annual balanced supply and use tables. These tables have been compiled from 1994–95, up to the year preceding the latest complete financial year. As integration with balanced supply and use tables ensures that the same estimate of GDP is obtained from the three approaches, annual estimates using the I, E and P approaches are identical for the years for which these tables are available.

Prior to 1994–95 the estimates using each approach are based on independent sources, and there are usually differences between the I, E and P estimates. Nevertheless, for these periods, a single estimate of GDP has been compiled. In chain volume terms, GDP is derived by averaging the chain volume estimates obtained from each of the three independent approaches. The current price estimate of GDP is obtained by reflating the average chain volume estimate by the implicit price deflator derived from the expenditure-based estimates.

As a result of the above methods:

- There is no statistical discrepancy for annual estimates from 1994–95 up to the year prior to the latest complete financial year, in either current price or volume terms
- For years prior to 1994–95, and the latest year, statistical discrepancies exist between estimates based on the I, E and P approaches and the single estimate of GDP, in both current prices and volume terms. These discrepancies are shown in the relevant tables.

Income approach (I)

GDP using the income approach is derived as the sum of factor incomes and taxes less subsidies on production and imports. Volume estimates are derived by deflating current price estimates by the implicit price deflator from the expenditure approach.

APPENDIX 2 THE AUSTRALIAN NATIONAL ACCOUNTS *continued*

Expenditure approach (E)

GDP using the expenditure approach is derived as the sum of all final expenditures, changes in inventories and exports of goods and services less imports of goods and services. Volume estimates are derived for each of the components as well as for their sum.

Production approach (P)

GDP using the production approach is derived as the sum of gross value added for each industry, at basic prices, plus taxes less subsidies on products. Basic values represent the amounts received by producers, including the value of any subsidies on products, but before any taxes on products. The difference between the sum over all industries of gross value added at basic prices, and GDP at market (or purchasers) prices, is the value of taxes less subsidies on products.

ACCOUNTING FOR PRICE CHANGE

There are several price effects in basic source data for which allowances can be made by the national accountant to put the national accounts on a more appropriate conceptual basis and to better meet the needs of many users of the data. A distinction can be made between two types of adjustment. The first concerns the compilation of volume estimates. Changes in the value of production over time are a function of movements in prices and changes in volumes. For many uses it is the change in the quantity of production which is of major interest. Therefore the development of time series which remove the effect of price changes is an important part of a national accounting system. In the past, constant price estimates were provided as a measure of volume. These have now been replaced by annually reweighted chain volume measures. In general, chain volume measures provide better indicators of movement in real output and expenditure than do constant price estimates because they take account of changes in price relativities that occur between one year and the next. A full discussion of the concepts and methods underlying ABS chain volume measures is contained in the *Information Paper, Introduction of Chain Volume Measures in the Australian National Accounts* (cat. no. 5248.0), published in March 1998.

The second type of adjustment, which is relevant to the current-price estimates, concerns what is commonly known as 'inflation accounting' and has a parallel in some of the issues surrounding the adoption of current cost accounting in commercial accounts. It relates to price effects in the measurement of income, saving and inventories, with the price adjustment involving the expression of the aggregates in terms of the average prices applying in each accounting period. Examples include the stock valuation adjustment and the treatment of the consumption of fixed capital.

Inventory valuation adjustment

According to the standards of historical cost accounting, businesses measure the value of inventories as the lower of cost or net realisable value. In times of rising prices, the change in the book value of inventories from one period to the next will reflect an element of holding gain in addition to any physical change. This holding gain will also be reflected in business income and saving. In the ASNA, the element of holding gain is excluded from increase in inventories, income and saving by way of the inventory valuation adjustment.

Consumption of fixed capital (COFC)

According to the standards of historical cost accounting, businesses allocate the original purchase cost of an asset over the estimated life span of the asset. In periods of rising prices the book value of depreciation will understate the real cost of productive activity and therefore result in an overstatement of business income and saving. The book value of depreciation is adjusted to a current market price basis in the ASNA in order to reflect the fall in value of the asset at the prices current in the period for which the estimates are being made. This is referred to as consumption of fixed capital.

Consumption of fixed capital (COFC) continued

No adjustment is made in the ASNA income accounts for the effect of price change on financial assets and liabilities (it is reflected, implicitly, in the balance sheets and, explicitly, in the reconciliations between the balance sheets and transaction accounts), although it is recognised in the ASNA that it can have important implications for some types of analyses. Table 21 and 47 show measures that highlight the links between the traditional income flows and the change in net worth as reflected in the balance sheets. The calculation and presentation of these measures provide additional insights into changes in income, saving and wealth in Australia.

TYPES OF ACCOUNTS

The types of accounts reflect the major economic processes occurring in the economy, namely production, the distribution of incomes, consumption, saving and investment, financial flows and asset accumulation. The national accounts are composed of the following types of accounts:

- Production accounts
- Income accounts
- Capital accounts
- Financial accounts
- Balance sheets, supported by associated accumulation and revaluation accounts.

Each of these accounts is produced for the nation as a whole, and the set of accounts together constitutes the consolidated summary accounts. In addition, income accounts, capital accounts, financial accounts and balance sheets are constructed for each of the four domestic institutional sectors i.e. non-financial corporations, financial corporations, households, and general government, and for the external sector. The national accounts also include a number of supplementary tables which provide more detailed presentations of the individual sector accounts. Although, in principle, production accounts could be constructed for the four individual institutional sectors, major interest centres instead around production on an industry basis. This cuts across the institutional type of sectoring used in the income and capital accounts since the classification of production units by industry in such a presentation is done without regard to institutional sector.

An important feature of the accounts is that they are a double entry system and, therefore, are fully balanced. Every entry has a counterpart entry i.e. every outgoing reappears elsewhere as an incoming, reflecting the circularity of the economic process. Materials and the services of factors of production flow into productive enterprises and final goods and services flow into consumption, capital formation, and changes in inventories. These flows of goods and services are matched by reverse flows of money. Producers pay for their materials and also pay out factor income which (after a number of transfers such as income taxes, and borrowing and lending transactions) flow back as payments from final purchasers.

