

CENSUS OF THE COMMONWEALTH OF AUSTRALIA.

30th June, 1947.

STATISTICIAN'S REPORT.

PREPARED UNDER INSTRUCTIONS FROM THE RIGHT HONORABLE THE TREASURER.

BY

S. R. CARVER, ACTING COMMONWEALTH STATISTICIAN.

By Authority:

L. F. Johnston, Commonwealth Government Printer, Camberra. (Wholly set up and printed in Australia.)

[C.S. No. 865.]—1596.

* COPIES may be purchased for 5s. each, plus postage, from the Government Printer, Canberra; the Commonwealth Sub-Treasury in each capital city; McCarron, Bird and Co., 479 Collins-street, Melbourne; or may be ordered through the leading booksellers in the principal cities of Australia.

PREFACE.

The main object of this Report is to present within reasonable compass an analysis of the statistical data already published in the Detailed Tables of the Census. The results of the detailed enumeration are shown in condensed form, with the "not stated" particulars appropriately distributed where a distribution was thought desirable.

The Census legislation and regulations, and the schedules used in the enumeration, are reproduced in the early chapters. A short account is also given of the preparatory work required for the taking of the Census, of the organization of the staff, of the tabulation procedure and of the general Census organization. Brief chapters deal with the publication of results, and with the method of adjustment of intercensal estimates of population. The chapters dealing with specific aspects of the Census results are preceded by a chapter reviewing the growth and changes in the general characteristics of the population.

The organization, general planning and tabulation of the material of the Census were directed by Dr. Roland Wilson, C.B.E., B.Com., D.Phil., Ph.D., Commonwealth Statistician until his appointment in 1951 as Secretary to the Treasury. In this work he was ably assisted by Mr. J. Barry, Assistant Statistician, and Mr. A. E. Callander, who carried out the duties of Supervisor of Census with conspicuous ability. This Report was prepared under the direction of Mr. J. Barry by senior officers of the Census and Mechanical Tabulation Division and Mr. R. C. Gilligan, B.Com., who wrote many of the chapters.

S. R. CARVER,
Acting Commonwealth Statistician.

Commonwealth Bureau of Census and Statistics, Canberra, A.C.T., 10th November, 1952.

CHAPTER I.

LEGISLATION.

- 1. General.—The Census was taken on the 30th June, 1947, and was the fourth of the series undertaken by the Commonwealth Bureau of Census and Statistics. It was taken under the provisions of the Census and Statistics Act 1905-1946, which provides that the Census shall be taken in the year 1911 and in every tenth year thereafter or at such other time as is prescribed. The Census which should normally have been held in 1941 was postponed on account of the war.
- 2. Census Act and Regulations.—The text of the Act and the regulations made thereunder are shown below. Although it makes no reference to the Census it was considered advisable to embody in the text of the Act the provisions of the latest amendment, assented to on 12th July, 1949.

CENSUS AND STATISTICS ACT 1905-1949.

An Act relating to the Census and Statistics of the Commonwealth.

Be it enacted by the King's Most Excellent Majesty, the Senate, and the House of Representatives of the Commonwealth of Australia as follows:—

PART I.—INTRODUCTORY.

SHORT TITLE.

1. This Act may be cited as the *Census and Statistics Act* 1905-1949.

PARTS.

- 2. This Act is divided into Parts, as follows:—
 - Part I.—Introductory.

Part II.—Administration.

Part III.—The Census.

Part IV.—Statistics.

Part V.—Miscellaneous.

DEFINITIONS.

3. In this Act, unless the contrary intention appears—

- "Dwelling" means a building, erection, or tenement, whether permanent or temporary, which is wholly or partly used for the purpose of human habitation and includes any ship or other vessel in any port of the Commonwealth or in any inland waters thereof, or any ship or vessel on a passage between any two Commonwealth ports.
- "Factory" means any work, mill, or establishment, used for the purpose of manufacturing treating or preparing any article.

- "Occupier" includes every governor, superintendent, officer in charge, or keeper, of any gaol, prison, hospital, lunatic asylum, or public or charitable institution.
- "The Statistician" means the Commonwealth Statistician.

PART II.—ADMINISTRATION.

APPOINTMENT OF STATISTICIAN.

4. The Governor-General may appoint a Commonwealth Statistician, who shall have such powers and perform such duties as are conferred or imposed on him by this Act or the regulations.

Power of Statistician to Delegate.

- 5.—(1.) The Statistician, in relation to any particular matters or class of matters or to any particular State or part of the Commonwealth, with the approval of the Minister, may, by instrument under his hand, delegate any of his powers under this Act (except this power of delegation) so that the delegated powers may be exercised by the delegate with respect to the matters or class of matters or the State or part of the Commonwealth specified in the instrument of delegation.
- (2.) Every delegation shall be revocable in writing, at will, and no delegation shall affect the exercise or performance by the Statistician of any power or duty.

Arrangements with State Governments as to Execution of Act.

- 6.—(1.) The Governor-General may enter into any arrangement with the Governor of any State providing for any matter necessary or convenient for the purpose of carrying out or giving effect to this Act and in particular for all or any of the following matters:—
 - (a) The execution by State officers of any power or duty conferred or imposed on any officer under this Act or the regulations;
 - (b) The collection by any State Department or officer of any statistical or other information required for the purpose of carrying out this Act; and
 - (c) The supplying of statistical information by any State Department or officer to the Statistician.
- (2.) All State officers executing any power or duty conferred or imposed on any officer under this Act or the regulations, in pursuance of any arrangement

entered into under this section, shall for the purposes of the execution of that power or duty be deemed to be officers under this Act.

UNDERTAKING OF FIDELITY AND SECRECY.

7. Every officer executing any power or duty conferred or imposed on any officer under this Act or the regulations, shall, before entering upon his duties or exercising any power under this Act, sign in the presence of a witness, an undertaking of fidelity and secrecy in accordance with the prescribed form.

PART III.—THE CENSUS.

TAKING OF CENSUS.

- 8.—(1.) The Census shall be taken in the year One thousand nine hundred and eleven, and in every tenth year thereafter or at such other time as is prescribed.
- (2.) The Census Day shall be a day appointed for that purpose by proclamation.

STATISTICIAN TO TAKE STEPS FOR COLLECTION OF CENSUS.

9. It shall be the duty of the Statistician, subject to the regulations and to the directions of the Minister, to prepare and issue forms and instructions, and take all necessary steps for the taking and collection of the Census.

FORMS TO BE LEFT AT DWELLINGS.

- 10.—(1.) For the purpose of taking the Census, a form called the Householder's Schedule shall be prepared, and left, in accordance with the regulations, at every dwelling throughout the Commonwealth.
- (2.) Where a building is let, sublet, or held in different apartments and occupied by different persons or families, each part so let, sublet, or held and used for the purpose of human habitation shall be deemed a dwelling.

Occupiers to fill up Householders' Schedules.

11. Every occupier of a dwelling, with or for whom a Householder's Schedule has been left, shall to the best of his knowledge and belief, fill up and supply therein, in accordance with the instructions contained in or accompanying the Schedule, all the particulars specified therein, and shall sign his name thereto and shall deliver the Schedule so filled up and signed to the Collector authorized to receive it.

Penalty: Ten pounds.

Particulars in Schedule.

- 12. The particulars to be specified in the Householder's Schedule shall include the particulars following:—
 - (a) the name, sex, age, condition as to, and duration of, marriage, relation to head of the household, profession, or occupation, religion and birthplace, and (where the person was born abroad) length of resi-

dence in Australia and nationality of every person abiding in the dwelling during the night of the Census Day;

- (b) the material of the dwelling and the number of rooms contained therein;
- (c) any other prescribed matters.

Collectors to Assist in Filling up Schedules.

13. It shall be the duty of each Collector if requested to assist occupiers of dwellings in filling up the Householder's Schedule, and to satisfy himself by inquiries from occupiers of dwellings or other persons that the Householder's Schedule has been correctly filled up.

Duty of Persons to Supply Information to Collectors.

14. Every person shall, to the best of his know-ledge and belief, answer all questions asked him by a Collector necessary to obtain any information required to be filled up and supplied in the House-holder's Schedule.

Penalty: Ten pounds.

RETURNS OF PERSONS NOT ABIDING IN DWELLINGS.

- 15.—(1.) The Statistician shall obtain such returns and particulars as are prescribed with respect to persons who, during the night of the Census Day, were not abiding in any dwelling.
- (2.) Every person shall, on being required by the Statistician so to do, furnish to the best of his knowledge and belief any prescribed particulars relating to persons who were not abiding on the night of the Census Day in any dwelling.

Penalty for any offence under this sub-section: Ten pounds.

Publication of Returns.

- 15A.—(1.) The Statistician shall compile and tabulate the Census returns collected pursuant to this Act and shall publish the results so obtained or abstracts thereof as the Minister directs, with observations thereon.
- (2.) All results or abstracts prepared for publication and the Statistician's observations thereon (if any) shall be laid before both Houses of Parliament.

PART IV.—STATISTICS.

- 16. The Statistician shall, subject to the regulations and the directions of the Minister, collect, at least annually, statistics in relation to all or any of the following matters:—
 - (a) Population;
 - (b) Vital, social, and industrial matters;
 - (c) Employment and non-employment;
 - (d) Imports and exports;
 - (e) Inter-State trade;
 - (f) Postal and telegraphic matters;
 - (g) Factories, mines, and productive industries generally;

- (h) Agricultural, horticultural, viticultural, dairying, and pastoral industries;
- (i) Banking, insurance, and finance;
- (j) Railways, tramways, shipping, and transport;
- (k) Land tenure and occupancy; and
- (1) Any other prescribed matters.

FORMS TO BE FILLED UP.

17.—(1.) For the purpose of enabling the statistics referred to in this Part of this Act to be collected, the Statistician may require a person to fill up and supply, in accordance with the instructions contained in or accompanying a form supplied to that person by the Statistician, the particulars specified in that form, and that person shall, to the best of his knowledge, comply with the requirement.

Penalty: Ten pounds.

(2.) A prosecution for a contravention of this section shall not be instituted without the consent of the Minister.

DUTY OF PERSONS TO ANSWER QUESTIONS.

18. Every person shall, to the best of his knowledge and belief, answer all questions asked him by the Statistician or an officer authorized in writing by the Statistician, necessary to obtain any information required for the purposes of any statistics authorized by this Act to be collected. Provided that no prosecution for contravention of this section shall be instituted without the consent of the Minister.

Penalty: Ten pounds.

Powers of Entry and Inspection.

- 19.—(1.) For the purpose of making any inquiries or observations necessary for the proper carrying out of this Act, the Statistician or any officer authorized in writing by him may, at any time during working hours, enter any factory, mine, workshop, or place where persons are employed, and may inspect any part of it, and all plant and machinery used in connexion with it, and may make such inquiries as are prescribed or allowed by the regulations.
- (2.) No person shall hinder or obstruct the Statistician or any officer authorized in writing by him in the execution of any power conferred by this section.

Penalty: Ten pounds.

Publication of Statistics.

- 20.—(1.) The Statistician shall compile and tabulate the statistics collected pursuant to this Act and shall publish such statistics or abstracts thereof, as the Minister directs, with observations thereon.
- (2.) All statistics or abstracts prepared for publication and the Statistician's observations thereon (if any) shall be laid before both Houses of the Parliament.

(3.) This section shall not authorize the publication of any matter the publication of which by the Statistician otherwise than under this section would be a contravention of section twenty-four of this Act.

PART V.—MISCELLANEOUS.

Person not Bound to State his Religion.

21. No person shall be liable to any penalty for omitting or refusing to state the religious denomination or sect to which he belongs or adheres.

DESERTION BY OFFICERS.

22. No officer, after having signed the prescribed undertaking, shall desert from his duty, or shall refuse or wilfully neglect, without just excuse, to perform the duties of his office.

Penalty: Twenty pounds.

Untrue Returns by Officers.

23. No officer shall wilfully or without lawful authority alter any document or form under this Act or shall wilfully sign any untrue document or form.

Penalty: Fifty pounds.

Officers and Occupiers to Observe Secrecy.

- 24. The Statistician, an officer, or the occupier of a dwelling, shall not, except as allowed by this Act, divulge the contents of any form filled up, or any information furnished—
 - (a) in pursuance of this Act; or
 - (b) at the request of the Statistician, for statistical purposes.

Penalty: Fifty pounds.

FORGERY OF FORMS..

25. Any person who forges, or utters knowing it to be forged, any form or document under this Act, shall be guilty of an indictable offence, and liable to imprisonment for a term not exceeding three years.

PENALTY FOR FALSE RETURNS OR ANSWERS.

26. No person shall knowingly make in any form or document filled up or supplied in pursuance of this Act or in answer to any question asked him under the authority of this Act any statement which is untrue in any material particular.

Penalty: Fifty pounds.

REGULATIONS.

27. The Governor-General may make regulations, not inconsistent with this Act, prescribing all matters and things which, by this Act, are required or permitted to be prescribed, or which are necessary or convenient to be prescribed for carrying out or giving effect to this Act and in particular for prescribing penalties not exceeding Fifty pounds for breaches of the regulations.

CENSUS REGULATIONS.

Statutory Rules 1947, No. 3.

REGULATIONS UNDER THE CENSUS AND STATISTICS ACT 1905-1946.*

I, the Governor-General in and over the Commonwealth of Australia, acting with the advice of the Federal Executive Council, hereby make the following Regulations under the *Census and Statistics Act* 1905-1946.

Dated this fifteenth day of January, 1947.

HENRY

Governor-General.

By His Royal Highness's Command,

J. B. CHIFLEY

Treasurer.

CENSUS REGULATIONS.

CITATION.

1. These Regulations may be cited as the Census Regulations.

REPEAL.

2. The Census Regulations (being Statutory Rules 1932, No. 142) are repealed.

CENSUS DAY.

3. The Census which would, but for the *Census and Statistics Act* 1930, have been taken in the year One thousand nine hundred and forty-one shall be taken in the year One thousand nine hundred and forty-seven.

DEFINITIONS.

- 4. In these Regulations, unless the contrary intention appears—
 - "Census Day" means 30th June, 1947;
 - "Schedule" means the Householder's Schedule referred to in the Act and includes any personal card or slip supplementary to that Schedule;
 - "Territory" means the Australian Capital Territory and the Northern Territory;
 - "The Act" means the *Census and Statistics Act* 1905-1946.

Delegation of Powers of Statistician.

- 5.—(1.) The Statistician may, by writing under his hand, delegate any of his powers or functions under these Regulations (except this power of delegation) in relation to any matters or class of matters or to any particular State or Territory, so that the delegated powers or functions may be exercised by the delegate with respect to the matters or class of matters, or the State or Territory, specified in the instrument of delegation.
- (2.) Every delegation by the Statistician shall be revocable in writing at will, and no delegation shall prevent the exercise of any power or function by the Statistician.

CHIEF FIELD SUPERVISOR.

- 6.—(1.) There shall be an officer called the Chief Field Supervisor who shall be appointed by the Statistician, and shall hold office from the date of appointment until the thirty-first day of December, 1947, or until the termination of the appointment by the Statistician, whichever first happens.
- (2.) The following persons shall be eligible for appointment as Chief Field Supervisor, namely:—
 - (a) The Chief Electoral Officer for the Commonwealth; or
 - (b) Any other person approved by the Statistician.
- 7. Subject to the Act and to these Regulations and to any directions of the Statistician, it shall be the duty of the Chief Field Supervisor—
 - (a) to advise the Statistician generally in relation to matters affecting the distribution and collection of the Census Schedules;
 - (b) to make advance plans for the recruitment of the necessary number of Collectors;
 - (c) to ensure that all Deputy Field Supervisors, Enumerators, Sub-enumerators and Collectors thoroughly understand their duties and responsibilities;
 - (d) to check the receipt before Census Day by all officers and employees of the field staff of sufficient supplies of Census Schedules, Personal Cards or Slips, envelopes, maps and diagrams, compilation books, instruction manuals and other Census material; and
 - (e) to arrange, as agent for the Statistician, for the payment of Collectors, Sub-enumerators and Enumerators in accordance with these Regulations, and to deal with all correspondence and claims in relation thereto.
- 8. The Chief Field Supervisor shall, in addition to any emolument to which he is otherwise entitled, receive such payment as the Minister, on the recommendation of the Statistician, approves.
- 9. The Chief Field Supervisor shall, before entering upon his duties or exercising any power under the Act or these Regulations, sign, in the presence of a witness an undertaking in accordance with the following form:—

COMMONWEALTH OF AUSTRALIA. Census and Statistics Act 1905-1946. Undertaking of Chief Field Supervisor.

I,, of, undertake, in connexion with the taking of the Census in the year 1947, that I will faithfully and with due dispatch perform the duties of Chief Field Supervisor of Census under the Census Regulations within the Commonwealth and I do solemnly and sincerely promise that I will carry out, in every particular, all instructions supplied to me by the Commonwealth Statistician, and that I will not

^{*} As mentioned earlier, the Act was further amended in 1949, but the latest amendment contained no reference to the Census.

desert from my duty, or will not refuse or neglect, without just excuse, to perform the duties of the office of Chief Field Supervisor or wilfully or without lawful authority alter any document or form under the above-named Act or the Regulations thereunder, or wilfully sign any untrue document or form, or, except as allowed by the said Act or Regulations, divulge the contents of any form filled up in pursuance of the said Act or any information furnished in pursuance of the said Act.

DEPUTY FIELD SUPERVISORS.

- 10.—(1.) For each State and Territory there shall be an officer called the Deputy Field Supervisor, who shall be appointed by the Statistician, and shall hold office from the date of appointment until the thirty-first day of December, 1947, or until the termination of the appointment by the Statistician, whichever first happens.
- (2.) The following persons shall be eligible for appointment as Deputy Field Supervisor for a State, namely:—
 - (a) the Commonwealth Electoral Officer for the State;
 - (b) an officer of the Bureau of Census and Statistics;
 - (c) the State Statistician; or
 - (d) any other person approved by the Statistician.
- (3.) The following persons shall be eligible for appointment as a Deputy Field Supervisor in a Territory, namely:—
 - (a) the Administrator; or
 - (b) Any other person approved by the Statistician.
- 11. Subject to the Act and these Regulations, and to any directions of the Statistician, it shall be the duty of each Deputy Field Supervisor—
 - (a) to make all necessary arrangements for the distribution and collection of the census schedules in the State or Territory for which he is appointed;
 - (b) to obtain an accurate record of the population of that State or Territory; and
 - (c) to forward promptly to the Statistician all such schedules and records, together with such summaries or reports in relation to those schedules and records as the Statistician directs.
- 12. Each Deputy Field Supervisor shall, in addition to any emolument to which he is otherwise entitled, receive such payment as the Minister, on the recommendation of the Statistician, approves.

13. A Deputy Field Supervisor shall, before entering upon his duties or exercising any power under the Act or these Regulations, sign, in the presence of a witness an undertaking in accordance with the following form:—

COMMONWEALTH OF AUSTRALIA.

Census and Statistics Act 1905-1946.

Undertaking of Deputy Field Supervisor.

I,, of,
undertake, in connexion with the taking of the
Census in the year 1947, that I will faithfully and
with due dispatch perform the duties of Deputy
Field Supervisor of Census under the Census Regu-
lations within the State/Territory of
and I do solemnly and sincerely promise that I will
carry out, in every particular, all instructions sup-
plied to me by the Commonwealth Statistician, and
that I will not desert from my duty, or will not
refuse or neglect, without just excuse, to perform
the duties of the office of Deputy Field Supervisor or
wilfully or without lawful authority alter any docu-
ment or form under the above-named Act or the
Regulations thereunder, or wilfully sign any untrue
document or form, or, except as allowed by the said
Act or Regulations, divulge the contents of any form
filled up in pursuance of the said Act or any infor-
mation furnished in pursuance of the said Act.

-						
	Signa Date					
of Witness.						

CENSUS DIVISIONS.

- 14.—(1.) Each State shall, for the purposes of census collection, be divided into Census Divisions, which shall, where practicable and suitable, coincide with the Commonwealth Electoral Divisions.
- (2.) Each Territory may, for the purposes of census collection, be divided into Census Divisions in such way as is approved by the Statistician.

Enumerators in Charge of Census Divisions.

- 15.—(1.) For each Census Division there shall be an officer called the Enumerator, who, in relation to that division, shall carry out such duties in connexion with the taking and collection of the census as are prescribed, or as are assigned to him by the Statistician.
- (2.) Where a Census Division coincides with a Commonwealth Electoral Division, the Commonwealth Divisional Returning Officer for that Electoral Division, or such other person as the Statistician approves, shall be the Enumerator for that division.
- (3.) Where a Census Division does not coincide with a Commonwealth Electoral Division, such person as the Statistician approves shall be the Enumerator for that Division.
- 16. Each Enumerator shall, in addition to any emolument to which he is otherwise entitled, receive such payment as the Minister, on the recommendation of the Statistician, approves.

- 17. Each Enumerator shall hold office from the date of appointment until the thirtieth day of September, 1947, or until the termination of the appointment by the Statistician, whichever first happens.
- 18. Each Enumerator shall, before entering upon his duties or exercising any power under the Act or these Regulations, sign, in the presence of a witness, an undertaking in accordance with the following form:-

COMMONWEALTH OF AUSTRALIA. Census and Statistics Act 1905-1946. Undertaking by Enumerator.

I,, of undertake, in connexion with the taking of the Census in the year 1947, that I will faithfully and with due dispatch perform the duties of Enumerator under the Census Regulations within the Census Division of in the State/Territory of, and I do solemnly and sincerely promise that I will carry out, in every particular, all instructions supplied to me by the Commonwealth Statistician, or by the Deputy Field Supervisor of the said State/Territory, and that I will not desert from my duty, and will not refuse or neglect, without just excuse, to perform the duties of the office of Enumerator, or wilfully, or without lawful authority, alter any document or form under the above-named Act, or the Regulations thereunder, or wilfully sign any untrue document or form, or, except as allowed by the said Act or Regulations, divulge the contents of any form filled up in pursuance of the said Act, or any information furnished in pursuance of the said Act.

			Signa	ture

Address	of	Witness								

CENSUS SUBDIVISIONS.

- 19.—(1.) Each Census Division within a State shall be divided into Census Subdivisions, which shall, wherever practicable and suitable, coincide with the Commonwealth Electoral Subdivisions in the Census Division, but the Statistician may group two or more Commonwealth Electoral Subdivisions to form a Census Subdivision, or he may divide a Commonwealth Electoral Subdivision into two or more Census Subdivisions.
- (2.) The Statistician may divide Census Divisions within Territories into Census Subdivisions.

Sub-Enumerators in Charge of Census SUBDIVISIONS.

- 20.—(1.) For each Census Subdivision there shall be an officer called a Sub-enumerator who, in relation to that subdivision, shall carry out such duties in connexion with the taking and collection of the Census as are prescribed or as are assigned to him by the Statistician.
- (2.) Where a Census Subdivision coincides with a Commonwealth Electoral Subdivision, a person who holds the position of Commonwealth Electoral Registrar or who has acted as Assistant Returning

- Officer for that subdivision, or such other person as the Deputy Field Supervisor in charge, on the recommendation of the Enumerator in charge, approves, shall be appointed Sub-enumerator of that sub-
- (3.) Where a Census Subdivision does not coincide with a Commonwealth Electoral Subdivision, such person as the Deputy Field Supervisor in charge, on the recommendation of the Enumerator in charge, approves, shall be appointed Sub-enumerator of that subdivision.
- 21. Each Sub-enumerator shall, in addition to any emolument to which he is otherwise entitled, receive such payment as the Minister, on the recommendation of the Statistician, approves.
- 22. Each Sub-enumerator shall hold office from the date of appointment until the thirtieth day of September, 1947, or until the termination of the appointment by the Deputy Field Supervisor in charge, whichever first happens.
- 23. Each Sub-enumerator shall, before entering upon his duties or exercising any power under the Act or these Regulations, sign in the presence of a witness an undertaking in accordance with the following form:—

COMMONWEALTH OF AUSTRALIA. Census and Statistics Act 1905-1946. Undertaking of Sub-Enumerator.

I,, of, undertake,
in connexion with the taking of the Census in the
year 1947, that I will faithfully and with due dispatch
perform the duties of Sub-enumerator under the
Census Regulations within the Census Subdivision
of in the State/Territory of
, and I do solemnly and sin-
cerely promise that I will carry out, in every par-
ticular, all instructions supplied to me by the Com-
monwealth Statistician, or by the Deputy Field
Supervisor of the said State/Territory, or by the
Enumerator for the said Census Subdivision, and
that I will not desert from my duty, or will not
refuse or neglect, without just excuse, to perform the
duties of the office of Sub-enumerator, or wilfully
or without lawful authority alter any document or
form under the above-named Act or the Regulations
thereunder, or wilfully sign any untrue document
or form, or, except as allowed by the said Act or
Regulations, divulge the contents of any form filled
up in pursuance of the said Act, or any information
furnished in pursuance of the said Act.

		Signar Date					
Witness Address of							
	_						

Collectors' Districts.

24.—(1.) Each Census Subdivision within a State, and each Census Division or Subdivision within a Territory, shall be divided into as many Collectors' Districts as the Statistician deems necessary.

- (2.) The division into Collectors' Districts of a Census Subdivision within a State, or a Census Division or Subdivision within a Territory, shall, as far as practicable, be so effected that no Collector's District shall lie partly in one and partly in another local government area.
- (3.) The Statistician may group two or more Collectors' Districts for the purposes of collection, and place them in charge of the same collector.

Collectors.

- 25.—(1.) For each Collector's District, or for each group of Collectors' Districts formed in accordance with the last preceding regulation, there shall be an officer called a collector, who shall, in relation to that district or group, carry out such duties in connexion with the taking and collection of the Census as are prescribed or as are assigned to him by the Statistician.
- (2.) Each Collector shall be appointed by the Enumerator in charge of the Collector's District, after consultation, where possible, with the Subenumerator in charge, and subject to such special instructions as he receives from the Statistician or the Deputy Field Supervisor in charge.
- (3.) A Deputy Field Supervisor may appoint a person to be a Collector in respect of any train or aeroplane specified in the instrument of appointment.
- (4.) Each Collector shall hold office during the pleasure of the Statistician, but not longer than is necessary to finish the work for which he is appointed.
- (5.) In an emergency an Enumerator or Subenumerator may appoint any person to act as a Collector, and that person shall be deemed a Collector until such time as he is notified of the termination of his appointment.
- 26. Each Collector shall, in addition to any emolument to which he is otherwise entitled, receive such payment as the Minister, on the recommendation of the Statistician, approves.
- 27. Each Collector shall, before entering upon his duties or exercising any power under the Act or these Regulations, sign, in the presence of a witness, an undertaking in accordance with the following form:—

COMMONWEALTH OF AUSTRALIA.

Census and Statistics Act 1905-1946.

Undertaking by Collector.

I, of undertake in connexion with the taking of the Census in the year 1947, that I will faithfully and with due dispatch perform the duties of Collector under the Census Regulations within the Census Sub-division of [or, in the case of a Collector in respect of a train or aeroplane, in respect of the train or aeroplane (here specify the particular train or aeroplane)], in the State/Territory

of, and I do solemnly and sincerely
promise that I will carry out, in every particular, al
instructions supplied to me by the Commonwealth
Statistician, or by the Deputy Field Supervisor of the
said State/Territory [or by the Enumerator or Sub-
enumerator in charge of my collector's district],*
and that I will not desert from my duty, or will not
refuse or neglect, without just excuse, to perform
the duties of the office of Collector, or wilfully, or
without lawful authority, alter any document or
form under the above-named Act, or the Regula
tions thereunder, or wilfully sign any untrue docu-
ment or form, or, except as allowed by the said Act
or Regulations, divulge the contents of any form
filled up in pursuance of the said Act, or any
information furnished in pursuance of the said Act

Signature

Householder's Schedule.

28.—(1.) The Householder's Schedule shall consist of a questionnaire in relation to—

- (a) the dwelling;
- (b) each person resident in the dwelling or employed or travelling on a ship or vessel, but the questionnaire may, if the Statistician thinks fit, be supplemented by Personal Cards or Slips.
- (2.) The Householder's Schedule and the Personal Card or Slip shall be in such form as the Statistician deems appropriate.
- (3.) In addition to the particulars specified in section 12 of the Act, the Householder's Schedule shall include the following:—
 - (a) In relation to the dwelling:—
 - (i) Class of dwelling (i.e., whether private house, hotel, institution, or other class of habitation);
 - (ii) Method of occupation (i.e., whether by owner, tenant, rent-purchaser, caretaker, or otherwise);
 - (iii) Weekly rent payable;
 - (iv) Number of persons sleeping on verandahs.
 - (v) Gas, electricity and water services (i.e., whether supplied with gas, electricity or running water);
 - (vi) Toilet, washing and cooking facilities (i.e., whether supplied with bathroom, flush toilet, laundry, and cooking facilities and if the last-named the means mostly used); and
 - (vii) Date of construction of building.
 - (b) In relation to each person:—
 - (i) Issue of existing marriage;
 - (ii) Dependent children;
 - (iii) Race;

- (iv) Grade of occupation (i.e., whether employer, wage-earner, or as the case may be);
- (v) Industry, trade or service in which employed; and
- (vi) Unemployment, with duration and cause of unemployment.

DISTRIBUTION OF SCHEDULES.

- 29.—(1.) Before Census Day each Collector shall, in accordance with his instructions, leave a Householder's Schedule at each occupied dwelling within the Collector's District or Districts allotted to him.
- 2.) Except under special instructions from his finumerator or Sub-enumerator, a Collector shall not leave a Householder's Schedule at any dwelling sarlier than seven days before Census Day, nor later than Census Day.
- (3.) The Householder's Schedule shall be left with the occupier of the dwelling, or, in the absence of the occupier, with the person apparently in charge of the dwelling. If no person is in the dwelling when the Collector calls, a Schedule may be placed in a letter-box, put under the door, or put in some other place where it is likely to come under the notice of the occupier.
- (4.) Every person (other than the occupier) who receives a Householder's Schedule, or into whose hands or to whose notice a Schedule comes, shall deliver it or bring it to the notice of the occupier for whom it is intended.

Penalty: Five pounds.

(5.) Where a house is let, sub-let, or held in different apartments, and occupied by different persons or families, a Schedule shall be left for each part so let, sub-let, or held as a separate apartment.

OCCUPIERS AND OTHERS TO SUPPLY PARTICULARS.

- 30.—(1.) The occupier of a dwelling shall supply, to the best of his knowledge and belief, the particulars asked for in the Householder's Schedule, sign the Schedule, and deliver it to the Collector.
- (2.) Any person in respect of whom particulars are required to be furnished to the Statistician, who is not a member of the family of the occupier or person in charge of the dwelling in which he resides, shall either furnish the required particulars to the occupier or person in charge for inclusion in the Householder's Schedule, or shall enter them on a Personal Card or Slip and hand it under cover to the occupier or person in charge.

Penalty: Ten pounds.

(3.) Every person who spent the night before Census Day in a dwelling, or who, being absent on that night, returned to the dwelling on Census Day without being counted elsewhere, shall supply to the occupier the particulars relating to himself asked for on the Schedule.

Penalty: Ten pounds.

HOUSEHOLDERS' SCHEDULES FOR SHIPS AND VESSELS.

- 31.—(1.) In the case of a ship or vessel in any port of the Commonwealth or in any inland waters thereof, the Schedule shall be delivered to the master of the ship or vessel, who shall be deemed to be the occupier for the purposes of these Regulations.
- (2.) Where a ship or vessel is on a passage between any two ports in the Commonwealth on Census Day, and a Schedule for the ship or vessel was not left with the master before Census Day, a Schedule shall be left with him immediately on arrival of the ship or vessel at the first port of call on or after Census Day.
- (3.) The master of a ship or vessel with whom a Schedule is left, in pursuance of either of the last two preceding sub-regulations, shall, to the best of his knowledge and belief, fill up and supply therein, in accordance with the instructions contained in or accompanying the Schedule, all the particulars specified in the Schedule, and shall sign his name to the Schedule, and shall deliver it so filled up and signed to the Collector authorized to receive it.

Penalty: Ten pounds.

(4.) Every person who spent the night before Census Day on a ship or vessel, or who, being absent on that night, returned to the ship or vessel on Census Day without being counted elsewhere, shall fill in the particulars asked for on the Personal Card or Slip relating to himself, and hand the completed Card or Slip to the master of the ship or vessel, or shall furnish to the master all information necessary to enable him to fill in those particulars.

Penalty: Ten pounds.

Persons on Trains and Aeroplanes.

32. A person who spends the night before Census Day on any train or aeroplane and who is not otherwise counted shall, upon being required by a Collector appointed in respect of the train or aeroplane, furnish to the best of his knowledge and belief the particulars asked for in the Schedule.

Penalty: Ten pounds.

Persons not in any Dwelling or Ship, Vessel, Train or Aeroplane.

33. Every person who spent the night before Census Day elsewhere than in a dwelling or on a ship, vessel, train or aeroplane, and who did not return to a dwelling or a ship, vessel, train or aeroplane on Census Day, and who was not otherwise counted, shall report to the nearest post office or police station at the first opportunity on or after Census Day, and shall there furnish the particulars asked for in the Schedule.

Penalty: Ten pounds.

34.—(1.) If a Collector comes in contact with any person camping out in his district on the night before Census Day, or meets on or after Census Day any person who camped out on that night, and who at the time of meeting had not been recorded, he shall require that person to fill in forthwith a Schedule,

or to furnish the Collector forthwith with all information necessary to enable the Collector to fill in the Schedule.

(2.) Any person who refuses or fails to comply with any requirement of the Collector under this regulation shall be guilty of an offence.

Penalty: Ten pounds.

COLLECTION OF SCHEDULES.

35. On or after Census Day each Collector shall, in accordance with his instructions, call at each dwelling within the Collector's District or districts allotted to him, and shall obtain therefrom the appropriate Schedule duly filled in.

Houses "Uninhabited" and "Under Construction."

36.—(1.) Where a building or part of a building ordinarily used for human habitation, is uninhabited on Census Day, the Collector shall supply on a

Schedule such of the particulars as are required to be filled in on the Schedule as he can ascertain by observation and inquiry, and shall sign the Schedule, writing the word "unoccupied" across the face of it.

(2.) Where a house intended for human habitation is in the course of construction on Census Day, the Collector shall supply on a Schedule such of the particulars as are required to be filled in on the Schedule as he can ascertain by observation and inquiry, together with an estimate of the probable date of completion, and shall himself sign the Schedule, writing the words "under construction" across the face of it.

PENALTIES FOR OFFENCES.

37. Any breach of these Regulations for which no other penalty is provided shall be punishable on summary conviction by a fine not exceeding Ten pounds.

CHAPTER II.

THE CENSUS SCHEDULE.

1. The 1911 and 1921 Schedules.—At the first Commonwealth Census in the year 1911 the "Householder's Schedule" consisted of a Householder's Card and a Personal Card. Householder's Card was made available for every dwelling and provided for a summary of inmates of the dwelling and for particulars relating to the dwelling. A personal Card was made available for each member of every household. The householder or person in charge of the dwelling was required to fill in the Personal Cards and the Householder's Card or to ensure that each inmate of the dwelling filled in one of the Personal Cards. These cards were subsequently sorted and counted by manual process. The questions asked at the 1911 Census on the Personal Card were as follows:-Name, Sex, Date of Birth (or Age if exact date of birth unknown), Conjugal Condition, Date of Marriage, Number of Children from existing and previous marriages, Relation to Head of Household, Infirmity, Birthplace, Nationality, Race, Length of Residence in Australia, Date of Arrival in Australia, Religion, Education, Schooling, Occupation, Grade of Employment.

At the Second Commonwealth Census of 1921 the "Householder's Schedule" consisted of (1) a Dwelling Slip containing the names of all persons in each dwelling, certain particulars respecting the householder and also particulars relating to the dwelling, (2) a Personal Slip for each individual, and (3) a Shipping Slip which gave for each ship in Australian waters a list of the persons on board and particulars relating to the ship. These slips were of foolscap size and were printed on paper instead of cardboard as used for the purpose of the previous Census. The occupier of a dwelling was responsible for filling up and supplying the particulars asked for on the Dwelling and Personal Slips.

The questions on the Personal Slip numbered sixteen with nine sub-headings. As the machine tabulation system was introduced for the first time at the 1921 Census the particulars supplied were transferred to machine tabulation cards for the purposes of electrical tabulation. Questions, additional to those asked in 1911, were as follows:—Birthplace of Father and Mother, and Cause of Unemployment, while the Age last Birthday was required for each individual and not only, as in 1911, for those whose exact date of birth was unknown. It may be mentioned that a new question on the Dwelling Slip related to the number of children under fourteen years of age dependent on the householder.

- 2. The 1933 Schedule.—At the 1933 Census the "Householder's Schedule" consisted of a large form of foolscap length but of triple foolscap width folded to foolscap size, which provided for the particulars required concerning each inmate of the dwelling to be inserted in columnar form under the name of each individual on the Schedule, eight columns being provided for the purpose. It will be seen that the Householder's Schedule was a combination of the Dwelling and Personal Slips previously used, although a Personal Slip was provided for use in special cases where objection might be raised to the entry of the required particulars on the Householder's Schedule. The occupier of the dwelling was made responsible for seeing that Personal Slips issued to boarders, servants, &c., were duly delivered, in the envelope provided, to the Collector. The size of the form was such as to permit the instructions and an example of a completed Householder's Schedule being printed on the back. Additional questions included in the 1933 forms related to Orphanhood, Language, War Foreign Industry and Craft (which replaced vice, and the Occupation), Income, whilst and 1921 question relating to issue from existing and any previous marriages was omitted. The questions concerning Age, Duration of Marriage, and Length of Residence in Australia, were modified slightly by the omission of the questions concerning the date of birth, date of existing marriage, and date of arrival in Australia, and by the substitution of "Period" for "Length" of Residence. The question concerning dependent children was broadened to cover all persons and to relate to children under sixteen years of age. An additional form relating to the number of poultry and live-stock on the premises was distributed in Victoria at the request of the Government Statist.
- 3. The 1947 Schedule.—As the composite 1933 Householder's Schedule proved so convenient to distribute, collect and subsequently handle a schedule of similar type and size was adopted in The size of the Personal Slip also was the same as in 1933. Particulars relating to the dwelling were required to be entered on the right hand side of the schedule, and eight columns, one for each person, were again provided for the individual particulars of the persons who spent the night of 29th June, 1947, in the dwelling to be inserted opposite to the personal questions printed on the left hand side of the schedule. Reproductions of a Householder's Schedule and a Personal Slip are given on pp. 11-14 and of a cover of the envelope for the Personal Slip on p. 15.

Personal Slip-Census Form 2

COMMONWEALTH OF AUSTRALIA.

CENSUS, 30th JUNE, 1947.

Instructions for Filling In the Personal Slip.

Owing to the national character of the Command its importance to the Governments and the man to confidently expected that all will embayone to make it successful by giving full and accurate hologometric Information given on a Comus Form is strictly confidential and is used only for statistical payments. Callector or Occupier of the dwelling disclosing any particulars is liable to a penalty of £50.

A-GENERAL

There are two Committeens the Hampholder's Schedule (white) and the Personal Stindfolder. The Hampholder's Schedule is the principal form and generally particulars regarding all persons who apent the night of 29th June, 1942, in the dwelling should be entered on that form. The Personal Slip is to be used only for special cases where some instant of the dwelling objects to having his or her particulars entered on the householder's schedule. In that case the person who objects is required to fill in a separate Personal Slip which must be banded, in an envelope, to the head of the household or manager of the establishment for delivery to the Collector.

The occupier, or person in charge, of the dwelling for ship) is responsible;—
(1) For filling in the particulars on the Schedule for all members of the homseleld.

(i) For secure that the Personal Sline issued to bearders, servants, &c., are duly delivered to the Collector. The name of each person who has been issued with a Personal Sign must be entered on the Householder's Schoolste also, and the words "Personal Sign" must be written in the column under the name. A Fersonal Slip is not required for any person whose particulars are supplied on a Householder's Schodule

If any person who usually resides in the dwelling was away during Sunday night, 29th June, and returned to the deedling on Monday. 30th June, without having been counted chewbere, the name and particulars must be entered on the schedule or a nersonal alin must be filled in by that serson.

Every person must asswer the questions which the Cellector asks for Course purposes. There is a ally of 100 for not answering and a possibly of 100 for knowingly making an unrue statement either to the Collector or on a Census form. The Personal Slin must be filled in with non and ink—not consid-

R-PERSONAL SLIP. The name and address of the homeholder, proprietor or person in charge of the dwelling must be entered in the space provided at the top-left hand corner of the form, in Question 1.

Occasite each question write the source in the source provided in the culture for the purpose. Name.—The name of the person to whom the information on the Personal Slip relates must be written at the top of

the column. Write only first name and the surname. Number of Dependent Children under 16 Years of Age. This question must be amounted by every person who has dependent children under 16 years of age (including step-children and adopted children) who are at present residing in Australia (whether in the range dwelling or not). Where the parents are together only one parent (the father, unless the circumstances are exceptionall should give the particulars. Where the parents are expected at the time of the Conus, whether temporarily or permanently, the parent financially reasonable for the maintenance

of the children should give the porticulary. Children boarded out to present other than parents are not to be counted as described on the content with where they are branched out. Children saming \$1 or more ner work are not to be counted as dependent children. Quarties 18. Nationality.-- If legally of ex-energy nationality by remon of association, add previous nationality in brackets; for

example. "German (Austrian)". Quarter 11. Rass. - In the case of a possion both of whose purents are non-European but of different races, state the race of that person's father (and do not old "H.C.").

Question I. Occupational Status .-Part (i),-Temporary immates of hospitals and members of religious orders (see below) should not be described as

> For mother, wife, daughter and other relatives performing unpaid home duties, write "R.D.". For young persons seeking work but not previously employed, write "U" in answer to question (c) in part (ii) and state the period since leaving school in answer to question (a) in part (ii).

Person working regularly but for considerably less than normal working hours should answer only nort fill. saless they look to their exemings from such work for their main livelihood (in which case they should answer part

If unemployed or temperatily about from work, write promotion or realt in which usually consend (c) Industry, Trade or Service.—State the exact branch of industry, business, tends or service in which at present engaged or employed: for example, "Dairy Farming," "Coal Mining," "Woollen Mills," "Real Greeces," "Road Construction," Soc. 18 rendpressed by a government december of order realize half.

Counterviewed

Greecy. Road Construction, on it employees my a government repairment in particular in name. For employees (other than domestical) state the exact branch of the industry or trade of the emology: for paid housekeepers and domestic servants in private household, write "P.R."

Tolloring

In 1947, the number of questions relating to each person was thirteen, together with nine sub-headings, whilst there were nine questions with twelve sub-headings relating to the dwelling. The personal questions asked in 1933 regarding Orphanhood, Blindness and Deafmutism, Foreign Language, Schooling, War Service and Income were omitted in 1947, whilst the question relating to Existing Marriage was expanded to include particulars of the number of children born to that marriage. The

questions regarding occupation were re-arranged to assist householders filling in the schedule by providing separate sub-sections for (1) persons not engaged in industry, (2) those usually engaged in industry but out of employment at the time of the Census, and (3) those engaged in industry at the time of the Census. Additional questions included regarding the dwelling related to Materials of Roof, Gas, Electricity and Water Supply, Toilet, Washing and Cooking Facilities, and Date of Building.

[Cover of Envelope for Personal Slip.]

This ENVELOPE must NOT be opened, but will be called for by th as soon after as practicable.	e Collector on Monday, 30th June, 1947, or

ROLAND WILSON, Commonwealth Statistician.

CHAPTER III.

PRELIMINARY ARRANGEMENTS.

- 1. **General.**—The following outline of the organization and methods employed in the distribution of forms and the collection of data for the Census will probably prove of general interest.
- 2. Preparatory Work.—The success of a census depends largely on the planning of the organization and the completeness of the preliminary arrangements. The large area and the diverse conditions to be encountered make it necessary that the preparations for the Census of Australia should be commenced early, and that the varying conditions of transport to remote places, and kindred matters, should be kept under continuous observation to ensure that the Census material will reach its destination at the due date.
- 3. Collecting Staff.—The Census of 1911 was the first enumeration of the Australian population to be carried out under a central direction from the Commonwealth Bureau of Census and Statistics. Prior to that date, the Census for each of the States now composing the Commonwealth of Australia was taken under the provisions of a State Act and was controlled by an officer of the State Government. In 1911, however, the local control in each State was still in the hands of an officer of the State, and much of the preliminary work was done by State officers working under the direction of the Commonwealth Statistician.

For the Censuses of 1921 and 1933, the organization of the Commonwealth Electoral Branch was enlisted and this arrangement proved so satisfactory on both occasions that approval was obtained to utilize the same organization in 1947. In 1921 and 1933, the Commonwealth Electoral Officer in each State was made directly responsible to the Commonwealth Statistician during the period of his appointment but, in 1947, the Chief Electoral Officer for the Commonwealth was appointed as Chief Field Supervisor of Census and undertook the responsibility for the organization of the field staff and the distribution and collection of the Census material. The Commonwealth Electoral Officer in each State became the Deputy Field Supervisor of Census, each electoral division became a Census division, and the Divisional Returning Officer became the Census Enumerator for his division, while the Sub-enumerators were in most instances the officers engaged in the electoral organization as Presiding Officers, Assistant Presiding Officers, Assistant Returning Officers or Electoral Registrars. As most of the last-named officers held official positions under the Government of the Commonwealth or of a State, it was necessary to obtain the permission of the heads of departments affected for these officers to undertake the Census work. Such

permission was readily granted, and on all occasions the most cordial co-operation was received by the Commonwealth Statistician from other officers of the Public Services. A Deputy Field Supervisor of Census was appointed for each Territory, and this officer carried out the work with the assistance of collectors. The Deputy Field Supervisors appointed for the Territories were-Northern Territory, Superintendent of Police; Australian Capital Territory, Chief Officer of Police; Territory of Papua-New Guinea, Superintendent of Police; Norfolk Island, the Government Administrator; and Nauru, the Government Administrator. With the exception of those in the Australian Capital Territory, Norfolk Island, and a few in Papua-New Guinea, the collectors appointed were also Government officials.

When the apportionment of a State subdivision into collectors' districts had been approved, the Enumerator was instructed to procure suitable persons to act as collectors. The Enumerator was required also to determine the best method of collection in each district, and to indicate the time which he considered would be necessary for the work. These estimates were compared in the Census Office with the records for the same locality at the previous Census, and where necessary they were referred for reconsideration.

The necessary declarations having been made, the appointments of the Chief Field Supervisor, the Deputy Field Supervisors and Enumerators were duly published in the *Commonwealth Gazette*.

- 4. Scheme of Division.—(i) States.—For the Census of 1911 the several States of the Commonwealth were divided into Census districts, mainly in accordance with the districts which had been determined by State authorities for the 1901 Census. At each of the last three Censuses the Census divisions were identical with the electoral divisions, and the Census subdivisions were divided or grouped on the basis of electoral subdivisions. The Census subdivisions were apportioned into collectors' districts suitable to the most economical distribution and collection of the Census schedules.
- (ii) Territories.—In the division of the Territories Census subdivisions were dispensed with, each Territory forming one Census division under the immediate control of the Deputy Field Supervisor. In allocating collectors' districts, police districts were used as a basis in the Northern Territory, and administrative districts and divisions in the Australian Capital Territory and the Territory of Papua-New Guinea. For Norfolk Island two collectors' districts sufficed, one embracing the eastern and one the western portion of the island. Nauru formed one district only.

- (iii) Shipping.—Special subdivisions were created, where necessary, to permit of the enumeration of the shipping population as a separate group, under a sub-enumerator appointed for the purpose.
- (iv) General.—Lists bearing the name and index letter of each Commonwealth electoral subdivision, and showing for each such subdivision the number of electors on the latest roll, the estimated population and the estimated number of dwellings, together with the maximum remuneration which it was proposed to pay to the respective Subenumerators, were prepared in the Bureau. These lists were forwarded to the Deputy Field Supervisors during October, 1946, for their consideration and comment. It was desired that particular attention should be given, on the one hand, to cases where

two or more electoral subdivisions might be grouped to form a single Census subdivision, and, on the other hand, to cases where it might be desirable to subdivide an electoral subdivision for Census purposes. In such cases the Deputy Field Supervisor was asked to suggest an equitable remuneration for each Census subdivision recommended.

These lists, as amended, formed the basis for the preparation of maps, the appointment of the field staff and other allied matters.

As already stated in this chapter, the Commonwealth electoral organization was used to great advantage in the appointment of the collecting staff. Details of the staff employed in the several States and in the internal Territories were as follows:—

			Field Staff.			Average I per		Area in	Average Are Miles	
State or Territory.	Deputy Field Supervisors.	Enumera- tors.	Sub- enumera- tors.	Collectors.	Population Enumerated.	Sub- enumerator.	Collector.	Square Miles.	Sub- enumerator.	Collector.
New South Wales	1	28	408	3,973	2,984,838	7,316	751	309,433	758	78
Victoria	ĺ	20	269	2.951	2,054,701	7.638	696	87.884	327	30
Queensland	Ī	10	139	1,766	1,106,415	7,960	627	670,500	4.824	380
South Australia	1	6	99	952	646,073	6,526	679	380,070	3,839	399
Western Australia	1	5	68	753	502,480	7,389	667	975,920	14,352	1,296
Tasmania	1	5	57	448	257,078	4,510	574	26,215	460	59
Northern Territory Australian Capital	1		• •	22	10,868	·	494	523,620		23,801
Territory	1			24	16,905		704	939		. 38
Australia	8	74	1,040	10,889	7,579,358	7,261	696	2,974,581	2,356	273

The foregoing table shows that Tasmania had a smaller population per sub-enumerator and per collector than any other State although the averages were fairly uniform. On the other hand, the average area per Sub-enumerator and per Collector varied greatly in the States, owing to the existence in certain of the States of immense areas with few inhabitants.

The Census staff in each of the External Territories except Nauru comprised a Deputy Field Supervisor assisted by Collectors. In Nauru the Deputy Field Supervisor performed the collection without assistance. The number of Collectors in the other external Territories was as follows:—Territory of Papua-New Guinea 47, and Norfolk Island 2.

- 5. Scale of Pay.—The remuneration paid to the different classes of officers engaged in the pre-liminary work was as follows:—
 - (a) Deputy Field Supervisors.—New South Wales, £150; Victoria, £130; Queensland £110; South Australia and Western Australia, £90; and Tasmania, £80.
 - (b) Enumerators.—Mainland States, £80 each, Tasmania, £50 each.
 - (c) Sub-enumerators.—A minimum payment of £8 with an additional amount of 20s. per 1,000 persons enumerated over 1,000.
 - day; using an ordinary bicycle, 32s. 6d. per day; using a horse, 37s. 6d. per day; using a motor cycle, 40s. per day; and using a motor car, 57s. 6d. per day. Under

special circumstances higher rates were approved by the Chief Field Supervisor as agent for the Commonwealth Statistician. A definite offer, based on the time it was considered would be occupied on the work, was made to each Collector, and if he agreed to perform the work for the total amount specified a contract was duly signed, one copy of which was held by the Collector and the other by the Enumerator.

- 6. Instructions.—(i) Need for Instruction.— The majority of persons connected with the Census are employed temporarily, and for no longer than is necessary. An organization has thus to be formed for each Census of persons who are, with very few exceptions, without experience or knowledge of the work, because a Census is normally taken in Australia only once in ten years. It was necessary, therefore, that provision should be made to enable the various members of the Census field staff of 12,063 persons to become acquainted with the objects and methods of the Census.
- (ii) Conferences.—There can be no doubt that the most effective method of informing those responsible for the collection of the Census data of what is required of them, and the best method of attaining it, is by personal discussion. Following the practice of 1921 and 1933, the Chief Field Supervisor and the Deputy Field Supervisors of States met the Commonwealth Statistician and other officers of the Bureau in conference in Canberra from the 12th to 14th

November, 1946. Excellent results were obtained from the calling together of these officers. All aspects of the Census were discussed, including local State difficulties which required special consideration, and much valuable information was gained by all officers concerned.

In conformity with the practice of previous Censuses, and in order to enable the Enumerators in charge of divisions to become familiar with their duties, approval was obtained for the Electoral Divisional Returning Officers of each State to meet in conference with the Deputy Field Supervisor in the capital city of the State. These conferences were held early in 1947.

The electoral officers in the subdivisions were in most cases appointed as Census Sub-enumerators, and arrangements were made by which the Census Enumerator in each Division met all his Sub-enumerators in conference at an early stage in the preliminary period, so that the general outline of the procedure and all the instructions for taking the Census could be personally passed on to them.

In many instances, also, it was possible for the Collectors to be called together for personal instruction.

- (iii) Printed Booklets.—In addition to the personal instruction imparted at these conferences, detailed instructions concerning the duties of Deputy Field Supervisors, Enumerators, Sub-enumerators, and Collectors were prepared separately, and issued in indexed booklets. Every effort was made to anticipate and provide guidance for any circumstance which might arise.
- 7. Estimates of Material Required.—Estimates of material required for each subdivision were based on the number of electors on the latest available Commonwealth rolls. As the total enrolment for Australia represented approximately 63 per cent. of the estimated population, the factor ion might have been used to obtain the estimated population for each subdivision, but in order to provide for any increase subsequent to the date of the rolls the number of electors was actually multiplied by 2. On the basis of four persons to each dwelling, estimates of the number of dwellings in each subdivision were then compiled. These estimates of dwellings were increased by 10 per cent. to arrive at the estimated number of Householders' Schedules required, the 10 per cent. increase representing an allowance for families of more than eight persons, as each Householder's Schedule provided for the recording of the personal particulars of a maximum of eight persons. The estimate of Personal Slips was quite arbitrary, and was based on the assumption that 60 Personal Slips would be required for every 100 dwellings.

The number of Householders' Schedules and Personal Slips so estimated to be required for each subdivision was set out on an appropriate form, which was forwarded from the Census Office to the Deputy Field Supervisor for checking and amendment, where necessary, by the Enumerator, who returned the form for the approval of the Deputy Field Supervisor. This form was in triplicate. The original was returned to the Census Office, the second copy was retained by the Deputy Field Supervisor and the third copy by the Enumerator. In submitting the estimates of material to the Enumerators it was intimated that, when ordering supplies from the Printer, an allowance of 10 per cent. would be added to the estimates of Householders' Schedules and Personal Slips for each subdivision as a specific reserve, and that an additional 15 per cent. general reserve would also be printed for the State. The latter was to be apportioned between the Subenumerators, Enumerators, and the Deputy Field Supervisor so that the material would be available for immediate distribution in any emergency. For subdivisions Enumerators sought obtained increases in the original estimates.

8. Printing.—The whole of the printing in connexion with the 1921 Census was carried out by the Government Printer at Melbourne, and the distribution of the material to all States and Territories was arranged by the Census staff in Melbourne but for the 1933 Census, the printing and distribution of the material was carried out by the Commonwealth Government Printer, Canberra, and the State Government Printers in Melbourne, Brisbane, Adelaide, Perth and Hobart. In 1947, owing to staff shortages, considerable difficulty was experienced in making arrangements for the printing of the Census forms, and it was again found necessary to distribute the work between the Commonwealth Government Printer, Canberra, and the Government Printers in the various States. Contracts for the manufacture and printing of the envelopes required for enclosing Personal Slips were let to commercial firms in Melbourne and Brisbane. In order to ensure uniformity of printing the Commonwealth Government Printer supplied the stereos for the Householders' Schedules and Personal Slips and made arrangements for the supply of the necessary paper, most of which was obtained from a mill in Tasmania. The material for Queensland and the Territories, together with the general reserve supply required for each State, was printed by the Commonwealth Government Printer at Canberra, whilst the main supply of Householders' Schedules and Personal Slips for the other States was printed either by the State Government Printers or by commercial firms under their direction. The distribution of the material was carried out by the Deputy Field Supervisors of Census in the various States in conjunction with the Government Printers.

The main supply of Census forms was printed with the indicative information concerning the number of the Census division and the capital letter of the subdivision. It might be explained that for the purpose of reference the Census divisions were arranged lexicographically in each State, and were numbered from 1 onwards; the subdivisions in each division and the collectors' districts in each subdivision were similarly arranged, subdivisions being allotted capital letters and the collectors' districts

small letters, in alphabetical sequence. Thus collector's district "d" of Census subdivision "B" of Census division "5" in the State of New South Wales could be briefly referred to as "N.S.W. 5 B d."

The general reserve supplies of Householders' Schedules and Personal Slips were not similarly stamped, and the Deputy Field Supervisor in each State was instructed to distribute one-third of this supply to Enumerators, one-third to Sub-enumerators and to retain one-third himself. Arrangements were also made for a small supply of Personal Slips to be available at each post office.

In May, 1947, advice was received that the contractors had dispatched all the envelopes to their destinations, and that all printing of Householders' Schedules and Personal Slips was completed.

9. Transmission of Material.—In the meantime arrangements were in train for the actual transmission of the material to the Sub-enumerators throughout Australia. As the printing of Householders' Schedules and Personal Slips for all States except Queensland was undertaken by the local State Government Printers, the distribution to the Sub-enumerators of these forms, together with the envelopes for Personal Slips received from the contractors in Melbourne and Brisbane, was carried out by the Deputy Field Supervisors. The Queensland Householders' Schedules and Personal Slips, which were printed in Canberra, were packed by the Commonwealth Government Printer separately for each subdivision and forwarded in bulk to Brisbane for distribution by the Deputy Field Supervisor. Early in January, 1947, the Deputy Field Supervisors were asked to report on the best means of transmission and the latest date by which the material should be

dispatched from the capital city so that material could be checked and its receipt acknowledged in time. These arrangements were carried out, and all material reached its destination in ample time.

Collectors' record books, compilation books and maps were forwarded to the Sub-enumerators from the mapping section, which was located in Melbourne.

The general reserve supplies of Householders' Schedules and Personal Slips for each State were dispatched to the Deputy Field Supervisors by the Commonwealth Government Printer.

10. Return of Census Material.—After checking and parcelling the completed forms, record book and compilation book for each collector's district included in his subdivision, the Sub-enumerator forwarded them to his Enumerator. The latter repacked them in strong cases and, in all States except New South Wales, forwarded them to the Deputy Field Supervisor for transmission to the Census Office in Sydney.

In New South Wales the Enumerators forwarded the material direct to the Census Office.

The last parcels of completed Census material reached the Census Office in Sydney from the several States and Territories on the following dates:—New South Wales, 22nd August, 1947; Victoria, 15th September, 1947; Queensland, 16th October, 1947; South Australia, 10th September, 1947; Western Australia, 21st October, 1947; Tasmania, 1st October, 1947; Northern Territory, 2nd October, 1947; Australian Capital Territory, 19th July, 1947; Norfolk Island, 21st November, 1947; Territory of Papua-New Guinea, 11th February, 1948; Territory of Nauru, 30th September, 1947.

CHAPTER IV.

CENSUS MAPS AND DIAGRAMS.

One of the most important features of the preliminary arrangements for the taking of the Census was the preparation of the maps and plans required for the field staff. The preparation of these maps, with the exception of those for the Northern Territory, the Australian Capital Territory and the External Territories, which were prepared in Canberra by the Property and Survey Branch of the Department of the Interior, was carried out by the Australian Survey Corps of the Department of the Army in Melbourne. The compilation took about nine months. The Commonwealth electoral maps were used as a basis of operation, and these were very largely supplemented by maps obtained from various State departments and other sources. In many cases, as in previous Censuses, difficulty was experienced in obtaining suitable basic maps, and in some instances the best available were not very satisfactory. As a result many difficulties presented themselves as the work progressed, principally in attempting to define local government and other boundaries accurately upon maps which were many years out of date. For the purpose of the Census, Commonwealth electoral divisions were adopted as Census divisions and Commonwealth electoral subdivisions as Census subdivisions, except in a few cases where it was considered desirable to combine two or more electoral subdivisions to form one Census subdivision, or to divide an electoral subdivision to form two or more Census subdivisions. For reference purposes, the initial letter of the State was employed to indicate State of enumeration-numerals commencing at 1 for each State to indicate Census division, capital letters commencing at "A" for each Census division to indicate Census subdivision, and small letters commencing at "a" for each Census subdivision to indicate the collector's district. To enable the distribution and collection of Census forms to be carried out in the prescribed time, each Census subdivision was apportioned into collectors' districts of convenient size. The work of apportionment formed part of the duty of the Enumerator, assisted where necessary by the Sub-enumerator, so that full advantage might be taken of any knowledge of the district possessed by the latter officer. The number of inhabited dwellings allowed per collector was generally 250 to 350 in densely populated centres, 150 to 250 in less densely populated suburbs or towns, 50 to 150 in the comparatively more settled

agricultural districts, and less than 50 in districts of widely scattered population. Subdivisional maps were forwarded to divisional Enumerators for this purpose, and on completion of the work of apportionment, the maps for each division showing the collectors' district boundaries, accompanied by a brief description of the boundaries, were forwarded by the divisional Enumerator to the State Deputy Field Supervisor for approval. The maps were then returned to the Census Office for examination to ensure that the instructions had been complied with, that all territory including islands off the coast had been embraced, and that shipping in navigable rivers, bays, and harbours had been provided for. Copies of the maps were then prepared in duplicate by the Australian Survey Corps, thus providing three sets, one of which was retained in the Census Office, one distributed to the Enumerators, and one to the Sub-enumerators concerned. In addition, a separate diagram of each collector's district was prepared, and, with a typed description of the boundaries, was pasted in the collector's record book for the use of the collector. Distribution of the State subdivisional maps to Enumerators for the allocation of collectors' districts commenced on 23rd December, 1946, and the last map forwarded to the Census Office for approval was received on 13th May, 1947. The dispatch of the maps complete with collectors' district boundaries for the use of Enumerators and Sub-enumerators, together with the collectors' record and compilation books, commenced on 15th April, 1947, and the final acknowledgment was dated 20th June, 1947. In the case of the Northern and Australian Capital Territories, the Deputy Field Supervisors apportioned the collectors' districts, and collectors' diagrams were prepared by the Property and Survey Branch of the Department of the Interior from the maps submitted. In the case of the External Territories any work of this nature was carried out by the Deputy Field Supervisors, who subsequently forwarded maps, with collectors' districts defined, from which copies were prepared for reference in the Census Office. The number of maps prepared by the Australian Survey Corps was about 3,700, and the number of diagrams about 12,000. The maps with very few exceptions were forwarded to their destinations and returned to the Census Office by post.

CHAPTER V.

AUTOMATIC MACHINE TABULATION.

- 1. Use of Machines.—The Census of 1921 marked the first occasion on which automatic machines were employed in connexion with the tabulation of a census in Australia, and they have been used for each subsequent Census. The Hollerith system, adopted for the Australian Census, was first used by the United States of America for its Census of 1890, and has since been employed for census or other statistical tabulation in a number of other countries. In this chapter no attempt will be made to describe the mechanical working of the machines, but a brief survey of the methods followed during the tabulation of the 1947 Census may prove of interest.
- 2. Machine Card.—The machine card used measured $7\frac{3}{8}$ inches in length, $3\frac{1}{4}$ inches in breadth, and 0.007 inches in thickness. Two distinct cards were necessary for the Census (a) the "personal card," containing particulars relating to the indi-

vidual and certain particulars relating to husbands and wives enumerated together, and (b) the "dwelling card," containing particulars relating to the dwelling and certain personal particulars relating to the householder. Samples of the cards are reproduced below. The black rectangles represent the punched perforations of the appropriate code numbers.

As will be seen from the reproductions, each card was divided into 80 vertical columns. In each column ten digits were printed beginning at "0" and ending at "9". In addition to the punch spaces represented by these digits two spaces designated "X" and "Y" were provided directly above the "0" in each column. Thus there were twelve punch positions in each column or 960 in all. The spaces between the vertical lines on the card are known as "fields," and the headings indicate the nature of the information each "field" contains.

Before the diverse facts recorded at the Census can be punched on to the cards, they must be expressed in numerical terms. This was achieved by the use of codes designed for the purpose, in each of which one particular combination of figures represents one possible answer to the question covered by the code. The space provided on the cards was more than sufficient to accommodate all the information to be recorded together with required identification items and, in consequence, only 54 columns of the personal card and 61 columns of the dwelling card were punched.

- **3. Hollerith Machines Employed.**—The plant installed for the Australian Census comprised 35 automatic duplicating key punches (card perforating machines), 30 hand punch verifying machines, 10 electric sorting-counting machines, and 2 electric tabulating machines.
- (i) Automatic Duplicating Key Punch.—The automatic duplicating key punch, which is electrically operated, has twelve keys corresponding to the twelve punch positions in the columns of the card and is operated in a manner somewhat similar to a typewriter. As a position in a column is perforated the card is automatically advanced a column. When so arranged the key marked "x" may be used to skip a field where no information is to be punched. The machine is equipped with devices for the automatic feeding of the blank cards and the ejection of the punched cards. It is also capable of automatically reproducing the information punched from one card to another. By means of a master card this feature was used in the Census punching to reproduce information such as the "Collectors' District" and "Municipal Area" fields which was common to a large number of cards. The average rate of speed attained by the girl punch operators at the Census was 153 cards per hour. The number of cards punched, exclusive of spoiled cards requiring replacement, was as follows:—Personal Cards, 7,579,358; and Dwelling Cards, 1,907,895.
- (ii) Punch Verifier.—The verifier which is a hand operated machine is similar in operation to the key punch except that the plungers operated by

- the keys have no cutting edges. The card to be verified is placed in the machine by hand and the operator proceeds as though punching a new card. The failure of the card to advance when the appropriate key is depressed indicates an error. The verifying staff, which was the same as that employed on the key punches, attained an average speed of 189 cards per hour.
- (iii) Electric Sorter-Counter.—The sorter-counter, which is specially adapted for census tabulation, is a combination of the sorter with a card-counting machine enabling the two operations of sorting and counting to be performed at the same time. The function of the sorting unit which is entirely automatic in its action, is to arrange the cards in any desired order according to the holes punched in any particular field, one column being sorted at a time. It is fitted with thirteen pockets to receive the cards as sorted, twelve corresponding to the punch positions on the card and the thirteenth to receive unpunched cards. The counting unit is provided with two rows of counters known as "banks". Each bank consists of fifteen counters, thirteen corresponding to the pockets of the sorting machine and two total counters each with a cumulative capacity of five figures. As many columns on the card as there are banks on the machine may be counted simultaneously, but sorting is restricted to one column at a time. The machine will deal with 400 cards per minute or 24,000 per hour.
- (iv) Electric Tabulator.—The tabulator is used to total amounts or quantities in fields containing such information. The model used for the Census was of the rolling total type and was equipped with six adding counters and automatic print unit. Each counter could be arranged to add from one to ten columns according to the number of columns in the field to be added. Regardless of its arrangement, each column had an accumulative capacity of ten figures. This type of tabulator will add 150 cards per minute or 9,000 per hour on the full number of counters if required. Much more complex tabulators are now used for other machine tabulation work carried out in the Bureau of Census and Statistics.

CHAPTER VI.

TABULATION PROCEDURE.

1. Tabulating Staff.—As living accommodation for the large number of temporary employees required for the Census Tabulating Staff could not be provided in Canberra, arrangements had to be made, for the first time, to carry out the whole of the tabulation work of the Census away from the headquarters of the Bureau of Census and Statistics. Suitable office accommodation having been secured in Mary Street, Sydney, the Census Office was established there in June, 1947. An examination conducted by the Commonwealth Public Service Board was held in all capital cities for men desiring to qualify for appointment as temporary clerks on the Census Tabulating Staff in Sydney. The examination provided an elementary educational test in arithmetic, spelling and essay writing. Preference in employment was given to ex-servicemen, and although many others passed the qualifying examination, very few were required.

The main work of the male staff consisted of preparing the figures for the preliminary results, entering and checking the code equivalent to the replies on the Householders' Schedules and Personal Slips for subsequent punching by the machine operators, and summarizing the machine results. With the exception of a small amount of hand tabulation, the whole of the tabulating work was performed by Hollerith machines. The use of these machines calls for a comparatively large female staff operate the card-punching and verifying machines. Females over the age of sixteen years were employed on this work and were selected from among those who applied in response to newspaper advertisements and those registered for temporary employment at various employment centres in Sydney. With the exception of a very few who had previous experience of the machines to be operated all of the girls had to be trained before commencing the punching of the Census cards.

The male clerical staff reached a maximum of 266 on 29th September, 1947, the female staff a maximum of 70 on 7th October, 1947, and the staff of male assistants a maximum of 23 on 22nd October, 1947. Punching of the personal cards was completed in October, 1948, and of the dwelling cards in May, 1949. Retrenchment of the male staff commenced in July, 1948. In the case of the male clerks the fares for return from Sydney to their home towns were paid by the Bureau.

2. Tabulation Organization.—As the building which was made available in Mary Street, Sydney, for the housing of the Census Tabulating staff provided ample floor space to accommodate the whole staff, the usual Public Service hours were observed. The male tabulating staff was divided into three groups, each in charge of a permanent

officer designated "tabulating superintendent" and directly responsible to the Supervisor of Census and Mechanical Tabulation. The staff in each group was further divided into sections of ten men in charge of "section leaders" appointed from the temporary staff to ensure discipline and uniformity of work. The duties of organizing and supervising the staff of female card punch operators were carried out by a permanent female officer of the Bureau of Census and Statistics who was assisted by four "section leaders" appointed from the temporary female staff.

3. Tabulation Programme. — (i) Personal Particulars—As in previous Censuses, the Local Government Area was adopted as the basic tabulating unit for each State and the Administrative District for the Territories.

After preliminary checking the punched cards for the collectors' districts in each Local Government Area were grouped according to sex and tabulated separately under each of the following characteristics:—Age (single years), Dependent Children, Conjugal Condition, Birthplace, Period of Residence in Australia of Persons born outside Australia, Nationality, Race, Religion, Occupational Status, Occupation, and Industry. Details of these tabulations by sex for all Local Government Areas throughout Australia and for Administrative Districts for the Territories are contained in Parts I. to VII. of the Detailed Tables of the Census.

On completion of the above-mentioned single entry tabulations the cards for the various Local Government Areas were grouped by sex into larger divisions of each State, namely the Metropolitan, Urban Provincial, Rural and Migratory Divisions, and all subsequent tabulations involving cross analysis of personal characteristics were made for each division separately. The tabulations completed in this form were as follows:—

Conjugal Condition in conjunction with single Years of Age, Age Groups and Occupational Status, Dependent Children, Religion.

Dependent Children in conjunction with Age Groups, Occupational Status, Occupation Order.

Birthplaces in conjunction with Age Groups, Occupational Status, Occupation Order, Race.

Period of Residence in Australia (For persons born outside Australia only), in conjunction with Single Years of Age, Nationality, Race, Birthplace.

Nationality in conjunction with Age Groups. Race in conjunction with Age Groups.

Religion in conjunction with Age Groups, Occupational Status, Occupation Order. Industry in conjunction with Age Groups, Occupation and Occupational Status.

Occupation in conjunction with Age Groups, Occupational Status.

Persons Not at Work (For persons usually engaged in industry, business, trade or service only)—Reason Not at Work in conjunction with Age Groups, Period since last at work, Industry.

In addition to the above, special "Family" tabulations were compiled from the particulars relating to both males and females who were married at the date of the Census, excluding those permanently separated either legally or otherwise. In these tabulations which contain particulars of (1) Relative ages of husbands and wives, (2) Age and issue of existing marriage of both husbands and wives, and (3) Average issue according to age and duration of existing marriage of both husbands and wives, distinction was made between those persons enumerated in Metropolitan and Extra-metropolitan divisions of the States.

Owing to limitations of space, complete particulars of all subjects cross-analysed by divisions of State with summaries for the various States and the Commonwealth could not be published, but as much relevant detail as practicable is contained in Parts IX. to XIX. and XXVIII. of the Detailed Tables of the Census.

(ii) Particulars of Dwellings.—Particulars relating to dwellings were tabulated for each Local Government Area separately for each class of private dwelling, namely (1) Private house (occupied by one family), (2) Private house shared by two or more families, (3) Share of private house, (4) Flat, and (5) Tenement, the subjects tabulated being—Class of Dwelling, Material of Outer Walls, Material of

Roof, Number of Rooms, Number of Inmates, Nature of Occupancy, Number of Persons Sleeping Out, Household facilities, and Weekly Rental (of tenanted dwellings only). Dwellings other than private were tabulated under the first six subjects only. All subsequent tabulations involving cross-analysis of subjects were prepared for divisions of State for the several classes of private dwelling only. The tabulations completed in this form were as follows:—

Material of Outer Walls in conjunction with Material of Roof.

Number of Rooms in conjunction with Number of Inmates, Date of Building, Material of Outer Walls, Number of Persons Sleeping Out, Nature of Occupancy, Weekly Rent (tenanted dwellings only).

Nature of Occupancy in conjunction with Age of Householder, Conjugal Condition and Sex of Householder, Dependent Children of Householder, Industry of Householder, Occupational Status of Householder, Date of Building.

Details of the tabulations for Local Government Areas in each State and for administrative districts in each Territory are contained in Parts XX. to XXVI. of the Detailed Tables of the Census, whilst as much detail as practicable for all other tabulations is contained in Part XXVII.

From the cards prepared for occupied dwellings a special tabulation giving details of the number of occupied dwellings and population in each town, village, or other locality in rural areas throughout Australia was compiled. Details of all such localities and also all separately incorporated urban areas in which fifty or more persons were enumerated are contained in Part VIII. of the Detailed Tables of the Census.

CHAPTER VII.

PUBLICATION OF RESULTS OF CENSUS.

1. Preliminary Results.—The results of the preliminary count for the six States and internal Territories, made available on the 24th October, 1947, were as follows:—

PRELIMINARY COUNT OF CENSUS, 30th JUNE, 1947.

(Subject to revision.)

State or Territory.	Males.	Females.	Persons.
New South Wales	1,492,827	1,492,637	2,985,464
Victoria	1,014,508	1,040,744	2,055,252
Queensland	567,539	538,730	1,106,269
South Australia	320,220	325,996	646,216
Western Australia	258,303	244,428	502,731
Tasmania	129,285	127,832	257,117
Northern Territory Australian Capital	7,379	3,487	10,866
Territory	9,092	7,813	16,905
Australia	3,799,153	3,781,667	7,580,820

2. Revised Results.—On the 19th November, 1948, the following revised results were made available:—

REVISED RESULTS OF CENSUS, 30th JUNE, 1947.

(Subject to further revision.)

State or Territory.	Males.	Females.	Persons.
New South Wales	1,492,211	1,492,627	2,984,838
Victoria	1,013,867	1,040,834	2,054,701
Queensland	567,471	538,944	1,106,415
South Australia	320,031	326,042	646,073
Western Australia	258,076	244,404	502,480
Tasmania	129,244	127,834	257,078
Northern Territory	7,378	3,490	10,868
Australian Capital	,		,
Territory	9,092	7,813	16,905
Australia	3,797,370	3,781,988	7,579,358

No subsequent revision of these results was found to be necessary.

3. Advance Bulletins.—As the information became available, advance bulletins were published Bulletin No.

from time to time. These bulletins, numbering 25, were as follows:—

CHAPTER VIII.

POST - CENSAL ADJUSTMENT OF POPULATION ESTIMATES FOR THE INTERCENSAL PERIOD 1933-1947.

1. Intercensal Records.—(i) Normal Procedure.—Between the date of the Census of 1933 and that of 1947 there elapsed a period of fourteen years. During this period records were kept of the several elements contributing to variations in the population of Australia as a whole, and of its component States and Territories. As regards the former the only variations were additions by births and by oversea arrivals, and deductions by deaths and over-The term "oversea" refers to sea departures. countries, including Territories under the control of the Commonwealth, outside Australia. With regard to the States and Territories there is the further factor of interstate migration, which may be by land, sea or air. In the case of any State, therefore, to which migration by land is possible, twelve distinct sets of records were kept, namely:—(i) births registered; (ii) deaths registered; (iii) oversea arrivals by sea; (iv) oversea arrivals by air; (v) interstate arrivals by sea; (vi) interstate arrivals by land; (vii) interstate arrivals by air; (viii) oversea departures by sea; (ix) oversea departures by air; (x) interstate departures by sea; (xi) interstate departures by land; (xii) interstate departures by air.

Crew movements were included in the figures for oversea migration prior to July, 1922. Otherwise both oversea and interstate migration relate to passenger traffic. The records of interstate migration by land are incomplete, as no efficient system of recording overland migration other than by rail has yet been devised.

(ii) War-time Records.—With the outbreak of war in 1939, new problems arose in the recording of population. For security reasons it was essential that particulars of embarkations of Australian troops for overseas, and of returning troops, should be excluded from current migration statistics during the It was not, therefore, possible to maintain population estimates for Australia strictly on a de facto basis. The war-time population estimates accordingly represented the de facto position, together with Australian troops overseas. Initially, population estimates for States and Territories were prepared on a corresponding basis, Australian defence personnel within Australia being counted in the State or Territory in which they were located at the time. Subsequently, in order to avoid disclosing troop concentrations, interstate movements of troops were excluded from migration and population records. Previous statistics were revised on a similar basis and new population estimates prepared, as from the outbreak of war, for each State and Territory, which included Australian defence personnel enlisted in the particular State or Territory, irrespective of their actual location at the time.

Deaths of Australian defence personnel, whether occurring within Australia or overseas, were taken into account in the population estimates.

With the progress of the war, the accuracy of records of interstate civilian migration declined. Large movements of Australian and Allied servicemen made it increasingly difficult to keep records of civilian migration separate from those of defence personnel, while deficiencies were unavoidable in the records of some movements of civilian evacuees from areas within Australia and from overseas. When results became available for a quasi-Census based on civilian registration cards issued in June, 1943, population estimates from September, 1939, to June, 1943, for each State and Territory were adjusted for deficiencies in interstate migration records revealed by those results. Interstate migration was totally excluded from subsequent population estimates, which were based for the ensuing four years to the Census of June, 1947, on records of births, deaths of both civilians and defence personnel, and oversea migration. Australian defence personnel were still included in the population of the State or Territory from which they enlisted.

The war-time treatment of the Australian military population in respect of migration and deaths was continued until the taking of the Census in June, 1947.

Members of Allied forces, enemy prisoners of war and internees from overseas were not counted in the population but refugees and evacuees were included.

2. Comparison of Census Results with those derived from Intercensal Records.—For Australia as a whole, the number of live births registered during the fourteen years from 30th June, 1933, to 30th June, 1947, was—

Males, 966,629; females, 918,738; total 1,885,367. Against this must be set off the deaths registered, as follows:—

Deaths of Civilians: males, 531,683; females, 426,862; total, 958,545. Deaths of Australian defence

personnel: males, 37,525; females, 158; total, 37,683. Overseas arrivals into Australia, as recorded during the same period, were—

Males, 295,621; females, 281,979; total, 577,600. During the same period oversea departures as recorded were—

Males, 272,520; females, 263,974; total, 536,494. Thus according to the records the net immigration to Australia—i.e., the excess of oversea arrivals over

oversea departures—during the intercensal period

Males, 23,101; females, 18,005; total, 41,106. The figures for migration are exclusive of troop movements.

The following statement shows the result of applying to the Census population of 30th June, 1933, the foregoing *recorded* figures for the succeeding fourteen years to 30th June, 1947:—

Particulars.	Males.	Females.	Persons.
Census population, 30th June, 1933	3,367,111	3,262,728	6,629,839
Excess of births over deaths—fourteen years, 30th June, 1933, to 30th June, 1947	397,421	491,718	889,139
Excess of arrivals over departures—fourteen years, 30th June, 1933, to 30th June, 1947	23,101	18,005	41,106
Estimated population, 30th June, 1947	3,787,633	3,772,451	7,560,084

The population on the 30th June, 1947, according to the Census results was—Males, 3,797,370; females, 3,781,988; persons, 7,579,358. Thus the estimate based on the intercensal records of births and deaths and oversea migration was short of the Census figure by the following numbers:—

Males, 9,737; females, 9,537; persons, 19,274. This *understatement* indicated an average error of about 1,400 per annum.

3. Cause of Discrepancy.—The understatement of population estimates for Australia revealed by this comparison continues the experience of the previous census. From the nature of the case errors are probable in all records of population, and possible sources of error which could cause understatement are the practice of using figures for birth registrations rather than the actual number of births occurring in a given period, and deficiencies that may exist in the records of immigration from oversea countries. At the same time there may, of course, be errors in the opposite direction arising from deficiencies in the recording of deaths and oversea departures.

The numbers of births and deaths registered and the recorded oversea migration are believed to be substantially complete, but the period between the Censuses of 1933 and 1947 was abnormal in that (a) births increased greatly from the low rates of the depression era at the commencement of the period to record high levels in the post-war period, and (b) oversea migration records were liable to a greater degree of error, due to disturbances caused by the 1939-45 War. The effect of the unequal levels of the birth rate at the time of the two censuses, together with the increase in the number of births that would normally have resulted from the growth of population between the Censuses, was that the understatement in the estimated population at 30th June, 1947, caused by the omission of births that had occurred by that date but were

registered subsequently was much greater than the overstatement due to the inclusion in the population estimates of births that occurred before the 1933 Census, but were registered during the 1933-47 intercensal period. War-time oversea migration records were affected by the principle adopted of excluding troops, numbers of whom, however, may possibly have been included in certain circumstances, while the arrival of those British and Allied servicemen who took their discharge in Australia after the war would not have been recorded. It is thought also that the records of evacuees who came to Australia after the entry of Japan into the war may not be complete.

It is possible again that an explanation of the discrepancy revealed by the results of the 1947 Census may be found to some extent in the Census itself. The understatement in population estimates could well be a reflection of a relatively higher standard of accuracy in the 1947 Census than in the previous Census, while also some differences in the composition of the enumerated population from Census to Census may be unavoidable due to changed circumstances, as for example the inclusion in the 1947 Census of Torres Strait Islanders, who on previous occasions had been regarded as full-blood aboriginals and accordingly excluded. The Census, moreover, gives a complete enumeration of all persons in Australia at the time of the Census, including passengers and crews of oversea ships, together with Australian naval personnel in port or travelling between ports. A difference, therefore, exists between the enumerated and the estimated population at the 30th June, 1947, which is represented approximately by the excess of this oversea migratory population at the 1947 Census over that recorded in 1933. This difference may in actual fact be larger or smaller than that in the oversea migratory population between Censuses, as a proportion of the migratory population who were passengers embarking or disembarking

in Australia in the vicinity of the Censuses may have been excluded, included or duplicated in the intercensal migration and population records, depending on the nature of their movements. Owing to the difficulties involved, no attempt is made to record the movements of crews and naval personnel between Censuses.