Production accounts

Production accounts record the expenses incurred in production and the receipts from sales of goods and services. Sales of goods and services (including goods and services produced for own use) are recorded on the credit side of the account. On the debit side, expenses of production, namely intermediate consumption, compensation of employees, taxes less subsidies on production and imports, gross operating surplus and gross mixed income are recorded. The gross domestic product account is, in effect, a consolidation of the trading accounts of individual enterprises.

The receipts side of the gross domestic product account in the ASNA shows sales of goods and services to final consumers (including exports less imports) and changes in inventories. Because only sales to final consumers are shown, revenue from the sale of intermediate goods and services (i.e. goods and services used up in the production of final output) does not appear. In the process of consolidation of the production accounts of all sectors, intermediate goods and services cancel out as the revenue of one

APPENDIX 2 THE AUSTRALIAN NATIONAL ACCOUNTS *continued*

Production accounts continued

producer is a cost to another. On the payments side the incomes from production are shown, namely compensation of employees, gross operating surplus, gross mixed income and net taxes on production and imports. Where the gross domestic product account has been derived from balanced supply and use tables, the sum of the two sides of the account are balanced, otherwise statistical discrepancies are inserted to achieve balance.

Income accounts

The national income account records income and use of income. On the income side it shows compensation of employees, gross operating surplus, gross mixed income (from unincorporated enterprises) and taxes less subsidies on production and imports. Net secondary income from non-residents is added to derive gross national disposable income. The use of income side of the account shows how gross disposable income is used for final consumption expenditure and the consumption of fixed capital (depreciation), with the balance being the nation's net saving - one source of finance for gross capital formation.

The sectoral income accounts are disaggregations of the national income account, and record for each institutional sector its net income arising both from production and from transfers from other sectors, and its uses of income. The difference between income and use of income is net saving (the balancing item). For some institutional subsectors, it has not been possible to estimate consumption of fixed capital separately, so the balancing item is equal to net saving plus consumption of fixed capital.

For corporations (both financial and non-financial), the income accounts show income arising from gross operating surplus from the gross domestic product account and property income (such as interest, dividends, reinvested earnings and rent on natural assets) from other sectors. Total income is used to make various payments (such as interest, dividends, reinvested earnings and rent on natural assets) to other sectors. The balance is the saving of the respective sectors and is transferred to their capital accounts.

The income account of the household sector shows compensation of employees, gross mixed income (on account of unincorporated enterprises) and gross operating surplus on dwellings owned by persons, which are all from the gross domestic product account, as well as property income (interest, dividends, reinvested earnings on investment funds, property income attributed to insurance policyholders and rent on natural assets) from other sectors, social assistance benefits and various other forms of secondary income. On the use of income side are shown final consumption expenditure, consumer debt interest and other property income payable, income taxes and other current taxes payable, other current transfers to non-residents and other sectors, consumption of fixed capital (on account of unincorporated enterprises and dwellings owned by persons) and net saving (the balancing item).

The general government income account shows receipts from income taxes, other taxes on income, wealth, etc., taxes on production and imports, property income (interest, dividends and rent on natural assets) and gross operating surplus. On the use of income side are shown final consumption expenditure, property income payable to other sectors, subsidies, social assistance benefits and other current transfers, consumption of fixed capital and net saving (the balancing item).

Capital accounts

The national capital account shows sources of funds for financing gross capital formation and the use of these funds. Sources of funds comprise consumption of fixed capital, net saving transferred from the national income account and net capital transfers receivable from non-residents. On the use side gross fixed capital formation, the change in inventories, net acquisitions of non-produced non-financial assets are shown. Conceptually, net lending to non-residents is the balance of the national capital account. However, if there are statistical discrepancies in the gross domestic product account,

APPENDIX 2 THE AUSTRALIAN NATIONAL ACCOUNTS *continued*

Capital accounts continued

then these discrepancies must also be taken into account before the derivation of the balancing item.

Similar information is provided in the sectoral capital accounts. The balancing item, net lending, reflects the net lending of a particular sector to all other sectors. As sectoral production accounts are not compiled, it is not possible to break any national statistical discrepancies by sector. Accordingly, the sectoral net lending balance includes, implicitly, each sector's share of the national discrepancy.

Financial accounts

To this point, the discussion has centred around the measurement of the production of goods and services and the links with the income and expenditure of the various sectors of the economy. These are recorded in the production accounts (and input-output tables) and the income accounts and capital accounts of the system, all of which may be referred to as the 'real' accounts. The financial accounts on the other hand address the issue of transactions in financial assets and liabilities. The financial accounts show the changes in assets and liabilities that flow from production decisions in the real economy and, in concept, represent an elaboration of net lending in the capital accounts (where net lending represents the difference between a sector's saving and investment). As all transactions on the real side of the accounts have an exact counterpart on the 'financial' side, the surplus or deficit (net lending) of a sector can be measured from each side i.e. from the financial side as well as from the real side. Any differences in practice due to deficiencies in data sources are reflected in a statistical discrepancy. The major focus in financial accounts is on the different types of financial instruments and their flows between the various institutional sectors (including the rest of the world).

Balance sheets

National and sector balance sheets record, at particular points in time, values of produced and non-produced assets owned by a nation and its institutional sectors, and the outstanding financial claims between institutional sectors. For any one sector, the total value of all assets held less the value of financial liabilities (including equity capital issued by the sector) is equal to net worth. In a closed economy, national net worth (or national wealth) would be equal to the sum of produced and non-produced assets. In an open economy, national net worth is equal to the sum of produced and non-produced assets and financial claims on non-residents less the sum of liabilities to non-residents (including domestic shares held by non-residents).

The change in balance sheet values from one period to the next is necessarily linked to the flows shown in the capital and financial accounts given that stock is equal to the net accumulation of past flows. Produced tangible assets enter stock through gross fixed capital formation and exit through the consumption of fixed capital or scrapping. Non-produced assets also enter the balance sheets as a result of transactions (flows) appearing in the capital accounts. The balance sheets also reflect the impact on stocks of financial assets and liabilities arising from transactions in financial assets and liabilities recorded in the financial accounts.

Although the difference between opening and closing balance sheet values is consistent with flows shown in the capital and financial accounts, there are other factors which can lead to a change in balance sheet values. As balance sheet values are measured at current market prices, changes in valuation will result in a different balance sheet position. Balance sheet values are also affected by such things as catastrophic losses and uncompensated seizures. None of these things is recorded in the transaction accounts. Balance sheets also reflect net changes in the value of certain assets that are not accounted for in the capital accounts. Included are natural growth less depletions of timber tracts and forests, and new finds less depletion of subsoil. All non-transaction changes in balance sheet values are reflected in an accumulation and revaluation account. This account, in association with the capital and financial accounts, provides a

Balance sheets continued

complete picture of the processes involved in moving from the balance sheet position at the beginning of the period to that at the end of the period.

The estimates for non-produced assets (natural resources and permission to use natural resources) are the result of ABS estimation techniques that are still considered experimental. It is recommended that interpretation of the monetary value of non-produced assets be undertaken in conjunction with the physical stock data.

The national balance sheet is presented in real terms as well as in current prices. The balance sheet includes both non-financial and financial assets, and liabilities which, by definition, are financial.

Unlike non-financial assets, financial assets and liabilities cannot be decomposed into prices and volumes, and so it is not possible to derive volume indexes for them. The same is true of gross operating surplus and other income flows. This is the reason chain volume estimates of GDP cannot be derived by aggregating volume indexes of its income components.

However, it is possible to deflate income flows, financial assets and liabilities by a general price deflator in order to measure the purchasing power of the aggregate in question over a designated numeraire set of goods and services. Such measures are called 'real' estimates. Real net worth has been derived by aggregating the chain volume estimates of the non-financial assets with the real estimates of financial assets less liabilities. Financial assets and liabilities have been deflated using the implicit price deflator for domestic final demand, that is the changes in real values for these can be interpreted as changes in their purchasing power over the set of goods and services that make up domestic final demand.

External accounts

All current transactions between Australian residents and non-residents are recorded in the external income account. The income of non-residents includes Australia's imports of goods and services, compensation payable to non-resident employees, property income receivable from Australia and other current transfers from Australia. The use of income side shows Australia's exports of goods and services, compensation payable by non-residents to Australian employees, property income payable to Australia and other current transfers to Australia. The balance on the external income account represents net lending to non-residents: positive net lending to non-residents corresponds to a surplus on current transactions and negative net lending corresponds to a deficit. Aside from some presentation differences, the external income account shown in the national accounts is the same as the current account in balance of payments statistics.

The external capital account shows, on one side, the balance on external current transactions (from the external income account) and net capital transfers receivable from Australian residents. On the other side, net acquisitions of non-produced non-financial assets by non-residents is shown. The balance is net lending from non-residents to Australia.

The external financial account records all transactions in financial assets between Australian residents and the rest of the world. The balancing item in the external financial account (that is, net acquisition of financial assets less net incurrence of financial liabilities) is conceptually equal to the balancing item in the external capital account. However, in practice a statistical discrepancy is required to achieve balance.

The external balance sheet records Australian residents' assets in the rest of the world and non-residents' assets in Australia. The balancing item is Australia's net international investment position, which is a component of Australia's net worth.

APPENDIX 2 THE AUSTRALIAN NATIONAL ACCOUNTS *continued*

INPUT-OUTPUT TABLES

Input-output tables are essentially a disaggregation of the gross domestic product account. The gross domestic product account represents a fully consolidated measure of economic production for the economy where only transactions representing final production are shown and intermediate production is netted out. Input-output tables on the other hand bring back into focus inter-industry flows of goods and services, thereby providing a more complete description of the process of economic production. They provide detailed information about the supply and disposition of commodities in the economy and the structure and interrelationships of industries.

The ABS publishes detailed input-output statistics in *Australian National Accounts: Input Output Tables* (cat. no. 5209.0.55.001).

MULTIFACTOR PRODUCTIVITY ESTIMATES

Information contained in the national accounts can be used, along with other information, to obtain estimates of multifactor productivity (MFP). A description of the latest ABS developments in this area, refer to *Information Paper: Experimental Estimates of Industry Multifactor Productivity* (cat. no. 5260.0.55.001). (For a more information about MFP, refer to Chapter 27 of *Australian National Accounts: Concepts, Sources and Methods* (cat. no. 5216.0).)

GLOSSARY

Actual consumption	To allow for the fact that the consumption of goods and services by households may be paid for, in cash or in kind, by the general government sector an alternative measure of consumption called actual consumption has been defined. It is measured by first separating government final consumption expenditure (GFCE) into individual and collective consumption. Individual consumption refers to services that are provided by general government to households which are consumed individually, for example health and education. Collective consumption, on the other hand, relates to the provision of public services such as policing and defence. Household actual consumption is measured as household final consumption expenditure plus individual consumption within GFCE. General government actual consumption is measured as GFCE less individual consumption. Actual consumption is a particularly useful measure for international comparison since countries often have different systems for providing individual services.
Adjusted disposable income	Consistent with the estimation of an alternative measure of consumption (see Actual consumption) an alternative measure of disposable income can also be measured. Adjusted household disposable income is measured by adding the value of individual consumption (recorded as transfers in kind on the income side of the account) to gross disposable income.
Agricultural factor income	The total factor income arising from production in agriculture and services to agriculture. It is equal to the estimated gross value of production (after the inventory valuation adjustment) less estimated production costs other than compensation of employees and consumption of fixed capital for all enterprises engaged in agriculture and services to agriculture. It includes agricultural output produced by the household sector for its own consumption.
Agricultural income	The income accruing from agricultural production during the year. It is equal to gross agricultural product at factor cost less consumption of fixed capital, compensation of employees, and net rent and interest payments.
Agricultural production costs	Include all costs (other than compensation of employees and consumption of fixed capital) incurred in current production but exclude net rent and interest payable which are treated as appropriations out of operating surplus. In general, marketing costs are as shown in the statistical publication <i>Value of Agriculture, Australia</i> (cat. no. 7113.0) and represent the difference between the value at the farm or other place of production and at the wholesale markets. Other costs include taxes on production and imports, fertilisers, fuel, costs associated with inter-farm transfers of livestock and fodder, maintenance and other miscellaneous items.
Average compensation per employee	Calculated as total compensation of employees divided by the number of wage and salary earners from the monthly Labour Force Survey.
Basic price	The amount receivable by the producer from the purchaser for a unit of a good or service produced as output, minus any tax payable plus any subsidy receivable, on that unit as a consequence of its production or sale; it excludes any transport charges invoiced separately by the producer.
Capital account	Records the values of the non-financial assets that are acquired, or disposed of, by resident institutional units by engaging in transactions, and shows the change in net worth due to saving and capital transfers or internal bookkeeping transactions linked to production (changes in inventories and consumption of fixed capital).
Capital productivity	See ' <i>Productivity estimates</i> '
Capital transfers	Transactions in which the ownership of an asset (other than cash and inventories) is transferred from one institutional unit to another, in which cash is transferred to enable the recipient to acquire another asset or in which the funds realised by the disposal of another asset are transferred. Examples include general government capital transfers to