It is likely that all the factors mentioned contributed to the discrepancy between the estimated and Census populations at 30th June, 1947, but the relative extent to which each factor did so is not definitely known.

4. Adjustment of Discrepancy.—At previous Censuses adjustments were made, for simplicity, on the recorded figures for oversea departures. In the case of the 1947 Census, however, this procedure would have resulted in a relatively greater adjustment to population estimates in the pre-war period than in the war and post-war period, when it was thought the major discrepancies would have occurred. As already mentioned, it was felt also that other factors in addition to unrecorded migration were important. A further consideration in the case of the 1933-1947 intercensal period was that this was the first complete period for which statistics of oversea migration were compiled according to permanent and temporary categories of migrants. These statistics are used extensively and it was desired to avoid arbitrary adjustment of the figures, as would have been involved under the previous procedure.

The method adopted for the 1933-1947 period was, therefore, to adjust the population estimates without corresponding amendment of migration or other

records. An additional element was thus introduced, termed "intercensal adjustment", which represents unrecorded movement of population as disclosed by the results of the 1947 Census. The precise nature of this unrecorded population cannot be indicated, but is believed to represent largely unrecorded migration, although other elements are also involved.

5. Adjustment of Intercensal Estimates.

—Under the procedure followed the adjustment was spread over the intercensal period in proportion to the total increase in population recorded in each quarter.

The recorded increase in population for the complete intercensal period was—

Males, 420,522; females, 509,723; persons, 930,245.

The error in the numbers derived by adding these recorded increases to the results of the Census of 1933 represented an understatement of—

Males, 9,737; females, 9,537; persons, 19,274, which is equal to 2.3155 and 1.8710 per cent. of the total increase in males and females respectively.

By applying these percentages to the recorded increases in population in each quarter, corrected results for quarterly increases were obtained by means of which adjusted estimates of the population of Australia were made for successive periods throughout the intercensal period.

The following table gives a comparison of the estimates of population which were made prior to the Census of 1947 on the basis of the Census of 1933, with the estimates for the same years adjusted in accordance with the Census of 1947:—

POPULATION OF AUSTRALIA: ADJUSTMENT OF INTERCENSAL ESTIMATES.

30th June-	Intercensal Estimates based on Census of 30th June, 1933 (a).		Intercensal Es with Cen	stimates adjusted sus of 30th June	l in aecordance , 1947 (b).	Error of Understatement in Original Estimates.

(a) Results of Census of 1933, plus natural increase, deaths of defence personnel and net migration. (b) Estimates for fourteen years 1933-1947, based on results of the Censuses of 1933 and 1947, natural increase, deaths of defence personnel and net migration, together with an addition to total recorded increase of 2.3155 per cent. for males and 1.8710 per cent. for females.

6. Post-censal Adjustment of State Populations.—Having adjusted the intercensal estimates of population for Australia as a whole, it remains to treat the estimates for the several States and Territories so that in the aggregate they

will coincide, at any date, with the number already determined for the Commonwealth. In this connexion, there is, in addition to the natural increase and the oversea migration, the further factor of interstate migration to be taken into account. The discrepancy between the estimated number of the population of Australia at 30th June, 1947, based on the Census of 1933, plus recorded increase, and the number at the same date recorded at the Census of 1947, amounted to—

Males, 9,737; females, 9,537; persons, 19,274, the discrepancy being in the direction of an underestimate.

The errors in the estimates for the several States and Territories, after exclusion of the interim adjustments made in the light of data obtained from the Civilian Register of 1943 and of interstate migration for the four years July, 1943, to June, 1947, were—

State or Territory.	Males.	Females.	Persons.
New South Wales Victoria	- 1,875 + 5,217 - 53 - 220 - 8,533 - 837 - 45 - 3,391 - 9,737	- 609 + 2,177 - 3,672 - 1,888 - 2,211 - 1,007 - 183 - 2,144 - 9,537	$\begin{array}{r} -\ 2,484 \\ +\ 7,394 \\ -\ 3,725 \\ -\ 2,108 \\ -\ 10,744 \\ -\ 1,844 \\ -\ 228 \\ -\ 5,535 \\ -\ 19,274 \end{array}$
•	i	}	

It was stated in Section 5 above that, to compensate for the error in the totals for the Commonwealth the recorded total increase in population was increased by 2.3155 per cent. for males and 1.8710 per cent. for females. It is convenient to apply to the recorded increases for each State the correction factor which has been found to be necessary for Australia as a whole, and to effect further adjustment to the extent found to be necessary to bring the estimates for each State into harmony with the Census results. Assuming that the factors mentioned, namely, 2.3155 per cent. for males, and 1.8710 per cent. for females, have been applied to the population increases in each State during the

intercensal period 1933 to 1947 the errors shown in the immediately preceding table would become—

State or Territory.	Males.	· Females.	Persons.
New South Wales Victoria Queensland South Australia Western Australia Tasmania Northern Territory	+ 1,948 + 7,420 + 1,671 + 557 - 7,778 - 418 - 43	+ 3,146 + 4,275 - 1,977 - 1,172 - 1,353 - 639 - 169	+ 5,094 + 11,695 - 306 - 615 - 9,131 - 1,057 - 212
Australian Capital Territory Australia	- 3,357 	<u> </u>	

It was necessary that these errors should be so adjusted that at any point of time during the intercensal period the aggregate of the several adjustments should be zero. The application of the correction as a percentage, on, say, recorded departures, would in practice involve awkward complications. The procedure was, therefore, followed as in the previous Census of making a uniform distribution of the error in each case over the 56 quarters comprised in the intercensal period as being simple in application as well as satisfactory from the standpoint of Commonwealth totals.

Further adjustment was necessary in order to reconcile the estimated population so obtained for the Australian Capital Territory at the 30th June, 1938, with the results of a special Census taken for the Territory at that date. The discrepancy shown was adjusted by distributing the error on a pro rata basis over the populations of the various States at 30th June, 1938, and spreading it for each State and the Territory by equal quarterly amounts to the 30th June, 1938, and by another set of equal amounts per quarter for the remaining 36 quarters.

The whole of the adjustments referred to in the preceding two paragraphs were effected by the one process of spreading, the corrections applied to the figures for the several quarters being approximately as follows:—

					Ma	iles.	Fem	ales.	Persons.	
	Territory.	_		To June Quarter, 1938.	From September Quarter, 1938.	To June Quarter, 1938.	From September Quarter, 1938.	To June Quarter, 1938.	From September Quarter, 1938.	
New South Wales Victoria Queensland South Australia Western Australia Tasmania Northern Territor Australian Capital	· · · · · · · · · · · · · · · · · · ·	 tory			$\begin{array}{ccccc} - & 20 \\ - & 123 \\ - & 24 \\ - & 7 \\ + & 141 \\ + & 9 \\ + & 1 \\ + & 23 \end{array}$	$\begin{array}{ c c c c c c }\hline -&43\\ -&138\\ -&33\\ -&12\\ +&137\\ +&7\\ +&7\\ +&1\\ +&81\\ \hline\end{array}$	$\begin{array}{c cccc} - & 50 \\ - & 71 \\ + & 38 \\ + & 22 \\ + & 25 \\ + & 12 \\ + & 3 \\ + & 21 \end{array}$	$ \begin{array}{rrrrr} & - & 60 \\ & - & 79 \\ & + & 34 \\ & + & 20 \\ & + & 24 \\ & + & 11 \\ & + & 3 \\ & + & 47 \end{array} $	$\begin{array}{c ccccccccccccccccccccccccccccccccccc$	$ \begin{array}{ c c c c c c c c c c c c c c c c c c c$
Australia				• •		-		-	-	<u> </u>

On the basis of these principles the populations of the several States as at the end of each quarter between 30th June, 1933, and 30th June, 1947, have been estimated, and from these the mean populations for the several intercensal years have been computed. These re-computed mean populations have

been employed in the adjustment of intercensal of the Bureau of Census and Statistics since January,

The following table summarizes the recorded rates based upon population in all the publications facts of births, deaths and migration, and gives the intercensal adjustments necessary to reconcile the results of the Censuses of 1947 and 1933:-

INTERCENSAL INCREASE OF THE POPULATION FROM EXCESS OF BIRTHS OVER DEATHS, AND FROM NET MIGRATION.

⁽a) Deaths of defence personnel which were registered in civil registers during the years 1940 and 1941 and which were included in the tabulations of civilian deaths for those years have been deducted.

(b) Provisional figures as available at the time of revision of intercensal population estimates. Final totals for feaths of defence personnel to June, 1947, are as follows:—New South Wales, 13,375 males, 55 females; Victoria, 10,913 males, 57 females; Queensland, 5,502 males, 25 females; South Australia, 3,247 males, 19 females; Western Australia, 3,461 males, 16 females; Tasmania, 1,074 males, 7 females; Northern Territory, 25 males; Australia and Territoricy, 2 males; Australia, 37,599 males, 179 females. The figures for States and Territories relate variously to place of enlistment or of usual residence. Separate details for the Territories are available only in part.

(c) Excludes troop movements.

(d) Owing to the uncertainty of war-time records, figures for the period July, 1943, to June, 1947, have been excluded.

(e) Interstate arrivals equal interstate departures.

(f) Includes adjustment for net migration of passengers entering or leaving a State or Territory on "round trip" or cruise voyages.

(g) Unrecorded movement of population disclosed by the Census of 30th June, 1947. This item is believed to represent largely unrecorded migration but the period covered was abnormal and various factors were involved. The discrepancy has accordingly not been apportioned between the various elements of population growth.

Note.—Minus sign (—) denotes decrease.

Note.—Minus sign (—) denotes decrease.

CHAPTER IX.

GROWTH AND CHARACTERISTICS OF THE POPULATION OF AUSTRALIA.

THE RECORD OF POPULATION CHANGES.

1. Early Enumerations of the Population in Australia.—The primitive form of the modern census is the simple enumeration, or "muster", as it was known when a count was made of the number of people in the early settlements of Australia. So far as the number can be ascertained, the nucleus around which the population of Australia has grown consisted in the first instance of 1,024 persons, including the military, who landed in Sydney Cove on the 26th January, 1788. For many years the number increased very slowly, and in 1825, when Tasmania (then known as Van Diemen's Land) was separated from New South Wales and constituted a separate colony, i.e., 37 years after the first settlement, the total population was only 52,505 persons, of whom 38,313 were in New South Wales and 14,192 were in Tasmania. With a view to estimating the food and other requirements of the early settlements, enumerations or "musters" were carried out at least annually from 1788 to 1825, when they were discontinued. A "muster" meant the compulsory attendance and the counting of inhabitants on a certain day at a specified place in their particular district.

2. Census-taking in Australia.—The first regular Census in Australia, as distinct from simple enumerations for administrative purposes, was taken South Wales in November, Particulars of the number, names, age groups, sex, nominal religious profession and civil condition of the inhabitants, as well as the number of horses, horned cattle and sheep, and the area of land located, cleared and cultivated in each district, were collected under the supervision of resident magistrates. Thereafter similar Censuses were taken at irregular intervals in the several colonies. Not until 1861 was anything like a simultaneous Census taken in the Australasian colonies. On the 7th April, 1861, the day chosen for the Census of the United Kingdom, a Census was taken in each of the colonies forming the Australasian group, with the exceptions of Western Australia and New Zealand. In 1871, of the Australasian colonies only New South Wales, Victoria and South Australia adopted the Imperial date. In 1881, however, all the Australasian as well as most of the other colonies fell into line, and the first simultaneous Census of the British Empire was taken. Practically simultaneous Censuses were also taken in 1891, 1901, 1911 and 1921.

The first all-Australian Census was thus taken in 1881. This Census and those of 1891 and 1901 were taken by the statistical offices of the States, those of 1911, 1921 and 1933 by the Commonwealth Bureau of Census and Statistics. The seventh Census was to have been taken on the 30th June, 1941, but on account of the war was not taken until 30th June, 1947. It will be remembered that, for reasons of economy, the previous Census also was postponed, from 30th June, 1931, to 30th June, 1933.

Even though the taking of a census provides the most direct and accurate way of getting the facts about population, it must not be supposed that it is by any means error-proof. It is subject to all the liabilities to error of the questionnaire. It has to leave much to the intelligence and truthfulness of the people who supply the facts, and not a little to their judgment and to the judgment of the Statistician and his officers, who are practised in these matters. The latter know that the beginning of accuracy in statistics is the exactness, simplicity and clearness of the questions asked. schedule constitutes a group of questions. Every enlargement of the group increases the liability to imperfection in the replies. No little art and craftsmanship are therefore needed in the construction of a census questionnaire, if it is to be a really reliable extractor of information. It must be drawn up with care and tact having in mind the general intelligence and sensitiveness of the people questioned, and with understanding in order to secure their voluntary co-operation,

The following table gives a chronological statement of the Censuses taken in the several States of

Australia, and the population enumerated on each occasion:—

(a) Previously included with New South Wales. (b) 3rd April. (c) Previously included with South Australia. Actually Northern Territory was not transferred to the Commonwealth until 1st January, 1911. (d) 5th April. (e) 31st March. (f) 4th April. (g) 30th June.

3. Growth of the Population.—As already stated, the growth of the population of Australia in its earliest years was very slow, and it was not until 1858, or 70 years after the first settlement, that the first million was reached. At this time the population was distributed among the States, or Colonies as they were then, as follows:—New South Wales, 31.97 per cent.; Victoria, 47.22 per cent.; South Australia, 11.29 per cent.; Tasmania, 8.14 per cent.; and

Western Australia, 1.38 per cent. The second million was reached in 1877, after a lapse of nineteen years, by an average increase of 3.53 per cent. per annum. The third million was reached twelve years later, in 1889, by an annual rate of increase of 3.48 per cent.; the fourth million sixteen years later, in 1905, at the rate of increase of 1.74 per cent. per annum; and the fifth million thirteen years later, in 1918, by an annual average rate of 1.79 per cent. It had been

anticipated that the fifth million would be reached in 1915, but the suspension of immigration and the dispatch of Australian troops to the war delayed its attainment until March, 1918. The sixth million was reached in December, 1925, by an annual rate of increase of 2.41 per cent. over the preceding seven years. The seventh million was reached towards the end of 1939 by an annual rate of increase of 1.11 per cent. after a lapse of fourteen years. The rate of growth of population was subsequently retarded by a falling off of immigration during the war and the immediate post-war period, with a net loss by migration actually being recorded in some

years. However, the later resumption of large-scale immigration, and the high level of the birth-rate throughout and particularly from 1946 onwards, brought the population to the 8,000,000 level in November, 1949. This last million represented an annual rate of increase of 1.34 per cent. over a period of ten years. Of this total over 205,000 was added since the beginning of 1949.

The following table shows the estimated population of Australia at the end of each decade from the first settlement, and also the actual and proportional increment during each successive decade:—

(a) On 26th January. (b) Not available. (c) Includes all defence personnel enlisted in Australia irrespective of movements subsequent to enlistment.

NOTE.—The estimated population of the various States and Territories at decennial periods up to 1940 and annually from 1941 may be found in the Official Year Book of the Commonwealth of Australia No. 39, Chapter XIII., section 3 (1).

4. Elements of Increase.—The next table shows for each decade from 1861 to 1950 the extent to which the increase in the population was due to

the excess of births over deaths (natural increase) and to net migration:—

ELEMENTS OF POPULATION INCREASE, AUSTRALIA.

⁽a) Includes deaths of defence personnel, which were excluded from the records of natural increase during the period September, 1939, to June 1947, and also unrecorded intercensal movement of population as disclosed by the results of the 1947 Census.

The large increase in the population which marked the 'fifties (see table, Section 3) was due to the development of the gold-fields, and when the rush of gold seekers spent itself the rate of increase declined to the more moderate dimensions fitting to the normal development of the country. The average annual rate of natural increase per 1,000 of mean population fell from 24.37 for the period 1861-70 to 15.26 for the decade 1901-10, but rose to 15.82 for the decade 1911-20, reaching a maximum of 17.44 in 1914. This rise was almost entirely accounted for by the lower average death rate during the later period. For 1921 the rate was 15.04. 1933 it had fallen to 7.87, by 1934 to 7.07, since when it had recovered to 7.71 in 1939. The rate of natural increase rose during the 1939-45 War, and increased still further after the war, when a peak of 14.37 was reached in 1947. The decline in the rate since 1914 is attributable to the much more marked fall in the crude birth rate as compared with the fall in the crude death rate.

The increase in the population from net migration has varied greatly from decade to decade. The greatest increase from this source which has occurred in any one decade was during the ten years 1881–90. This period, however, concluded in world-wide speculative activity, which in Australia

took the form of speculation in land values, and one effect of the financial collapse which followed this boom is revealed in the small increment by migration from 1891 to 1910. In many of the years during this latter period, Australia experienced an actual loss of population by net migration. In 1907 the stream of migration again turned in favour of Australia, but the 1914-18 War interrupted the flow. During the quinquennium 1921-25 the increase of population by net immigration was 183,266 persons, the largest number recorded till then for any five-year period. For the period 1926-30 the figure was still substantial, though lower, at 129,707; but during the period including the great depression, 1931-35, departures exceeded arrivals by 10,886. This tendency was reversed in 1936 and for the period 1936-40 a net gain of 43,128 persons was recorded from migration. As a result of the war, the net gain in the succeeding quinquennium was only 7,809 persons, but largely as a result of the Government's policy of encouraging immigration after the war, the period 1946-50 saw a record high net influx of 353,084 persons. In the Official Year Book of the Commonwealth of Australia the increase of population is dealt with in greater detail, the position being reviewed for each of the States and Territories (see Official Year Book, No. 39, Chapter XIII., Section 5).

CHANGES IN CERTAIN GENERAL CHARACTERISTICS OF THE AUSTRALIAN POPULATION.

5. Changes in Characteristics of the Population in General.—The data given in the following table, indicating changes which have

taken place in certain characteristics of the population, are discussed in the sub-sections which follow:—

SOME CHARACTERISTICS OF THE AUSTRALIAN POPULATION, CENSUSES, 1901 TO 1947.

Particulars.			1901.	1911.	1921.	1933.	1947.
Density (persons per square mile)			$\frac{1.27}{1.27}$	1.50	1.83	2.23	2.55

			46.76	46.78	52.09	51.8	4

- (i) Density.—The density of population, as measured here, is little more than a convenient way of showing the increase in numbers. The density of the population in Australia as a whole, the greater part of which can never be more than sparsely settled, although still extremely low as compared with the density of population in countries of smaller habitable area and a longer history of occupation by Europeans, has more than doubled from 1891 to 1947. A comparative table showing the number and density of population of the more important countries of the world is to be found in the Official Year Book of the Commonwealth of Australia (see No. 39, Chapter XIII., Section 6 (1)). A table showing the different densities of population in the several States and Territories of Australia itself, in association with the percentage which the area of each State and Territory bears to the total Australian area, will also be found in the Official Year Book (see No. 39, Chapter XIII., Section 3 (3)). It must be pointed out, however, that neither the simple measure of density (number of inhabitants per square mile), nor the density measured by the ratio of number of inhabitants to the area of productive land, nor the measure of density obtained by reference to the ratio of the agricultural population to the area of land suitable for cultivation, is a satisfactory criterion in assessing how far a country is under-populated or over-populated. The concepts of under-population, over-population and optimum population imply reference to a general standard of living, and must take account, more particlularly in countries of advanced industrial development, of factors additional to those of soil and population, such as access to capital resources, development of marketing and banking facilities, the extent of technical developments in production, and the level of educational attainments among the population. The figures of density shown in the table above have, therefore, a very subordinate use in any attempt to determine what is the optimum population of Australia.
- (ii) Proportion of Australian-born in Total Population.—Another feature of change shown in the table above is the growing proportion of the nativeborn element in the Australian population. At each Census since 1891 the ratio of native-born females to all females has been higher than the ratio of native-born males to all males. Over the period from 1891 to 1947, however, the two ratios have been tending progressively to come closer together. The higher proportion of oversea-born males throughout the period, especially from 1891 to 1911, was due to the relatively larger influx of male than of female immigrants. The significance of birthplace statistics is discussed in Chapter XI., "Birthplace", Section 1.
- (iii) Masculinity.—A general experience in the early stages of colonization and development of a new country is the large preponderance of males in the population. In 1800 the population of Australia, then confined to New South Wales, had 263.05 males for every 100 females. In 1830 the figure was 308.30 males for every 100 females, i.e.,

75 per cent. of the population were males. From 1830 to 1921 the masculinity of the population declined, falling to 103.37 by 1921. After 1921, however, masculinity tended to rise until 1927 (104.54), since when it has been gradually falling. At the 1947 Census there was only a very slight excess of males over females, but as a result of the subsequent high immigration the ratio had risen to 101.88 by the end of 1950. An examination of masculinity according to age at the 1947 Census as compared with the situation at previous Censuses, and of the effects upon masculinity of the loss of male lives in the two world wars, will be found in Chapter X., "Age", Section 7.

- (iv) Relation of Growth of Numbers Australian-born and to Masculinity.-With the increase in numbers there is eventually an improvement in the conditions of life, which induces a larger number of females to enter the country. With the growth of family life the native-born become an increasing element in the population, and, as the numbers of children born of each sex are substantially equal, the masculinity is further reduced. The relationship between the density and the masculinity of population and the industrial development of a country is strikingly illustrated by comparing the conditions in the several States of the Commonwealth of Australia (see Official Year Book of the Commonwealth of Australia, No. 39, Chapter XIII., Section 3(3).
- (v) Average Age, Age Composition and Expectation of Life.—By the substitution of native-born for the immigrant population which has been eliminated by death, the average age of the population of a young country should tend to increase to a point where, birth and death rates being constant and other contributing factors remaining unchanged, it would remain comparatively stable. The average age of the Australian community has increased very materially during the period covered by the table, a fact reflected in the changing age composition Minors, both male and of the population. have been a progressively female, proportion of the total population. This is manifest from the figures in the table, more particularly in respect of minors fifteen years of age and under, despite the improvement in the birth-rate between 1933 and 1947. The growing proportion of the older age groups is brought out even more impressively in the table showing the percentage of population of each sex in each "natural age" group, 1881–1947 (see Chapter X., Section 11). The increasing average age is due partly to the decline in the birth-rate, which has failed to keep up the proportion of young lives, and partly to the greater longevity resulting from improvement in public health services, and in medical and surgical science, and from the more general accessibility to the people of medical aid, as well as from the higher wage scale and the consequently higher standard of living. The increase in longevity is indicated by the expectation of life, as ascertained from Australian experience during each of the decades 1881-90, 1891-1900, 1901-10, and during the three-year periods 1920-22, 1932-34 and 1946-48.

COMPLETE EXPECTATION OF LIFE AT BIRTH ACCORDING TO AUSTRALIAN MORTALITY EXPERIENCE, 1881-1948.

	Sex.	1881-90.	1891–1900.	1901–10.	1920–22.	1932-34,	1946-48.
Males Females	••	 Years. 47.20 50.84	Years. 51.08 54.76	Years. 55.20 58.84	Years. 59.15 63.31	Years. 63.48 67.14	Years. 66.07 70.63

From the most recent experience it appears that the average expectation of life for males is 66.07 years compared with 47.20 years about 60 years ago. Similarly the expectation of life for females has increased by nearly twenty years. From the actuarial point of view, however, these figures do not present the complete picture. The following table, which shows the probability of surviving ten

years at each successive tenth year of age, indicates that the probability of surviving has increased continuously throughout all the ages specified, with the exception of the very old ages and in 1946–48 of males at ages 60 and 70 years. The improvement in mortality has been most striking in the first ten years of life.

AUSTRALIAN LIFE TABLES: PROBABILITY OF SURVIVING TEN YEARS.

The economic effect of this improvement in the rates of mortality is apparent from the observed fact that the average length of the working life—between the ages of 15 and 65 years—of all persons born has been increased in the interval of 60 years or so between the decade 1881–90 and the

triennium 1946–48, by about thirteen years in the case of males and slightly less in the case of females. The following table shows the marked improvement in recent years in the extent of life experienced in the ages from 15 to 65 for each 100,000 born:—

YEARS OF LIFE EXPERIENCED BETWEEN AGES 15 TO 65.

				Males.			Females.	
Period In	Period Investigated.		Total Number.	Average per Male born.	Average per Male attaining 15 years.	Total Number.	Avernge per Female born.	Average per Female attaining 15 years.
•			Years.	Years.	Years.	Years.	Years.	Years.
1881–1890			3,098,605	30.99	39.37	3,300,165	33.00	40.91
1891–1900			3,374,153	33.74	41.23	3,554,834	35.54	42.42
1901–1910			3,655,653	36.56	42.61	3,819,502	38.20	43.59
1920-1922			3,902,039	39.02	44.00	4,082,021	40.82	44.98
1932–1934			4,181,717	41.82	45.15	4,313,407	43.13	4 5.8 9
1946–1948			4,376,451	43.76	45.96	4,530,851	45.31	47.05

The figures indicate that, on the rates of mortality experienced during the decennium 1881–90, approximately 31 years between ages 15 and 65 would be contributed on the average to the life of the community by each male born, and 33 years by each female. The improvements disclosed by successive investigations had the effect of increasing

such contributions continuously, until on the basis of the 1946–48 rates each male born has an average life of 44 years between 15 and 65, and each female of 45 years. Similarly, males reaching age 15 would, on the basis of 1881–90 figures, contribute on the average about 39 years to the supporting ages, as compared with 46 years for

1946–48. For females reaching age 15 the corresponding contributions are 41 years and 47 years respectively.

(vi) Females of Reproductive Age.—The proportion of the female population which is of reproductive age is shown by the table at the beginning of the section to have fallen progressively since 1911, from 49.43 per cent. at that time to 45.29 per cent. in 1947, but the effect on the number of potential mothers has been more than offset by large increases in the proportion of women at the child-bearing ages who are married, which has risen over the same period from 46.78 to 62.51 per cent. The average number of children per married woman has, however, declined significantly, from 3.78 in 1911 to 3.22 in 1921 and still further to 2.36 in 1947. These averages refer to issue of existing marriages of married women of all ages. Further details of changes in the size of the Australian family will be found in Chapter XXII.-Families.

6. Changes in Characteristics of the Economically Active Population.—The data given in the following table, indicating changes which have taken place in certain characteristics of the economically active population, are discussed and amplified in the following sub-sections. The

economically active population in this section and throughout this Report is referred to as the "work force", and includes all persons who were either employed or were seeking employment in any industry, business, trade or service at the time of the Census. (See also Section 3 of Chapter XVIII.)

Persons of independent means and pensioners are excluded by definition from the work force and comparison are consequently difficulties of encountered with previous Reports where comparisons were drawn between breadwinners (including persons of independent means and pensioners) and dependants. Prior to the 1933 Census persons of independent means and pensioners were instructed to record their previous industry on the Census Schedule and they were classified according to the industry stated, but for purposes of comparison they have been deleted from the economically active population for the years 1911 and 1921 in all the tables in this section. In addition to persons of independent means and pensioners the inactive population or those not in the work force consisted of females engaged in unpaid home duties, children not attending school, full-time students, inmates of institutions, and a comparatively small number of others not engaged in industry.

SOME CHARACTERISTICS OF THE ECONOMICALLY ACTIVE POPULATION, AUSTRALIA, CENSUSES, 1901 TO 1947.

Particulars.		1901.(a)	1911.	1921.	1933.	1947.
Males of Supporting Age (15-64 years last birthday)—

earners in the work force		(b)	4.00	9.57	22.91	(c) 3.27

⁽a) Includes pensioners and retired persons whose previous industry was recorded in Census schedules. at work at the time of the Census.

(i) Persons in the Work Force Generally.—With the gradual increase in the average age of the population the number of persons whose ages range from 15 to 64 years are now a larger proportion of the population than was the case in the early part of the

century. Despite the increase in the proportion of persons of supporting age the proportion of persons in the work force declined slightly over the period. There was a significant decline in the proportion of juvenile workers, and adolescents were also less

⁽b) Not available.

⁽c) Includes all persons not

proportionally than earlier, but persons of adult age increased slightly at recent Censuses. The reason for the notable decline in juvenile workers since 1901 was the diminishing pressure upon children to engage in bread-winning activities, but the decline in adolescent workers was primarily on account of a reduction in the ratio of young persons aged 15 to 19 years in the population.

The proportion of males in the work force per 100 of the males in the population aged 15 years and over declined from 93.96 per cent. in 1911 to 87.30 per cent. in 1947. It should be remembered, however, that changes in social conditions were an important factor in reducing the percentage at the latest Census. In 1947 there were proportionally to the population twice as many full-time students aged 15 years and over recorded as in 1911 and 50 per cent. more pensioners. A not inconsiderable part of the latter increase was due to the introduction of invalid pensions about the time of the earlier Census and

to the liberalization of the conditions governing the granting of old-age pensions.

(ii) Persons engaged in Primary, Secondary and Other Activities.—Perhaps the most striking change in the characteristics of the Australian bread-winning population is the secular decline in the proportion engaged in the primary industries. In Australia the term "primary" is applied to the extractive industries, viz., fishing and trapping, agricultural, pastoral and dairying, forestry, mining and quarrying; whereas the term "secondary", whilst often confined to the manufacturing industries solely, is used broadly to describe manufacturing (including production of heat, light and power), building, and the construction of roads, railways and earthworks.

The following table provides a conspectus of the shifts in the percentage of persons engaged in the major industrial groups, as shown at each Census from 1901 to 1947.

PERCENTAGE OF PERSONS IN EACH INDUSTRY ORDER ON TOTAL PERSONS IN INDUSTRY, AUSTRALIA, CENSUSES, 1901 TO 1947.

(a) See note (a) to previous table. (b) Includes 165,000 labourers (6.1 per cent. of persons engaged in industry) whose industry was not stated. The majority of these were unemployed or employed part-time.

Despite the short-period shifts associated with economic conditions the percentage distribution of persons in the work force among the broad categories of industry in 1947 emphasizes the persistence of the long-period or secular trend away from the primary activities and personal and domestic service to secondary and other activities. The decade 1911–20 marks the period during which the persons engaged in Australian manufacturing and other secondary processes became more numerous than those engaged in primary production. In 1911 the

secondary group already had first place in New South Wales, Victoria and South Australia. In other States, however, the predominance of the primary group was such that, for Australia as a whole, the primary group was the greater. By 1921 the preponderance of the secondary group in New South Wales, Victoria and South Australia had increased to such an extent, and at the same time the excess in favour of the primary industries, although still existing in Queensland, Western Australia and Tasmania, had so diminished, that

the number of persons engaged in secondary occupations throughout Australia exceeded those in the primary group by about 22 per cent. Falling employment in the rural industries and in mining has been responsible for the decline in the primary group. Despite an increase of more than 60 per cent. in the total number of persons in the work force since 1911, the number engaged in agricultural, pastoral and dairying industries was only 25,000 higher (approximately 6 per cent.) than in 1911, whilst the number employed in mining in 1947 was less than half of that recorded in 1901. Every decade has witnessed a relative decline in employment in agricultural, pastoral and dairying industries, but the decline was particularly steep between 1933 and 1947, when the actual numbers recorded dropped by 83,000. In this connexion statistics of the numbers of milking machines and tractors on farms suggest that attempts are being made to offset the decline in employment by increased mechanization. The number of milking stands (units) has grown from 90,000 in 1943, when this information was first collected, to 166,000 in 1951, whilst the number of tractors on farms has increased from 42,000 in 1939 to 123,000 in 1951.

The number in the mining industry reached its peak at the Census in 1901 when more than 118,000 persons or 7.4 per cent. of those engaged in industry were recorded. Since that year the proportion of persons engaged in mining has decreased perceptibly at each Census mainly on account of the decline in gold, copper and tin mining.

The changes shown in the table and discussed in the sub-sections above have reference to persons in the work force only. A table appearing in Section 15 of Chapter XVIII., "Industry", shows comparable changes over the same period for the population as a whole (males, females, persons). The long and short period shifts between the population groups are substantially similar to those of persons in the work force, although some difference is produced by variations in the proportion of dependants at the several Census dates.

(iii) Females Engaged in Industry.—The following table shows for each of the Censuses from 1901 to 1947 the total female population of working age (i.e. ages 15-64) and the total persons engaged in industry, in relation to the total females engaged in industry:—

PERCENTAGES OF FEMALES IN INDUSTRY ON FEMALE POPULATION OF WORKING AGE AND TOTAL PERSONS ENGAGED IN INDUSTRY, AUSTRALIA, CENSUSES, 1901 TO 1947.

		Oate. 		Number of Females 15-64.	Total Persons engaged in Industry.	Total Females engaged in Industry.	Percentage (3) on (1).	(5) Percentage (3 on (2).	
1901	 		 	1,074,227	1,614,760	330,240	30.7	20.5	
1911	 		 	1,355,239	1,922,320	385,641	28.5	20.1	
1921	 		 	1,706,028	2,237,235	455,230	26.7	20.3	
1933	 		 	2,153,134	2,743,805	599,068	27.8	21.8	
1947	 		 	2,522,876	3,196,431	717,162	28.4	22.4	

The percentage of females in the work force on the total number of females aged 15 to 64 years reveals a steady downward trend to 1921, and a gradual rise during each of the last two intercensal periods. Part of the downward trend may have been due to methods of statistical classification formerly adopted whereby persons not engaged in industry at the time of the Census were classified to their previous industry wherever stated. The rise in the proportion of females in the work force since 1921 has taken place in spite of a substantial increase in the proportion of married women to all women of working age. The percentage of all women aged 15-64 who were married increased from 51 per cent. in 1901 to 52 per cent. in 1911, 56 per cent. in 1921, 57 per cent. in 1933, and 65 per cent. in 1947. Since 1933 the number of married

women in the work force has increased from 65,000 to 140,000.

The proportion of females in the total work force remained almost stationary from 1901 to 1921, but has risen during each of the last two intercensal periods. The rise since 1933 was not as great as that from 1921 to 1933, but this might have been due at least in part to the possible exclusion of a number of part-time female workers, who in 1947 were instructed to exclude themselves from the work force unless their earnings from such part-time work was their main source of livelihood. From these general figures it is impossible to come to any definite conclusions as to the relation of female to male employment. In order to do so it is necessary to consider changes in the distribution of female employment among industries.

The following table shows for the Census years 1901-47 the changes in the distribution of female employment amongst industries:—

PERCENTAGE OF FEMALES IN SPECIFIED CLASSES OF INDUSTRY ON TOTAL FEMALES IN INDUSTRY, AUSTRALIA, CENSUSES, 1901 TO 1947.

(a) Includes pensioners and retired persons whose previous industry was recorded on Census Schedules.

This table offers decisive evidence of the more important shifts of female workers during the present century up to 1947. The most pronounced redistribution has been the shift of women from the traditional female field of personal and domestic service to other fields of work. The number engaged in personal and domestic service decreased at each successive Census from 46.42 per cent. in 1901 to 32.60 per cent. in 1933, and then fell steeply to 18.16 per cent. in 1947 with the many opportunities for more remunerative employment provided by. war and post-war conditions. The latter decline occurred mainly in private domestic service, where the actual numbers engaged fell from 125,000 in 1933 to 42,000 in 1947.

The employment of females in manufacturing has fluctuated over the period. From 1901 to 1911 the

proportion of females in factories rose appreciably, then declined successively during the next two intercensal periods, and finally rose again in 1947 to slightly more than the percentage obtaining in 1911. The principal feature in this sphere was the movement of females from the manufacture of articles of dress to other forms of manufacture such as food, textiles, paper and printing, and more recently to clerical and the lighter operative duties in engineering and metal-working.

Apart from the transport and communication industries where the numbers engaged are relatively small, the principal increases in female employment occurred in commerce and finance and public authority (n.e.i.) and professional activities. The increase in commerce may be attributed in considerable part to the growth of large-scale retailing

and the increasing tendency to employ females as shop assistants in large retail stores. In the field of public authority (n.e.i.) and professional activities the main increase was in Commonwealth, State, semi-Government and Local Government services, wherein large numbers of female clerks and typists

are now engaged. Of the two essential services of education and health, the former has fluctuated throughout the period but with a downward tendency, whilst the relative position of nurses has advanced steadily with the growth in health services.

THE GROWTH OF URBAN POPULATION.

7. Changes in the Proportions of Rural and Urban Population.—(i) The Trend Towards Urbanization.—Closely linked with changes in the proportions of the economically active population engaged in primary and other industries are changes in the proportions of the population living in rural and urban areas respectively. Whilst a dissection of the results at each Census is made according to the three broad Divisions of metropolitan, urban provincial and rural areas, it is to be remembered that owing to the adoption of the local government area as the unit of Census tabulation and the lack of adequate maps of unincorporated towns, it is not possible without a vast amount of labour to make a completely accurate allocation of population to these Divisions. The numbers living in urban areas throughout Australia prior to 1911—when the first Census of Australia was taken under the one authority—are not readily available. According to the Census of 1911 the urban population represented 57.83 per cent. of the total population—excluding shipping and other migratory elements—whereas according to the Census of 1921 it represented 62.46 per cent. The proportion has increased further to 64.00 per cent. in 1933 and 68.86 per cent. in 1947. During the decade ending at the Census of 1921 the population of the metropolitan areas increased by about 38 per cent., and of the other urban areas by about 20 per cent., giving an increase over the whole urban population of about 32 per cent. During the same period the rural population increased by 9 per cent. only. During the period of $12\frac{1}{4}$ years ending at the Census of 1933, the population of the metropolitan areas increased by about 33 per cent., and the other urban areas by about $8\frac{1}{2}$ per cent., giving an increase over the whole urban population of about 25 per cent. During the same period the rural population increased by about 17 per cent. A marked redistribution of the population occurred between 1933 and 1947. While the urban population as a whole rose by 23 per cent., which is a lower rate than in previous intercensal periods, the population of urban provincial areas increased 21 per cent., nearly treble the percentage growth between 1921 and 1933. The increase in metropolitan population, although low compared with previous changes, was still high at 24 per cent. For the first time at an Australian Census, an actual decrease in numbers was recorded in rural areas in 1947, the fall being about 1 per cent. since 1933. Changes of boundaries were responsible for some arbitrary transfers of population from the rural to urban areas in 1947, but if allowance is made for these transfers a fall in the rural population is still recorded.

An important factor to be kept in mind in interpreting the comparison between 1921 and 1933 is the prolonged depression which had not passed by 1933. The actual proportions of the population in rural and urban areas in 1933 were not what, in the light of the long period trend towards urbanization, might have been expected. During the depression years the mobility of men of the younger ages was considerably increased, as necessity drove many to seek work away from their usual place of residence. Many town-dwellers roved the country districts as prospectors for minerals or as seekers of casual farm work or as applicants for locally-distributed government relief. One result was the reversal, in 1933, of the downward trend from 1911 to 1921 of the masculinity of the rural population, especially of that portion of it within the range of age 15-34. Whereas the masculinity of this age group of the rural population in 1921 was 119.85, i.e., an excess of 58,619 males in a total of 649,349 persons, the masculinity of the same age group in 1933 was 134.79, i.e. an excess of 119,108 males in a total of 803,802 persons. The position had been adjusted by 1947, when there was an excess of only 45,303 males in a total of 706,979 persons aged 15-34 years, equivalent to a masculinity of 113.69.

A comparison of the first two intercensal periods in terms of increase by absolute numbers for the respective areas of population shows that, although in 1933 the rural population was a smaller proportion of the total population than in 1921, its gain between 1921 and 1933 was twice as much as its gain between 1911 and 1921; whereas the gain to the provincial urban population between 1921 and 1933 was only half as much as its gain between 1911 and 1921. Moreover, whereas the gain in absolute numbers to all-urban population between 1911 and 1921 was nearly five times as great as the gain to rural, it was only a little over twice as great between 1921 and 1933. To express the same facts in a rather different way, we may say that, whereas urban areas absorbed 83.39 per cent. of the total gain to the population (excluding migratory elements) between 1911 and 1921, they appear to have absorbed only 70.87 per cent. of a larger total gain to the population between 1921 and 1933. Were the influence of the depression years 1930 to 1933 to be overlooked, this comparison would suggest a slackening of the growth of urban population relatively to the rural. But this slackening was more apparent than real and in the succeeding period 1933-47 the urban areas absorbed the whole of the increase in population.

While the slackening in the relative growth of the population in the metropolitan areas continued, with actually a lower numerical increase between 1933 and 1947 than in the preceding intercensal period, the increment to the urban provincial population was nearly treble that of the 1921–33 period.

The percentages given in the following table show the striking changes between 1881 and 1947 in the proportion which the metropolitan population bears to the total:—

PROPORTION OF THE POPULATION OF AUSTRALIA IN METROPOLITAN AREAS, CENSUSES, 1881 TO 1947.