GLOSSARY *continued*

Capital transfers <i>continued</i>	private schools for the construction of science blocks or libraries and transfers to charitable organisations for the construction of homes for the aged.
Chain price indexes	Annually-reweighted chain Laspeyres price indexes referenced to the same year as the chain volume measures. They can be thought of as a series of indexes measuring price change from a base year to quarters in the following year using current price values in the base year as weights, linked together to form a continuous time series. In other words, chain price indexes are constructed in a similar fashion to the chain volume indexes.
Chain volume measures	Annually-reweighted chain Laspeyres volume indexes referenced to the current price values in a chosen reference year (i.e. the year when the quarterly chain volume measures sum to the current price annual values). Chain Laspeyres volume measures are compiled by linking together (compounding) movements in volumes, calculated using the average prices of the previous financial year, and applying the compounded movements to the current price estimates of the reference year.
Changes in inventories held by enterprises and general government	Obtained after adjusting the increase in book value of inventories by the inventory valuation adjustment. The need for an inventory valuation adjustment arises because the changes in the value of inventories as calculated from existing business accounting records do not meet national accounting requirements. For national accounting purposes, physical changes in inventories should be valued at the prices current at the times when the changes occur. The inventory valuation adjustment is the difference between the change in (book) value of inventories and the physical changes valued at average current prices. The physical changes at average current quarter prices are calculated by applying average quarterly price indexes to the changes in various categories of inventories in volume terms.
Collective consumption	Services provided simultaneously to all members of the community or to all members of a particular section of the community, such as all households living in a particular region. Collective services are automatically acquired and consumed by all members of the community, or group of households in question, without any action on their part. Typical examples are public administration and the provision of security, either at a national or local level. Collective services are the 'public goods' of economic theory. By their nature, collective services cannot be sold to individuals on the market, and they are financed by government units out of taxation or other incomes. The defining characteristics of collective services are as follows: collective services can be delivered simultaneously to every member of the community or of particular sections of the community, such as those in a particular region; the use of such services is usually passive and does not require the explicit agreement or active participation of all the individuals concerned; and the provision of a collective service to one individual does not reduce the amount available to others in the same community or section of the community, i.e. there is no rivalry in acquisition. See also <i>Individual consumption</i> .
Compensation of employees	The total remuneration, in cash or in kind, payable by an enterprise to an employee in return for work done by the employee during the accounting period. It is further classified into two sub-components: wages and salaries; and employers' social contributions. Compensation of employees is not payable in respect of unpaid work undertaken voluntarily, including the work done by members of a household within an unincorporated enterprise owned by the same household. Compensation of employees excludes any taxes payable by the employer on the wage and salary bill (e.g. payroll tax). See also <i>Employers' social contributions</i> ; <i>Wages and salaries</i> .
Consumption of fixed capital	The reduction in the value of fixed assets used in production during the accounting period resulting from physical deterioration, normal obsolescence or normal accidental damage. Unforeseen obsolescence, major catastrophes and the depletion of natural resources are not taken into account.

GLOSSARY *continued*

Cultivated Biological Assets	Includes such assets as orchard growth and livestock. The definition of orchard growth is any plant that can produce a marketable quantity of fruit for more than one year in which the grower intends to obtain a future benefit from the sale of the fruits borne. It can include trees, vines, bushes and shrubs. The costs to be capitalised as part of the value of fruit and nut bearing plants are the establishment costs involved in planting the new nursery plant and then maintenance costs associated with making the plant grow. Livestock assets are classified as either fixed assets or inventories. Those livestock which are used in production of other products (e.g. breeding stock, animals for entertainment, sheep for wool and dairy cattle) are fixed assets. Inventories cover all other livestock types and includes those animals raised for meat or other one-off products (e.g. leather).
Current prices	Estimates are valued at the prices of the period to which the observation relates. For example, estimates for 2002–03 are valued using 2002–03 prices. This contrasts to chain volume measures where the prices used in valuation refer to the prices of the previous year.
Current transfers	Transfers, other than those classified as capital transfers, in which one institutional unit provides a good, service or cash to another unit without receiving from the latter anything of economic value in return.
Current transfers to non-profit institutions	Transfers for non-capital purposes to private non-profit institutions serving households such as hospitals, independent schools, and religious and charitable organisations.
Current taxes on income, wealth, etc.	Include taxes on the incomes of households or the profits of corporations and taxes on wealth that are payable regularly every tax assessment period (as distinct from capital taxes that are levied infrequently).
Dividends from public corporations	Comprises that part of the net income of public corporations (financial and non-financial) which is paid to general government whether described by the corporations as dividends or transfer of profits. Income tax and other forms of taxation are excluded. Public corporation net income is derived by deducting consumption of fixed capital, interest payable and working expenses from interest receivable and charges for goods and services.
Economically significant prices	Prices which have a significant influence on both the amounts producers are willing to supply and the amounts purchasers wish to buy.
Employers' social contributions	Payments by employers which are intended to secure for their employees the entitlement to social benefits should certain events occur, or certain circumstances exist, that may adversely affect their employees' income or welfare – namely work-related accidents and retirement.
Exports of goods and services	The value of goods exported and amounts receivable from non-residents for the provision of services by residents.
Final consumption expenditure – general government	Government final consumption expenditure is current expenditure by general government bodies on services to the community such as defence, education, and public order and safety less any explicit charges for these services. If these are provided free of charge or at charges which cover only a small proportion of costs, the government is considered to be the consumer of its own output. This output has no directly observable market value, and so it is valued in the national accounts at its cost of production. It also includes the value of the portion of market output purchased by the General Government sector on behalf of beneficiaries.
Final consumption expenditure – households	Net expenditure on goods and services by persons and expenditure of a current nature by private non-profit institutions serving households. This item excludes expenditures by unincorporated businesses and expenditures on assets by non-profit institutions (included in gross fixed capital formation). Also excluded is expenditure on maintenance of dwellings (treated as intermediate expenses of private enterprises), but personal expenditure on motor vehicles and other durable goods and the imputed rent of