	Sex.	 1881.	1891.	1901.	1911.	1921,	1933.	1947.
Males Females Persons		 29.63 34.81 32.00	34.73 39.84 37.10	% 34.58 39.21 36.78	% 35.17 41.13 38.03	9% 40.34 45.77 43.06	% 43.81 50.03 46.87	$\frac{\%}{48.71}$ 52.73 50.72

(ii) The "Drift to the Cities" from the Farming Areas.—This long-period trend in the relative growth of city populations, and of the numbers engaged in the industries and services which may most economically be undertaken in large centres of population, is not peculiar to Australia. characteristic The trend is world-wide and of countries very dissimilar in geography, industrial structure, stage of industrial development, and industrial and fiscal policies. It is to be seen in Great Britain, the United States, Germany, Denmark, France and Sweden, as it is in Japan, Russia, New Zealand and Australia. Hence it is unlikely that the explanation is to be found in local conditions. As countries develop and real income per head rises, a larger part of the income takes the form of services and of commodities other than food-We should therefore expect a tendency under modern conditions for activities on the land to increase at a slower rate than activities in other parts of a growing economy, and for a growth of the rural sections of the community slower than that of other sections. Each of the Australian Censuses of 1911 to 1947 shows a larger average family of dependants in the rural than in the

This basic disparity at the metropolitan areas. source of material increase of population in the rural and metropolitan areas, in conjunction with the factors mentioned above, leads to a movement from country to city. A marked "drift to the cities" of the younger farming population might be expected, in the absence of opportunities in the rural areas to absorb them in attractive employment. important factor limiting opportunities, as far as the pastoral, dairying and agricultural industries are concerned, lies in the change which the arts of farming have been undergoing since the beginning of the century. These have produced less dependence upon man-power, and more dependence upon machine-power, for a given output of goods. It is not possible to devise any statistical measure to show whether the use of mechanical appliances in farming has been *more* important than other technical improvements in bringing about this result, and, as a further result, the drift of part of the farming population to the cities. But there is enough evidence to suggest that mechanization of farming has been a major causal factor in accentuating the movement to non-rural centres of farm workers generally, and not merely of the maturing dependants.

CHAPTER X.

AGE.

THE RECORDING OF AGE STATISTICS.

- 1. Significance of Age Statistics.—Just as statistics of many kinds can gain their real significance only by being related to a given number of people who are in turn related to a given area, so also the statistics of population itself cannot attain completeness unless related to age-constitution. Information concerning the ages of the people given at a census is of the greatest importance. If given adequately in a succession of censuses, it permits observation of change in the average age of the population and in the proportions of the younger and older age groups. It provides a periodic check upon and increases the value of currently-recorded vital statistics. It yields the basic material required for the computation of nuptiality, fertility and death rates, of the probability of survival, and Other information gained annuity rates. Census, when used in conjunction with age data, as is done in almost every chapter throughout this Report, takes on a significance which would otherwise be entirely lacking. Furthermore, the Census provides the basis of annual estimates of the age distribution of the population which may be made between Censuses with the aid of annual records of births, deaths and net migration according to age. For these reasons it is necessary that the age data themselves should be as full and as accurate as possible.
- 2. The Form of Inquiry.—The ensuring of accuracy of statement on the part of people answering the question of age is part of the difficulty in framing a satisfactory census schedule. illustrated in the discussion below concerning the degree to which ages are actually either unstated or mis-stated. At the Censuses of 1891 and 1901, the form of inquiry on the schedule was that of simply asking the age last birthday. In the hope of improving on the answers given at these two Censuses, the form of inquiry on the personal card at the 1911 Census was amended by asking the date of birth; those whose date of birth was unknown were asked to state their age last birthday. An appreciable improvement in results for 1911 followed. At the 1921 Census persons were asked on the personal slip to give specifically both the date of birth and age last birthday. Although relatively far fewer people failed to state their age in 1921 than in 1911, the results so far as other irregularities were concerned were not very different in 1921 from those in 1911. At the Censuses of 1933 and 1947 the form of inquiry reverted to the simple asking of the age last birthday, with the instruction "For children under one year write '0'." As shown in Section 3 (ii) below, mis-statement of age appears to have been smaller in 1947 than in 1933, although the proportion of ages omitted was much greater.
- 3. Completeness and Accuracy of Age Data.—(i) Ages Unstated.—For Australia as a whole the number of persons whose age was not

stated at the 1947 Census was 48,793, of whom 24,847 were males and 23,946 were females. These numbers represent 6.54 per 1,000 males, 6.33 per 1,000 females, and 6.44 per 1,000 of the total persons. These rates of failure to state age were the highest experienced at an Australian Census and were more than twice those at the preceding Census, which were 3.03, 2.65 and 2.84 respectively. The corresponding proportions were lowest at the Census of 1921, being respectively 2.87, 2.35 and 2.61; at the Census of 1911 the proportions respectively were 5.36, 5.13 and 5.25. In distributing these unspecified ages it has been assumed that they all belonged to the ages fifteen and over, except at the 1911 Census when an attempt was made to distinguish, somewhat loosely, "children" from "adults" by means of other particulars on the Census cards, the cases of "children" so identified then being distributed over ages 0 to 14 and "adults" over ages fifteen and upwards.

(ii) Mis-statement of Age.—Besides those cases in which no age was stated, there were many others in which the age given on the Census schedule was not correct. To eliminate the effects of these misstatements it has been customary to subject the recorded figures (after adjustment for unstated ages) to a process of graduation in order to obtain a series of figures more in accordance with the facts. (The processes employed for the 1933 and 1947 Census figures are described in Section 5.)

It should be borne in mind that the use of a series of graduated figures for the purpose of detecting possible mis-statements and the degree of such mis-statement is in itself no decisive measure of mis-statement, nor, indeed, is it a proof of the existence of mis-statement. The general grounds for believing mis-statement to occur at certain ages are discussed below.

One form in which mis-statement of age manifests itself at a census is the preference for certain digits. Several methods are available for showing the relative degree of such preferences, but no method is without its defects and none can go beyond providing hints as to the reasons for particular preferences. It should be possible to get some idea of the relative degree of total mis-statement of age among males and females and persons at a particular census by comparing the numbers of recorded single ages with the numbers of graduated ages. The extent to which the same kind of comparison will truthfully reveal relative degrees of preference for certain digits depends upon the method of graduation and, where the comparison involves the aggregation of numbers recorded for each digit, upon the range of ages selected and upon the digit of the first age in the selected range. Two simpler and perhaps less controversial methods are available. The first of these methods is merely to examine the crude recorded figures at each age for the evidence of "local" overstatement or understatement. The second method

merely gives more precision to the first by expressing the degree of apparent preference for any age with a particular digit as the percentage by which the number recorded at that age exceeds the average of the numbers at that age and at the two adjacent ages. This method assumes that the preference for the end-digit of the middle age of a three-age group is at the expense mainly of correct statement of one or other, or of both, of the adjacent ages.

The following two tables, based on Canadian practice, show by this second method the degree of preference for certain digits in recorded ages by certain single years in the Australian Census: Table I. for males and females in 1947, and Table II. for persons in 1933 and 1947. The percentages shown in both tables are strictly comparable, provided no weight is attached to the absolute numbers in each three-year age group indicated, and therefore to the absolute number of apparent preferences for certain digits in recorded numbers throughout

the whole range of single ages. From Table I. it will be seen that for both males and females from 30 years of age upwards there was a strong tendency in 1947 for many to state an age ending in 0 rather than to state a correct adjacent age ending in 9 or 1, and likewise to prefer 2 to 1 or 3. Females in particular showed a strong propensity to prefer round numbers. Except at age 65, the preference noted at previous Censuses for ages ending in 5 was not in evidence in 1947, but on the contrary a slight preference for 6 to 5 and 7 was expressed. Abnormal movements in the population can explain an excess of Census population at any one age over adjoining ages such as at age 5 in 1947, but generally there is no special reason to expect the numbers of the population at the ages for which preferences are shown to be appreciably greater than the numbers in adjacent ages, and on this ground it may be concluded that the preferences are mostly misstatements.

The tables bring out with precision what may be observed in a general way from inspection either of the crude recorded ages or of the differences between the recorded and graduated, or otherwise corrected, ages. The preference for even numbers over odd numbers observed at previous Censuses was again in evidence in 1947. The degree of clustering at these ages was, however, less pronounced in 1947. It will be seen also that unlike previous Censuses there was very little concentration at the digit 5, which in turn explains the slightly greater preference shown for digit 6 in 1947 compared with 1933. A preference noted in 1933 for ages ending with 8 was absent in 1947.

Inspection of the crude numbers of recorded ages in 1947 shows that among the avoided odd numbers the digit 1 received less favour than digit 9. The preference for the round number 0 goes far to explain the shift of preference from 9 and from 1. The slight preference for 6 as an even number does not in itself appear to indicate any greater aversion to 5 than to 7. Within the range of ages from 32 upwards, the appearance of strong favour for the digit 2 is to be explained by the pull of digit 0 over digit 1, whilst digit 2 as an even number receives preference over digit 3.

The inspection for local errors in the 1947 recorded figures reveals that mis-statements begin to show seriously from age 30 upwards. There is no apparent mis-statement by females at the ages 20 and 21, although some preference for age 21 was shown by males. In 1933 these ages appeared to be free of mis-statement by either sex, whereas in 1901 mis-statement by males favoured the age 21 and by females the age 20, in 1911 by both sexes the age 20, and in 1921 by females the age 21 and by males the age 20. No generalization as to uniformity of behaviour in the matter of overstating or understating age by young persons on the threshold of adulthood seems therefore possible.

At age 30 there appears to have been some overstatement but more understatement of age by males and females. The male preference for 40 appears to be mainly understatement, but both understatement and overstatement are apparent for females. At 50, where preference becomes marked, there appears to be much more understatement than overstatement for both sexes. At 60, 65, 70 and 80 the evidence points to understatement by both sexes.

In general, it would seem, the tendency for both males and females at the 1947 Census was for understatement rather than overstatement at ages where mis-statements usually occur, with this propensity somewhat stronger among females than among

males. Among minors there is not much evidence of mis-statement. Mis-statement, with preference for understatement, appears to increase with age in adults up to 70 or so.

An independent check on the accuracy of age data at the 1947 Census was furnished by estimates available for the single age distribution of both male and female population for Australia as a whole, which represented the numbers at each age at the 1933 Census brought up to date by means of vital and migration statistics. The increase from Census to Census from one age in 1933 to the age 14 years older in 1947 given by these estimates, that is, the aggregate of recorded births, deaths and net migration at successive ages in each intercensal year, showed a high degree of regularity and it would have been expected that the estimated age distribution would have provided a close check on the Census results. It was found, however, that although mis-statements in Census ages were clearly indicated by these comparisons, it was not practicable by this means alone to determine the extent to which an inaccuracy related to the age at 1947 or to the age 14 years younger in 1933. However, an examination of the discrepancies between the estimated and Census age distributions verified generally the existence of the mis-statements discussed above and also indicated other probable mis-statements, which are not revealed by the preferences for an age calculated as a percentage of the three-yearly average centred around that age.

The actual reasons to which mis-statements of age are to be attributed are too uncertain and complex to permit unassailable generalization. Some of the mis-statements are due to ignorance of correct age; some reflect carelessness combined with a more or less conscious preference for certain attractive digits, and possibly unconscious aversion to certain other numbers, which varies to some extent from Census to Census; and some are wilful misrepresentations arising from motives of an economic, social or purely individual character. To what degree each of these factors plays its part in age mis-statement at a census it is impossible to say from the evidence of figures alone. It is, however, a gratifying feature of the 1947 Census that the answers to the age question contained fewer inconsistencies than in the This improvement is due probably to the increasing importance attached to the age factor in many people's lives in recent years arising out of the necessity for furnishing particulars of age for the purposes, for example, of the National Register, the war-time system of rationing, and of social benefits schemes.

4. Infantile Ages.—(i) Effect of Decline in rate upon the age structure of the infantile popula-Birth Rate.—The effect of fluctuations in the birth tion is to be seen in the following tables:—

(a) Number of deaths under one year of age per 1,000 live births.

Where, as is usual, the migration of young children is relatively insignificant, and the relationship between the movement of birth rates and the movement of infantile death rates does not vary greatly from year to year, it is to be expected that

the number of children should diminish at successive ages from age 0 onward. Irregularity has characterized this expected symmetry in the age structure of the ages 0 to 4 at each of the decennial Censuses from 1891 to 1947. In consequence of the 1914-18

War, the stability of conditions necessary to give such results did not exist for some years prior to the 1921 Census, with the result that the order of numbers in ages 0 to 4 recorded at that Census is very much disturbed, though still tending to reflect the expected order. At the Census of 1933, however, the order is quite reversed. The sharp rise in the numbers from ages 0 and 1 to age 4 is due to the preponderant influence of the declining birth rate, which fell more rapidly over the five years 1929 to 1933 than over any previous five-yearly Although the mortality rate of infants under one year of age also fell in unprecedented degree from 1929 to 1933, its fall did not mean the survival of enough infants under one year of age to offset the progressive decline over the period in births per 1,000 of the population. The recovery of the birth rate under war and post-war conditions is reflected in the greatly increased numbers at corresponding ages in 1947 compared with 1933 and in the reversion to the general pattern of Censuses prior to 1933 with the numbers tending to fall from one age to the next higher age.

(ii) Comparison of Infantile Census Returns with Registration Records.--Except for the net migration of children under one year of age, which is relatively small, the number recorded at the Census as under one year of age should represent the number surviving from those born within the year

ending at the time of the Census.

Statistics of births and deaths are compiled according to period of registration and not of occurrence. It is to be borne in mind, therefore, that the results which follow can be affected by the lag between the date of occurrence and registration of the events. Although it is not practicable to make an exact comparison between the number ascertained by the Census and the registrations of births and deaths, reasonable approximations can be made. Thus for the year ending 30th June, 1947, the number of births registered in Australia was 192,286, of which 99,047 were males and 93,239 were females. During the same period the number of deaths under one year of age registered was 5,385, of which 3,107 were males and 2,278 were females. What is required to be known is the number of these deaths which arose from births which took place in the year ended 30th June, 1947. Having this number, its subtraction from the number of births for that year would give approximately the number of registered children under one year of age living at 30th June, 1947. The fact that statistics of deaths under one year of age for the year in question were available in considerable detail enabled a fairly accurate estimate of the required number of deaths to be obtained. The following example, based on the deaths under one year for the whole of Australia, will illustrate the process:-

DEATHS UNDER ONE YEAR OF AGE REGISTERED IN AUSTRALIA DURING THE YEAR ENDED 30th JUNE, 1947.

Age at Death.	Deaths under	One Year of Ag	e Registered.	Approximate Proportion whose birth occurred in the Year ended 30th June, 1947.	Estimated Number of Deaths during Year ended 30.6.47 arising from Births which took place in that Year.

Total	3,107	2,278	5,385		2,713	1,994	4,707		

It appears from the foregoing table that of the 5,385 deaths under one year registered during the year ended 30th June, 1947, approximately 4,707 or 87.41 per cent. were the deaths of children who had been born in that year. The percentages for males and females separately were 87.32 and 87.53 respectively.

The process of estimation may be stated as follows:-

Of the deaths in any year of children aged under

one week, all except those who died in the first week of the year must have been born in that year, while of those who died in the first week, a proportion would have been born in the preceding year. In the calculation above, this proportion has been assumed to be half, which is probably somewhat too high, but not sufficiently so to affect the results seriously. In consequence of this assumption, $51\frac{1}{2}/52$ or 103/104 of the whole year's deaths are taken. Similar explanation applies to each of the other ages

Similar calculations to that described above have been made for the several States for the year ended 30th June, 1947, and the figures obtained have been compared with the registration returns. The results are as follows:—

COMPARISON OF CENSUS AND REGISTRATION RESULTS FOR INFANT AGES.

	Births Registered during the Year ended 30th June, 1947.	Approximate Number of Deaths under One Year of Age in Year ended 30th June, 1947, arising from Births in that Year. (a) The percentages shown for the Territories are affected by the fact that the figures for births and infant deaths are as registered in the respective Territories. The totals of births and infant deaths for the Northern Territory are slightly deficient due to the exclusion of cases which occurred outside the Territory but in respect of which the mother or infant was usually resident in the Territory, while a large proportion of the births and infant deaths registered in the Australian Capital Territory relates to mothers and infants whose usual residence was in Queanbeyan, just over the New South Wales border.

Note.—Minus sign (—) denotes excess of Registration Estimates.

5. Graduated (smoothed) Results.—As previously mentioned the tabulated results relating to age disclose many mis-statements. In an attempt to obtain results more nearly in accord with the facts, a process of graduation or smoothing was applied at previous Censuses to the recorded figures for each sex for each of the States and Territories and for Australia as a whole.

Since the purpose of graduating or smoothing is solely to eliminate the effects of a tendency to misstatement at certain ages, not to achieve any hypothetically perfect smoothing which would ignore actual irregularities in the symmetry of the age composition of the population, it was considered preferable at those Censuses to employ a mechanical rather than a mathematical procedure. The method of smoothing adopted was as follows:—The number of persons of either sex for each age or group of ages last birthday, from 0 upwards (after adjustment for unstated cases), was plotted as a rectangle on

cross-ruled paper, the base of each rectangle representing the number of years contained in the age group involved, and the height representing the number of persons in that age group. Through the upper part of these rectangles a smooth curve was drawn so that the area contained between it and the base would in some cases be greater and in others less than the area of the corresponding rectangle, the principle being that of making the excesses balance the defects within as short a range as practicable consistent with the maintenance of a fair degree of smoothness in the curve. From the curve so drawn values were read off for determining the areas, which had, by its means, been substituted for the original rectangles, and these areas were compared item by item with the original data. These values were further adjusted to eliminate irregularities or other defects indicated by a table showing the deviations from the data at each point, the accumulated deviations up to that point, and the first differences of the readings.

This procedure was discontinued at the 1947 Census, and at the time of publication of this Report no complete graduation of the 1947 age data had been made. A partial smoothing or adjustment has, however, been effected which corrects the more obvious errors of mis-statement. This departure from previous practice has arisen from the fact that the preparation and use of annual intercensal estimates of single age distributions have directed attention to the basic age data of the 1933 Census from which they are projected. Both the adjusted and graduated age distributions for 1933 were accordingly reviewed on the basis of available information, including a graphical comparison for each individual year of age between the 1933 results and those of 1911 and 1921 advanced 22 and 12 years respectively, and also of these various sets of data with the numbers of births in appropriate past These comparisons suggested that the graduation applied in 1933 went further than correcting mis-statements and in fact eliminated actual features of the population that are important when individual ages are being considered. Approximate modifications of the 1933 adjusted figures were accordingly determined in place of the original graduation and were used for intercensal estimates of ages up to the date of the 1947 Census. It is thus apparent that if a graduation is to give results that are representative and sufficiently accurate for practical use it must take into account any real irregularities that may be present in the age structure of the population. The difficulties in the way of preparing a graduation of the 1947 Census data that would be satisfactory from this point of view are many, and it has been decided to adopt for practical purposes an approximate adjustment of the major inaccuracies, disregarding those of lesser consequence which are difficult to distinguish from fluctuations actually present in the age distribution as a result of the ups and downs of the birth rate or other

factors. The amount of the correction applied to the selected ages has been determined after a consideration of the preferences for certain ages indicated in Section 3 (ii), a graphical comparison between the 1947 results and those of earlier Censuses arranged according to age in 1947, past movements in the birth-rate, and the discrepancies between the estimated and enumerated age distribution in 1947. The latter are particularly significant as they reflect the variations in the intercensal increase or decrease at individual ages in 1947 from those 14 years younger in 1933, which were very marked at many ages in contrast to the regular progression of the corresponding increase or decrease derived from recorded births, deaths and net migration. The adjustments determined have been used to modify the adjusted Census results for the purpose of compiling post-censal estimates of the age distribution of the population, but because of their rather arbitrary nature have not been incorporated in the tables of this Chapter. The age groups shown herein, however, are not appreciably affected.

6. Age Grouping.—In the study of statistics of population, the labour involved usually renders it impracticable to deal thoroughly with single ages, so that it becomes necessary to adopt some grouping of the data. The method generally employed is that of quinquennial groups beginning with a multiple of 5, as for example, 10–14; 15–19; 20–24; etc. For most purposes this grouping has been used at the present Australian Census, because it facilitates comparisons with the past and with other countries.

The following table shows the distribution in these age groups of each sex and total population (after adjustment for unstated ages) by States and Territories. Similar tables for the age group distribution of persons in metropolitan and rural population respectively appear in Sections 15 and 16 below:—

AGE.

GENERAL FEATURES OF THE AGE CONSTITUTION OF THE POPULATION.

7. Masculinity according to Age.—The "masculinity" or "femininity" of the population indicates the extent to which either sex predominates in the total. The figures in the following table,

deduced from the Census results after distribution of unspecified ages, show for each age group the number of males to each 100 females:—

MASCULINITY OF POPULATION ACCORDING TO AGE, 30th JUNE, 1947.

Several interesting observations may be made on the basis of this table and of the two which follow. In the column for Australia as a whole, which is not affected by interstate movements, the excess of male children at birth results in the high masculinity shown at early ages, although the higher mortality rate for males expresses itself in the decline in the masculinity rate as the young-age groups proceed from 0-4 to 15-19, and in the low masculinity rates for the old-age groups, there generally being no offsetting influence from oversea migration at these more extreme groups. In 1947 an approximate equality of sexes in the age group 20-24 and an excess of females between ages 25 and 34 were due to deaths of young men on service during the 1939-45 War and the absence of defence personnel who formed part of the occupation forces of Japan at the time of the Census. Another feature in the table above is the high masculinity rate for the age group 40-44, followed by a progressive fall in the rate through the succeeding groups, with the exception of group 55-59. sharp rise and dip in the rates as they stood in 1947 is to be explained by the loss of young male lives in the War of 1914-18 and by the excess of male elements in the net gain from oversea migration during the early and middle years of the intercensal period 1921-33. Men of ages ranging

from about 46 to 55 in 1947 would have been in the range 20 to 29 in 1921, when the masculinity for that range was definitely below 100 per cent. From 1921 to 1933 inclusive the country received an excess of 59,094 males over females by way of net oversea migration. This excess of males, more particularly of those in late adolescence and young adulthood, had not only increased masculinity by 1933 to a high percentage for the age group 20–29, but had also helped to offset the effects of the war upon the population attaining ages ranging from 30 to 44. These effects were still apparent in 1947 at correspondingly older ages.

The disparity between the States in 1933, especially for the age ranges just considered, is due, again, not only to the war and subsequent net migration from overseas as factors, but also to the influence of net interstate migration. At the 1933 Census all States, but more particularly Western Australia and Queensland, showed the influence upon the age range 25 to 34 of the influx of young male migrants during the years of greatest post-war net migration from overseas, viz., 1924 to 1927. Between 1933 and 1947 oversea migration was not at a high level and did not appreciably affect the masculinity of the population. Taken in combination with interstate migration, a net gain in migration was recorded in New South Wales and Victoria, in which

males were in excess of females but not sufficiently so to be reflected in the masculinity of those States in 1947.

The next two tables are interesting in showing for each age group the differing rates of masculinity in the population of urban and rural areas respectively in 1933 and 1947. In considering the

masculinity of any particular age group as between the two years, two comparisons must be made, namely, a diagonal comparison between any age group in 1933 and the appropriate survival age group in 1947, and a horizontal comparison between any age group in 1933 and the same age group in 1947.

In terms of the diagonal comparison, outstanding features in the tables are—(i) the lower masculinity in 1947 for the population in the various areas according to age attained by that year as follows:—Metropolitan, 60 and over; urban-provincial, 60 and over; and rural, 30 and over; (ii) the much higher masculinity in 1947 for the population in the rural areas attaining the ages 15 to 29 by that year, with a fall in masculinity at those ages in both metropolitan and urban-provincial areas.

In terms of the horizontal comparison, noteworthy features in the tables are—(i) an appreciably higher metropolitan masculinity in 1947 than in 1933 for ages between 15 and 49, and in some older age groups; (ii) the lower urban masculinity in 1947 than in 1933 for most age groups from 50–54 onwards; and (iii) the lower rural masculinity from 10–14 onwards in nearly all age groups, the drop being most marked between ages 20 and 34 and between ages 45 and 84.

The decline in masculinity for the metropolitan population reaching the ages 50 and over by 1947 continues the trend observed in the previous two intercensal periods, and while partly to be accounted for by the greater longevity of women it also reflects a tendency for life under city conditions to attract and retain relatively more women than men. The lower masculinity in 1947 than in 1933 for similar age groups from 10 upwards in the rural population also conforms to an expected trend. Masculinity for these ages in the rural areas in 1947 was still much greater than masculinity for the same ages in the population of the whole country, indicating the lag in the rural areas of the spread of those conditions of settlement attractive in equal degree to both sexes. The masculinity in 1933 for the rural population at ages 20 to 34 in that year was, however, abnormal. As was pointed out in Section 7 (i) of Chapter IX., the high masculinity among the younger age groups in the rural areas in 1933 is chiefly to be explained as a depression phenomenon, seen in the unusual mobility of young men of the towns and cities seeking work or relief in country The tendency for young women in rural areas to seek occupations in the towns and cities, which was accelerated under war conditions, is no doubt the explanation of the higher masculinity rate for the ages 15 to 29 in the rural areas in 1947 compared with that of rural population fourteen years younger in 1933.

The next table gives a comparison of the masculinity of the population of Australia as a whole as ascertained from each Census from 1891 to 1947. The most striking point in this comparison is the fall in the masculinity of the population which has accompanied settlement, with its complementary spread of conditions suitable to women and to the establishment of families. Two factors have operated in the equalization of the sexes in the population. As social conditions improved there was a larger proportion of females among immigrants, and, consequently, as population grew, the native-born element-which tends to an equality of the sexes-provided an increasing proportion of the population. It is also possible from the table to trace the effects upon masculinity of variations in the flow of net migration from overseas. In the first eight years of the 'eighties, when the wave of immigration from overseas was at its highest since the years of the gold rushes in the 'fifties, there were on average two males for every female among the migrants who remained in the country. influence of this excess of males and of the preponderance of youths and men of the younger ages is seen in the high rates of masculinity in 1891 for the ages 25 to 39, as compared with the masculinity rates for the corresponding age groups in 1901. The lower rates in 1901 are largely a reflection of the very considerable fall in net migration from overseas during the 'nineties. Likewise, the rates are again lower for these groups in 1911, since, with the exception of 1909 and 1910, net migration during the first decade of the present century was at a low ebb. The natural increase of the Australian-born population, moreover, was tending to equalize masculinity and femininity. The marked decline in the masculinity rate in 1921 for the age groups 20-24 and 25-29, as well as the decline in the rate the middle years, is chiefly accounted for by the 1914-18 War, despite the contribution given to masculinity by the excess of males in another large wave of immigration from overseas from 1909 to 1913. During the intercensal period 1933 to 1947, immigration was a comparatively unimportant factor, and the decline in the masculinity rate by 1947 as a result of the loss of male lives in both World Wars, the absence of Forces abroad, and the higher mortality generally for males is apparent at the appropriate ages.

MASCULINITY OF POPULATION OF AUSTRALIA ACCORDING TO AGE, CENSUSES, 1891 TO 1947.

8. Age Distribution.—The fluctuations in birth rates which were mentioned in Section 4 (i) above are illustrated clearly in the accompanying diagrams. These present a comparison of the age distribution in Australia and in each State and Territory at the last two Census dates. In 1933, with some exceptions, the normal population pyramid had given place to a mushroom-shaped diagram which indicated that the children born were insufficient to replace those in the higher age groups. This deficiency now appears at the age

115.89

110.14

107.99

All Ages

groups 10-14 and 15-19 years. The broadening of the base of the age pyramid in 1947 is the result of the increase in births prior to the Census which is also referred to in Section 4 (i).

- 9. Average Age.—It may be desirable to know, not only the number of persons at each age, but also the average age of each sex or of the whole community. Two kinds of average are frequently employed in the statistics of demography, namely:—
 - (1) The mean age, obtained by totalling the ages of all the population, male, female, or combined, and dividing by the number of each sex, or of both combined, as the case may be.
 - (2) The median age, obtained by ascertaining that age for either sex, or for both combined, which is so situated that there are as many persons above it as there are below it.

In the case of the mean age, it is clear that, since in the Census returns all persons are shown as at their age last birthday, the totalling of the recorded ages and the division by the number of persons will understate the true mean age by approximately ½, for on the average approximately half a year has elapsed since the birthday.

In computing the average ages for the purposes of this section, use has been made in previous years of the smoothed results, as these were believed to represent the position with greater accuracy than the original data. The difference in average between crude data and graduated results will, however, be insignificant, and for 1947 the recorded figures after distribution of unspecified ages but omitting the arbitrary corrections for age mis-statements have been used. At each Census the calculations have been based on the single age distributions. The mean age for each sex, and for both combined, for each State and Territory in 1947 was as follows:—

MEAN AGE OF POPULATION, 30th JUNE, 1947.

	Mean Age.							
State or Territory.	Males.	Females.	Persons.					
New South Wales	32.06	32.87	32.47					
Victoria	32.85	34.29	33.58					
Queensland	31.56	31.45	31.51					
South Australia	32.71	33.93	33.33					
Western Australia	32.01	31.59	31.80					
Tasmania	30.64	31.17	30.90					
Northern Territory	32.71	25.67	30.45					
Australian Capital Territory	29.69	28.63	29.20					
Australia	32.19	32.99	32.59					

Apart from the Australian Capital Territory, where the numbers are small, and the age composition exceptionally young, the lowest mean age for both males and females occurred in Tasmania. This applied also in 1933 and is due largely to heavy adult emigration combined with a high birth-rate.

The following table shows the median ages of males and females in each State and Territory in 1947:—

MEDIAN AGE OF POPULATION, 30th JUNE, 1947

Old more	Median Age.							
State or Territory.	Males.	Females.	Persons					
New South Wales	30.13	30.82	30.48					
Victoria	31.35	32.61	32.02					
Queensland	29.66	29.26	29.47					
South Australia	31.16	32.13	31.68					
Western Australia	30.79	29.44	30.14					
Tasmania	28.08	2 8. 3 5	2 8. 2 2					
Northern Territory	31.73	25.61	29.49					
Australian Capital Territory	$\boldsymbol{27.52}$	26.69	27.16					
Australia	30.44	30.99	30.75					

The median age was less than the mean age in all cases. For Australia as a whole, the mean age for males was greater than the median age by 1.75 years, for females by 2.00 years, and for persons by 1.87 years.

The next table gives a comparative statement of the mean and median ages for Australia, covering the Censuses from 1881 to 1947. From 1911 to 1921 the average age for males and the average age for females were rapidly approaching equality, with the former still somewhat higher than the latter. The average age of females actually exceeded that of males in 1933 and again in 1947 despite the effect of the 1939-45 War, which, with the curtailment of immigration and deaths of young men on war service, would have tended to raise the average age for males relatively to that of females. The absence overseas of Australian Forces in 1947 would contribute also to the increase in average age for males. The relative change in the average ages for males and females has been the outcome of the long-period tendency to equality of the numbers in each sex in the population, combined with the greater longevity of females. The gradual increase of the average age of both sexes since 1881 also reflects increasing longevity for each sex, and the ageing of the population is particularly emphasized by the marked rise from 1921 to 1947. During the 66 years covered by the table, the mean age of males increased by 6.76 years and of females by 10.50 years.

MEAN AND MEDIAN AGES OF POPULATION OF AUSTRALIA, CENSUSES, 1881 TO 1947.

Year of		Mean Age.		Median Age.					
Census.	Males.	Females.	Persons.	Males.	Females.	Persons

10. Full (Adult) Age.—One of the most important divisions in the ages of a community is that which distinguishes the numbers under 21 years of age from those above that age. The following

table gives the numbers of males and females who were over 21 years of age at the Census of 30th June, 1947, together with the percentages which they bore to the corresponding totals for all ages:—

ADULT POPULATION: NUMBERS AND PROPORTIONS, 30th JUNE, 1947.

				d 21 years wards.		ed 21 years wards.	Persons aged 21 years and upwards.		
State o	r Territory.		Number.	Percentage on Total Males of all Ages.	Number.	Percentage on Total Females of all Ages.	Number.	Percentage on Total Persons of all Ages.	
New South Wales		 	969,372	64.96	987,917	66.17	1,957,289	65.57	
Victoria		 	673,450	66.42	710,803	68.29	1,384,253	67.37	
Queensland		 !	362,375	63.86	341,393	63.34	703,768	63.61	
South Australia		 	211,542	66.10	221,052	67.80	432,594	66.96	
Western Australia		 \	165,440	64.11	153,866	62.96	319,306	63.55	
Tasmania		 	79,323	61.37	79,678	62.33	159,001	61.85	
Northern Territory		 	5,434	73.65	2,072	59.37	7,506	69.07	
Australian Capital T	'erritory	 	5,811	63.91	4,854	62.13	10,665	63.09	
Australia.		 	2,472,747	65.12	2,501,635	66.15	4,974,382	65.63	

Omitting the Territories, Victoria showed the highest percentage of adults of either sex, and Tasmania the lowest.

The following tables show comparable figures

for Australia for each of the Censuses from 1881 to 1947, together with the estimated numbers at 30th June for the post-censal years 1948 to 1950:—

ADULT POPULATION OF AUSTRALIA: NUMBERS AND PROPORTIONS, 1881 TO 1950.

					d 21 years over.		ed 21 years over.	Persons aged 21 years and over.		
		Year.		 Number.	Percentage on Total Males of all Ages.	Number.	Percentage on Total Females of all Ages.	Number.	Percentage on Total Persons of all Ages.	
1881				 624,633	51.41	457,641	44.20	1,082,274	48.10	
1891	• •	• •	••	 924,463	54.19	706,858	48.02	1,631,321	51.33	
1901				 1,080,728	54.64	913,973	50.89	1,994,701	52.86	
1911				 1,322,439	57.17	1,176,646	54.93	2,499,085	56.10	
1921				 1,607,872	58.20	1,547,839	57.91	3,155,711	58.05	
1933				 2,066,858	61.38	2,004,418	61.43	4,071,276	61.41	
1947	. ,			 2,472,747	65.12	2,501,635	66.15	4,974,382	65.63	
1948				 2,509,386	64.92	2,537,314	66,01	5,046,700	65.45	
1949				 2,579,303	64.89	2,595,516	65.93	5,174,819	65.41	
1950				 2,673,793	64.79	2,664,525	65.66	5,338,318	65.22	

The results given above show a striking increase (from 48.10 per cent. in 1881 to 65.63 per cent. in 1947) in the proportion of adults in the population, which is mainly the result of the joint causes of a falling birth-rate throughout the period and a greater longevity. From 1948 onwards, however, as a result of the high post-war level of the birth rate, this proportion showed a slight downward trend. The change in the age constitution of males, however, has differed materially from the change in that of females. During the 69 years covered by the table the proportion of adult males increased from 51.41 per cent. in 1881 to 64.79 per cent. in 1950, while the proportion of adult females increased from 44.20 per cent. in 1881 to 65.66 per cent. in 1950.

view of the age distribution of the population of Australia, and of the changes which have taken place therein at different stages from 1881 onwards, may be obtained by a classification into what have been termed "Natural Age Groups". For the present purposes the following groupings have been taken:—Infancy (ages under 2 years); Childhood (ages 2-13 inclusive); Adolescence (ages 14-20 inclusive); Early Adult Life (ages 21-44 inclusive); Mature Age (ages 45-64 inclusive); Old Age (65 and over). In each case the ages quoted are the ages last birthday.

AGE.

Classified in this manner, the graduated, or in the case of 1947, the adjusted results for the Censuses from 1881 to 1947 are as follows:—

POPULATION OF AUSTRALIA IN NATURAL AGE GROUPS, CENSUSES, 1881 TO 1947.

		Old Age	2.11	2.00	3.00	1.20	1.00	0.50	0.01

The results show the decline which has taken place in the proportions furnished by the minor age groups, except the infant group in 1947, and the corresponding increase in the adult groups, a fact which, of course, is in harmony with the higher

average age of the community already referred to. It may be noticed, too, that the changes have been much more marked in the females than in the males. In 1933, the absolute number in infancy diminished and the relative number in both infancy

and childhood declined. The contrast between the low birth-rate under the adverse economic conditions existing at the 1933 Census and the high birth-rate under the favorable post-war influences is reflected in the rise in the proportion of infants in 1947 to a level slightly under that of 1921. The proportion of adolescents began to decrease in 1921, recovered slightly, though not to the 1911 proportion, in 1933, but decreased again in 1947. Early adult life will not be affected at the next Census, but mature age and old age will further

increase. Eventually the numbers in early adult life and mature age must be influenced by the present reduction in infancy and childhood, unless migration and mortality rates operate as offsetting factors. The effect of the long-period changes shown in the tables above has been to bring the age structure of the population of Australia more into line with that of older countries.

The following tables give a similar analysis for males and females in each State and Territory:—

MALES IN NATURAL AGE GROUPS: NUMBERS AND PERCENTAGE DISTRIBUTION, 30th JUNE, 1947.

SPECIAL FEATURES OF THE AGE CONSTITUTION OF THE POPULATION.

12. School Age.—In Australia it is compulsory for all children within certain ages to attend school, except under special circumstances. In all States this provision applies to children who have attained age 6, but the upper age for compulsory attendance varies from the fourteenth birthday in Victoria, Queensland, South Australia and Western Australia, to the fifteenth and sixteenth birthdays in New South Wales and Tasmania respectively.

The number of children at each of the ages from 6 to 13 inclusive at the date of the Census is shown in the following table. The results are as recorded at the Census without graduation for mis-statements of age. Any inaccuracies that may be present as a result of age mis-statements appear, however, to be very slight at these ages:—

CHILDREN AT EACH SCHOOL AGE, 30th JUNE, 1947.

Note.—Minus sign (–) denotes decrease.

The decreases shown in the preceding table in the results for 1911 as compared with 1901 were due to the smaller number of births during the period 1898–1905 inclusive than in the corresponding years of the earlier decade. The late 'eighties and the early 'nineties were a "boom" period of trade and speculation, and the smaller birth rate was an effect of the subsequent collapse. Another striking feature is the smaller increase in the number of children of school age over the twelve years 1921 to 1933 than over the ten years 1911 to 1921 and the large decrease during the succeeding intercensal period. Whereas

the increases recorded in the total population between successive Censuses from 1911 to 1947 were 22.01, 21.97 and 14.32 per cent., the children of school age increased by 28.72 and 12.12 per cent. during the periods 1911 to 1921 and 1921 to 1933 respectively and decreased by 11.04 per cent. between 1933 and 1947.

13. Supporting (Working) Age. — An interesting grouping of the male population is that according to productive capabilities. The first group embraces those up to and including 14 years as Dependants, the second group includes the

AGE.

Supporting Ages—15-64 inclusive, and the Old of males in these groups is given below for each Age group covers all 65 and over. The number State and Territory:—

MALE POPULATION IN ECONOMIC AGE GROUPS: NUMBERS AND PERCENTAGE DISTRIBUTION, 30th JUNE, 1947.

						_			_

Amongst the States, the proportion at Supporting Age was highest in Victoria—67.64 per cent., and lowest in Tasmania—63.66 per cent. The proportion of boys at Dependent Ages was highest in Tasmania at 28.99 per cent., and the proportion of males who

had attained the Old Age of 65 was greatest in South Australia at 7.92 per cent.

Similar particulars are given for Australia in the next table for each Census from 1891—

MALE POPULATION OF AUSTRALIA IN ECONOMIC AGE GROUPS: NUMBERS AND PERCENTAGE DISTRIBUTION, CENSUSES 1891 TO 1947.

						Male Po	pulation.

	Total	1,705,835	1,977,928	2,313,035	2,762,870	3,367,111	3,797,370	100.00	100.00	100.00	100.00	100.00	100.00

The change which has taken place in the age composition of the male population is clearly shown by the percentages in the last table. The eccentric movement shown by the results for 1911, in the small proportion of children, is covered by the explanation of the decline in the number of children at school age given in Section 12 above. even greater percentage decline in the proportion of children in 1933 is explained by the marked fall in the birth rate since 1921. The further decrease in 1947 was modified by the recovery of the birth rate during the latter portion of the intercensal period. By far the largest proportionate changes shown are those in the population aged 65 and over, which has risen from 3.20 per cent. of the total male population in 1891 to 7.43 per cent. in 1947. This increase in the older age groups taken in conjunction

with the relatively small increase in the proportion of males of supporting age is of important social and economic consequence. The explanation for the relatively rapid growth of the old age group is to be explained not only by the long decline in the birth rate but also by the small volume of immigration during the past twenty years or so and by improved mortality rates.

14. Childbearing Age.—It has been, and still is, a common practice to compare the birth-rates of different countries by dividing the number of births occurring in each country during a stated period by the total population of the same country. As, however, the most important primary factor in the birth-rates so compared is the proportion of women in the respective communities who are capable of contributing children, any proper comparison of

birth-rates requires that allowance should be made for the varying age composition of the female sections of the populations concerned. The same remark applies to any country in the different stages of its development. For the purpose of modifying these crude birth-rates it is convenient to divide the female population into the three groups which are physiologically controlled by age, viz., Immature, Reproductive, and Sterile. Although

the limits of the groups are not precise, they may be taken in practice as 0-14 for the Immature, 15-44 for the Reproductive, and 45 and onward for the Sterile.