GLOSSARY *continued*

Final consumption expenditure – households <i>continued</i>	owner-occupied dwellings are included. The value of 'backyard' production (including food produced and consumed on farms) is included in household final consumption expenditure and the payment of wages and salaries in kind (e.g. food and lodging supplied free to employees) is counted in both household income and household final consumption expenditure.
Financial account	Records the net acquisition of financial assets and net incurrence of liabilities for all institutional sectors by type of financial asset.
Fixed Assets	Are defined as produced assets that are used repeatedly, or continuously, in processes of production for more than one year. Fixed assets not only include structures, machinery and equipment and intellectual property products but also cultivated assets such as trees and animals that are used repeatedly or continuously to produce other products such as fruit and dairy products.
Gross disposable income – households	Gross household income less income tax payable, other current taxes on income, wealth etc., consumer debt interest, interest payable by unincorporated enterprises, net non-life insurance premiums and other current transfers payable by households.
Gross domestic product (GDP)	Is the total market value of goods and services produced in Australia within a given period after deducting the cost of goods and services used up in the process of production but before deducting allowances for the consumption of fixed capital. Thus gross domestic product, as here defined, is 'at market prices'. It is equivalent to gross national expenditure plus exports of goods and services less imports of goods and services. <i>Farm product</i> is that part of gross domestic product which arises from production in agriculture and services to agriculture. It is equivalent to the value added of ANZSIC 06 subdivision 01 'Agriculture' plus taxes less subsidies on products primary to this subdivision. <i>Non-farm product</i> arises from production in all other industries.
GDP per capita	The ratio of the chain volume estimate of GDP to an estimate of the resident Australian population. Population estimates use data published in the quarterly publication <i>Australian Demographic Statistics</i> (cat. no. 3101.0) and ABS projections.
Gross domestic product per hour worked	The ratio of the chain volume estimate of GDP to an estimate of hours worked. Hours worked estimates are derived as the product of employment and average hours worked. Movements in chain volume estimates of GDP per hour worked are commonly interpreted as changes in labour productivity. However, it should be noted that these measures reflect not only the contribution of labour to changes in production per hour worked, but also the contribution of capital and other factors (such as managerial efficiency, economies of scale, etc.).
Gross entrepreneurial income	The gross entrepreneurial income for a corporation, quasi-corporation, or institutional unit owning an unincorporated enterprise engaged in market production is defined as its gross operating surplus or gross mixed income, plus property income receivable on the financial or non-financial assets owned by the enterprise, less interest payable on the liabilities of the enterprise and rents payable on land or other tangible non-produced assets rented by the enterprise. See <i>Gross operating surplus</i> , <i>Gross mixed income</i> .
Gross fixed capital formation – general government	Expenditure on new fixed assets plus net expenditure on second-hand fixed assets whether for additions or replacements including defence weapons platforms that have an anticipated ongoing use (greater than one year). Expenditure on new roadworks (or upgrading existing roads) is included but expenditure on road repair and maintenance is classified as government final consumption expenditure.
Gross fixed capital formation – private	Expenditure on fixed assets broken down into dwellings, non-dwelling construction, machinery and equipment, cultivated biological assets, intellectual property products and ownership transfer costs. The machinery and equipment category includes plant, machinery, equipment, vehicles, etc. Expenditure on repair and maintenance of fixed assets is excluded, being chargeable to the production account. Additions to fixed assets are regarded as capital formation. Also included is compensation of employees and other

GLOSSARY *continued*

Gross fixed capital formation – private <i>continued</i>	costs paid by private enterprise in connection with own-account capital formation. Expenditure on dwellings, non-dwelling construction, and machinery and equipment is measured as expenditure on new and second-hand assets, less sales of existing assets. Cultivated biological assets includes livestock and orchard growth. Along with Computer software, Mineral and petroleum exploration and Artistic originals, Research and development is now included in the intellectual property products asset type. Ownership transfer costs comprise of stamp duty, real estate agents' fees and sales commissions, conveyancing fees and miscellaneous government charges.
Gross fixed capital formation – public corporations	Expenditure on new fixed assets plus net expenditure on second-hand fixed assets and including both additions and replacements. Also included is compensation of employees and other costs paid by public corporations in connection with capital works undertaken on own account.
Gross income – households	The total income, whether in cash or kind, receivable by persons normally resident in Australia. It includes both income in return for productive activity (such as compensation of employees, the gross mixed income of unincorporated enterprises, gross operating surplus on dwellings owned by persons, and property income receivable, etc.) as well as transfers receivable (such as social assistance benefits and non-life insurance claims).
Gross mixed income of unincorporated enterprises	The surplus or deficit accruing from production by unincorporated enterprises. It includes elements of both compensation of employees (returns on labour inputs) and operating surplus (returns on capital inputs).
Gross national disposable income	Is equivalent to gross national income plus all secondary income in cash or in kind receivable by resident institutional units from the rest of the world, less all secondary income in cash or in kind payable by resident institutional units to the rest of the world.
Gross national expenditure	The total expenditure within a given period by Australian residents on final goods and services (i.e. excluding goods and services used up during the period in the process of production). It is equivalent to gross domestic product plus imports of goods and services less exports of goods and services.
Gross national income (GNI)	The aggregate value of gross primary incomes for all institutional sectors, including net primary income receivable from non-residents. Gross National Income was formerly called <i>gross national product</i> (GNP).
Gross operating surplus	The operating surplus accruing to all enterprises, except unincorporated enterprises, from their operations in Australia. It is the excess of gross output over the sum of intermediate consumption, compensation of employees, and taxes less subsidies on production and imports. It is calculated before deduction of consumption of fixed capital, dividends, interest, royalties and land rent, and direct taxes payable, but after deducting the inventory valuation adjustment. Gross operating surplus is also calculated for general government and it equals general government's consumption of fixed capital.
Gross value added	The value of output at basic prices minus the value of intermediate consumption at purchasers' prices. The term is used to describe gross product by industry and by sector. Basic prices valuation of output removes the distortion caused by variations in the incidence of commodity taxes and subsidies across the output of individual industries.
Hours worked	The hours worked by all labour engaged in the production of goods and services, including hours worked by civilian wage and salary earners, employers, self-employed persons, persons working one hour or more without pay in a family business or on a farm, and members of the Australian defence forces.
Household saving ratio	The ratio of household net saving to household net disposable income. Household net saving is calculated as household net disposable income less household final consumption expenditure. Household net disposable income is calculated as household gross disposable income less household consumption of fixed capital.

GLOSSARY *continued*

Implicit price deflator	Obtained by dividing a current price value by its real counterpart (the chain volume measure). When calculated from the major national accounting aggregates, such as gross domestic product, implicit price deflators relate to a broader range of goods and services in the economy than that represented by any of the individual price indexes that are published by the ABS. Whereas the chain price indexes are chain Laspeyres indexes, the annual implicit price deflators are chain Paasche price indexes, i.e. each year-to-year movement is calculated using the current price value shares of the second of the two years to weight together the elemental price indexes.
Imports of goods and services	The value of goods imported and amounts payable to non-residents for the provision of services to residents.
Individual consumption	An individual consumption good or service is one that is acquired by a household and used to satisfy the needs and wants of members of that household. Individual goods and services can always be bought and sold on the market, although they may also be provided free, or at prices that are not economically significant, or as transfers in kind. Individual goods and services are essentially 'private', as distinct from 'public'. See also <i>Collective consumption</i> .
Institutional unit	An institutional unit is an economic entity that is capable, in its own right, of owning assets, incurring liabilities, engaging in economic activities and engaging in transactions with other entities.
Intellectual property products	Includes such assets as computer software, research and development, entertainment, literary or artistic originals, and mineral exploration intended to be used for more than a year.
Intangible fixed assets	Includes such assets as computer software, entertainment, literary or artistic originals, and mineral exploration intended to be used for more than a year.
Intangible non-produced assets	Includes such assets as purchased goodwill, 3G spectrum licences, patented entities and leases on land and subsoil assets. Estimation of these assets is in its infancy. Currently only the value of 3G spectrum licences is included in the national and sector balance sheets.
Intermediate consumption	Consists of the value of the goods and services used as inputs by a process of production, excluding compensation of employees and the consumption of fixed capital.
Inventories	Consist of stocks of outputs that are held at the end of a period by the units that produced them prior to their being further processed, sold, delivered to other units or used in other ways and stocks of products acquired from other units that are intended to be used for intermediate consumption or for resale without further processing.
Labour productivity estimates	See ' <i>Productivity estimates</i> '
Livestock	Livestock assets are classified as either fixed assets or inventories. Those livestock which are used in production of other products (e.g. breeding stock, animals for entertainment, sheep for wool and dairy cattle) are fixed assets. Inventories cover all other livestock types and includes those animals raised for meat or other one-off products (e.g. leather).
Machinery and equipment	Consists of transport equipment, computing equipment and other machinery and equipment other than that acquired by households for final consumption.
Market output	Output that is sold at prices that are economically significant or otherwise disposed of on the market, or intended for sale or disposal on the market.
Market sector	With the introduction of ANZSIC06, the definition of those industries that constitute the 'market' sector' has also changed. It is now defined to include all industries except for Public administration and safety (O); Education and training (P); and Health care and social assistance (Q). The chain volume measure of the production of a group of industries referred to as the market sector is defined to be the chain volume estimate of industry gross value added of all industries less Divisions O, P and Q, less Ownership of