The number and proportion of the female population in each State and Territory according to the three age groups mentioned are given below, together with a comparison of similar results for Australia as a whole since 1891:—

FEMALE POPULATION IN REPRODUCTIVE AND NON-REPRODUCTIVE AGE GROUPS: NUMBERS AND PERCENTAGE DISTRIBUTION, 30th JUNE, 1947.

	Total	1,471,988	1,795,873	2,141,970	2,672,864	3,262,728	3,781,988	100.00	100.00	100.00	100.00	100.00	100.00

Amongst the States the proportions at reproductive ages were fairly uniform, the highest being 45.87 per cent. in New South Wales and the lowest 44.54 per cent. in South Australia. On the other hand, the proportions at immature ages and of those who have passed the childbearing age varied widely. Tasmania had the highest proportion (28.09 per cent.) in the immature group and the lowest proportion (26.95 per cent.) at the sterile ages, while Victoria had the lowest (22.92 per cent.) and the highest proportions (32.44 per cent.) in these respective groups.

Over the period from 1891 to 1947 (and, indeed, from the year of the first all-Australian Census, 1881) the effect of the declining birth-rate is seen in the decreasing proportion of the female popula-

tion in the immature group from decade to decade, with a corresponding contrary movement in the sterile group. Up to 1911 the proportion in the reproductive group rose steadily; in 1921 it fell abruptly and declined again in 1933 and 1947. These changes in the proportion of the female population in the reproductive ages are most significant from the point of view of the future growth of the population of Australia. It is obvious that the falling proportion represented by the immature group will render it difficult to maintain the proportion of women of childbearing age at the present level. Unless this trend is reversed by a rise in the birth-rate or by immigration, the capacity of the population to replace itself will be reduced progressively by the declining proportion of the population that is physiologically capable of bearing children.

GEOGRAPHICAL FEATURES OF THE AGE CONSTITUTION OF THE POPULATION.

15. Metropolitan Population in Ages.— The following table gives the number of persons in each age group who were enumerated in the several metropolitan areas throughout Australia and the aggregate for those areas combined. In compiling these results, persons of unspecified age have been distributed *pro rata* over the several age groups above 10–14 years.

A feature of the table is the large proportion formed by the youngest age group 0-4 years, and to a lesser extent by the next oldest group 5-9 years, in all metropolitan areas. These results are a reflection of the high level of the birth-rate in recent years and particularly the boom following the end of the

war. If comparison is made with a preceding table in Section 6, it will be seen, however, that the capital cities had proportionately fewer children at these ages than did the respective States. Another abnormal condition depicted in this table is the smaller number in each of the young age groups 10–14 and 15–19 than in the group next above, except for the ages 15–19 in Perth. This is due, as was similarly pointed out in Section 4 (i) above in the examination of the infantile age structure for the country as a whole, to the preponderant influence of the pre-war decline in the number of births per 1,000 of the population.

Total				100.00	100.00	100.00	100.00	100.00	100.00	100.00

The proportions of the populations of the several metropolitan areas in the economic groups,

Dependent Ages, Supporting Ages, and Old Ages, respectively, are as follows:—

METROPOLITAN POPULATION IN ECONOMIC AGE GROUPS: PERCENTAGE DISTRIBUTION, 30th JUNE, 1947.

Age last Birthday (Years).	Period of Life.	Sydney and Suburbs.	Melbourne and Suburbs.	Brisbane and Suburbs.	Adelaide and Suburbs.	Perth and Suburbs.	Hobart and Suburbs.	Total Metropolitan.
0–14 15–64 65 and over	Dependent Age Supporting Age Old Age Total	21.04 70.77 8.19 100.00	21.35 69.88 8.77 100.00	23.30 68.60 8.10	22.01 68.53 9.46 100.00	24.75 66.15 9.10	24.86 66.91 8.23	21.81 69.63 8.56

It thus appears that for the metropolitan areas as a whole 21.81 per cent. of the population in 1947 were under 15; 69.63 per cent. were of ages from 15 to 64; and 8.56 per cent. were 65 years of age or over. For the corresponding ages in 1933 the percentages were 24.64, 68.24 and 7.12, respectively.

For the population outside the metropolitan areas throughout Australia in 1947 the proportions were—Under 15, 28.39 per cent.; from 15 to 64, 64.08 per cent.; and 65 and over, 7.53 per cent. For the corresponding ages in 1933 the percentages were 29.98, 64.10 and 5.92. Thus, there was a larger proportion at working ages in the metropolitan cities than outside them in 1933 and 1947. In both years the reverse is true for children. In both years the proportion of persons 65 and over was somewhat

larger in the metropolitan than in the extrametropolitan areas.

The masculinity of the metropolitan population in age groups is given in the following table. The results present a striking contrast to the results for the States and for Australia as a whole which are given in the first table of Section 7 of this chapter. In the populations of the metropolitan areas it is an exception to find an excess of males in any age groups but the very young. In 1947 the low masculinity in the age groups 15-19 to 35-39 was accentuated in metropolitan cities as in other areas by the effects of the 1939-45 War, including the curtailment of immigration, loss of male lives during war service, absence of Australian Forces in Japan, and the impetus given to the movement of females from the country to the city to meet the war demand for labour.

All Age	s			49.72	59.69	36.34	59.20	54.24	29.77	50.72

The results given above show that of the total population of Australia at the time of the 1947 Census, 50.72 per cent. were enumerated in one or other of the metropolitan cities of the various States. The proportion of population in the metropolitan area varied widely between States but in all cases rose from age 45 onwards, with, however, a falling

off in New South Wales and Victoria amongst the more advanced ages.

In Section 9 of this chapter the mean and median ages of the several States and Territories are shown. Similar particulars for the various metropolitan areas are given in the following table:—

METROPOLITAN POPULATION: MEAN AND MEDIAN AGES, 30th JUNE, 1947.

				Mean Age.			Median Age.	
Metropolitan	Division.	 	Males.	Females.	Persons.	Males.	Females.	Persons.
Sydney and Suburbs		 	33.24	35.02	34.16	31.63	33.31	32.50
Melbourne and Suburbs		 	33.32	35.45	34.43	31.99	33.87	32.96
Brisbane and Suburbs		 	32.67	33.97	33.34	30.91	32.19	31.57
Adelaide and Suburbs		 	33.45	35.59	34.56	32.01	33.90	32.99
Perth and Suburbs		 	32.48	33.41	32.96	30.84	31.41	31.14
Hobart and Suburbs		 	31.53	33.22	32.42	28.99	30.55	29.84
Total, Metropolitan		 	33.14	34.95	34.08	31.60	33.25	32.47

A comparison between the metropolitan areas, and the States as a whole, will show that for both mean and median ages the averages for the metropolitan areas are the higher. For instance, the mean age for all the persons in the metropolitan areas was 34.08 years, as compared with a mean age of 32.59 years for Australia, and the metropolitan median age was 32.47 years against 30.72 years for Australia.

For the metropolitan areas the mean age of the population exceeded the median age by 1.61 years,

whereas for Australia the mean age was greater than the median by 1.87 years.

16. Rural Population in Ages.—The following table gives the number of persons in each age group in the rural areas of each State and Territory and the aggregate for those areas combined. The recorded figures are adjusted by distributing unspecified ages *pro rata* over the several age groups above 10–14 years.

RURAL POPULATION ACCORDING TO AGE, 30th JUNE, 1947.

Age last I	Birthday (Years).	New South Wales.	Victoria.	Queensland.	South Australia.	Western Australia.	Tasmania.	Northern Territory.	Australian Capital Territory.	Australia.

The proportions of the population in the rural areas of the several States and Territories in the

economic groups, Dependent Ages, Supporting Ages and Old Ages, respectively, are as follows:—

RURAL POPULATION IN ECONOMIC AGE GROUPS: PERCENTAGE DISTRIBUTION, 30th JUNE, 1947.

Age last Birthday (Years).	Period of Life.	New South Wales.	Victoria.	Queensland.	South Australia.	Western Australia.	Tasmania.	Northern Territory.	Australian Capital Territory.	Australia.
0–14 15–64 65 and over	Dependent Age Supporting Age Old Age	29.56 62.87 7.57	27.92 63.49 8.59	30.89 63.31 5.80	$28.15 \\ 64.34 \\ 7.51$	30.17 63.00 6.83	33.33 59.95 6.72	23.16 73.59 3.25	28.59 65.98 5.43	29.47 63.15 7.38
	Total	100.00	100.00	100.00	100.00	100.00	100.00	100.00	100.00	100.00

When this table of proportions is compared with the corresponding table for the metropolitan areas (in Section 15 above), it will be seen that in the rural areas (i.e., excluding provincial towns) there was a smaller proportion of population at working ages than in the metropolitan centres, a smaller proportion of elderly persons, and a larger proportion of children.

The masculinity of the rural population proper by States and Territories and for Australia is given in the following table. The high rates for the rural areas for all but the youngest and oldest ages may be contrasted with the rates for the whole area of each State and of Australia (see first table, Section 7 above) and with the still lower rates for the metropolitan areas (see fourth table, Section 15 above). As already explained in Section 7, the much higher masculinity in the rural areas indicates the lag in the spread to "country" areas of conditions of settlement attractive in equal degree to both sexes. The relatively low level of masculinity at the early adult ages is due to special war factors, as already referred to in connexion with metropolitan masculinity.

MASCULINITY OF RURAL POPULATION ACCORDING TO AGE, 30th JUNE, 1947.

The results given above show that of the total population of Australia at the time of the 1947 Census, 31.06 per cent. were enumerated in rural, i.e., the "country" areas. As will be seen from the corresponding table in Section 15 above, 50.72 per cent. of the State populations in the aggregate were in metropolitan areas. addition of persons in the Territories to the total of the States makes no appreciable difference to this percentage.) The remaining 18.22 per cent. were in provincial towns or, to a much smaller degree, comprised migratory population. A comparison with the corresponding proportions of 35.91, 46.87 and 17.22 per cent. respectively in 1933 indicates the relative growth of urban areas at the expense of rural communities.

17. Census Records for Subdivisions of States.—In the foregoing statement reference has been restricted to the various States and Territories and to the metropolitan and rural areas. In Part IX. of the Detailed Tables of the Census further particulars will be found concerning the ages of the population in Urban Provincial and in Rural Divisions of each State and in Tropical and non-Tropical Regions of Australia. Particulars relating to the age composition of the population of each Local Government Area—Municipalities, Shires, District Councils, &c.—are given in Parts I. to VI. inclusive, which deal with the several States separately; similar particulars for the Territories are given in Part VII.

CHAPTER XI.

CONJUGAL CONDITION.

NATURE AND SCOPE OF THE INQUIRY.

- 1. The Importance of Statistics of Conjugal Condition.—Statistics of the conjugal condition of the population are of great social and economic importance. The relation of conjugal condition to age and the ratio of the married to the unmarried in the population have a bearing on the socially-significant question of reproduction. Again, the relation of the married structure to birthplace, nationality, race, and religion has social significance. And there is an economic interest in the relation of conjugal condition to industry, occupation, occupational status, and dependent children.
- **2. Form of Inquiry in 1947.**—At the Census of 1947 persons were asked to state their conjugal condition as at the Census date under three headings—

(i) Condition as to Marriage;

(ii) Duration of Existing Marriage;

(iii) Children Born to Existing Marriage. The first item comprised the following direction:—
"If never married, write 'N.M.' If married, write 'M'; but—If permanently separated (legally or otherwise), write 'S'; If widowed and not remarried, write 'W'; If divorced and not remarried, write 'D'." The other items on the Schedule relating to duration and issue of marriage, which were to be answered only by those persons who were married (and not permanently separated) at the date of the Census, are not dealt with in the present Chapter but are discussed at length in Chapter XXII.—Families.

3. Tabulation of the Results in 1947.—As in 1933, detailed classifications of the population according to conjugal condition were made in conjunction with related characteristics of age, dependent

children, religion and occupational status. Additional data were tabulated in 1933 in relation to conjugal condition in conjunction with birthplace, nationality, race, industry and occupation, but these items were omitted from the tabulations in 1947.

The relationship of conjugal condition to geographic location and to the ages of the population is considered in the present Chapter, while conjugal condition classified in conjunction with other characteristics (dependent children, religion and occupational status) is dealt with in the respective Chapters relating to those subjects.

Special cross-classifications relating to age, duration of marriage and issue of married males and females were made in considerable detail in 1947, and summaries will be found in Chapter XXII.—Families. Married females in the work force were tabulated according to occupation in conjunction with occupational status, and separate details are available for those married women who were permanently separated from their husbands.

Further details of the conjugal condition of the Australian population, such as the numbers in the urban and rural divisions of each State and Territory and classifications in conjunction with age and occupational status and with dependent children, will be found in Part X. of the Detailed Tables of the Census; particulars of conjugal condition in conjunction with other classifications will be found in the following Parts:—Religion, Part XVI.; and Occupational Status, Part XIX. Particulars of the conjugal condition of the population in the several local government areas throughout each of the States and Territories of Australia will be found in Vol. I., Parts I. to VII.

GENERAL VIEW OF THE CONJUGAL CONDITION OF THE AUSTRALIAN POPULATION.

4. Conjugal Condition of the Population in States and Territories.—The following table shows the conjugal condition of the population in each State and Territory in 1947.

Those for whom particulars as to conjugal condi-

tion were not given—3.2 per 1,000 males and 2.8 per 1,000 females—have been distributed proportionately throughout this Chapter. Those for whom age was unspecified have been similarly apportioned over ages 15 and upwards.

As might be expected, the numbers of persons in each marital group were distributed throughout the various States and Territories generally in accordance with their respective total populations (of all conjugal conditions), minor exceptions only occurring in Western Australia and the Australian Capital Territory. The proportions of each marital category within the respective States and Territories, however, varied, although not greatly if the Territories, in which conditions are abnormal, are disregarded. Of the States, the highest ratios of "never married" persons aged fifteen years and over to the total population of all ages and conjugal conditions were recorded in Queensland in the case of males (26.43 per cent.) and in Victoria for females (21.21 per cent.), while this group was lowest proportionately in South Australia (22.12 per cent.), and Western Australia (17.47 per cent.), for males and females respectively. The married population varied from 49.11 per cent. of total population in South

Australia to 43.51 per cent. in Queensland for males, and from 48.34 per cent. in South Australia to 44.96 per cent. in Tasmania for females. Widowers and widows were more numerous relatively in Victoria, where they represented 3.16 and 8.73 per cent. respectively of the total population. The proportions of widowers (2.79 per cent.) and of widows (7.21 per cent.) were lowest in Queensland and Tasmania respectively. The relative distribution of divorced persons was more variable, ranging from 0.92 per cent. in Western Australia to 0.50 per cent. in Queensland for males and from 0.87 per cent. in New South Wales to 0.50 per cent. in Tasmania for females.

As children under 15 years of age are included among the unmarried, a more concise statement of the conjugal condition of the population is obtained by excluding all persons under 15 years. Such a statement is given below:—

CONJUGAL CONDITION OF THE POPULATION OF AUSTRALIA AGED 15 YEARS AND OVER: NUMBERS AND PERCENTAGE DISTRIBUTION, 30th JUNE, 1947.

Co	Conjugal Condition.				Number.		Percentage.			
	,			Males.	Females.	Persons.	Males.	Females.	Persons.	
Never marr	ied			932,938	751,360	1,684,298	32.97	26.36	29.65	
Married				1,759,258	1,760,650	3,519,908	62.17	61.76	61.97	
Widowed				112,363	311,168	423,531	3.97	10.92	7.46	
Divorced	• •	• •		25,052	27,516	52,568	0.89	0.96	0.92	
Tota	l			2,829,611	2,850,694	5,680,305	100.00	100.00	100.00	

In point of actual numbers and proportionately males who had never been married exceeded females in the same category. Of those who were married, females exceeded males in actual numbers, but were less proportionately. Of the widowed and divorced, females were in excess both numerically and proportionately.

5. Conjugal Condition of the Population in Metropolitan Divisions.—The numbers in each marital grouping of the population in the

various metropolitan divisions of Australia are shown in the following table:—

Although smaller in total population, Adelaide had a greater number of both males and females in the married and divorced groups, and also of widows, than Brisbane. The number of divorced males was greater also in Perth than in Brisbane. With these exceptions, the metropolitan areas in their numbers of each marital status followed the order of their total populations.

There were wide divergences between the conjugal condition of the metropolitan population and that of the extra-metropolitan population. Reference may be made to Section 15 below, which gives particulars of the distribution of the population in the metropolitan and extra-metropolitan areas, for Australia as a whole, according to conjugal condition and age. In general, it may be noted that compared with the extra-metropolitan areas there were, at ages 15 years and over, relatively fewer single men but more married, widowed and divorced males in the capital

cities in 1947, while for females there were relatively fewer married women but more single, divorced and widowed.

Comparisons between the conjugal condition of the metropolitan population and that of the respective State populations are also informative. The highest ratios of never married, married and divorced in any metropolitan area to the corresponding groups in the total State population were found in Melbourne and of widowed in Adelaide. For all conjugal groups, in combination and separately, the lowest proportions were in Hobart. For the metropolitan areas of Australia as a whole, in which 48.71 and 52.73 per cent. of the male and female populations respectively were located, the largest relative concentration was of divorced, who represented 62.82 per cent. of all divorced males and 74.48 per cent. of all divorced females. In Melbourne the corresponding proportions of State population rose as high as 73.91 per cent. for men and 81.41 per cent. for women. The metropolitan married population of Australia represented 51.78 and 53.06 per cent. respectively of all husbands and wives. Widowers in the metropolitan area formed a slightly lower proportion (50.87 per cent.) than married males, but widows, with a corresponding

percentage of 61.16, were relatively much more numerous than married females in the capital cities. The remaining persons aged 15 years and over were those who had never been married at the time of the Census and of these 47.19 per cent. of the males and 58.07 per cent. of the females were enumerated in metropolitan areas.

CONJUGAL CONDITION IN RELATION TO AGE.

6. Larger Age Groups according to Conjugal Condition.—The following table shows the population of Australia—males and females sepa-

rately—in larger age groups, according to their conjugal condition:—

CONJUGAL CONDITION AND AGE OF THE POPULATION OF AUSTRALIA, 30th JUNE, 1947.

In the age groups specified in the table, bachelors exceeded spinsters in number up to 60 years, but in all cases widows were more numerous than widowers. In the age group 15-44 married women were more numerous than married men, but in the

older ages the reverse was the case; the same applies to divorced persons.

In the following table the figures given above have been reduced to proportions per 10,000 of the populations according to sex:—

Total .	. 1,900,697	1,759,258	112,363	25,052	3,797,370	1,682,654	1,760,650	311,168	27,516	3,781,988

Among males, bachelors predominated in all groups below 25, married men in all groups between 25 and 85, and widowers in the later ages. Among females, spinsters were the most numerous below 25, married women in all age groups between 25 and 70 years, and widows from 70 years onward. It is interesting to notice that at all ages under 50 bachelors were in excess of spinsters in number and that this disparity between the sexes was parti-

cularly pronounced between ages 20 and 34, when most marriages normally are contracted. Taking the age-group 15 to 49 as a broad indication of marriageable age, there were within this group, in 1947, 826,299 bachelors and 630,673 spinsters, or an excess of 195,626 bachelors of marriageable age. This does not mean, however, that this large number of males will not marry, since many at the youngest ages in this group will eventually marry girls who

were younger than 15 at the Census date. If, for example, the relative ages of persons who marry in the future follow the same pattern as that of bridegrooms and brides who married during 1947, and mortality rates remain unchanged, about 30 per cent. of the "never married" males aged 15 to 49 at the Census of 1947 will marry girls who were too young to be included in the marriageable group at the time. Widowed and divorced persons also should be taken into account as part of the stock of marriageable persons but, while females preponderate in this group, the excess of widows and divorcees over widowed and divorced males between ages 15 and 49 in 1947 was only about Despite the relatively favorable position enjoyed by women, in Australia as a whole, of the total females aged 50 years and over in 1947, 120,687, or 13 per cent., had not married, compared with 106,639 males (also 13 per cent.) in the same age group.

The distribution of the population within Australia is a further factor of importance. Insofar as the composition of the population according to sex, age and conjugal condition varies between and within each State and Territory, the prospects of marriage of the population generally may be enhanced or lessened. At the 1947 Census wide variations in the there were from the and Territories Australian averages previously mentioned. Disregarding the Territories, in which the conditions are abnormal, the deficiency within the age group 15 to 49 the numbers of females compared with males was lowest in Victoria and South Australia,

where there were 23 per cent. more bachelors than spinsters, while in these two States, and in Tasmania, the proportions of females at ages 50 and over who had never been married were the highest in Australia, being 16 per cent. for Victoria and 14 per cent. each for South Australia and Tasmania. On the other hand, both Queensland and Western Australia had about 45 per cent. more bachelors than spinsters in the age group 15 to 49, which was the highest proportion of all the States, but the lowest proportion of females of 50 years and over who had never been married, namely, 11 and 8 per cent. respectively. New South Wales, with 30 per cent. more bachelors than spinsters and 13 per cent. "never married" females of 50 years and over, occupied an intermediate position close to the Australian average.

In the metropolitan divisions of Australia as a whole the "never married" males and females were more evenly distributed. In the broad age group 15 to 49 there were 395,176 bachelors compared with 357,242 spinsters, a difference of 37,934 or only 11 per cent. more bachelors than spinsters, while in the age groups 15–19 and each quinquennial age group from age 35 onward the "never married" females exceeded males in number. With the position more unfavorable for females in the metropolitan areas than in Australia generally, the proportion of females at ages 50 and over who had never been married was relatively high at 15 per cent.

The following table shows the proportions of males and females per 10,000 of the same sex in each age group according to their conjugal condition:—

CONJUGAL CONDITION AND AGE OF THE POPULATION OF AUSTRALIA: PROPORTIONAL DISTRIBUTION PER 10,000, 30th JUNE, 1947.

Age last			Males.					Females.		
Birthday (Years).	Never Married.	Married.	Widowed.	Divorced.	Total.	Never Married.	Married.	Widowed.	Divorced.	Total.

80–84	1,305	4,555	4,103	37	10,000	1,327	1,504	7,151	18	10,000
85 and over	1,157	5,234	5,581	2 8	10,000	1,157	791	8,041	11	10,000
Total	5,005	4,633	296	66	10,000	4,449	4,655	823	73	10,000

The maximum proportion of married men in any age group in 1947 was 82.75 per cent. in group 40–44; in 1933 and 1921 the maximum was in groups 45–49 and 40–44 respectively. Among

females, the maximum proportion of married was 83.53 per cent. in the earlier age group 35–39 in 1947; this same age group also took precedence in 1933 and 1921.

COMPARISONS WITH PREVIOUS CENSUSES.

8. General.—In the following series of tables comparisons are made between the numbers of males and females at various ages in each conjugal condition as ascertained at each Census from 1901 to 1947. In the earlier years there was a lack of consistency between the States in regard to the age groups adopted, and, consequently, some estimation has been necessary to make the figures comparable. It is probable, however, that any defect arising from this cause will be negligible. The numbers unspecified, whether as to age or conjugal condition, have been distributed on the bases of those specified.

9. Trends in Nuptiality.—(i) The Nuptial Ratio.—The nuptial ratio, or the ratio of the married to the unmarried, provides a useful means of comparing the condition of the population in relation to marriage over a period of time. A strict division of the population into married and unmarried is not possible owing to the existence of widowed and divorced persons. But since the interest of the nuptial ratio lies in its bearing on reproduction, these classes may be grouped, with the "never married", under the term "unmarried".

The following table shows the nuptial ratios for successive Censuses, the widowed and divorced being regarded as "unmarried":—

POPULATION OF AUSTRALIA: NUPTIAL RATIO, CENSUSES, 1891 TO 1947.

(Ratio of Married to Unmarried.)

				Total Population.	l)	Population aged 20 and over.				
	Year	•	Males.	Females.	Persons.	Males.	Females.	Persons.		
1891 1901 1911 1921 1933 1947			 0.387 0.403 0.469 0.571 0.635 0.863	0.475 0.465 0.521 0.599 0.661 0.871	0.426 0.432 0.493 0.585 0.647 0.867	0.987 1.035 1.165 1.544 1.588 2.268	1.727 1.458 1.458 1.653 1.652 2.135	1.253 1.210 1.294 1.597 1.619 2.200		

The second part of this table is the more significant. As was to be expected the female nuptial ratio was, in the earlier years, far greater than the male, but the two ratios have come closer together as the country has developed and the numerical relationship of the sexes has become more balanced (i.e. as the masculinity of the population has approached 100). Thus at the 1947 Census the nuptial ratios (for persons aged 20 years and over) were males 2.268 and females 2.135, as against 0.987 and 1.727 respectively in 1891.

While these two ratios have tended to become closer, it does not necessarily follow that the male ratio must always be increasing and the female ratio decreasing. In fact, the latter has shown increases between 1911 and 1921 and again between 1933 and 1947. There are various factors operating which can increase or decrease either the male or the female nuptial ratio, or both. The most important is, of course, the marriage rate itself. This varies considerably, particularly in periods of prosperity, depression and war. Any change in the marriage rate will tend to bring about a change in the same direction in both the male and female ratios. Another important influence is the division of the

adult population between the lower age groups (where the proportion married is relatively small) and the higher age groups (where the proportion married is relatively large). In 1891, the proportion of the adult population who were aged 45 years or more was about 29 per cent., but in 1947 this proportion had risen to nearly 45 per cent. Of the other factors, the most important is probably immigration. At previous Censuses, the tendency has been noted for a far greater proportion of overseaborn than Australian-born adults to be married. Any rise in immigration may thus be expected to increase both nuptial ratios and any fall to decrease them.

The stability of the female ratio between 1921 and 1933 might be accounted for by the fact that the effects of a fall in the marriage rate, due to the depression in the later part of the period, were counteracted by the effects of the ageing of the population, which was particularly noticeable between the two Census years. The high marriage rates of the 1939–45 war and post-war periods were no doubt mainly responsible for the marked rise in both the male and female ratios between 1933 and 1947.

(ii) Proportions "Ever Married".—By combining the numbers of married, widowed and divorced persons, comparisons can be made between the proportions of "ever married", that is, persons who were or at some time had been married, at each Census. These proportions, which are shown in the following table in broad age groups for successive Censuses from 1891 onwards, express the nuptiality experiences at various ages which have resulted from the operation of past demographic forces, of which, as has been indicated, fluctuations in marriage rates and in immigration are the most

important. Because of its differential effect on the sexes and on unmarried as compared with the married, mortality has also been a factor in determining the proportions married at any age, while furthermore previous birth rates have influenced the relative numbers of men and women available at marriageable ages and so the proportions married. Having arisen from actual events of the past, the proportions married shown in the table below are to be distinguished from corresponding hypothetical results given by indexes of nuptiality derived from current or assumed experiences.

"EVER MARRIED" MALES AND FEMALES IN AUSTRALIA: PERCENTAGES OF TOTAL POPULATION OF EACH SEX IN AGE GROUPS, CENSUSES, 1891 TO 1947.

Age last Birthday			Ma	les.					Fem	ales.		
(Years).	1891.	1901.	1911.	1921.	1933.	1947.	1891.	1901.	1911.	1921.	1933.	1947,
15–19	0.22	0.18	0.39	0.43	0.44	0.68	4.10	2.91	3.82	3.65	3.93	5.58
20-24	10.96	9.56	12.19	14.60	12.85	23.53	34.85	27.98	30.04	33.59	31.19	48.61
25-34	48.38	45.27	49.68	58.23	55.11	70.23	73.68	65.33	64.88	69.66	69.68	82.63
35–44	70.58	70.29	72.14	78.21	81.22	84.50	89.44	85.43	80.66	81.68	83.90	87.22
45–54	75.71	76.70	78.61	80.44	85.29	86.66	93.92	91.07	87.21	84.06	85.63	87.49
55 and over	79.49	80.05	81.43	82.16	83.93	87.48	95.87	95.00	92.57	89.03	86.28	86.43
Total, 15 years and over	47.09	47.94	50.32	57.32	58.04	67.03	61.97	59.48	59.76	64.21	65.03	73.64

Perhaps the most important feature of the results above is the increased proportions of men and women recorded as "ever married" at the younger ages 15-19 and 20-24 years. With some exceptions in 1901, 1921 and 1933, which were due to special factors, 1901 and 1933 being affected by economic depression, and 1921 by the loss of young male lives in the 1914-18 War, these increases have been noted at each Census. The tendency towards earlier marriage which has been apparent in Australia is thus seen to be of the nature of a long-term trend, although it was greatly accelerated between 1933 and 1947. In the older age groups the proportions of married men on the whole showed a fairly consistent increase at each Census but those for women, before increasing, first decreased until 1911 for ages 25-44, until 1921 for ages 45-54 and until 1933 for the remaining group 55 years and over. declines in nuptiality, which are seen to affect mainly women who were under 25 years in 1891, are indicative of the trends current at each Census, females which accompanied settlement and which was accentuated by the fall in immigration during the 1891–1901 intercensal period, as discussed in Section 7 of Chapter X., "Age". It may also be noted that the movements shown in the table above for individual age groups are largely independent of changes in the age structure of the population and, therefore, provide a more accurate measure of the trends in proportions married than the nuptial ratios described in the preceding sub-section (i).

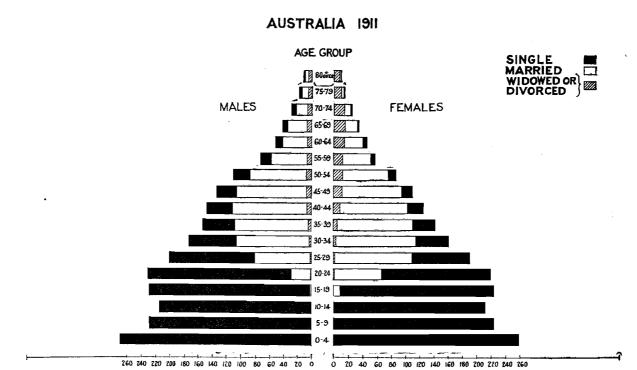

The proportions married in the age group 45–54 years are of particular significance as the numbers who marry for the first time after passing through this age group are very small, and the proportions are, therefore, a fairly close measure of complete nuptiality, that is, of the proportion of the population who ultimately marry. These proportions relate, of course, to the experience over a long period preceding the respective Censuses and are not indicative of the trends current at each Census,

that is, of the proportion of the Census population at young ages who are likely to marry eventually. The proportion of males who marry between ages 45 and 55 as shown by these figures has increased steadily from Census to Census, reaching 86.66 per cent. in 1947. The corresponding female nuptiality has fluctuated although within a comparatively small range. In 1947 the proportion of women married at the ages 45-54 years at 87.49 per cent. was much the same as that for men. It must be remembered, however, that the number of males in this age group was reduced by deaths in the 1914-18 War and that, therefore, the proportion of men married is higher than might otherwise have been the case, while the opposite tendency has applied in the case of married women. Corresponding ratios at succeeding ages reflect the experiences of earlier generations of men and women. In 1947 the proportions married in each quinquennial age group above 45-54 years were fairly stable for both males and females. Comparisons between such age groups are, however, affected by differences between the mortality of the "never married" and of the "ever married" and also of the various conjugal states forming the "ever married" population, in which the proportion of widowed increases rapidly with advancing age. Ages 55 and over have accordingly been combined in the table above.

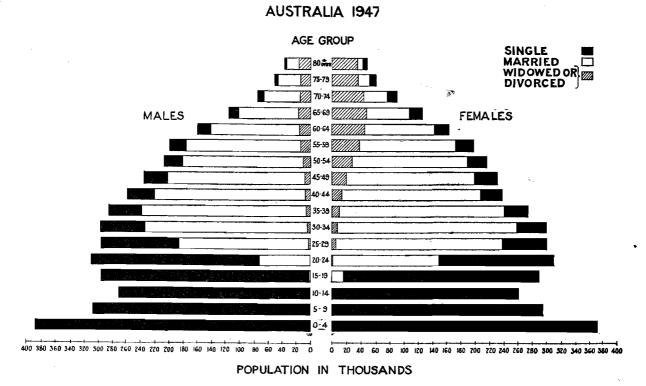

The proportions recorded as married at successive ages at a Census are those of unrelated groups of men and women, and do not, therefore, represent a continuous experience, which can be ascertained only from the history of a group of men or women born about the same time. If the effect of migration is disregarded, the nuptiality experience of particular generations of men and women as they advance in age from Census to Census can be seen from the table above by reading the figures diagonally, but these experiences can be traced more precisely perhaps from quinquennial age groups. On account of the departure in 1933 and 1947 from the tenyearly intervals between Censuses, comparisons on the latter basis are only approximate for the age groups concerned in 1933 and 1947, but subject to this qualification the following were the percentages married at successive Censuses for the generations of males who were aged 15-19 years at the 1891, 1901 and 1911 Censuses respectively:-Aged 15-19 years in 1891—0.22 at 15-19, 35.07 at 25-29, 69.90 at 35-39, and 80.34 at 45-49 (in 1921); aged 15-19

years in 1901-0.18 at 15-19, 40.35 at 25-29, 76.94 at 35-39, and 85.34 at 45-49 (in 1933); aged 15-19 years in 1911-0.39 at 15-19, 47.78 at 25-29, 78.72 at 35–39, and 87.24 at 50–54 (in 1947). It will be seen that the rise in the proportions married at 25-29 years was relatively much higher than at the later For females of the same generations, the corresponding proportions have moved in similar directions but the changes in nuptiality have been relatively smaller. These proportions are as follows:—Aged 15-19 in 1891-4.10, 56.76, 78.59 and 83.40; aged 15-19 in 1901-2.91, 58.67, 81.12 and 85.67; aged 15-19 in 1911—3.82, 63.51, 82.97 and 87.63.

Because of their bearing on the reproductive capacity of the population, the greatly increased proportions of young married persons are of considerable importance. In the principal child-bearing age groups 20-24 and 25-29, the proportions of "ever married" females increased between 1891 and 1947 from 34.85 to 48.61 per cent. and from 67.18 to 79.01 per cent. respectively, equivalent to increases during the 56 years of 39.48 and 17.61 per cent. respectively. For a consideration of the broad age group 15-44 years which corresponds approximately to the reproductive ages, it is more appropriate to deduct first the widowed and divorced persons who are included in the "ever married" population. The proportions of married population, excluding widowed and divorced, will be found in Sections 11 and 14 following. Expressed as percentages, those for females in the age group 15-44 as a whole are as follows:—1891, 49.80; 1901, 46.76; 1911, 46.78; 1921, 52.09; 1933, 51.84; and 1947, 62.51. Compared with that of 1891, the proportions married at ages 15-44 in 1947 represents an increase of 25.52 per cent. The major portion of this increase is seen to have occurred between 1933 and 1947 and is due to the trend towards earlier marriages. The fact that women are marrying younger does not necessarily imply a larger average family eventually but nevertheless the increased length of married life that will result within the reproductive period and other associated influences may tend to raise the average size of family. The structure of the Australian population has thus undergone an important change, particularly under the influence of the economic and social conditions of recent years, and if the present marriage trend is continued the future level of births may be affected appreciably.

POPULATION IN THOUSANDS

MALES AND FEMALES IN AUSTRALIA CLASSIFIED ACCORDING TO CONJUGAL CONDITION IN CONJUNCTION WITH AGE

Explanation.—The diagrams on this page illustrate the age distribution in relation to the conjugal condition of the male and female population of Australia in 1911 and 1947. The horizontal length of each bar measures the number of persons of the age group to which it corresponds, while the subdivisions of each bar represent the numbers of each conjugal condition in the respective age groups, after

distribution of cases of unspecified age or conjugal condition.

A comparison between the two diagrams shows the greatly increased proportion of married males and females in 1947 compared with 1911, while also the relatively higher proportion of widowed or divorced (predominantly widowed) among females than among males is indicated clearly in both diagrams.

10. The Never Married.—(i) Males.—The following table shows the numbers of males in quinquennial age groups who had never been married, and the proportions which they bore to all males of the same ages at each Census from 1901 to 1947:—

The proportion of males who were never married has diminished in each age group over 15 years between 1901 and 1947, and also, with the exception of the age groups 20–34 in 1933 and one or two other instances, from census to census during that period. The proportion of unmarried females in each age group between 15 and 40 years also declined between 1901 and 1947. At the remaining ages unmarried females increased in proportion between 1901 and 1947, with fluctuations in age groups 40–64, but regularly at ages 65 years and over. In the age groups under 40 years the decrease has been fairly consistent throughout the period.

Although there is a contrary movement among the "never married" males and females in age groups from 40 years onward, it may be noticed that when all ages are taken together the movements in the proportions are in the same direction for both sexes. It may be observed that in 1901 about $36\frac{1}{2}$ per cent. of the female population was under 15 years of age, whereas in 1921 this group was less than 32 per cent., and only $24\frac{1}{2}$ per cent. in 1947. The modifying effects of the elimination of those under 15 years of age may be seen from the figures given in the table above, which show that of all females 44.49 per cent. had never been married by 1947, as compared with 62.24 per cent. in 1901, representing a decrease of 17.75 per cent. of the total female population but on the basis of females over 15 years of age the decrease amounted to only 14.16 per cent.—from 40.52 to 26.36.

11. The Married.—(i) Males.—The next table shows the numbers of married males in quinquennial age groups, and the proportions which they bore to all males of the same ages at each Census from 1901 to 1947:—

The proportions of married males in each age group except 85 and over and for all ages collectively were higher in 1947 than at any of the preceding Censuses shown in the table. The results for 1947 show that the proportion of married males increased with age until the maximum proportion was reached in age group 40–44, in which the married represented 82.75 per cent. From this point onward, owing

mainly to the separation of married couples by death, the proportion of married males declined with increasing age. In the earlier Censuses covered by the table the maximum proportion of married males was in the next higher age group 45–49, with the exception of 1921, when it fell in the same age group 40–44.

(ii) Females.—The next table shows the numbers and proportions of married females in quinquennial age groups at each Census from 1901:—

Although the proportions of married females in the separate age groups under 75 years, and for all ages collectively, increased between 1901 and 1947, it will be noticed that between 1901 and 1911 and in succeeding intercensal periods the proportions in some age groups decreased. As in the case of married males, the proportions of married females recorded in 1947 in each age group, excluding the more advanced ages, were higher than the corresponding proportions at each previous Census shown. This trend is of considerable sociological and economic importance in

view of its bearing on the reproductive capacity of the population, housing requirements and other questions.

In 1901 and 1911 the greatest proportion of married females in any age group was in group 40–44, but at succeeding Censuses in group 35–39.

12. The Widowed. — (i) Widowers. — The numbers and proportions of widowers in quinquennial age groups at each Census from 1901 are shown in the following table:—

Between 1901 and 1947 there was an increase in numbers in the main age groups (45 years and over), and in the totals, but the proportion of widowers decreased in almost every age group.

On the other hand, the proportion of widowers in the population for all ages combined was higher in 1947 than 1901. This position, however, merely arises from the fact that the population under 15 years of age, in which no widowers were recorded, is included in the total and that, with the changing age constitution of the Australian population, males under 15 years formed a much lower proportion of the total in 1947 than in 1901. As will be seen from the table above, if only ages 15 years and over are considered the proportion of widowers in the total is less in 1947 than in 1901.

(ii) *Widows.*—The next table shows the numbers and proportions of widows in quinquennial age groups at each Census from 1901. The apparent anomaly referred to in the previous table relating to widowers is also present in the figures relating to widows, namely, that while in practically all age groups the proportion of widows in 1947 shows a decline compared with 1901, the proportion for all ages combined shows an increase.

As in the case of males, the proportion of females under 15 years fell between 1901 and 1947, but the elimination of this whole group only reduced the divergence referred to, without bringing the relative number of widows in 1947 below the 1901 level. It is necessary, therefore, to examine the effect of changes in the composition of the female population in the next few older age groups, in which the incidence of widowhood is still low. It will be found that the proportions which females in each of these age groups bear to all females also fell between 1901 and 1947, but that before the 1947 proportion of widows is lowered below that of 1901 it is necessary to exclude all age groups under 30 years. The elimination of these ages gives a proportion of 1,575 widows in every 10,000 females in 1947 compared with a corresponding figure of 1701 in 1901.

The effect of the Wars of 1939-45 and 1914-18 is shown in the increase in the proportion of widows at the ages 20-29 between 1933 and 1947 and at the ages 15-39 between 1911 and 1921 respectively. With the exceptions of these special instances arising out of wars, and some others in 1933 at the extremely old ages, the figures show decreases in the proportion of widows in all age groups from census to census, which are largely a consequence of improved mortality rates.

(a) Exclusive of South Australia.

Prior to 1911 no record was made of divorced persons in South Australia, so comparisons cannot be carried back beyond that date. At the successive Censuses from 1911 onward divorced males represented 1.5 per 1,000, 2.3 per 1,000, 4.2 per 1,000 and 8.9 per 1,000 respectively of all males aged 15 and over. The greatest proportion of divorced males in 1947 was between the ages 40 and 45, when it reached 14.3 per 1,000, but previously had been at a slightly

older age, falling generally within the broad age group 40 to 54.

(ii) Females.—The following table shows the numbers and proportions of divorced females in quinquennial age groups at each Census from 1901. The results are substantially the same as those already given for males. The maximum proportion of divorced females at each Census occurred mainly in age group 40–44, reaching 16.0 per 1,000 females of the same ages in 1947.

(a) Exclusive of South Australia.

For reproduction the important group in the preceding tables is the group of married females aged 15-44. During the period 1891 to 1947 the number in this group increased from 344,313, represent-

ing 10.83 per cent. of the total population, to 1,070,821, or 14.13 per cent. of the total. These changes are important from the viewpoint of their effect on the birth rate.

METROPOLITAN AND EXTRA-METROPOLITAN AREAS IN RELATION TO AGE.

15. Conjugal Condition of Males and Females in Quinquennial Age Groups.—The following tables present particulars of the conjugal condition and age of males and females in the metro-

politan and extra-metropolitan areas of Australia. The metropolitan area comprises the six capital cities and their suburbs.

15 years and over	3,505	6,036	393	66	10,000	2,482	6,511	952	55	10,000		

The highest proportions of married males and females occurred in age groups 40–49 and 30–39 respectively for both metropolitan and extra-metropolitan areas. Amongst males aged 20 years and over the proportion "never married" was considerably higher in all age groups in the extra-metropolitan than in the metropolitan population. Amongst females the reverse was the case so far as the results for separate age groups from 15–19 onwards are concerned, though a difference, which is corrected by excluding ages under 15 as in other instances previously referred to, appears again between the results for the separate age groups and for the aggregate.

Conversely, the proportions of married males were in all age groups (except 15–19) higher, and the proportions of married females were in all age groups lower, in the metropolitan than in the extra-metropolitan areas. In almost all age groups the proportions of widowed and divorced males and females were higher in the metropolitan areas.

The table above and corresponding results in the Reports on previous Censuses throw further light on the trends in nuptiality discussed for Australia as a whole in Section 9. Including widowed and divorced in the term "married" for the purpose of the following comparisons with that Section, it will be seen that while only slight changes occurred between 1921 and 1933, the proportions married in both metropolitan and extra-metropolitan areas rose to very high levels by 1947. If abnormally high experiences for females in some older age groups in 1891 and the early years of the present century are disregarded, the proportions married in 1947 were the highest recorded at an Australian Census for Australia as a whole and for both the metropolitan A comparison and extra-metropolitan areas.

between metropolitan and extra-metropolitan results, however, shows important contrasting features at each Census. Almost without exception, the proportions of males married in each age group have been higher in metropolitan than extra-metropolitan areas, but for females the extra-metropolitan proportions have been the higher. Also, at each Census, there were proportionately more females than males married in metropolitan areas below age 35 but fewer from age 35 onwards. In the extra-metropolitan population, on the other hand, the proportions married in all age groups were greater for females than for males.

The more favorable female nuptiality experience compared with that of males for age groups under 35 years may be due mainly to the differences in ages at which men and women marry. The remaining results, indicating that the highest proportions married are those for men in metropolitan areas and for women elsewhere, reflect largely the greater migration of women than men from the country to the city, which is discussed in connexion with masculinity of the population in Chapter X., "Age". The effect of these movements by increasing the numbers of single women in metropolitan areas at the expense of extra-metropolitan areas has been to increase the proportions of females married in the latter and to decrease them in the former localities, and at the same time by lowering the ratio of single men to single women at the marriageable ages in metropolitan areas and raising it in extra-metropolitan areas, to provide greater opportunities for marriage for men than for women in the former areas, but the reverse in extra-metropolitan areas. The proportion of males married in metropolitan areas in the age group 45–54 years, representing approximately their completed nuptiality experience, reached 88.30 per cent. in 1947, while the corresponding proportion for extra-metropolitan females was 89.91 per cent. An even greater percentage of 90.10 was recorded at ages 35–44 for females in extrametropolitan areas. As already mentioned, "married" here includes widowed and divorced.

16. Conjugal Condition and Average Age of Persons Aged 15 years and over.—The following table shows the average age in each conjugal condition for males and females in metropolitan and extra-metropolitan areas of each State. The results are only approximate, because they have been computed from quinquennial age groups.

CONJUGAL CONDITION AND AVERAGE AGE (IN YEARS) OF MALES AND FEMALES AGED 15 YEARS AND OVER IN METROPOLITAN AND EXTRA-METROPOLITAN AREAS, 30th JUNE, 1947.

For Australia as a whole and for each State the average age of males who had never married was lower, and that of the "never married" females higher, in the metropolitan than in the extrametropolitan areas. A similar distinction was noted

in the case of married persons for Australia, but not for all States. The difference between the average ages of married males and married females is less in all metropolitan areas than in the extra-metropolitan areas.

CHAPTER XII.

DEPENDENT CHILDREN.

SIGNIFICANCE AND SCOPE OF INQUIRY.

1. Form of Inquiry.—At the 1947 Census, persons were asked to state the number of children under sixteen years of age (including step-children and adopted children) who were dependent upon them, and who were residing in Australia (whether in the same dwelling as the person or not), at the time of the Census. Instructions were given that where the parents were together only one parent, who would be the father unless the circumstances were exceptional, should give the particulars, and that where the parents were separated at the time of the Census, whether temporarily or permanently, the parent financially responsible for the maintenance of the children should give the particulars. It was also specified that children boarded-out to persons other than parents were not to be regarded as dependent on the persons with whom they were boarded out, and furthermore that children earning £1 or more per week were not to be counted as dependent children. Children in institutions did not come within the scope of the inquiry.

The foregoing instructions were similar to those applying at the 1933 Census, except that the amount of earnings which excluded a child from the dependency class was fixed in 1933 at ten shillings or more per week. However, the numbers so excluded at either Census would have been comparatively small and it is considered that, taking into account also the differing economic conditions at the time of the two Censuses, the results can be regarded as comparable.

The question relating to dependent children at the 1921 Census referred to children aged under fourteen years *dependent on the householder*, so that no direct comparison may be made between that Census and the two later Censuses, Because of the nature of the question asked at the Census the tabulations made related to the category of the person with dependent children and not that of the dependent children themselves, it being impossible from the information collected to classify all dependent children according to their own sex, age, place of residence, &c.

In Part XI. of the Detailed Tables of the Census persons are classified according to the number of their dependent children in conjunction with their sex, place of enumeration, age, occupation, and occupational status. A further classification of such persons in conjunction with their conjugal condition is given in Part X.

2. Adequacy of the Data.—The question concerning dependent children differs from most other questions asked at the Census, in that it is impossible to ascertain the number of persons who omitted, incorrectly, a reply to the question. The coding instruction was that, where no reply was given, code 00 (no children) was to be inscribed, unless it was evident from data given on the schedule that there were children dependent upon a certain person whose name appeared and who gave "no reply", in which case such children (appearing on the schedule) were coded to that person.

It was not possible to determine the number of dependent children who were absent on the night of the Census and who were not claimed by their parent or guardian.

By reason of the foregoing, it can be seen that the persons who gave "no reply" and those who had no dependent children are not available separately.

COMPARISON WITH PREVIOUS CENSUS.

3. Comparative Summary, Censuses of concerning dependent children at the 1933 and 1947.—The results of the inquiry Censuses are summarized in the following table:—

PERSONS WITH DEPENDENT CHILDREN UNDER SIXTEEN YEARS OF AGE, AUSTRALIA: NUMBERS AND PERCENTAGE DISTRIBUTION ACCORDING TO NUMBER OF DEPENDENT CHILDREN, CENSUSES, 1933 AND 1947.

At the 1947 Census 993,871 persons, comprising 927,453 males and 66,418 females, stated that they had children under sixteen years of age dependent on them at the time of the Census. The total number of such dependent children was 1,962,791, of whom 1,853,314 or 94.4 per cent. were dependent on males and 109,477, or 5.6 per cent., were dependent on females. For each person with dependent children these figures represent an average of 2.00 for males, 1.65 for females, and 1.97 for both sexes combined.

Compared with 1933, persons with dependent children increased by 127,759, or 14.75 per cent., but the number of children under sixteen years dependent on such persons increased by only 42,932, or 2.24 per cent. Thus the average number of children dependent on each person fell from 2.22 in 1933 to 1.97 in 1947. This decline was common to both males and females having dependent children.

It may be noted that although both persons with dependent children and the children supported

showed an increase in number between 1933 and 1947, they represented actually a slightly smaller proportion of the total population of relevant age in 1947 than in 1933. Thus, of the total population aged sixteen years or over persons with dependent children comprised 17.84 per cent. in 1947, compared with 18.47 per cent. in 1933, while the number of dependent children per cent. of all children under sixteen years of age fell slightly from 98.88 in 1933 to 97.73 in 1947.

Persons with one, two or three dependent children represented 89.8 per cent. of the total number of persons with dependent children under sixteen years in Australia at 30th June, 1947, and the children dependent on such persons represented 75.7 per cent. of the total number of dependent children stated to be maintained by persons in Australia.

The number of children dependent on persons with one, two or three dependent children increased by 234,521, but this increase was largely offset by decreases in the number of children dependent on persons with four or more dependent children.

Although the movement of the birth-rate and oversea migration in periods preceding the respective Censuses can be expected to account largely for the differences between the results for dependency in 1933 and 1947, it is difficult to draw satisfactory conclusions from the changes recorded as allowance must be made for the effect of children reaching their sixteenth birthday between the dates of the two Censuses. To a great extent, however, direct com-

parisons can be made by a consideration of the ages of persons in relation to the number of children dependent on them, and an examination of the results on this basis will be found in Section 6 following. When using the Census results, it should be remembered also that as they exclude children sixteen years of age or more, they do not in themselves indicate the size of families, which is considered in Chapter XXII.—Families.

GENERAL VIEW OF JUVENILE DEPENDENCY.

4. Conjugal Condition in Relation to Dependent Children.—The following table shows the distribution of males and females with dependent children, according to their conjugal condition and number of dependent children. The

results include 319 males and 253 females who did not specify their conjugal condition and who have been distributed proportionately over the various conjugal states:—

 $\begin{tabular}{ll} (a) & Includes persons permanently separated (legally or otherwise). \end{tabular}$

Being in the great majority of cases the breadwinner of the family, the married male forms by far the most important class from the viewpoint of dependency. At the 1947 Census, married men with children dependent on them comprised 91.49 per cent. of the total and were responsible for the support of 92.82 per cent. of all dependent children. Next in order of numerical importance came married women and widows, who, however, represented only 2.98 and 2.70 per cent. respectively of all persons with dependent children, while persons in the remaining conjugal groups amounted, in all, to only 2.83 per cent. of the total.

The number of married men with dependent children in 1947 was equivalent to 51.69 per cent. of the total married men. The next highest

proportion of dependency was recorded in the divorced group, in which those persons having dependent children represented 19.34 per cent. of the total divorced population in the case of males and 21.54 per cent. in the case of females. Of the remainder with dependent children, widowers and widows, who comprised 9.20 and 8.62 per cent. of the total male and female widowed populations respectively, were the most important. The corresponding percentages in 1933 for the five principal groups mentioned were: married males, 59.79 per cent.; divorced males, 18.03; divorced females, 27.01; widowers, 17.75; and widows, 15.73. It will be seen that in comparison with the results in 1933 the proportion of persons with dependent children in the population showed decreases for each of the principal conjugal groups, other than divorced males, who represented a slightly higher proportion in 1947 than in 1933. Of other persons who had dependent children, married females may be mentioned as

showing an increase from 1.28 per cent. of total married females in 1933 to 1.68 in 1947.

Irrespective of their marital status, persons with dependent children decreased rapidly in numbers with each increase in the number of children supported, but the percentage of persons having specified numbers of dependent children varied considerably according to conjugal condition. Thus, while married males with one dependent child formed only 43.02 per cent. of the total married males with dependent children, the corresponding proportions for other persons with one dependent child varied from 55.94 per cent. for widowers to 83.95 for "never married" females.

The number of persons with dependent children in each State followed the order of total population of the respective States, but their distribution expressed as a percentage of those populations, after deduction of dependent children, was greatly different. Tasmania and Western Australia, with rates respectively of 19.47 and 18.96 per cent. of population excluding dependent children, showed the highest proportions of persons with dependent children, while the lowest proportion (16.79 per cent.) was recorded in Victoria. The corresponding percentage for Australia as a whole was 17.70.

It may be noticed that the average number of dependent children per person with dependent children varies considerably between the several States—from a minimum of 1.90 in South Australia up to a maximum of 2.14 in Tasmania. There is

also what appears to be a significant difference between the averages for tropical and non-tropical regions, the tropical figure being 2.12 compared with the non-tropical figure of 1.97. The high average for Tasmania may be attributed to the comparatively high percentages of families in that State which include five or more dependent children. The percentages for Tasmania of persons with dependent children who have 5, 6, 7, 8, 9, or 10 and over dependent children are 3.48, 1.82, 0.79, 0.35, 0.17, and 0.05 respectively, compared with corresponding percentages for South Australia, the State having the lowest percentages for the groups considered, of 1.93, 0.83, 0.27, 0.12, 0.05, and 0.01.

The following table shows the distribution in urban and rural divisions of persons with dependent children:—

PERSONS WITH DEPENDENT CHILDREN UNDER SIXTEEN YEARS OF AGE IN URBAN AND RURAL DIVISIONS: NUMBERS AND PERCENTAGE DISTRIBUTION ACCORDING TO NUMBER OF DEPENDENT CHILDREN, 30th JUNE, 1947.

⁽a) Persons on board ships, railway trains and aircraft.

(b) Ratio of Divisional to Total average.

The number of persons supporting children is much larger relatively to total population in rural parts than in the metropolitan areas. Thus, persons with dependent children represented 20.31 per cent. of population, less dependent children, in the rural division, but only 16.04 per cent. in the metropolitan division.

It is noticeable also that there is a marked tendency for persons in rural areas to have a larger number of dependent children than the average for the whole State, and for persons in the metropolitan areas to have a smaller number. This is shown strikingly by comparison between the percentages of persons with dependent children in the two divisions who have four or more children. The percentages of persons with four or five dependent children were 8.33 and 3.76 respectively in the rural areas, compared with 4.21 and 1.45 respectively in the metropolitan areas. For the persons with 6, 7, 8, 9 and 10 and over dependent children, the percentages for rural

divisions were 1.78, 0.73, 0.32, 0.14 and 0.04 respectively, while those for metropolitan areas were much less—0.55, 0.19, 0.07, 0.03 and 0.01.

6. Age Groups of Persons Supporting Dependent Children.—The next table shows the

persons with dependent children classified according to age groups. For the purpose of this table persons whose ages were not stated, numbering 6,998, and the children dependent upon them, numbering 12,689, have been distributed proportionately over the various age-groups.

(a) Ratio of average for specified age-group to Total average.

The 35-39 age group is the modal group for persons with dependent children, both as regards their own number and the number of children supported. This group also has the highest average number of dependent children per person with dependent children, 2.28. It should be remembered that dependent children considered here are aged less than sixteen years, and that the modal age group for all persons with children of all ages would be higher than the 35–39 age group.

Compared with 1933, the number of persons with dependent children showed substantial increases, totalling 165,403 in age groups below the age of 45 years, but decreases to the total of 37,644 occurred in the numbers for the remaining or older age-groups. The increases at ages below 45 years were confined, practically without exception, to persons having less than four dependent children, the gain

in numbers by those with one, two and three dependent children being 93,621, 71,059 and 16,971 respectively. Of the various groups, persons aged 25-29 years with one dependent child were affected to the greatest extent, contributing 29,227 to the total increase of 165,403 below the age of 45 years. The total number of persons with dependent children in each age-group from 45 years upwards showed decreases, although between the ages of 45 and 60 years increases occurred in the one dependent child class. It will be seen, therefore, that persons under the age of 45 years who had one, two or three dependent children were mainly responsible for the total increase of 127,759 recorded for all ages between 1933 and 1947. In this group, only a comparatively small proportion of families would have been affected by exclusions due to children turning the age of sixteen years, and a comparison between the results at the two Censuses, taken in conjunction with the number of births, and of oversea migration in successive periods terminating at the respective Censuses, can be made. This comparison suggests that the series of high birth rates which marked the 1939-45 war and post-war periods was the principal factor in raising the number of persons with dependent children.

The general decrease between 1933 and 1947 in the number of larger-sized families with dependent children is reflected in the reduced average number of dependent children recorded per person with dependent children. This average was lower in 1947 than 1933, not only for all ages combined, but also, other than ages 15 to 19 years, for each age group individually.

Considered in relation to total population, in which the proportion of persons in the older age groups had increased between 1933 and 1947,

increases in the number of persons with dependent children were restricted to those groups below the age of 40 years. The number of persons aged 15 to 39 years with dependent children in 1947 represented 19.43 per cent. of the total population of the same ages, excluding dependent children, compared with a corresponding percentage of 15.75 in 1933. In 1933 21.61 per cent. of the total population aged 40 years or more claimed dependent children, but this proportion had fallen to 15.85 per cent. by 1947.

7. Economic Status of Persons Supporting Dependent Children.—Under this heading come the occupational status and occupation of persons with dependent children. The next table deals with occupational status, persons who did not state their occupational status having been distributed proportionately over the various groups comprising the work force:—

⁽a) Includes persons who were (1) unable to secure employment, (2) temporarily laid off from their jobs, and (3) not actively seeking work at the time of the Census on account of sickness or accident, industrial dispute, resting between jobs, or for any other reason.

(b) Ratio of average for specified occupational status group to Total average.

Persons with dependent children in the "selfemployed" and "employer" groups in 1947 had an appreciably higher average number of dependent children (2.19 and 2.03 respectively) than those in the "employee group" (1.93). In the next table persons supporting children in 1947 are shown according to their main occupational groupings:—

PERSONS WITH DEPENDENT CHILDREN UNDER SIXTEEN YEARS OF AGE CLASSIFIED ACCORDING TO OCCUPATION, AUSTRALIA: NUMBERS AND PERCENTAGE DISTRIBUTION, 30th JUNE, 1947.

(a) Ratio of average for specified occupation order to Total average.

Numerically, operatives were the most important class, forming 20.85 per cent. of all persons with dependent children and having 21.04 per cent. of the total dependent children. The average number of dependent children per operative was 1.99, which while above the average of 1.97 for all persons having dependent children was nevertheless well below averages of 2.29 dependent children per person engaged in rural, fishing and hunting occupations, in which the number of dependent children was greatest proportionately, and of 2.21 for labourers, who showed the next highest average number of dependent children.

An interesting feature is that operatives in 1947 formed a consistent proportion of 20 to 21 per cent. of all persons with dependent children

irrespective of the number of children supported, while with only slight exceptions, workers following rural, fishing and hunting occupations, together with labourers, showed a progressive increase in their proportion of total persons with corresponding numbers of dependent children as their number of dependent children increased, the range from those with one dependent child to those with ten or more dependent children being from 12.88 per cent. to 38.32 per cent. and from 4.52 to 9.35 per cent. for the respective groups. The proportions in indefinite or not stated occupations also tended upwards with the number of children, but with some exceptions, the most important being persons in professional or semi-professional and administrative occupations and craftsmen who had a second dependent child,

Other gainfully-occupied groups formed a decreasing proportion of the total with each increase in the

number of children supported.

The lowest average number of dependent children per person, 1.78, was recorded in commercial and clerical occupations, while domestic and protective service (1.85), professional and semi-professional (1.89), craftsmen (1.90) and administrative occupations (1.91) were other gainfully-occupied groups in which the average number of dependent children, indicated in parentheses, was below the average for all occupations combined.

The proportional distribution of dependent children within each occupation group is not affected by the relative numbers in the respective occupation groups. A comparison of these results, which may be derived from the table above, may, therefore, be of interest. Excluding persons not gainfully occupied, in which the results are influenced to some

extent by the presence of pensioners and others in the older age-groups, the proportion with one dependent child only was highest in the domestic and protective service group (49.63 per cent.) and lowest in rural, fishing and hunting occupations (35.66 per cent.), and with two dependent children, highest in the professional and semi-professional group (34.48) and lowest in the group of indefinite or not stated occupations (27.82). For each number of dependent children over two, the greatest proportions were recorded in either the rural, hunting and fishing group or in labourers, while the lowest percentages were those recorded in the professional and semi-professional group and in commercial and clerical occupations. In the first two groups just mentioned, 3.50 and 3.69 per cent. respectively had large families of six or more dependent children, compared with only 0.57 and 0.72 per cent. for the last two mentioned classes.

CHAPTER XIII.

BIRTHPLACE.

GENERAL SIGNIFICANCE OF BIRTHPLACE STATISTICS.

1. The Utility of Birthplace Statistics.— Geographic origin of the population forms an important phase in the analysis of the composition of the population. The culture which develops in a comparatively new country like Australia will tend to be increasingly characterized by its own peculiar features, and these will tend to be more firmly established, the greater the proportion of native-born Australians in the population as a whole. expectation is derived from the simple fact that environment exercises its influence most strongly, though not exclusively, in the early formative years of life. On the other hand, those elements of the population which are recruited from other countries bring with them a variety of cultural influences. It is important to know, therefore, what proportion of the total population was born outside Australia and the countries of birth of these immigrants. The significance of birthplace statistics relates chiefly to the complex of factors which make up a country's cultural outlook and is not identical with the significance to be attached to statistics of nationality or political allegiance or to statistics of "racial" or ethnic origin.

2. Form of Inquiry and Tabulation of the Data.—The question concerning birthplace asked at the 1947 Census was as follows:—"For persons born in Australia write the name of the State or Territory in which born. For persons born outside Australia write the name of the country where born (not town or other locality)." Questions concerning birthplace of father and mother which were

placed on the 1921 Census form were omitted on the occasions of the 1933 and 1947 Censuses.

Detailed tables compiled from the replies received to this question in conjunction with other appropriate data furnished at the Census appear in the Detailed Tables of the Census, Part XII. "Birthplace", pp. 635–754. These tables show particulars of individual countries of birth, grouped under the respective continents, in accordance with a detailed classification corresponding generally to those adopted at previous Censuses. Particulars relating to the principal birthplaces of the population of each local government area are given in the Detailed Tables of the Census, Parts I. to VI., pp. 1–464, and of the population of each Territory in the Detailed Tables of the Census, Part VII., "Territories", pp. 465–492.

3. Completeness of Birthplace Data.—The number of persons who omitted to state their birthplace at the 1947 Census was relatively small compared with the experience of previous Censuses. In such cases as occurred the procedure was adopted of assigning a birthplace, at the coding stage, on the basis of other information available on the Householder's Schedule or Personal Slip. For the purposes of this Report persons whose birthplace appears as "Australia undefined" in the Detailed Tables of the Census, Part XII., have been distributed proportionately over the States and Territories. In all cases the figures shown are exclusive of full-blood aboriginals, but from 1891 onwards include half-caste aboriginals.

AUSTRALIAN-BORN AND OVERSEA-BORN POPULATION OF AUSTRALIA.

4. General View of Position in 1947.—In dealing with birthplaces the main distinction to be drawn is between native-born population and persons born outside Australia. In this Section the main characteristics of the population are summarized in relation to these two divisions of birth-

places. A more detailed analysis will be found in succeeding Sections, wherein particulars are given of Australian-born population according to State or Territory of birth and of oversea-born population according to continents and principal individual countries of birth.

The following table furnishes a summary of the numbers, percentage distribution and masculinity of the native-born and oversea-born population enumerated in each State and Territory at the 1947 Census:—

AUSTRALIAN-BORN AND OVERSEA-BORN POPULATION: NUMBERS, PERCENTAGE DISTRIBUTION AND MASCULINITY, 30th JUNE, 1947.

New South Wales had the largest number of persons, whether born in Australia or overseas. Although ranking only fifth in order of total population, Western Australia had the fourth largest number of oversea-born persons. In all States males

exceeded females in number among immigrants, the masculinity, or number of males per 100 females, of the immigrant population reaching 141.21 in Western Australia, with a still higher ratio in the Territories.

Of the total population of Australia, only 9.82 per cent. had been born elsewhere than in Australia, the corresponding percentage for males being 10.98 and for females 8.65. Dealing with the proportional distribution within the various States and Territories, it will be noticed that Tasmania had the highest, and South Australia the next highest, proportion of persons of Australian birth. The proportions of foreign-born in New South Wales, Victoria and Queensland did not differ very greatly from each

other nor from the Australian average, but in Western Australia the percentage of those born outside Australia was 18.20, or almost double the average for Australia.

5. Comparison of the Birthplaces of the Population, Censuses, 1881 to 1947.—A comparison of the birthplaces of the population of Australia at the date of each Census from 1881 to 1947 furnishes the following results:—

(a) Number of males per 100 females.

As will be seen from the preceding table, the number of persons in Australia of Australian birth increased between 1881 and 1947 by 5,412,446 persons, and in proportion from 63.23 per cent. to 90.18 per cent. of the total population.

Largely as a result of the record high immigration of the preceding decade, the number of persons in Australia of oversea-birth was greatest at the Census of 1891, when a total of 1,008,189 persons born outside Australia, representing 31.73 per cent. of the total population, was recorded. Since 1891 the main increments to the population by migration occurred during the periods 1909-13 and 1920-29, and were reflected in the increased number of oversea-born persons recorded at the Censuses of 1921 and 1933 respectively. However, the stream of migration after 1891 was seriously interrupted by the two World Wars and two major economic depressions. As a result the number of persons in the population who were born elsewhere than in Australia had fallen by 1947 to 744,187 persons, or 9.82 per cent. of the total population, and as will be seen in Section 17, of this total 60.71 per cent. had been resident in Australia from 20 to 39 years, corresponding approximately to the last two periods of migration referred to above.

- 6. Birthplaces and Locality.—In connexion with the birthplaces of the population, a matter of some importance is the relative tendency of persons born in different countries to live in the capital cities. It is also of interest to know the number from each birthplace in the urban provincial and rural areas, and for this reason the Census data are customarily tabulated in three divisions of the State, namely:—Urban Metropolitan, Urban Provincial, and Rural. The migratory population, chiefly persons on ships or railway trains, is treated as a separate item. Reference is made to these divisions in this chapter.
- (i) Urban and Rural.—After eliminating the migratory population, the proportional distribution of the population according to birthplace in urban and rural divisions of Australia was as follows:—

AUSTRALIAN-BORN AND OVERSEA-BORN POPULATION: PROPORTIONS PER CENT. IN URBAN AND RURAL DIVISIONS, 30th JUNE, 1947.

				_	Urb	an.				D1	
Birthpla	Birthplace.			Metropolitan.			Provincial.			Rural.	
			Males.	Females.	Persons.	Males.	Females.	Persons.	Males.	Females.	Persons.
Australia Outside Australia		••	47.67 59.27	51.60 65.01	49.66 61.82	18.32 13.73	18.70 13.16	18.51 13.48	34.01 27.00	29.70 21.83	$31.83 \\ 24.70$
\mathbf{Total}			48.92	52.76	50.84	17.82	18.22	18.02	33.26	29.02	31.14

From the foregoing comparison it will be seen that the proportion per cent. of persons of Australian birth in both the urban provincial and the rural divisions of Australia was substantially higher than the proportion per cent. of oversea-born. The omission from this table of the migratory population accounts for the slightly different percentages given in the next table.

(ii) Metropolitan.—The numbers in the metropolitan areas of the States, divided into Australian-born and oversea-born elements, together with

the proportions which these numbers represent of the total population for each group in the respective States, are shown in the following table:—

AUSTRALIAN-BORN AND OVERSEA-BORN POPULATION IN METROPOLITAN DIVISIONS: NUMBERS AND PROPORTIONS, 30th JUNE, 1947.

Total			49.72	59.69	36.34	59.20	54.24	29.77	50.72

A comparison of the birthplaces of the metropolitan population in the foregoing table shows that Sydney had the greatest number both of native-born and oversea-born persons, while Melbourne ranked second. Brisbane occupied third place with persons born in Australia but was closely followed by Adelaide, in which the number of Australian-born females actually exceeded that in Brisbane. After Sydney and Melbourne, Perth and Brisbane in that

order had the greatest number of persons born outside Australia.

The latter portion of the table shows that 49.61 per cent. of persons born in Australia were recorded in the metropolitan areas compared with 60.92 per cent. of persons born outside Australia. This relationship held good for the two sexes in all States and Australia, except for males in Western Australia, although the differences in the percentages for the

two birthplaces varied considerably. The proportion of State population recorded in the metropolitan area was highest in Victoria in the case of Australian-born and in South Australia in the case of the oversea-born element. It is interesting to observe that, as shown in a table in Section 11, about 49 per cent. of the Australian-born population remaining

in the State of birth, and about 55 per cent. of those who had migrated to other States, were recorded in the capital cities.

7. Birthplace and Age.—Birthplaces in the two main divisions in conjunction with quinquennial age groups are shown for males, females and persons in the following table:—

AUSTRALIAN-BORN AND OVERSEA-BORN POPULATION OF AUSTRALIA ACCORDING TO AGE, 30th JUNE, 1947.

(a) Number of males per 100 females,

The foregoing table shows a marked difference in the age structure of the Australian-born population in comparison with that of the oversea-born. For the former, for example, the highest proportion of population is to be found in the group aged less than 5 years, while in the case of the oversea-born the age group 40-44 years has the greatest percentage of population. Considering also the percentages of Australian-born and oversea-born in each age group, it will be seen that there is a decline, with increasing age, in the proportions of persons born in Australia and an increase in the proportions represented by persons born elsewhere. Thus, of the children under 5 years of age, the Australian-born represented 99.59 per cent. and the oversea-born only 0.41 per cent., whereas, of the persons aged 75 years and over, 72.15 per cent. only were born in Australia and 27.85 per cent. were immigrants. In 1933 only 50.33 per cent. of the persons aged 75 years and over were born in Australia, whilst 49.67 per cent. were born overseas. For all age groups under the

age of 70 years at the 30th June, 1947, more than 75 per cent. of the population were Australian-born.

While the oversea-born population showed an excess of males in all age groups, Australian-born males exceeded Australian-born females only at ages below 20 years and in the age group 40–44 years. The comparatively low masculinity of the Australian-born at the intermediate ages from 20 to 39 years may be traced to the loss of male lives during the 1939–45 War, while at the older ages, losses during the 1914–18 War and, in the highest age groups, superior female longevity were responsible for the excess of females shown.

The distribution per cent. of persons born in certain birthplaces according to urban and rural divisions of Australia is given in the following table. Ages have been grouped into periods of 20 years, and birthplaces into Australian, European and other birthplaces. The migratory population has been omitted.

A comparison of the birthplaces in the previous table discloses that the proportion per cent. of persons of Australian birth to be found in the metropolitan divisions of Australia was lower in each age group than the corresponding proportion

of European birth which in turn was lower than that of the "other birthplaces" group, and that the proportions per cent. in both the urban provincial and rural divisions followed the reverse order.

THE AUSTRALIAN-BORN POPULATION.

8. General.—At the Census of 1933 persons born in Australia represented 86.38 per cent. of the total population, and at the Census of 1947, 90.18 per cent. The percentages of Australian-born in each State and Territory in 1947 were—New South Wales, 89.84; Victoria, 91.31; Queensland, 89.68; South Australia, 93.26; Western Australia, 81.80; Tasmania, 96.23; Northern Territory, 87.43; and Australian Capital Territory, 88.38. These propor-

tions are higher than the corresponding figures for 1933.

Particulars relating to the native-born populalation of each State and Territory appear in the following table. From this table it will be seen that persons born in New South Wales and Victoria together comprised 66.44 per cent. of the Australianborn population in 1947 as against 67.54 in 1933 and 68.01 per cent. in 1921.

Total, 1881	-1947	2,666,144	373.32	2,746,302	387.60	5,412,446	380.43	2.40

The greater increase of females than of males during the decennium 1891-1901 was due to the financial crises and resultant lack of employment at the beginning, and the South African war towards the end of the period. Each of these causes was responsible for the exodus from Australia of some of the Australian-born males. During the decade 1901-11 the increase of males was greater than of females, but, during the period 1911-21, war again interrupted the increase of males, so that at the Census of 1921 there was for the first time an

excess of females in the Australian-born population. Between 1921 and 1933 there was a slightly greater increase of males than of females, but in 1933 the female Australian-born population was still greater than the male. The loss of male lives during the 1939–45 War was responsible for further reducing the number of males in proportion to the number of females as recorded at the 1947 Census.

The following table furnishes a comparison of the numbers born in each State who were enumerated in Australia at each Census from 1911 to 1947:—

AUSTRALIAN-BORN POPULATION OF AUSTRALIA ACCORDING TO STATE OF BIRTH: NUMBERS AND PROPORTIONS, CENSUSES, 1911 TO 1947.

Continuing the trend from earlier years, the number of persons born in New South Wales, Queensland and Western Australia represented an increasing proportion, and the number born in Victoria, South Australia and Tasmania a decreasing proportion of the total Australian-born population in each period between 1911 and 1947. Relatively to the total population of Australia the native-born showed an increase in each State until 1911, but a decrease since then for Victoria, South Australia and Tasmania.

10. Interstate Migration of Australianborn Population.—The Census results of 1947 indicate that at the date of the Census a large proportion of the Australian-born population was recorded in States of Australia other than the State of birth. The tendency to rove is supposed to have been inherited by Australians from their immigrant forefathers, and while this may be the case, it is evident from the figures that the movement has been largely due to the discovery of gold, notably in Western Australia, greater opportunity particularly in the acquisition of land, and other economic causes.

The following table gives the numbers who were born in each State or Territory, and were enumerated in one or other of the States or Territories of Australia in 1947:—

AUSTRALIAN-BORN POPULATION ACCORDING TO STATE OR TERRITORY OF BIRTH AND OF ENUMERATION, 30th JUNE, 1947.

			Sta	te or Territory	of Enumerati	on.

The proportion per cent. of the population born in each State and Territory, who were enumerated in the State or Territory of birth or other States and Territories of Australia, is dealt with in the next table:—

AUSTRALIAN-BORN POPULATION ACCORDING TO BIRTHPLACE: PERCENTAGE DISTRIBUTION IN EACH STATE OR TERRITORY OF ENUMERATION, 30th JUNE, 1947.

			Sta	ate or Territor	y of Enumerati	lo n .			
Birthplace.	New South Wales.	Victoria.	Queensland.	South Australia.	Western Australia.	Tasmania.	Northern Territory.	Australian Capital Territory.	Total.
New South Wales	92.78	2.61	2.88	0.75	0.50	0.16	0.06	0.31	100.00
Victoria	6.16	88.90	1.17	$\overset{\circ}{1}.25$	1.76	0.58	0.07	0.11	100.00
Queensland	7.05	1.43	90.55	0.30	0.37	0.11	0.14	0.05	100.00
South Australia	4.47	5.31	0.80	85.81	2.98	0.25	0.32	0.06	100.00
Western Australia	3.36	4.34	0.65	1.82	89.35	0.21	0.20	0.07	100.00
Tasmania	5.77	13.47	1.05	0.75	0.65	78.16	0.06	0.09	100.00
Northern Territory Australian Capital	13.60	5.53	11.73	10.18	3.92	0.27	52.77	2.00	100.00
Territory	26.73	5.42	1.21	0.49	0.37	0.31	0.10	65.37	100.00
Australia	39.23	27.45	14.52	8.81	6.01	3.62	0.14	0.22	100.00

Comparing the proportions of the Australian-born in the States of birth, it will be seen that New South Wales retained the highest percentage, and Tasmania the lowest percentage of the population born within their boundaries. The order of the

States in 1947 was the same as the order at the Census of 1933.

The proportion of the Australian-born population of each State and Territory according to the State or Territory of birth is shown in the following table:—

AUSTRALIAN-BORN POPULATION IN EACH STATE OR TERRITORY OF ENUMERATION: PERCENTAGE DISTRIBUTION ACCORDING TO BIRTHPLACE, 30th JUNE, 1947.

			Sta	te or Territory	of Enumerati	on.			
Birthplace.	New South Wales.	Victoria.	Queensland.	South Australia.	Western Australia.	Tasmania,	Northern Territory.	Australian Capital Territory.	Total.

Territory	0.05	0.01	0.01	0.00	0.00	0.01	0.05	21.32	0.07
Australia	100.00	100.00	100.00	100.00	100.00	100.00	100.00	100.00	100.00

This table and the next one indicate the extent and direction of the inflow to any State of the population born in other States. The figures in these and related tables are based solely on Census results and indicate the net migration between States in relation only to the population existing at the time of the Census. As no account has been taken of deaths, nor of other events such as return movements to States of birth, which may have intervened between the time of migration and the Census, the results do not show the total volume of migration of Australian-born that has taken place from or to

any one State during the whole course of its history. Excluding the Territories, the inflow of population born in other States was proportionately greatest in Western Australia, where of the Australian-born population only 82.61 per cent. were born in that State, and proportionately least in Tasmania, where 92.33 per cent. were of local birth. With the exception that South Australia overtook New South Wales in the proportion of their respective populations born in other States, the relative positions of the States in this respect were unchanged from the Census of 1933.

The next table presents an interesting view of the net gains and losses of population experienced

by the different States and Territories, owing to the internal migration of the Australian-born:—

AUSTRALIAN-BORN POPULATION: NET INTERSTATE MIGRATION, 30th JUNE, 1947.

~					S	tate o	r Territory	whic	h has expe	ience	ed Net Gain	(+)	or Loss (-).			
State from or to which I Gain or Loss of Native-b Population had arisen	orn		ew South Wales.		Victoria.	Qu	eensland.		South ustralia.		Western ustralia.	T	asmania.		orthern erritory.		ustralian Capital erritory.

ritory	• •	-	6,851	-	1,841		417	-	376	-	24 8		251		83		• •
Australia	••,	+	55,844	_	40,127	+	17,089		34,182	+	31,031	_	44,833	+	5,111	+	10,067

The States with net gains from the interstate migration of Australian-born were in order of number—New South Wales, 55,844 persons; Western Australia, 31,031 persons; and Queensland, 17,089 persons; while the States with net losses were —Tasmania, 44,833 persons; Victoria, 40,127 persons; and South Australia, 34,182 persons.

Western Australia gained from every other State, and Tasmania lost to every other State. The largest net gains by one State from another were—

- (i) 49,627 persons by New South Wales from Victoria;
- (ii) 28,192 persons by Victoria from Tasmania;

- (iii) 17,193 persons by Western Australia from Victoria;
- (iv) 12,583 persons by New South Wales from Tasmania; and
- (v) 12,062 persons by Western Australia from South Australia.

Males and females were represented in roughly equal proportions in these movements.

The succeeding table shows the net gain or loss experienced by each State and Territory from the interstate migration of Australian-born as at the date of each Census from 1881 to 1947:—

AUSTRALIAN-BORN POPULATION: INTERCENSAL CHANGES BETWEEN STATES.

							Net (∃ain	(+) or Loss	s (—)	•				
State.			1881.		1891.		1901.	_	1911.		1921.		1933.		1947.

⁽a) Includes Australian Capital Territory.

(b) Includes Northern Territory.

As the figures in this table indicate, with the exception of the small loss experienced by Western Australia in 1881, New South Wales, Queensland and Western Australia had a net gain of Australian-born population from other States at each Census from 1881 to 1947, although these gains have been diminishing in number, due to losses by net migration and mortality, which in the case of the last-mentioned State extended over the past three Census periods. Victoria, after having a small gain in 1891, then lost substantially to other States. The table

shows, however, that the net loss declined after 1921. South Australia and Tasmania recorded net losses at each Census, which have been diminishing in the former State since 1911 but, except for a slight reduction in the last intercensal period, have been steadily increasing in the latter.

In the next table the number and proportion of Australian-born males and females who were outside their State of birth at each Census date from 1911 to 1947 are compared.

(b) Includes Northern Territory.

It will be observed that for the whole Commonwealth the proportion of the Australian-born population recorded in States other than that of birth decreased during the last three inter-censal periods. The rate at each period under review was higher for males than for females, but a greater falling off in the number of males migrating has progressively reduced the margin between the sexes until males actually numbered less than females, and the proportions were approaching equality, in 1947. Comparing the results for 1933 and 1947, the figures disclose that, with the exception of a slight decrease

which occurred in respect of males in Victoria, every State had an increased number of native-born males and females in other States in 1947. Taking the proportion of the native-born recorded in other States, New South Wales, Queensland and Western Australia had a higher percentage, and the other States a lower percentage in 1947. This applied also to the sexes separately. The States that had contributed the largest number of native-born to other States by 1947 were—Victoria, 212,639 persons; New South Wales, 183,101 persons; Queensland, 92,128 persons; and South Australia, 89,897 persons.

11. Australian-born Metropolitan Population.—The next table gives the number of the population born in each State and Territory who

were recorded in the metropolitan areas of Australia at the 1947 Census:-

AUSTRALIAN-BORN METROPOLITAN POPULATION ACCORDING TO STATE OF BIRTH, 30th JUNE, 1947.

Birthplace.	Sydney and Suburbs,	Melbourne and Suburbs.	Brisbane and Suburbs.	Adelaide and Suburbs.	Perth and Suburbs.	Hobart and Suburbs.	Total Metropolitan

(a) Includes Australian Capital Territory.

(b) Includes Northern Territory.