GLOSSARY *continued*

Market sector <i>continued</i>	dwellings, plus taxes less subsidies on products attributable to the market sector industries. The multifactor productivity estimates will continue to be produced, but on the basis of 'selected' ANZSIC06 industries (divisions A to K and R) until estimates are fully developed for the new definition of market sector.
Multifactor productivity	See 'Productivity estimates'. Also, multifactor productivity estimates for the ANZSIC06 industries encompassing divisions A to N, R and S, will be published in the productivity datacube (5260.0.55.002), due to be released in January 2010. These indexes will be available on both a gross output and value added basis, and will commence in 1994-95.
National lending	See ' <i>Net lending to non-residents</i> '
National saving	Calculated as the sum of the net saving of each of the resident sectors – households and unincorporated enterprises, non-financial corporations, financial corporations and general government. Also referred to as <i>net saving</i> .
Net domestic product	Calculated as GDP less consumption of fixed capital.
Net lending to non-residents	The excess of net acquisition of financial assets in the rest of the world by resident institutional units over their net incurrence of liabilities in the rest of the world.
Net saving – corporations	This is equal to the gross income receivable by corporations less income payable and consumption of fixed capital. Income receivable by corporations includes gross operating surplus, property income and current transfers receivable. Income payable includes property income and current transfers (including income taxes) payable.
Net saving – general government	The surplus of general government gross income over current use of income. Current use of income includes final consumption expenditure and current transfers (interest and other property income payable, social assistance benefits payments to residents, transfers to non-profit institutions, subsidies, etc.).
Net saving – households	Is equal to gross household disposable income less household final consumption expenditure and consumption of fixed capital. Household saving is estimated as the balancing item in the households income account. It includes saving through life insurance and superannuation funds (including net earnings on these funds), increased equity in unfunded superannuation schemes and the increase in farm assets with marketing boards.
Net secondary income from non-residents	All transfers to or from non-residents to resident government or private institutional units which are not payments for goods and services, compensation of employees or property income.
Net worth	In the national and sectoral balance sheets, net worth represents the difference between the stock of assets (both financial and non-financial) and the stock of liabilities (including shares and other equity). Because it is derived residually, it can be negative.
Neutral holding gains/losses	The value of the holding gain that would accrue if the price of the asset changed in the same proportion as the general price level.
Nominal holding gains/losses	On a given quantity of asset, it is the value of the benefit accruing to the owner of that asset as a result of a change in its price or, more generally, its monetary value, over time.
Non-market output	Goods and services produced by any institutional unit that are supplied free or at prices that are not economically significant.
Non-produced assets	Are defined as non-financial assets that come into existence other than through processes of production. These assets are needed for production but have not themselves been produced. In the ASNA, there is a distinction between Natural resources (Land; Subsoil assets; Native timber standing and Spectrum) and Permissions to use natural resources (Spectrum licences).
Other changes in real net wealth	Calculated as the sum of <i>real holding gains</i> , <i>net capital transfers</i> and <i>other changes in volume</i> .

GLOSSARY *continued*

Other changes in real net wealth – other differences	These arise due to a different treatment of stock and flow concepts between the balance sheet and capital account estimates. Net capital formation in mineral exploration is excluded from the change in net worth in the balance sheet and included in the capital account. Net capital formation in livestock inventories is included in the change in net worth in the balance sheet and excluded from the capital account.
Other changes in volume	A flow which recognises the entry and exit of assets across the asset boundary. An example is the discovery of new mineral resources.
Other subsidies on production	Consist of all subsidies, except subsidies on products, which resident enterprises may receive as a consequence of engaging in production. Other subsidies on production include: subsidies related to the payroll or workforce numbers, including subsidies payable on the total wage or salary bill, on numbers employed, or on the employment of particular types of persons, e.g. persons with disabilities or persons who have been unemployed for a long period. The subsidies may also be intended to cover some or all of the costs of training schemes organised or financed by enterprises. Subsidies aimed at reducing pollution are also included. See also <i>Subsidies on products</i> .
Other taxes on production	Consist of all taxes that enterprises incur as a result of engaging in production, except taxes on products. Other taxes on production include: taxes related to the payroll or workforce numbers excluding compulsory social security contributions paid by employers and any taxes paid by the employees themselves out of their wages or salaries; recurrent taxes on land, buildings or other structures; some business and professional licences where no service is provided by the Government in return; taxes on the use of fixed assets or other activities; stamp duties; taxes on pollution; and taxes on international transactions. See also <i>Current taxes on income, wealth, etc.</i> , <i>Taxes on production and imports</i> and <i>Taxes on products</i> .
Output	This consists of those goods and services that are produced within an establishment that become available for use outside that establishment, plus any goods and services produced for own final use.
Primary incomes	Consist of incomes that accrue to institutional units as a consequence of their involvement in processes of production or their ownership of assets that may be needed for the purposes of production.
Produced Assets	Are defined as non-financial assets that have come into existence as outputs from processes that fall within the production boundary. There are three main types of produced assets: fixed assets, inventories and valuables.
Productivity estimates	<p>A number of productivity measures are included in this publication.</p> <ul style="list-style-type: none"> ■ <i>Capital productivity estimates</i> are indexes of real GDP per unit of capital services used in production. They have been derived by dividing the index of the chain volume measure of GDP by an index of capital services. The capital productivity indexes reflect not only the contribution of capital to changes in production, but also the contribution by labour and other factors affecting production. ■ <i>Labour productivity estimates</i> are indexes of real GDP per capita or per hour worked. They have been derived by dividing the chain volume measure of GDP by the estimated resident population or hours worked. Estimates are also made using labour inputs adjusted for the quality and composition of labour input. Labour productivity indexes reflect not only the contribution of labour to changes in product per labour unit, but are also influenced by the contribution of capital and other factors affecting production. ■ <i>Multifactor productivity estimates</i> are indexes of real GDP per combined unit of labour and capital.

GLOSSARY *continued*

Productivity estimates <i>continued</i>	For a description of how these estimates are derived and the latest ABS developments in this area, refer to <i>Information Paper: Experimental Estimates of Industry Multifactor Productivity</i> (cat. no. 5260.0.55.001). For a more comprehensive description the reader should refer to Chapter 27 of <i>Australian National Accounts: Concepts, Sources and Methods</i> (cat. no. 5216.0).
Productivity growth cycles	A common method of examining changes in productivity over an extended period involves identifying and dividing the data into productivity 'growth cycles'. Year to year changes in measured productivity may reflect changes that are conceptually distinct from the notion of productivity. By analysing averages of productivity statistics between growth cycle peaks, the effects of some of these temporary influences can be minimised, allowing better analysis of the drivers of productivity growth in different periods. Productivity growth cycle peaks are determined by comparing the annual MFP estimates with their corresponding long-term trend estimates. The peak deviations between these two series are the primary indicators of a growth-cycle peak, although general economic conditions at the time are also considered.
Property income	Is the income receivable by the owner of a financial asset or a tangible non-produced asset in return for providing funds, or putting a tangible non-produced asset at the disposal of another institutional unit.
Purchasers' price	The amount paid by the purchaser, excluding any deductible tax, in order to take delivery of a unit of a good or service at the time and place required by the purchaser. The purchaser's price of a good includes any transport charges paid separately by the purchaser to take delivery at the required time and place.
Quality adjusted hours worked	This measure of labour input takes account of changes in the aggregate quality of labour due to changes in educational attainment and the length of experience in the workforce. Labour productivity and multifactor productivity estimates based on quality adjusted hours worked are also calculated. For a description of this work see the feature article, ' <i>Further developments in the analysis of productivity growth in Australia</i> ' in the September quarter 2001 issue of <i>Australian National Accounts: National Income, Expenditure and Product</i> (cat. no. 5206.0).
Real gross domestic income	<p>Calculated by:</p> <ul style="list-style-type: none"> ■ taking the volume measure of gross national expenditure (GNE) ■ adding exports of goods and services at current prices deflated by the implicit price deflator for imports of goods and services ■ deducting the volume measure of imports of goods and services ■ adding the current price statistical discrepancy for GDP(E) deflated by the implicit price deflator for GDP. <p>In the derivation of the aggregate all of the adjustments are made using the chain volume aggregation method used to derive all of the ABS chain volume estimates.</p>
Real gross national income	Calculated by adjusting real gross domestic income for the real impact of primary income flows (property income and labour income) to and from overseas.
Real holding gains	A real holding gain/loss is the difference between the nominal holding gain/loss on assets and liabilities, and the neutral holding gain. It is the value of the additional command over real resources accruing to the holder of an asset as a result of a change in its price relative to the prices of goods and services in the economy.
Real net national disposable income	<p>Calculated by:</p> <ul style="list-style-type: none"> ■ taking real gross domestic income ■ deducting real incomes payable to the rest of the world ■ adding real incomes receivable from the rest of the world ■ deducting the volume measure of consumption of fixed capital. <p>Real incomes payable and receivable are calculated by dividing the nominal income flows by the implicit price deflator for gross national expenditure. In the derivation of the</p>

GLOSSARY *continued*

Real net national disposable income <i>continued</i>	aggregate, all of the adjustments are made using the chain volume aggregation method used to derive all of the ABS chain volume estimates.
Secondary income	Consists of receipt and payment of current transfers.
Services from consumer durables	Represents the value of services provided by consumer durables to the household in the accounting period. It arises because consumer durables, unlike other final consumption goods, are not used up in the accounting period in which they are purchased. It is measured in the same way as consumption of fixed capital, i.e. as the reduction in value of the stock of consumer durables during the accounting period resulting from physical deterioration, normal obsolescence or normal accidental damage. Unforeseen obsolescence is not taken into account. Ideally, the service flow would be calculated in a manner analogous to the estimation of flows of capital services within the general capital stock model. Flows of capital services and flows of consumption of fixed capital are related but different concepts. Capital services relate to the changing efficiency of an asset whereas depreciation relates to the changing price of an asset.
Social assistance benefits in cash to residents	Includes current transfers to persons from general government in return for which no services are rendered or goods supplied. Principal components include: scholarships; maternity, sickness and unemployment benefits; family allowances; and widows', age, invalid and repatriation pensions.
Statistical discrepancy (I), (E) and (P)	Calculated as the differences between aggregate incomes, expenditures, or industry products respectively and the single measure of GDP. For years in which a balanced supply and use table is available to benchmark the national accounts, the same measure of GDP is obtained.
Subsidies on products	Subsidies payable per unit of a good or service. The subsidy may be a specific amount of money per unit of quantity of a good or service, or it may be calculated ad valorem as a specified percentage of the price per unit. A subsidy may also be calculated as the difference between a specified target price and the market price actually paid by a purchaser. A subsidy on a product usually becomes payable when the product is produced, sold or imported, but it may also become payable in other circumstances, such as when a product is exported, leased, transferred, delivered or used for own consumption or own capital formation.
Taxes less subsidies on production and imports	Defined as ' <i>taxes on products</i> ' plus ' <i>other taxes on production</i> ' less ' <i>subsidies on products</i> ' less 'other subsidies on production'.
Taxes on production and imports	Consist of ' <i>taxes on products</i> ' and ' <i>other taxes on production</i> '. These taxes do not include any taxes on the profits or other income received by an enterprise. They are payable irrespective of the profitability of the production process. They may be payable on the land, fixed assets or labour employed in the production process, or on certain activities or transactions. See also <i>Current taxes on income and wealth</i> , <i>Other taxes on production</i> and <i>Taxes on products</i> .
Taxes on products	Taxes payable per unit of some good or service. The tax may be a specific amount of money per unit of quantity of a good or service (quantity being measured either in terms of discrete units or continuous physical variables such as volume, weight, strength, distance, time, etc.), or it may be calculated ad valorem as a specified percentage of the price per unit or value of the goods or services transacted. A tax on a product usually becomes payable when the product is produced, sold or imported, but it may also become payable in other circumstances, such as when a good is exported, leased, transferred, delivered, or used for own consumption or own capital formation. See also <i>Current taxes on income and wealth</i> , <i>Other taxes on production</i> and <i>Taxes on production and imports</i> .
Terms of trade	Calculated by dividing the export implicit price deflator by the import implicit price deflator and multiplying by 100.

GLOSSARY *continued*

Total factor income	That part of the cost of producing the gross domestic product which consists of gross payments to factors of production (labour and capital). It represents the value added by these factors in the process of production and is equivalent to gross domestic product less taxes plus subsidies on production and imports.
Unit labour costs	These series represent a link between productivity and the cost of labour in producing output. A nominal <i>Unit Labour Cost (ULC)</i> measures the average cost of labour per unit of output while a real ULC adjusts a nominal ULC for general inflation. A ULC is calculated as the ratio of labour costs per hours worked by employees divided by <i>volume</i> gross value added per total hours worked. Positive growth in a real ULC indicates that labour cost pressures exist.
Wages and salaries	Consist of amounts payable in cash including the value of any social contributions, income taxes, fringe benefits tax, etc., payable by the employee even if they are actually withheld by the employer for administrative convenience or other reasons and paid directly to social insurance schemes, tax authorities, etc., on behalf of the employee. Wages and salaries may be paid as remuneration in kind instead of, or in addition to, remuneration in cash. Separation, termination and redundancy payments are also included in wages and salaries. Wages and salaries are also measured as far as possible on an accrual rather than a strict cash basis. See also <i>Employers' social contributions</i> ; <i>Compensation of employees</i> .