The next table shows the numbers and proportions of the Australian-born population in the metro-

politan areas of the State of birth and of other States:—

AUSTRALIAN-BORN POPULATION: NUMBERS AND PROPORTIONS IN METROPOLITAN DIVISIONS ACCORDING TO STATE OF BIRTH OR OTHER STATE, 30th JUNE, 1947.

		Australian-bo	orn Population in S	tate of Birth.	Australian-born Population in States other than that of Birth.				
Birthplace	•	Metropolitan Area.	Total.	Percentage of Metropolitan on Total.	Metropolitan Area.	Total.	Percentage of Metropolitan on Total.		
New South Wales(a)		1,165,434	2,447,443	47.62	96,634	183,101	52.78		
Victoria		 986,790	1,703,589	57.92	105,284	212.639	49.51		
Queensland		 307,727	882,961	34.85	53,291	$92,\!128$	57.84		
South Australia(b)	· · ,	 312,119	551,197	56.63	46,153	89,897	51.34		
Western Australia		 179,738	339,537	52.94	26,432	40,467	65.32		
Tasmania		 $65,\!662$	228,401	28.75	45,327	63,811	71.03		
Australia		 3,017,470	6,153,128	49.04	373,121	682,043	54.71		

(a) Includes Australian Capital Territory.

(b) Includes Northern Territory.

Taking the totals for Australia, it will be observed that 49.04 per cent. of the Australian-born population remaining in the State of birth, and 54.71 per cent. of those who had migrated to other States, were recorded in the capital cities. These figures represent a considerable increase as compared with 1933, when the proportions were respectively 45.03 per cent. and 49.51 per cent. The corresponding figures in 1921 were 40.79 per cent. and 46.49 per cent. respectively. It will also be seen that of persons born in New South Wales, Victoria and South Australia and migrating to other States the

percentages recorded in the metropolitan areas of the latter States are lower than the Australian percentage. On the other hand, the proportion of persons born in Western Australia who were enumerated in metropolitan areas was higher than the corresponding Australian average for both persons remaining in their State of birth and those migrating to other States. In the case of Tasmanian-born, the high proportion of 71.03 per cent. recorded in the metropolitan areas of other States was in contrast to the very low percentage of 28.75 in the Tasmanian metropolitan area.

12. Ages of the Australian-born.—Particulars concerning the ages of the Australian-born each State and Territory of birth:—

The following table shows the excess of Australian-born over immigrants in an average 100 males and females in Australia, and in the aggregate of the metropolitan areas, at different ages:—

AUSTRALIAN-BORN POPULATION: AVERAGE EXCESS IN EVERY 100 MALES AND FEMALES IN AGE GROUPS, 30th JUNE, 1947.

Age last Birthday	Aust	ralia.	Metropoli	tan Areas.
(Years).	Males.	Females.	Males.	Females.
0-4	99.20	99.17	98.92	98.86
5-9	98.75	98.77	98.10	98.15
10-14	98.00	98.04	96.88	96.98
15–19	96.72	97.40	96.17	96.39
20-24	89.76	91.89	88.66	90.49
25–29	85.14	87.48	82.91	85.46
30–34	85.07	87.74	82.77	85.49
35-39	71.24	78.05	67.32	73.92
40–44	60.32	72.96	56.41	68.92
45–49	59.26	69.67	55.13	65.93
50-54	60.60	69.49	56.67	66.16
55-59	56.87	69.79	50.96	66.12
60–64	49.63	62.15	40.42	57.04
65–69	44.93	56.24	32.78	50.33
70–74	44.20	53.80	31.88	48.41
75 and over	36.88	50.26	24.40	44.90
Total	78.04	82.70	73.90	78.74

The table shows that the higher the age the lower the proportion of Australian-born in the population. Among males 75 years of age and over in Australia, the Australian-born element showed an excess of 36.88 per cent., there being 68.44 Australian-born to every 31.56 immigrants, whereas among the infant males under 5 years of age the Australian-born exceeded the immigrant element by 99.20 per cent., there being 99.60 Australian-born to every 0.40 immigrants. In the young ages the proportions of Australian-born among males and females is practically identical but at the older ages the proportion of Australian-born females is higher than that of males. It will be observed that the 1947 Census showed excesses of the Australian-born element in each age group.

It may be noticed that the Australian-born element is relatively less at all ages, both in males and females, in the metropolitan areas than in Australia as a whole.

13. Interchange of Australian-born and New Zealand-born Populations.—The following table gives particulars of the interchange of native-born population between Australia and New Zealand, as disclosed by Census results from 1911 to 1947:—

NATIVE-BORN POPULATION OF AUSTRALIA AND NEW ZEALAND ENUMERATED IN THE RESPECTIVE COUNTRIES AT CENSUSES, 1911 TO 1947.

(a) Censuses of 1936 and 1945 respectively in the case of New Zealand.

Maoris and full-blood Australian aboriginals have been excluded from the table. In all cases, the Australian-born and New Zealand-born include a proportion of the population of unspecified birthplace.

Australian-born persons had migrated to New Zealand between 1891 and 1921 in greater numbers than New Zealand-born persons had migrated to Australia but, as will be observed by the figures, the number of Australian-born persons recorded at the 1936 and 1945 Censuses of New Zealand was in

each case less than the number of New Zealand-born recorded at the Australian Censuses of 1933 and 1947 respectively. Although these results are not directly comparable on account of the interval between the Census dates of the two countries, during which migration may have taken place, it would appear from the extent of the differences recorded that there was a net movement of native-born population in favour of Australia during the period 1921 to 1947

THE OVERSEA-BORN POPULATION.

14. Distribution.—The following table furnishes an informative summary of the distribution

of the oversea-born population according to continent of birth:—

OVERSEA-BORN POPULATION ACCORDING TO CONTINENT OF BIRTH: NUMBERS AND MASCULINITY, 30th JUNE, 1947.

New South Wales had the largest, and Victoria the second largest number of persons born in each of the birthplaces specified. The large number of persons of oversea-birth in Western Australia, relative to the total State population, which was referred to earlier in this Chapter, is seen to be comprised of immigrants from all the continents, but

principally they came from Europe and in particular the British Isles.

The following table shows the proportion per cent. of persons born in each oversea birthplace on the total oversea-born population of each State and Territory:—

OVERSEA-BORN POPULATION: PERCENTAGE DISTRIBUTION ACCORDING TO CONTINENT OF BIRTH, 30th JUNE, 1947.

(a) New Zealand and Australian External Territories.

The table shows that of the total oversea-born population of Australia, only 6.36 per cent. had been born elsewhere than in Australasia or Europe; the corresponding percentage for males being 6.94 and for females 5.64. Dealing with the constitution of the population of the States, it will be noticed that Tasmania had the highest proportion of persons of Australasian birth, mainly of New Zealand

birth, and the lowest proportion of European birth. New South Wales and Victoria did not differ from each other in any marked degree, while Queensland, South Australia and Western Australia were similar to each other in having relatively low proportions of Australasian birth, and relatively high proportions of European birth.

15. The Secular Growth Trend, 1881 to 1947.—The numbers of oversea-born persons at each Census from 1881 to 1947 will be found in

Section 5. The increases or decreases during the six intercensal periods since 1881 are shown in the next table:—

OVERSEA-BORN POPULATION OF AUSTRALIA: INTERCENSAL CHANGES.

				Males.					Females.				Persons.			
	Period.			Inc	umerical rease (+) ecrease (-).	Inc	ercentage rease (+) ecrease (-).	Inc	umerical rease (+) ecrease (-).	Inc	ercentage rease (+) eerease (-).	Inc	fumerical erease (+) ecrease (-).	Inc	rcentage rease (+) crease (-).

Total	, 1881–19	947			83,687	_	16.71	+	405	+	0.12		83,282	_	10.06	

Between 1881 and 1947 the oversea-born population decreased by 83,282 persons, representing a loss of 83,687 males and a gain of 405 females. As the table shows, considerable changes occurred in the numbers in the interim, which in the main reflected the fluctuations in oversea migration. For both males and females, the intercensal periods 1881–91, 1911–21 and 1921–33 saw rising numbers

of oversea-born persons but the remaining years were marked by substantial reductions, due to the fact that net migration fell to a level far below that required to replace losses by mortality.

A comparison of the birthplaces of the overseaborn population of Australia at the date of each Census from 1911 to 1947 furnishes the following results:—

OVERSEA-BORN POPULATION OF AUSTRALIA ACCORDING TO CONTINENT OF BIRTH: NUMBERS AND PROPORTIONAL DISTRIBUTION, CENSUSES, 1911 TO 1947.

(a) New Zealand and Australian External Territories.

As will be seen from the preceding table, the number of males in Australia who were born overseas decreased between 1911 and 1947 by 45,037, but the females increased by 23,154. Between 1911 and 1933 the population of European birth increased by 134,678 persons and in proportion from 87.81 per cent. to 89.38 per cent. of the total overseaborn population. Between 1933 and 1947, however, the number of European-born persons decreased by 155,752, of whom 95,668 were males and 60,084 were females. In the next highest group, comprising persons born in New Zealand or the Australian External Territories, the numbers increased from

32,117 in 1911 to 45,196 in 1947, the corresponding proportions rising from 4.19 to 6.08 per cent. Persons of African birth increased by 2,542 in number, and in proportion to the total overseaborn population from 0.65 per cent. in 1911 to 1.01 per cent. in 1947, both males and females contributing to the increase. The number of persons of American birth increased slightly in number to 11,630 persons, or 1.56 per cent. of the total overseaborn population. The population from other birth-places diminished by over 16,000 persons, and in proportion from 5.86 per cent. to 3.79 per cent. during the 36 years 1911 to 1947.

The masculinity of the population for each birthplace is shown in the following table:-

OVERSEA-BORN POPULATION OF AUSTRALIA ACCORDING TO CONTINENT OF BIRTH: MASCULINITY, (a) CENSUSES, 1891 TO 1947.

		Birthplace.											
	Year.	Australasia(b).	Europe.	Asia.	Africa.	America.	Polynesia.	At Sea.	Total.				
1891		 116.42	143.03	1,670.72	150.53	273.60	721.55	114.73	155.45				
1901		 110.58	137.31	1,350.83	154.65	245.79	974.15	111.91	151.27				
1911		 112.43	143.06	1,040.91	117.93	218.76	266.24	108.91	152.01				
1921		 108.10	128.86	671.23	112.97	177.11	169.38	102.12	134.19				
1933		 108.35	133.18	364.47	115.81	161.73	121.23	92.40	134.96				
1947		 100.60	127.71	200.97	111.71	144.69	94.26	90.82	127.48				

(a) Males per 100 females.

(b) New Zealand and Australian External Territories.

It will be noted that the masculinity under each of the birthplaces represented has with only minor fluctuations diminished steadily. In the case of Australasian-born persons, who are mainly New Zealanders, equality of sexes had been practically attained in 1947, while an excess of females was recorded in 1947, for the first time for any of the

continental birthplaces under review, in persons of Polynesian birth.

16. Oversea-born Metropolitan Population.—The metropolitan population of the States and Australia by continental divisions of oversea birthplaces is shown in the following table:—

OVERSEA-BORN METROPOLITAN POPULATION ACCORDING TO CONTINENT OF BIRTH, 30th JUNE, 1947.

(a) New Zealand and Australian External Territories.

A comparison of the birthplaces of the metropolitan population in the foregoing table shows that Sydney had the greatest number of persons of each of the birthplaces specified, while Melbourne ranked

second. Brisbane occupied third place with persons of Australasian, American, and Polynesian birth, and Perth third with persons born in Europe, Asia and Africa.

population from each birthplace in any metro- same birthplace in the relevant State:-

The next table shows the proportion which the politan area bore to the total population from the

This table shows a marked concentration of the oversea-born population in the capital cities. Except in the case of Queensland and Tasmania, where the greater proportion of the oversea-born population was on the contrary outside the metropolitan area, the number of persons from each of the continents was proportionately greater in the metropolitan areas than elsewhere. Females were attracted to the capital cities to a greater degree than males, and in the case of the Australasian-born group, who were mostly New Zealand-born, the proportion of females in the metropolitan area was as high as 78.70 per cent. in South Australia, compared with 72.46 per cent. for males in the same city. The Australasian-born also recorded the highest proportions, 65.16 per cent. for males and 71.66 per cent. for females, in the metropolitan areas of Australia as a whole.

The next highest proportions in the metropolitan area were, for males, American-born and Africanborn, and, for females, Polynesians and Asiatics. For persons born in Europe, the most important group numerically, the percentage of persons in metropolitan areas was 60.32, compared with 60.92 for the total oversea-born element.

17. Period of Residence of Oversea-born.

-Of the 744,187 persons born elsewhere than in Australia, 21,570, or 2.9 per cent., omitted to state their period of residence in Australia. The number has been distributed proportionately over the periods shown in the next table.

OVERSEA-BORN POPULATION OF AUSTRALIA ACCORDING TO CONTINENT OF BIRTH AND PERIOD OF RESIDENCE IN AUSTRALIA, 30th JUNE, 1947.

The numbers given in the preceding table indicate that 77.6 per cent. of the total immigrant population had resided in Australia for 20 years or more. The 1933 figure was 54.5 per cent. The proportion of immigrants resident 20 years or more in 1947 from each of the following birthplaces was:—New Zealand, 69.8; Europe, 79.9; Asia, 43.7; Africa, 77.5; America, 57.8; and Polynesia, 57.2. Compared with the Census of 1933, these proportions showed an increase except in the case of Asia and Polynesia. Of the group resident in Australia 20 years or more, slightly less than half were resident between 20 and 29 years, reflecting the high immigration of the decade following the 1914–18 War, while the

remainder represented mainly the survivors of the previous wave of immigration which was terminated by that war. The oversea-born population resident in Australia for less than 20 years comprised 22.4 per cent. of the total immigrant population, of whom 5.8 per cent. had been in Australia for less than 5 years, 5.5 per cent. between 5 and 9 years and 11.1 per cent. between 10 and 19 years.

18. Urban and Rural Divisions.—The following table shows for specified periods of residence in Australia, the proportion per cent. of the overseaborn population in urban and rural divisions. The migratory population has been excluded.

OVERSEA-BORN POPULATION ACCORDING TO SPECIFIED BIRTHPLACES AND PERIOD OF RESIDENCE IN AUSTRALIA: PERCENTAGE DISTRIBUTION IN URBAN AND RURAL DIVISIONS, 30th JUNE, 1947.

Total	64.42	11.30	24.28	100.00	61.11	14.07	24.82	100.00	61.82	13.48	24.70	100.00

This table indicates that the high proportion of oversea-born population in the metropolitan division previously referred to applied to both immigrants of less than 20 years' residence and those of longer residence in Australia. This concentration in the capital cities was, however, more marked in the case of the former group. Between 1933 and 1947 substantial increases were recorded in the proportions of the metropolitan population born in Europe and resident in Australia for less than 20 years and also of the metropolitan population of "other birthplaces" for both those resident under 20 years and those resident 20 years or more.

19. Australasian-born Population. — (i) General.—The Australasian-born population, other than Australian-born, comprises those born in the external territories of Australia (Norfolk Island, Papua, New Guinea and Nauru) and New Zealand. The numbers born in the external territories, particulars of whom will be found in the Detailed Tables of the Census, Part XII., "Birthplace", are very small.

(ii) New Zealand-born Population.—(a) States and Territories.—As already stated in this chapter, the New Zealand-born population enumerated in Australia at the Census of 1947 consisted of 43,610 persons, of whom 21,890 were males and 21,720 were females. The number in the States and Territories

is shown in the following table:-

NEW ZEALAND-BORN POPULATION: NUMBERS, PROPORTIONS AND MASCULINITY, 30th JUNE, 1947.

		Ma	iles.	Fen	nales.	Per	sons.	
Enumerated in—		Number.	Per 1,000 of Male Population.	Number.	Per 1,000 of Female Population.	Number.	Per 1,000 of Total Population.	Masculinity (Males per 100 Females).
New South Wales		11,684	7.83	11,853	7.94	23,537	7.89	98.57
Victoria		$5,\!529$	5.45	5,865	5.63	11,394	5.55	94.27
Queensland		2,247	3.96	1,658	3.08	3,905	3.53	135.52
South Australia		659	2.06	715	2.19	1,374	2.13	92.17
Western Australia		1,100	4.26	1,003	4.10	2,103	4.19	109.67
Tasmania		488	3.78	542	4.24	1,030	4.01	90.04
Northern Territory		72	9.76	14	4.01	86	7.91	514.29
Australian Capital Territory		111	12.21	70	8,96	181	10.71	158.57
Australia		21,890	5.76	21,720	5.74	43,610	5.75	100.78

Leaving the Territories out of account, persons of New Zealand birth were numerically, and in proportion to the population, most strongly represented in New South Wales, and had the lowest representation numerically in Tasmania, and the lowest in proportion to the total population in South Australia. The masculinity was highest in Queensland, while females exceeded males in New South Wales, Victoria, South Australia and Tasmania. Victoria, South Australia and Tasmania were the only States where New Zealand-born females exceeded males in 1933.

(b) Urban and Rural Divisions.—Of a total of 43,610 persons born in New Zealand and resident in Australia, 29,844 persons, or 68.43 per cent., were in the capital cities, a much higher proportion than that for persons born in Australia (49.61 per cent.) or Europe (60.32 per cent.).

Particulars of the New Zealand-born population in urban and rural divisions will be found in the Detailed Tables of the Census, Part XII.,

"Birthplace".

(c) Ages and Masculinity.—In the succeeding table will be found the number and masculinity of the New Zealand-born population in Australia in each quinquennial age group:—

NEW ZEALAND-BORN POPULATION OF AUSTRALIA ACCORDING TO AGE: NUMBERS AND MASCULINITY, 30th JUNE, 1947.

Age last Birthe (Years).	ia y	Males.	Females.	Persons.	Masculinity (Males per 100 Females).	Age last Birt (Years).		Males.	Females.	Persons.	Masculinity (Males per 100 Females).
0- 4 5- 9 10-14 15-19 20-24 25-29 30-34 35-39		166 265 256 506 995 1,182 1,663 2,536	151 245 251 491 954 1,407 1,762 2,479	317 510 507 997 1,949 2,589 3,425 5,015	109.93 108.16 101.99 103.05 104.30 84.01 94.38 102.30	40-44 45-49 50-54 55-59 60-64 65-69 70 and over	 er	2,566 1,887 1,544 1,907 2,277 1,961 2,179	2,159 1,674 1,470 1,777 2,188 2,125 2,587	4,725 3,561 3,014 3,684 4,465 4,086 4,766	118.85 112.72 105.03 107.32 104.07 92.28 84.23

An interesting fact in connexion with the preceding table is the greatly changed age distribution of the New Zealand-born population in 1947 compared with 1933. Thus, the numbers between ages 15 to 29 and 45 to 59 years in 1947 represented only 13 and 24 per cent. respectively of the total, as against 24 and 33 per cent. fourteen years earlier. These decreases may be attributed to the considerable contraction during the two world war periods of New Zealanders aged about 15 to 30 years at the conclusion of the respective wars. In contrast, despite a decrease in the total number of New Zealand-born in Australia between 1933 and 1947, substantial increases were recorded in the numbers, of both sexes, of New Zealand-born at ages 35 to 44 years and 60 years or over.

20. European-born Population.—(i) *Distribution.*—The population born in Europe, which numbered 651,606 persons in 1947, and represented

86.0 per 1,000 of the total population, was less by 155,752 persons than in 1933 and less in proportion per 1,000 of the population by 35.8. Of the 86.0 per 1,000 of the population represented by persons born in Europe, British countries accounted for 72.1 and foreign countries 13.9 per 1,000. It is interesting to note that, while persons born in British countries in Europe represented only 72.1 per 1,000 of the population in 1947, as against 108.2 in 1933, persons born in foreign countries in Europe increased their representation slightly from 13.6 per 1,000 in 1933 to 13.9 in 1947.

The distribution of the European-born population in urban and rural divisions of Australia is given in the Detailed Tables of the Census, Part XII., "Birthplace" for an extended list of European countries.

The numbers and proportions of the population born in European countries were as follows:—

EUROPEAN-BORN POPULATION OF AUSTRALIA ACCORDING TO COUNTRY OF BIRTH: NUMBERS, PROPORTIONS AND MASCULINITY, 30th JUNE, 1947.

				Ma	iles.	Fen	ales.	Per	sons.	35 37 11

In comparing the figures above with those of 1933, it may be said that, with a few exceptions, the number per 1,000 of the population born in the birthplaces specified was lower in 1947 than in 1933,

Of the exceptions, the most important increases in the proportions per 1,000 were from the following birthplaces:—Italy from 4.04 to 4.44; Greece from 1.26 to 1.62; Poland from 0.49 to 0.87; Yugoslavia

from 0.60 to 0.77; and Austria, Hungary and Czechoslovakia together, from 0.30 to 0.92. Of the decreases recorded between the 1933 and 1947 Censuses, by far the most important were those occurring in the population of British Isles birth. Thus, persons born in England decreased numerically from 486,831 to 381,592, representing, per 1,000 of population, a reduction from 73.43 to 50.35. The Scottish-born population decreased in number from 132,489 to 102,998 persons, and in proportion from 19.98 to 13.59 per 1,000. The Irish-born population showed the greatest proportionate decrease, being approximately halved by a fall from 11.86 per 1,000 in 1933 to 5.91 per 1,000 in 1947.

In numbers, the reduction was from 78,652 persons in 1933 to 44,813 persons in 1947. Further comparisons with previous Censuses will be found in sub-section (iv), wherein the numbers and proportions of the population of European birth according to the numerically more important countries are reviewed for each Census from 1911 to 1947.

The only European birthplaces showing an excess of females in 1947 were Belgium and France. In 1933, females were in excess in France only.

The distribution in States and Territories of the European-born population is shown in the following table:—

EUROPEAN-BORN POPULATION: PRINCIPAL BIRTHPLACES ENUMERATED IN STATES AND TERRITORIES, 30th JUNE, 1947.

Enumerated in—	England.	Wales.	Scotland.	Ireland.	Germany.	Greece.	Italy.	Rest of Europe.	Total Europe.

It will be seen that in general persons born in the birthplaces specified were distributed among the States in the order in which the latter are set down, which is the order of their population. The chief exception was Western Australia, which had more

males and females from each birthplace shown, apart from Germany, than South Australia. Also Queensland had more females from Ireland and Italy than Victoria. A comparison of the Europeanborn population in 1933 and 1947 discloses a decrease in the number recorded in each State and an increase in the number in each of the Territories. The largest decline numerically was in New South Wales, where the total dropped by 52,789 persons, and proportionately in Queensland, where the reduction of 42,845 persons represented a decrease of 29.2 per cent. The decreases recorded in the remaining States were as follows:—Victoria, 28,068 persons; Western Australia, 17,642 persons; South Australia, 12,759 persons; and Tasmania, 2,566 persons. In the

Territories, the increases were relatively high, being 466 persons, or 73.7 per cent., in the Northern Territory and 451 persons, or 36.9 per cent., in the Australian Capital Territory.

(ii) Urban and Rural Divisions.—The proportion of the European-born population in urban and rural divisions of Australia is shown in the following table, from which the migratory population has been omitted:—

EUROPEAN-BORN POPULATION: PERCENTAGE DISTRIBUTION OF PRINCIPAL BIRTHPLACES IN URBAN AND RURAL DIVISIONS, 30th JUNE, 1947.

Division.		England.	Wales.	Scotland.	Ireland.	Germany.	Greece.	Italy.	Rest of Europe.	Total Europe.
Urban— Metropolitan Provincial Rural	••	$\begin{array}{c} 62.68 \\ 13.45 \\ 23.87 \end{array}$	52.52 19.76 27.72	62.23 15.67 22.10	60.80 15.19 24.01	60.21 10.41 29.38	57.06 19.72 23.22	38.46 9.90 51.64	64.09 10.37 25.54	60.98 13.67 25.35
Australia		100.00	100.00	100.00	100.00	100.00	100.00	100.00	100.00	100.00

Of the birthplaces embraced by the United Kingdom, England had the highest proportion, 62.68 per cent., and Wales the lowest proportion, 52.52 per cent., in metropolitan areas. Excluding the "rest of Europe", England also had the highest proportion of metropolitan population of all the birthplaces shown. Taking the two urban divisions combined, Scotland, with 77.90 per cent., had the highest proportion of those same birthplaces. Scotland also followed England very closely in the proportion of population recorded in metropolitan areas. Ireland, Germany and Greece, in that order, had the next highest proportions after Scotland in the

metropolitan areas. Of the countries shown, Italy had by far the lowest proportion of population in both the metropolitan and urban provincial divisions, with the result that the proportion of the total Italian-born population in Australia who were recorded in rural areas (51.64 per cent.) was approximately double that of the other birthplaces reviewed.

(iii) Period of Residence of European-born.—The period of residence in Australia of persons born in Europe is dealt with in the next table in respect of the periods under 20 years and 20 years and over:—

EUROPEAN-BORN POPULATION OF AUSTRALIA ACCORDING TO PERIOD OF RESIDENCE: NUMBERS AND PROPORTIONS, 30th JUNE, 1947.

Number of Years of Reside	ence. E	ngland.	Wales.	Scotland.	Ireland.	Germany.	Greece.	Italy.	Rest of Europe.	Total Europe.

Total	••	381,592	11,864	102,998	44,813	14,567	12,291	33,632	49,849	651,606
Proportion per of 20 years and	cent.	86.08	81.52	85.17	85.25	54.65	49.87	52.41	50.14	79.92

An interesting feature of this table is that whereas the 1933 Census disclosed a fairly even distribution of the European-born population between the two periods of residence under review, the greater proportion (79.9 per cent.) in 1947 was resident in Australia 20 years and over. Germany, Greece, Italy, and "rest of Europe" provided notable exceptions, with proportions in the region of 50 per cent. in 1947.

In the decennium 1911–21, the proportion of those resident 20 years or more in the European-born

population declined heavily—from 73 per cent. to 51 per cent. The proportion for Europe as a whole, after recovering slightly between 1921 and 1933, rose to 79.9 in 1947.

(iv) Secular Change, Censuses, 1911 to 1947.— The number and proportion of the population of European birth to the total population of Australia at the date of each Census from 1911 to 1947 appear in the following table:—

EUROPEAN-BORN POPULATION OF AUSTRALIA ACCORDING TO COUNTRY OF BIRTH: NUMBERS AND PROPORTIONS, CENSUSES, 1911 TO 1947.

In the period 1891–1901 (not shown in the preceding table), the population born in each of the birthplaces, except Greece and Italy, diminished, the net decrease in the total European-born population numbering 149,234 persons. In the next decennium (1901–11) there was a further decrease of 82,759 persons, each of the birthplaces contributing to this result, with the exceptions of Wales, Greece and Italy. However, between 1911 and 1921, the

total increased by 77,606 persons, of whom 26,514 were males and 51,092 were females. In the period 1921–33 there was a further increase of 57,072 persons, of whom 38,670 were males and 18,402 were females, but a decrease of 155,752 persons (95,668 males and 60,084 females) followed in the next intercensal period. Birthplaces showing the greatest decreases between 1933 and 1947 were—England, 105,239 persons; Ireland, 33,839 persons;

and Scotland, 29,491 persons. Increases were recorded during the same period, however, in a number of birthplaces, principally "Rest of Europe", 6,884 persons; Italy, 6,876 persons; and Greece, 3,954 persons. The remarkable reduction in the number of Irish-born recorded at each successive Census is of more than passing interest. Between 1891 and 1901 the decrease was 43,228 persons, in the next ten years 43,105 persons, in the next ten years 35,368 persons, in the twelve years 1921–33 27,345 persons, and in the last fourteen years 33,839 persons, a total for the 56 years of 182,885 persons, or about 80 per cent. of the number of Irish-born residents in Australia in 1891.

The figures in the latter half of the table dealing with the proportional representation of the European-born from 1911 onwards, show that the number of persons of each birthplace per 1,000 of the total population diminished at each successive Census, with the exception of the English-born between 1911 and 1921, those born in the "rest of Europe" between 1933 and 1947, and the Greek and Italian-born populations who have shown a continuous increase over practically the whole period.

(v) Ages and Masculinity of European-born.— Particulars concerning the ages of the European-born population of each birthplace are given in the following table:—

EUROPEAN-BORN POPULATION OF AUSTRALIA ACCORDING TO BIRTHPLACE AND AGE, 30th JUNE, 1947.

T	otal		381,592	11,864	102,998	44,813	14,567	12,291	33,632	49,849	651,60

A feature of this table is the decrease, except in the case of children under the age of 5 years, since 1933 in the number of the European-born population in all age groups up to 50–54 years inclusive. In the groups comprising persons 5 to 54 years, the number decreased from 550,592, or 68.20 per cent. of the total in 1933, to 377,825, or 57.98 per cent., in 1947. This decrease of 172,767 persons was due principally to a drop of 128,702 in the number of English-born between the ages 5 to 54 years. The greatest decrease in any one age group occurred in the group 30–34 years in which the number of persons fell by 42,842. Apart from children under 5 years, already mentioned, the only increases in numbers were recorded in the groups between ages 55 and 69 years.

England and Wales were represented by the greatest number of persons in the age group 45-49 years, Scotland in the age group 40-44 years, Ireland in the age group 50-54 years, Greece and Italy in the age group 45-49, Germany in

the age group 40-44 years, and the "rest of Europe" in the age group 45-49 years. In the case of Ireland and Germany, the total number at ages 75 years and over exceeded those in the age groups mentioned, but this residual group has been disregarded for the purposes of these comparisons. These results indicate a marked increase between 1933 and 1947 in the modal age group of the population born in Scotland, Greece, Italy and the rest of Europe", and a decrease in the modal age group of the population born in Ireland and Germany. The modal age group for the population born in England and Wales was the same in 1947 as in 1933. Both in 1933 and 1947, the largest proportion for all European birthplaces was in age group 45-49 years.

The masculinity (i.e., the number of males per 100 females) of the European-born population is shown in the next table for each birthplace at each of the Census years from 1891:—

EUROPEAN-BORN POPULATION OF AUSTRALIA ACCORDING TO PRINCIPAL BIRTHPLACES: MASCULINITY, (a) CENSUSES, 1891 TO 1947.

	Year.	 England.	Wales.	Scotland.	Ireland.	Germany.	Greece.	Italy.	Rest of Europe.	Total Europe.
1891 1901 1911 1921 1933 1947		 150.32 140.99 144.39 123.35 123.34 116.49	161.04 148.43 153.61 139.33 141.68 137.04	143.75 136.71 144.08 125.28 124.55 117.92	104.44 100.04 100.81 102.96 112.14 114.72	188.22 187.39 192.62 170.90 179.95 159.57	1,244.44 1,296.83 1,616.98 622.75 366.01 287.00	685.51 604.21 471.20 345.44 299.82 202.28	405.20 391.14 373.81 300.16 267.38 195.91	143.03 137.31 143.06 128.86 133.18 127.71

Interesting features of this table are the downward trend in the masculinity of the population born in all countries shown other than Ireland, and the heavy preponderance of males that nevertheless still obtains among the population born in Germany, Greece, Italy and the "rest of Europe".

The following table shows the masculinity of the European-born population in each age group:—

EUROPEAN-BORN POPULATION OF AUSTRALIA: MASCULINITY (a) FOR PRINCIPAL OF TOTAL POPULATION OF RESPECTIVE COUNTRIES AT CENSUSES, 1891 TO 1947.

(a) Males per 100 Females.

It will be observed that for the European-born as a whole the age group 40-44 showed the greatest masculinity, followed by the age group 55-59, while in the two extreme age groups 0-4 and 75 and over, females were in excess of males. On the whole, the masculinity was slightly less than in 1933, when it was 133.18. The most striking difference occurred in the age group 25-29, which from a masculinity of 168.59 in 1933, decreased to 114.89 in 1947.

It will be observed that the masculinity in 1947 of the age groups 20–24 to 30–34 was less than for neighbouring age groups. The lowest masculinities in this group were recorded in the ages 25–29 years for persons born in England (101.66) and Ireland

(100.13). Compared with 1933, when the group 25–29 years, for example, had the highest masculinity of all age groups, these results indicate a greatly reduced proportion of European-born males between the ages 20 and 34 years, which no doubt was due to the loss of male lives during the 1939-45 War.

(vi) Comparison of Australian Population born in the British Isles with Populations of those Islands, 1891 to 1947.—The next table shows the percentages which those sections of the Australian population born in England, Wales, Scotland and Ireland bore to the total population in each of those countries:—

POPULATION OF AUSTRALIA BORN IN COUNTRIES OF BRITISH ISLES: PROPORTIONS OF TOTAL POPULATION OF RESPECTIVE COUNTRIES AT CENSUSES 1891 TO 1947.

	У евг.				Proportion Per Cent. Represented by Australian Population Born in—

(a) Eire and Northern Ireland combined.

BIRTHPLACE.

Notwithstanding the decline in the number of the Irish-born population in Australia, Ireland has, on the basis of her estimated population as at the Census of 1947, contributed a larger proportion of her people to increase the population of Australia, than has either England or Wales. Up to the 1921 Census the percentage contribution of Ireland was greater than that of Scotland as well. The relation between Irish-born people in Australia to the population of Ireland in 1947 was 1.04 per cent., whereas for Scotland the similar relation was 1.99 per cent., for England 0.94 per cent., and for Wales 0.47 per cent. From the figures in the table above it would appear that no part of the United Kingdom is sending to Australia as large a proportion of its population as it did in earlier years, though the period 1921-33 showed for England a slight reversion, and for Scotland a marked reversion, to the earlier experience.

21. Asiatic-born Population.—As already stated in this chapter the Australian population of Asiatic birth in 1947 numbered 24,096 persons, and represented only 0.32 per cent. of the total. Of this number, British India and Ceylon accounted for 8,160 persons—including a very large proportion of European race—China 6,404 persons and Syria and Lebanon 1,886 persons. Included in the total of 16,090 males of Asiatic birth were 2,959 who were enumerated in the migratory group. In the case of Asiatic birthplaces, the migratory group comprises very largely crew on oversea ships in Australia at the time of the Census, who do not form part of the permanent population of Australia. inclusion of this element would affect the results for some birthplaces considerably, they have been excluded from the following tables.

Particulars for most of the Asiatic countries recorded at the Census are given in the next table:—

ASIATIC-BORN POPULATION OF AUSTRALIA ACCORDING TO COUNTRY OF BIRTH: NUMBERS, PROPORTIONS AND MASCULINITY, 30th JUNE, 1947.

(b) Former Federated and Unfederated Malay States.

These figures, from which persons in the migratory group have been excluded, represent a decrease since 1933 of 3,001 in the Asiatic-born male population of Australia, and an increase of 2,591 in the Asiatic-born female population, leaving a net reduction of 410 persons. The countries of birth chiefly responsible for the reduction were China, 2,302 persons, and Japan, 696 persons. Countries

with the main increases for the fourteen years were Hong Kong and Straits Settlements. These increases were, respectively, 531 and 297 persons. No comparison can be made with the 1933 Census results for the countries of Palestine, Malaya (other than Straits Settlements) and Netherlands East Indies, which were classified as such for the first time at the 1947 Census.

The distribution of the Asiatic-born population in the succeeding table, in which the countries most in States and Territories of Australia is dealt with numerously represented appear separately:—

ASIATIC-BORN POPULATION OF AUSTRALIA: PRINCIPAL BIRTHPLACES ENUMERATED IN STATES AND TERRITORIES, 30th JUNE, 1947.

(Excluding Migratory Group.)

(a) Comprises territories specified in notes (a) and (b) to preceding table

In general both males and females were distributed among the States in the order of the population of the latter, though Western Australia was an exception in most cases with more persons than this order would allot. Comparing the results with those of 1933, all States except South Australia shared in the decrease of 3,001 males of Asiatic birth, and all States in the increase of 2,591 females.

22. African-born Population.—The population of African birth in 1947 numbered 7,537 persons—3,977 males and 3,560 females—and represented 0.10 per cent. of the population of Australia. Of the total the Union of South Africa contributed 5,866 persons, or 77.83 per cent. Between 1933 and 1947 the population of African birth decreased by 284 persons—220 males and 64 females.

23. American-born Population.—The population of American birth in 1947 numbered 11,630 persons, or 0.15 per cent. of the Australian population. Of these 6,877 were males and 4,753 were Persons born in the United States females. accounted for 53.59 per cent. of the total, and persons born in Canada 34.47 per cent. The increase in the period 1933-47 was 51 persons, but whereas males diminished by 278, females increased by 329. Canada was mainly responsible for both the decrease in the number of males and the increase in the number of females. The number of persons claiming the United States as birthplace, on the other hand, increased in the case of males and decreased for females.

- **24. Polynesian-born Population.** The population of Polynesian birth in Australia in 1947 numbered 3,145 persons—1,526 males and 1,619 females—and formed 0.04 per cent. of the population. About 47.95 per cent. of the total consisted of persons born in Fiji. The number of persons of Polynesian birth in 1947 was 258 greater than in 1933, but, with a similar experience to that of the
- Asiatic-born and American-born, males decreased by 56 against an increase of 314 in females.
- **25. Population Born at Sea.**—At the Census of 1947 there were 977 persons who had been born at sea, as against 2,051 persons in 1933. The number in 1947 consisted of 465 males and 512 females, and represented a reduction of 520 males and 554 females in the fourteen years 1933—47.

CHAPTER XIV.

PERIOD OF RESIDENCE IN AUSTRALIA.

GENERAL SIGNIFICANCE OF PERIOD OF RESIDENCE STATISTICS.

1. Objects of Inquiry.—Prior to the Census of 1901, inquiries relative to Period of Residence had been made only on rare occasions in connexion with any State Census in Australia. The chief reason for the introduction of the Period of Residence inquiry at the Census of 1901 was the value placed on the information for old-age pension purposes, since the legislation passed by some of the States provided for a minimum period of residence, amounting in certain cases to as much as 25 years. The Commonwealth Invalid and Old-age Pensions Act 1908, which superseded the Acts in operation in the various States, fixed the minimum qualifying period of residence in Australia at 20 years.

In addition to their use for old-age pension purposes, period of residence statistics furnish valuable evidence of the permanency of the migration from overseas. They afford a measure of the degree of stability of that part of a country's population which is derived from without its borders. The stability of the native-born population may be measured by comparison of numbers by age from one Census to the next, with allowance made in the comparison for births and deaths. It will be found from an inspection of the table in Section 4 below that in 1947 nearly 80 per cent. of the total overseaborn population in Australia had resided in the country for 20 or more years.

2. The Form of Inquiry.—At Censuses prior to that of 1933, the wording of the form of inquiry referred to "Length of Residence". In order to avoid even a possible ambiguity in the meaning of the word "Length" (some people taking it to mean linear measurement!), the wording used at the 1933 and 1947 Censuses was "Period of Residence". The Length of Residence questions on the "personal" slip at the Census of 1921 were (1)

"Give date of arrival in Australia: Day...... Month....... Year........." and (2) "State number of completed years of residence in Australia: years." Where the two replies were not in accord, the general practice was to accept the period of residence computed from the date of arrival in Australia. Similar particulars were required at the Census of 1911, but in 1901, the first occasion on which Period of Residence was dealt with, each State asked for the period of residence within its own boundaries. The instructions in the 1933 Census Schedule required each person not born in Australia to write the "number of complete years of residence in Australia, ignoring temporary absences". In 1947 the word "complete" was omitted but the further instruction was added that those persons who were resident less than one year should write "0".

3. Unspecified Period of Residence and Birthplace.—Included in the recorded population of Australia at the Census of 1947 were 6,835,171 persons born in Australia and 744,187 persons born elsewhere than in Australia. Persons who failed to state their birthplace were assigned birthplaces at the coding stage, as mentioned in the "Birthplace" Chapter. Of the 744,187 persons constituting the population from oversea, 21,570, or 2.90 per cent., failed to indicate their period of residence in Australia. The marked improvement in 1933 and 1921 (2.97 and 3.09 per cent. respectively) over 1911 (5.27 per cent.) has thus been maintained. The percentages for the 1933 and previous Censuses relate to persons who actually specified their birthplace.

In preparing the Census data for analysis in the present chapter, persons with unspecified period of residence have been distributed proportionately.

PERIOD OF RESIDENCE.

4. Comparative Results at Censuses 1911 to 1947.—The numbers and percentage distribution of the oversea-born population according to period of residence in Australia at each of the

Censuses from the commencement of collection of these particulars are shown in ten-yearly groups in the following table:—

OVERSEA-BORN POPULATION ACCORDING TO PERIOD OF RESIDENCE IN AUSTRALIA, NUMBERS AND PERCENTAGE DISTRIBUTION, CENSUSES, 1911 TO 1947.

It will be observed that, despite the broad groupings adopted, the distribution at each Census was highly irregular for both males and females. This variability is due to the large fluctuations that have occurred in the stream of migrants during the course of Australian history. Although exact comparisons are not practicable owing to the differing intervals between successive Censuses, the abnormalities of one Census can be seen to re-appear at the following Census in the next higher group. They tend, however, to disappear as their size is reduced by mortality. The effect of the 1939-45 War and the non-resumption of assisted migration after the depression is seen in the relatively low proportion of immigrants recorded in 1947 with less than ten years' residence. This group is of interest in that it contains immigrants of varying degrees of assimilation and permanency of settlement in the Australian community. In 1947 this element formed only slightly over 10 per cent., for both males and females, of all oversea-born, compared with over 30 per cent. in 1921, when the proportion in this group was the highest of the four Censuses. Relatively low numbers were also recorded in the group resident 10-19 years, which was affected adversely by the depression of the early 1930's. For both sexes, those resident 20 years or more were

nearly 80 per cent. of the total, compared with proportions of about 70, 50 and 55 per cent. at the respective Censuses of 1911, 1921 and 1933. In 1947, therefore, the immigrant population was comprised predominantly of permanent settlers of long standing. Except for the low proportions in the shorter durations of residence arising from the decline in immigration during the preceding two decades, the 1947 distribution follows the shape that would result from a continuing flow of immigration, the maximum proportion in the group resident 20–29 years falling progressively as mortality takes effect.

The differences between the distributions for males and females are of interest. Females have, with few exceptions, been relatively less than males for each of the ten yearly periods less than 40 years, reflecting the preponderance of males amongst immigrants. The higher proportion in 1947 for the resident group 10–19 years is probably explained by a greater loss of males through deaths on war service and also from the emigration from Australia that accompanied the depression. For practically all periods from 40 years onwards, females are proportionately more numerous than males owing to their greater longevity.

5. General View of Results in 1947.—The period of residence data obtained at the Census of 1947 have been tabulated by age, birthplace, nationality and race. Each of these cross-classifications is available for metropolitan, urban provincial and rural divisions of each State and Territory, but on account of limitations of space these double entry tables have been published in the Detailed

Tables of the Census, Part XIII., pp. 755–782, without distinguishing divisions. Period of residence in relation to birthplace, nationality and race is discussed in the respective Chapters dealing with those subjects.

The following table gives, for each period of residence specified up to 70 years and over, the numbers of oversea-born enumerated in the States and Territories at the Census of 1947:—

OVERSEA-BORN POPULATION ACCORDING TO PERIOD OF RESIDENCE IN AUSTRALIA, 30th JUNE, 1947.

The results published in this table show that the two quinquennial periods of arrival preceding the 1947 Census (1942–47 and 1937–42) contributed 42,909 and 40,900 persons, or 5.77 and 5.50 per cent. respectively, of the total oversea population in Aus-

tralia. This makes the contribution for the decennial period of arrival (1937-47) 83,809 persons, or 11.27 per cent. of the total oversea population in Australia. As previously mentioned, these figures illustrate the relatively low level of immigration into Australia

in recent years. The corresponding figures for the earlier period 1932-37 were 27,150 persons and 3.65 per cent., which were abnormally low as a result of the depression in the early part of the period. In contrast, the decennial period 1917 to 1927, despite the inclusion of war years, contributed 243,947 persons, representing 32.78 per cent. of the oversea-born population, and the preceding period 1907 to 1917 only a slightly lower total of 207,844 persons or 27.93 per cent. In any comparison of the number contributed within different periods it must be borne in mind that, the more remote the decennium, the greater the reduction effected by death in the number originally contributed. Records of the number of deaths of persons who were born outside Australia classified according to period of arrival in Australia are not available for recent years, but in the Report on the 1933 Census it was indicated, as illustrating the effect of mortality, that of the number arriving before 1903, 444,996 persons were enumerated at the Census of 1921 compared with only 260,574 at the Census of 1933, a decrease of approximately 180,000 persons in the twelve years. Statistics available showed that by the 1933 Census

death had accounted for about 171,000 persons, or 95 per cent. of that number. Another point to be remembered, in considering the figures for the latest quinquennial period of arrival under review. is that the number from overseas resident less than one year includes a large proportion who have come to Australia temporarily, such as crews of vessels, travellers, tourists, etc. Some idea of the extent of this migration is afforded by the numbers classified separately in the "migratory" group, which relates to persons enumerated on board ship, train or aircraft. Of the total of 25,340 males shown as arriving during the period 1942 to 1947, 7,291 were classified as migratory, while of the 17,569 females who arrived during the same period only 878 were included in the migratory group. In addition, of course, there would be other persons whose stay would be transitory but who have not been shown in the migratory group as they had already disembarked in Australia.

The next table shows the percentage distribution of the oversea-born population in each State and Territory over period of residence groups:—

The figures in the foregoing table disclose that 22.42 per cent. of the total oversea-born population, and about the same proportion of males and females separately, had resided in Australia for less than twenty years at the date of the Census. The corresponding figure at the Census of 1933 was 45.51 per cent. The relative proportions that had been resident less than ten years in Australia were 11.27 per cent. in 1947 and 25.47 per cent. in 1933, which reflects a much lower rate of immigration in the later The largest proportions resident under twenty years in Australia that were recorded in any State or Territory in 1947 were in the Northern Territory and in the Australian Capital Territory, amounting to 40.62 and 34.42 per cent. respectively of the total oversea-born in those Territories. Victoria followed with 24.89 per cent., while the lowest proportion under 20 years was 16.00 per cent. in Queensland. Taking the decennial periods separately, the largest proportion of the overseaborn population in all States, except Queensland, and in the Territories was contributed in the ten years 1917 to 1927 or between 20 and 29 years prior to the Census. When the higher rate of mortality amongst the older ages is taken into account this result is of greater significance than might at first appear. The maximum recorded in Queensland was in the ten years 1907 to 1917. In this period also, the proportions in the other States ranked next highest after those of the period 1917 to 1927 and if allowance is made for the greater reduction by mortality the proportions contributed in these two periods would be seen to be very close for all States other than Queensland, where the excess of immigrant population from the earlier period would be greater than shown by the table.

It will be noticed from the table above that while the "periods of residence" are similar to those employed in previous Census reports, the "periods of arrival" are different owing to the postponement of the last two Censuses till 1933 and 1947 respectively. The following table has been arranged to preserve continuity in the "periods of arrival":—

OVERSEA-BORN POPULATION OF AUSTRALIA ACCORDING TO PERIOD OF ARRIVAL IN AUSTRALIA: PERCENTAGE DISTRIBUTION, CENSUSES, 1911 TO 1947.

		100.00	100.00	100.00	100.00

(a) Period 1931-33 only.

This table readily shows how the survivors of each "period of arrival", with occasional exceptions, diminish in numbers at each successive Census. This decrease is most marked in the "periods of arrival" prior to 1891. This is undoubtedly due to the heavier mortality rate in the older ages. The percentages are peculiar in some instances inasmuch as the figure for the period 1901 to 1911 in 1933 is greater than that in 1921, while for both the periods 1921 to 1931 and 1911 to 1921 the percentage surviving in 1947 is greater than that shown at the previous Census. In the case of the period 1901 to 1911, this

may have been due to the effect of the 1914–18 War. Of the large number of the oversea-born population who departed on active service many may not have returned until after 1921, while the 1933 results may possibly have been affected by emigration during the depression of oversea-born persons who may subsequently have returned to Australia.

6. Period of Residence and Age.—Particulars of period of residence in conjunction with age

were tabulated in single years of residence and single ages, but owing to limitations of space these detailed results have not been published. A classification of the data in groups for both period of residence and age for the sexes, separately and combined, will be found for Australia and the States and Territories in the Detailed Tables of the Census, Part XIII., pages 762–773. A summary of the data for Australia, showing specified periods of residence in conjunction with age groups of importance, is contained in the following table:—

OVERSEA-BORN POPULATION OF AUSTRALIA ACCORDING TO PERIOD OF RESIDENCE IN AUSTRALIA AND AGE, 30th JUNE, 1947.

7. Survivors in Australia from each Census, 1881 to 1933.—The period of residence data read in conjunction with the ages of the Australian-born furnish a close estimate of the number surviving in Australia from the population

recorded at any previous Census. This method has been adopted in the following table, which gives a comparison of the population at each Census between 1881 and 1933 with the respective survivors in Australia in 1947:—

SURVIVORS FROM CENSUSES 1881 TO 1933 ENUMERATED IN AUSTRALIAN POPULATION, 30th JUNE, 1947.

Census.	Po	pulation Record	ed.		d Number of Sur Census of 1947.	rvivors at	Ratio per cent. of Survivors to Number Recorded.			
	Males.	Females.	Persons.	Males.	Females.	Persons.	Males.	Females.	Persons.	
3rd April, 1881	1,214,913	1,035,281	2,250,194	184,734	233,923	418,657	15.21	22.60	18.61	
5th April, 1891	1,705,835	1,471,988	3,177,823	472,053	548,574	1.020,627	27.67	37.27	32.12	
31st March, 1901	1,977,928	1,795,873	3,773,801	831,745	933,165	1,764,910	42.05	51.96	46.77	
3rd April, 1911	2,313,035	2,141,970	4,455,005	1,329,232	1,403,440	2,732,672	57.47	65.52	61.34	
4th April, 1921	2,762,870	2,672,864	5,435,734	1,969,049	2,050,783	4,019,832	71.27	76.73	74.14	
30th June, 1933	3,367,111	3,262,728	6,629,839	2,828,056	2,861,253	5,689,309	83.99	87.70	85.81	

These figures show that only 18.61 per cent. of the population enumerated at the Census of 1881 survived in Australia at the Census of 1947. corresponding proportions per cent. surviving from succeeding Censuses were—1891, 32.12; 1901, 46.77; 1911, 61.34; 1921, 74.14; and 1933, 83.81. In other words, 81.39 per cent. of the 1881 population died or departed from Australia in the succeeding 66 years, 67.88 per cent. of the 1891 population in the succeeding 56 years, 53.23 per cent. of the 1901 population in the succeeding 46 years, 38.66 per cent. of the 1911 population in the succeeding 36 years, 25.86 per cent. of the 1921 population in the next 26 years and 16.19 per cent. in the last 14 years under review. The female survivors from each Census specified were proportionately higher than the male survivors.

8. Eligibility for Age Pensions.—Under the law as existing at the time of the Census, the age qualification for age pensions was 65 years for males and 60 years for females, with a residential qualification of 20 years for both sexes.

The number of males in Australia 65 years of age and over at the Census of 1947 was 282,271, of whom 279,103, or 98.88 per cent., had the requisite residential qualification. The number of females 60 years of age and over was 492,370, of whom 485,929, or 98.69 per cent., were qualified by residence. By combining the males and females of the ages stated, it is shown that of 774,641 persons qualified by age, 765,032, or 98.76 per cent., had the

necessary residential qualification. The percentages having the residential qualification have increased since 1933, when they were 98.28 for males, 97.13 for females, and for persons 97.58. In these calculations the "adjusted" Census results have been used, as a graduation or other correction for age mis-statements is not available for age data in association with period of residence.

The term "eligible" as employed in this Section refers only to age and period of residence, as no statistics were available regarding the number of persons rendered ineligible by the financial provisions of the Act. Again, no attempt has been made to include full-blood aboriginals in the eligible population, although these persons under certain conditions are so regarded by the Act, nor to include persons born in New Zealand who are eligible for Australian age pensions under a reciprocity agreement made with New Zealand in 1943.

9. Comparison of Age Pensioners with Eligible Persons.—In the following table giving a comparison between the eligible population and age pensioners in each State and in Australia, age pensioners in benevolent institutions, the numbers of whom are not available separately from invalid pensioners, are excluded. References will be found in the preceding Section to certain classes of persons who are eligible for age pensions but who are not included in the number of eligible persons shown below.

AGE PENSIONERS AND ELIGIBLE PERSONS, 30th JUNE, 1947.

Australia	279,103	485,929	765,032	103,747	186,426	290,173	37.17	38.36	37.93	

(a) Represents all males 65 years and over and all females 60 years and over, less the oversea-born population of those ages resident in Australia less than 20 years. (b) See letterpress. (c) Includes Australian Capital Territory. (d) Includes Northern Territory.

From the foregoing table it will be seen that Western Australia, with 43.48 per cent., had the highest ratio of pensioners to eligible population, followed in order by Tasmania with 42.09 per cent., New South Wales with 40.56 per cent., Queensland with 39.19 per cent., South Australia with 35.92 per cent., and Victoria with 32.97 per cent. A com-

parison of the ratio per cent. of pensioners of each sex discloses a higher rate per cent. for females in each State, the Australian ratios being 37.17 per cent. for males and 38.36 for females.

A comparison of age pensioners with eligible persons for Australia as a whole for the last four Censuses is shown in the next table:—

AGE PENSIONERS AND ELIGIBLE PERSONS IN AUSTRALIA, CENSUSES, 1911 TO 1947.

	Census.		Number	Number of Eligible Persons.(a) Number of Age Pensioners.(b) Ratio per cent. of Eligible Pe				cent. of Pen ligible Person

1347	• •	••	219,100	400,525	100,002	105,141	100,420	290,110	91.11	30.30	'

(a) Represents all males 65 years and over and all females 60 years and over, less the oversea-born population of those ages resident in Australia less than 20 years. (b) See letterpress.

It may be noted that until April, 1943, the qualifying age for males in cases of incapacitation was reduced to 60 years. Males 60 to 64 years were, however, excluded from those shown as eligible at the Censuses concerned. This course was adopted owing to the very limited application of the Act to such males, the inclusion of whom as eligibles would have resulted in considerable understatement of the ratio of pensioners to eligibles.

From 1911 to 1947 eligible persons increased by 231.02 per cent., as compared with an increase in total population of only 70.13 per cent. During the intercensal period 1911–21 the increase in eligibles was 34.30 per cent. and in population 22.01 per cent. From 1921 to 1933 the eligible persons increased by 70.86 per cent. while the population increased by only 21.97 per cent. The corresponding increases between 1933 and 1947 were 44.26 and 14.32 per cent.

It will be seen from the foregoing results that the major cause of the large increase in age pensions in recent years has been the changed age composition of the population. However, other factors have contributed to this increase, as is shown by the higher ratio of pensioners to eligible persons. Of

these factors, the modification of income and property provisions determining eligibility for pension and the economic pressure of higher cost of living may be mentioned. In addition, the totals for age pensioners in 1947 include some 30,000 invalid pensioners who had qualified for age pensions and had been transferred to the list of age pensioners in 1940.

A comparison of the ratio per cent. of male pensioners with that of female pensioners discloses a higher rate for males in 1911, 1921 and 1933, but in 1947 the female ratio was higher. From 1911 to 1921 the rate for males fell from 34.55 per cent. to 33.15 per cent., but rose to 36.46 and 37.17 per cent. in 1933 and 1947 respectively. On the other hand, the female rate had risen from 29.33 per cent. in 1911 to 32.62 per cent. in 1921, and in 1933 had declined to 31.16 per cent. However, a sharp rise during the intercensal period 1933-47 brought the female ratio to 38.36 per cent., the highest recorded for either sex at the last four Censuses. The ratio per cent. for males and females combined rose from 31.57 in 1911 to 32.83 per cent. in 1921, to 33.27 per cent. in 1933 and to 37.93 per cent. in 1947.

PERIOD OF RESIDENCE AND LOCATION.

10. Metropolitan Population.—In Chapter XIII., "Birthplace", reference is made to the tendency of the oversea-born population of Australia to congregate in the capital cities to a relatively greater extent than the Australian-born. A comparison of the following tables with the corresponding ones for previous Censuses shows that while the tendency for an increasing proportion of new migrants to become residents of metropolitan areas

ceased to operate between 1921 and 1933, it had become increasingly evident by 1947. Between 1911 and 1921, the proportion of migrants of less than ten years' residence in Australia who were recorded in metropolitan areas increased from 45.01 per cent. to 54.29 per cent. Although by 1933 the proportion had fallen to 49.32 per cent., it rose to 63.79 per cent. by 1947.

The foregoing results show that 60.92 per cent. of the oversea-born population were enumerated in the capital cities in 1947. The corresponding proportion of the Australian-born at the same date was 49.61 per cent., and of the total population 50.72 per cent. For comparability, these proportions have been based on the respective total populations inclusive of the migratory element. With one slight exception at 10–14 years, the percentage of males

in the metropolitan areas of Australia as a whole was lower throughout the period of residence groups than the percentage of females.

11. Urban and Rural Population.—The distribution per cent. of the oversea-born population, excluding the migratory group, in urban and rural divisions of Australia in 1947 is shown in the next table for the period of residence groups adopted for the preceding tables:—

OVERSEA-BORN POPULATION ACCORDING TO PERIOD OF RESIDENCE IN AUSTRALIA: PERCENTAGE DISTRIBUTION IN URBAN AND RURAL DIVISIONS, 30th JUNE, 1947.

Of the total oversea-born population, 75.30 per cent. were in the urban (metropolitan and provincial) areas. The corresponding proportion of the

Australian-born in urban areas in 1947 was 68.17 per cent.

CHAPTER XV.

NATIONALITY.

CENSUS STATISTICS OF ALLEGIANCE.

1. Information from Earlier Censuses.—Prior to the Census of 1921 no attempt had been made in Australia to ascertain the nationality or allegiance of the population, except to determine whether a person was or was not a British subject. At the 1911 Census, however, in the case where a person was a British subject by parentage, the letter "P" was required to be inserted in the Personal Card, and where by naturalization the letter "N". In addition, in order to complete the record of persons of British nationality, persons born in British possessions were in tabulation classified as British subjects by birthplace, while foreign-born wives of British subjects were tabulated as British subjects by naturalization.

At the 1921 Census, all persons were asked to state their nationality, and also the qualification by which it had been attained—whether by birthplace, parentage, or naturalization.

At the Census of 1933, however, all persons were asked to state the nationality to which they belonged only in such terms as "British", "French", "U.S.A.", etc. The omission of any inquiry as to

the nature of the qualification determining nationality was dictated by the expediency of pruning some questions in the schedule in order to permit the elaboration of others and the inclusion of new questions.

2. Form of Inquiry in 1947.—In 1947 all persons were asked to state their nationality in relation to the country to which they owed legal allegiance and, where applicable, to indicate if they were naturalized British subjects. The particulars of naturalization were not tabulated but were collected primarily to ensure that persons in this category would describe themselves correctly as British nationals.

Details of the total population, with the distribution of individual nationalities throughout the urban and rural divisions of the States and Territories, will be found in the Detailed Tables of the Census, Part XIV. The particular Local Government Areas in which they were distributed on the night of the Census will be found in Parts I. to VI. Particulars for the Territories are given in Part VII.

NATIONALITY OF THE PEOPLE.

3. British and Foreign. — (i) Australia, Censuses, 1911 to 1947.—The following table shows the number and percentage of British and foreign nationals recorded in Australia at successive Censuses from 1911 to 1947. At the Censuses of 1911 and 1947 persons who did not state their nationality were, at the coding stage, assigned a definite nationality on the basis of any other information on the Census Schedule, while for uniformity in the

table below "Not stated" nationalities returned in 1921 and 1933, which were coded and tabulated as such, have been distributed proportionately over the two nationality groups. In order to maintain uniformity with the totals shown in Chapter XIII., Birthplace, for Australian-born in 1921 and 1933, all persons of unspecified nationality so assigned to British nationality have been regarded as having been born outside Australia.

This table reveals the predominantly British character of the Australian population. The percentage of British subjects to total population was 98.90 in 1911 and 99.49 in 1947. The increase since 1911 has occurred almost entirely in the male British population, which in 1911 represented 98.15 per cent. and in 1947, 99.23 per cent. of all males. Since the figures were first recorded in 1911 the proportion of female British subjects in the population has changed very little from 99.7 per cent.

An important feature of the changes between 1911 and 1947 has been the increasing proportion of Australian-born persons recorded in the British population at each Census. During this period the percentage of the total British subjects who were Australian-born increased from 83.72 to 90.64, and the proportion of other natural-born British subjects consequently declined.

The remainder of the British subjects recorded at the various Censuses, comprising persons who acquired British nationality by virtue of naturalization or marriage, are only a relatively small element in the community, and particulars have not been recorded separately since the 1921 Census, when they numbered 45,745 persons. The corresponding total at the time of the 1947 Census would probably be in the region of 70,000 or 80,000 persons, representing approximately 1 per cent. of the total population.

The number of persons recorded as owing allegiance to foreign countries in 1947 was 1 in every 196 persons (0.51 per cent.)—1 in every 130 males and 1 in every 403 females, compared with more than double that proportion of male aliens, and about the same proportion of female aliens, in 1911.

It should be borne in mind that the figures given above for foreign nationals include a number of persons not belonging to the permanent population of Australia, as referred to in the following sub-section.

(ii) Urban and Rural Divisions, Australia, 1947.—

The following table shows the nationality of all persons recorded at the 1947 Census, together with their distribution throughout Australia in metropolitan, urban provincial, and rural areas respec-In addition to the persons of foreign nationality in the areas mentioned, 1,928 males and females are included under the heading "Migratory" population which comprises all persons who spent Census night on ships, railway trains or aircraft. Foreigners in the migratory population were enumerated mainly on oversea ships and generally form no permanent part of the Australian community. Consequently, in order to indicate more precisely the foreign element in the Australian population, non-residents on ocean-going ships in Australian waters should be excluded. Passengers on board oversea ships have not been distinguished from members of the crews in the various Census tabulations, nor are particulars of the nationality of persons on oversea ships available separately from those of persons on vessels engaged in interstate traffic, on railway trains or on aircraft, who are more likely to belong to the permanent population. It is practicable, therefore, to adjust the Census figures for aliens only by omitting the entire alien element Particulars of each the migratory group. nationality comprised in this group are given in the following table and the effect of their exclusion from the figures for foreign nationals will be shown in subsequent tables.

NATIONALITY OF POPULATION IN URBAN AND RURAL DIVISIONS, 30th JUNE, 1947.

(iii) States and Territories, 1947.—The following tables show the number and percentage of males and females of British and foreign nationalities in each of the States and Territories, together with particulars of individual foreign nationalities after excluding those in the Migratory group, who have been

omitted because they do not in general belong to the permanent population. The figures, however, still include a number of persons of non-European race who had been admitted temporarily to Australia under exemption certificates for business, educational or other purposes.

The relation of the number of foreign males, excluding the migratory element in each case, to total males, in each State and Territory and in Australia as a whole was—New South Wales, 1 in 150; Victoria, 1 in 122; Queensland, 1 in 158; South Australia, 1 in 224; Western Australia, 1 in 70; Tasmania, 1 in 691; Northern Territory, 1 in 47; Australian Capital Territory, 1 in 246; Australia, 1 in 139. For females, the corresponding numbers were—New South Wales, 1 in 368; Victoria, 1 in 340; Queensland, 1 in 569; South Australia, 1 in 784; Western Australia, 1 in 306; Tasmania, 1 in 4,124; Northern Territory, 1 in 268;

Australian Capital Territory, 1 in 651; Australia, 1 in 405.

These results show that, in relation to the populations of the several States, the foreign element was greatest in Western Australia and least in Tasmania. In the Northern Territory, however, the proportion of foreign nationalities in the population was greater than in Western Australia, though the actual numbers were relatively small.

(iv) Foreign Subjects in Urban and Rural Divisions of States and Territories, 1947.—The next table shows the number of males and females of foreign nationality in the urban and rural divisions of each State and Territory of Australia:—

FOREIGN SUBJECTS IN URBAN AND RURAL DIVISIONS, 30th JUNE, 1947.

The number of foreign nationals, disregarding the migratory element, recorded in urban areas decreased between the 1933 and 1947 Censuses, but the decline was much greater in the rural areas where the number fell from 24,565 persons in 1933 to 10,256 persons in 1947. As the preceding table shows, however, the distribution of the foreign element between urban and rural areas at the 1947 Census varied widely in the various States and Territories. For Australia as a whole, Italian nationals, who formed the largest single group of foreign nationalities, were recorded

about equal proportions, whilst nationals of China, principally in the metropolitan and rural areas in Greece and the United States of America, the more numerous of the other foreign nationalities, were located mainly in the metropolitan areas.

4. British and Foreign Subjects According to Age.—The following table shows for four main age groupings the number of persons of British and foreign nationality—males and females separately—and the proportions which each nationality bore to the total:—

BRITISH AND FOREIGN SUBJECTS IN AUSTRALIA ACCORDING TO AGE: NUMBERS AND PERCENTAGE DISTRIBUTION, 30th JUNE, 1947.

Total				7,531,856	36,687	7,568,543	99.52	0.48	100.00	

It should be noted that in the table above persons in the migratory group who were born outside Australia have been omitted from both British and foreign nationalities. The totals and percentages shown, except the percentages for females, which do not change, differ, therefore, from the corresponding figures of those tables of the preceding section which relate to total population. In the case of foreign subjects the oversea-born comprise the whole of the alien element in the migratory population and

the results above are, therefore, comparable with those of the immediately preceding tables described as relating to foreign subjects exclusive of the migratory element.

5. Oversea-born Population according to Nationality and Period of Residence in Australia.—In the following table persons of British and foreign nationalities are classified according to period of residence in Australia at the date of the 1947 Census:—

The proportion of foreign nationals resident in Australia for less than five years was relatively high. For those with longer residence in Australia, the alien element has been reduced by naturalization, a necessary qualification for which is a minimum period of residence in Australia of five years.

Persons who had lived in Australia for five years or more but who were still of foreign nationality at the time of the Census numbered 22,054 males and 6,230 females, representing 5.66 and 2.01 per cent. respectively of all oversea-born males and females resident a similar period.

CHAPTER XVI.

RACE.

INTRODUCTION.

1. The Nature of Census Statistics of "Race."—At the outset of this Chapter it should be stressed that information regarding race collected at a census does not furnish a satisfactory indication of the ethnic constitution of a population. At best such information permits of only a partial classification of the ethnic groups in a community. An ethnic group may be defined as an aggregation of human beings with a genetic inheritance of physical and perhaps temperamental and other psychological characteristics common to them all, and whose general average combination of such characteristics is distinguishable from that of other ethnic groups.

The "races" so-called in the tables of this chapter and of Part XV., are named with a geographical rather than a truly ethnological description. Thus "Indian" to indicate "native of India" entirely ignores the fact that "India is more of a racial melting-pot than the United States". In other words, each racial group described in this fashion is a mixed group when viewed in the light of the hypothetical genetic types from which it is derived. The limitations of the Census data are further complicated by the necessity of combining as one group all persons of European origin, by classifying fullblood non-Europeans according to their commonly recognized rather than their scientific groupings and by the incompleteness of the returns covering the aboriginal population. Census statistics of "race" cannot, therefore, answer fully the questions which interest the anthropologist and ethnologist, but they do possess great utility for the purposes of governmental administration and other practical purposes.

2. The Scope of Inquiry.—Information relating to the racial composition of the population was collected for the first time at the Census of 1911. At that and each succeeding Census the population has been classified under three broad groupings, "European", "Full-blood non-European" and "Half-caste non-European", and, in the case of non-Europeans, according to individual races so far as information could be obtained. The form of inquiry at the 1947 Census, for example, was: "For persons of European Race, wherever born, write 'European'. For non-Europeans state the race to which they belong, for example, Aboriginal, Chinese, Negro, Afghan, etc. If the person is half-caste with one parent of European race write

also 'H.C.', for example, 'H.C. Aboriginal', 'H.C. Chinese', etc. The complementary instruction was: "In the case of a person both of whose parents are non-European but of different races, state the race of that person's father (and do not add 'H.C.')."

It may be noted that, as the essential distinction is between European and non-European races only, those having European blood to the extent of onehalf have been classed as half-castes.

3. Aboriginal Population. — No full-blood Australian aboriginals have been included in the tables of Part XV., "Race", of the Detailed Tables of the 1947 Census, because the Commonwealth Constitution (Section 127) provides that "In reckoning the numbers of the people of the Commonwealth, or of a State or other part of the Commonwealth, aboriginal natives shall not be counted". However, at the Census of 1947, as at previous Censuses, collectors were instructed to ascertain as fully as possible, by means of the ordinary schedule, detailed information concerning full-blood Australian aboriginals who were civilized or semi-civilized, and who were either in employment, or living in reserves, camps, etc., in proximity to settlements. A total of 23,869 full-blood aboriginals, comprising 12,688 males and 11,181 females, was actually recorded by means of the Census Schedule. The distribution of these fullblood aboriginals by States and Territories was as follows:-New South Wales-males 546, females 407; Victoria—males 100, females 108; Queensland -males 3,504, females 2,822; South Australiamales 259, females 205; Western Australia-males 2,664, females 2,269; Northern Territory—males 5,615, females 5,370.

The Protectors of Aborigines throughout Australia were asked to furnish estimates of the total number of full-blooded aboriginals, including those living in a nomadic state, in their States and Territories at the time of the Census, and the information supplied was as follows:—New South Wales, 953; Victoria, 208; Queensland, 9,100; South Australia, 2,139; Western Australia, 20,338; and Northern Territory, 13,900; or a total for Australia of 46,638. It should be remembered, however, that it is almost impossible to obtain reliable estimates of the numbers of aboriginals living beyond the confines of civilization in certain areas of Australia.

The Commonwealth Attorney-General's Department has given an opinion that persons of the half-blood are not "aboriginal natives" for the purposes of the Constitution, and *a fortiori* that persons of less than half aboriginal blood are not aboriginal natives. In the results dealt with in this Chapter, and tabulated in detail in Part XV. of the Detailed Tables of the Census (pp. 823–868), half-caste aboriginal natives have been included.

The principle followed in classification is that persons having a preponderance of aboriginal blood are regarded as full-blood, those of half aboriginal and half European blood as half-caste, while those having aboriginal blood to a degree less than one-half, and European blood to a degree greater than one-half, have been dealt with as of European race.

EUROPEANS AND NON-EUROPEANS.

4. Numbers in each State and Territory.— The distribution among the various States and Territories of the three main racial groups of the population at the 1947 Census is shown below:—

RACIAL GROUPS OF THE POPULATION, 30th JUNE, 1947.

Half-caste	• •	12,672	2,051	9,749	2,407	5,082	303	1,364	106	33,734
Total		2,984,838	2,054,701	1,106,415	646,073	502,480	257,078	10,868	16,905	7,579,358

The numbers of non-Europeans recorded in 1947 were greatest in New South Wales and Queensland, but they were, nevertheless, still only a very small proportion of the population of those States. Full-blood non-Europeans formed only 0.26 per cent. of the total population of New South Wales and 0.75 per cent. of the total population of Queensland, while the corresponding proportions for half-caste non-Europeans were 0.42 and 0.88 per cent. respectively.

Included in these figures is a relatively large number of full-blood non-Europeans who do not belong to the permanent population of Australia but who were enumerated among the "migratory" population, that is, persons on board ships, trains and aircraft. The full-blood non-Europeans of this group were almost entirely crew working on ships in Australian waters at the date of the Census. While it is not possible to state the number of such

persons with accuracy, the procedure has customarily been adopted to treat full-blood non-Europeans born outside Australia who were enumerated in the migratory group as approximately representative of the non-permanent element. Of the States, Western Australia and Tasmania are relatively most affected by the exclusion of such persons, the numbers of full-blood non-Europeans recorded in those States being more than halved when ex-Australian-born persons of the migratory group are deducted.

It is important that the effect of the migratory population should be borne in mind when figures relating to non-Europeans, and particularly to individual non-European races, are used. Otherwise the results can be misleading. The results after excluding ex-Australian-born persons of the migratory group are shown in detail for each individual race in a table in Section 7 following.

5. Numbers in Census Years 1911 to 1947.—The following table shows the numbers of full-blood Europeans, full-blood non-Europeans and half-castes, as well as the percentage which each of

these categories represented in the total population (excluding full-blood aboriginals) at the Censuses from 1911 to 1947:—

As will be seen from the table, full-blood non-Europeans were 0.85 per cent. of the total population (exclusive of Australian aboriginals) in 1911, and 0.28 per cent. in 1947. It is to be noted, however, that in 1947 Torres Strait Islanders who were

previously classified as full-blood aboriginals were counted in the Census population for the first time. The effect on the results for non-Europeans of the inclusion of this group is referred to in more detail in the various relevant Sections which follow.

FULL-BLOOD NON-EUROPEANS.

6. Principal Full-blood Races.—A comparison of some of the more important races, from the aspect of numbers, is given in the next table:—

PRINCIPAL FULL-BLOOD NON-EUROPEAN RACES IN AUSTRALIA, CENSUSES, 1911 TO 1947.

		191	1.	192	:1.	193	3.	1947.	
Race.		Males.	Females.	Males.	Females.	Males.	Females.	Males.	Females.
Chinese		21,856	897	16,011	1,146	9,311	1,535	6,594	2,550
Indian(a)		3,201	98	2,743	138	2,216	188	2,278	202
Japanèse		3,281	208	2,546	194	2,007	234	108	49
Javanese		436	8	298	24	57	13	84	23
Malay		1,033	44	986	101	813	156	425	15 5
Polynesian (b)		2,130	394	1,787	602	1,185	562	2,840	2,492
Syrian		1,297	1,042	1,584	1,308	1,553	1,327	888	78 7
Other		1,698	166	1,246	261	1,167	456	1,390	630
Total		34,932	2,857	27,201	3,774	18,309	4,471	14,607	6,888

(a) Native of India. (b) Includes Fijians, Maoris and Papuans, and, in 1947, Torres Strait Islanders, who were previously classified as full-blood aboriginals and accordingly not counted in the Australian population.

The number of full-blood non-European persons recorded at the Census of the 30th June, 1947, including those on ships in Australian waters, was 21,495, of whom 14,607 were males and 6,888 females. Compared with the corresponding figures for 1933 these figures represent a decrease of 3,702 males (20.22 per cent.) and an increase of 2,417 females (54.06 per cent.), leaving a net decrease of 1,285 persons (5.64 per cent.).

In the results above the large increase recorded between 1933 and 1947 in the number of Polynesians was due mainly to the inclusion of Torres Strait Islanders for the first time in 1947. The most significant changes were relatively large decreases in the numbers of males of Chinese race and of Japanese and Syrians of both sexes. There was an increase of 1,015 in the number of Chinese females, of which

488 were in the Australian-born population. In 1947 full-blood non-Europeans in Australia were 56.88 per cent. of their number in 1911. Full-blood Chinese in 1947 were only 40.19 per cent. of their number in 1911.

7. Numbers in each State and Territory.— The following comparative statement shows the changes which have taken place in each State and Territory during the intercensal periods since 1911:—

FULL-BLOOD NON-EUROPEANS IN EACH STATE AND TERRITORY, CENSUSES, 1911 TO 1947.

Australia	 34,932	2,857	27,201	3,774	18,309	4,471	14,607	6,888

(a) Includes Torres Strait Islanders who were previously classified as full-blood aboriginals and accordingly not counted in the Australian population.

The comparison above shows that in all States and Territories, except in Tasmania, there was, since 1933, a decline in the number of full-blood non-European males. The presence of a relatively large migratory population was responsible for the increase recorded in Tasmania. It has been necessary for the sake of comparison with the results of the Census of 1911 to include the migratory group, but in the next and in some subsequent tables the ex-Australian-born element in this group (which, so far as full-blood non-Europeans are concerned, are almost entirely on ships, and for the most part form no part of the Australian community) is excluded.

Opposed to the sharp decline in the number of males the results show an increase in the number of full-blood non-European females in the larger States, the increase for Australia as a whole, after exclusion of the Torres Strait Islanders referred to in the footnote to the table above, being approxi-

mately 480, or 11 per cent. The number of full-blood non-European females who were born in Australia, exclusive also of Torres Strait Islanders, increased by approximately 270, so that, allowing for deaths, more than half the increase just referred to is due to the propagation of these races within Australia. The figures relating to females are not affected by the shipping population.

The next table shows the number of full-blood non-Europeans in each State and Territory after excluding those persons in the migratory group who were not born in Australia, and who have been treated as not properly belonging to the Australian community. Notwithstanding the exclusion of these persons, there are still included in the figures a number of persons who were not permanent residents of Australia, but who had been admitted temporarily for various reasons.

FULL-BLOOD NON-EUROPEAN RACES, 30th JUNE, 1947.

 $(E_{X}$ -Australian-born of Migratory Group Excluded.)

(a) Native of India.

(b) Includes Torre Strait Islanders.

Accepting the figures given above as representing the numbers of each of the main full-blood non-European ethnic groups as nearly as they can be ascertained, there were in Australia on the 30th June, 1947, 18,474 full-blood non-Europeans, of whom 11,595 were males and 6,879 females. These numbers represent 31 in every 10,000 males, 18 in every 10,000 females, and 24 per 10,000—0.24 per cent.—of all persons in Australia.

A feature in the figures presented above is the disparity between the number of males and females. Of the 18,474 full-blood non-Europeans included in the table, 62.76 per cent. were males. The only groups which show an approximate numerical equality between the sexes are the Polynesian and Syrian groups, the males representing respectively 52.67 and 52.99 per cent. of the total persons in each group. The Polynesians and Syrians, too, show a large proportion (95.18 and 44.56 per cent. respectively) of Australian-born.

The full-blood non-European element in each 1,000 of the population of the various States and Territories was in the following order:—Northern Territory, 32.85; Queensland, 7.28; Australia (average), 2.44; New South Wales, 2.21; Western

Australia, 1.32; Victoria, 1.08; South Australia, 0.76; Australian Capital Territory, 0.41; Tasmania, 0.33. It may be noticed that the highest proportions are in the Northern Territory and Queensland, both of which enter the tropics.

8. Numbers in Urban and Rural Divisions.

-The following table shows the number of fullblood non-Europeans of each race separately, recorded in the urban and rural divisions throughout Australia, and the number classed as "migratory". Excluding in this instance the total migratory group as not being a part of the permanent population of Australia, 41.5 per cent. of the full-blood non-Europeans were in the metropolitan divisions, 18.2 per cent. were in the urban provincial areas, and 40.3 per cent. were in the rural areas. Of the Asiatics (who represented 67.4 per cent. of the total). 57.2 per cent. were in the metropolitan areas, 19.9 per cent. were in the urban provincial areas, and 22.9 per cent. were in the rural areas. Of the Chinese-who represented over 67.9 per cent. of the Asiatics, and 45.7 per cent. of the total-64.4 per cent. were in the metropolitan areas, 19.2 per cent. were in urban provincial areas, and 16.4 per cent. were in the rural areas.

9. Ages of Full-blood Non-Europeans.—In reviewing the non-European population it is necessary to examine the changes which are taking place in its age constitution. The following table gives

a comparative statement of the number and proportion per cent. of males and females in four principal age groupings:—

FULL-BLOOD NON-EUROPEANS IN AUSTRALIA ACCORDING TO AGE: NUMBERS AND PERCENTAGE DISTRIBUTION, CENSUSES, 1911 TO 1947.

It has already been shown that, while the number of males declined from 1933 to 1947, the number of females increased. The figures given above show that the decline in the number of full-blood non-European males as a whole took place almost entirely in the age group 45-64, although there was a small reduction also in the numbers at ages 65 and over. If Torres Strait Islanders, who as already mentioned were included in the figures for the first time in 1947, are omitted, these declines are accentuated, while increases shown between 1933 and 1947 in the younger age groups are reduced. In particular, the number of full-blood non-European male children, disregarding the Torres Strait Islanders, remained practically unchanged between 1933 and 1947. The decrease in the numbers of males in the two older age groups applied to all the principal ethnic groups but was most marked in the case of the Chinese and Japanese. At ages under 45 years, the Japanese male population was virtually eliminated as a consequence of the recent war, while the numbers of males of Syrian race decreased also. Chinese males increased in number. In other cases the changes in the various age groups are of little significance, owing to the smallness of the numbers involved and the presence of the migratory population.

Again allowing for the effect of including Torres Strait Islanders in 1947, the figures relating to females shown in the table above indicate approximately no change in the number of female children, but an increase in the numbers in all the older age groups. Increases occurred in the number of female children of Chinese parents, but these were offset by decreases in the number of female children of other non-European parentage, principally Syrian. Chinese females aged 15 and upwards increased in number as between 1933 and 1947.

In regard to the decline in the number of males, it may be pointed out that the losses by deaths have not been compensated by natural increase because of the small number of full-blood non-European women. In the age group 15–44 there was approximately in 1911, 1 woman to every 15 men; in 1921, 1 to every 6; in 1933, 1 to every 3; and in 1947, 1 to every 2. The operation of the Immigration Act prevents any substantial immigration of women and in this way contributes to the emigration of males desiring marriage in their own race. The increase in the number of full-blood non-Europeans born in Australia suggests that those who are able to marry more than reproduce themselves.

The following table shows the numbers in age groups of males and females belonging to the races which are most numerously represented in Australia:—

Of all the full-blood non-Europeans in Australia, about one-fifth were within the tropics. Nearly 95 per cent. of those in the Northern Territory, over 40 per cent. of those in Queensland and nearly 20 per cent. of those in Western Australia were in tropical regions.

11. Full-blood Non-Europeans Born in Australia.—It has been shown that the total number of full-blood non-European males in Australia declined during the last intercensal period by 3,702, while the number of females increased by 2,417. The following table shows that the number of these people who were born in Australia increased by 4,456—an increase of 2,246, or 66.2 per cent., for

males, and 2,210, or 71.2 per cent., for females. As previously mentioned, particulars of Torres Strait Islanders were included in the Census figures for the first time in 1947. These Islanders, all of whom were Australian-born, were not coded separately, but according to an approximate count, they numbered 1,814 males and 1,937 females. Exclusive of this group, the Australian-born element in the full-blood non-European males increased from 18.5 per cent. in 1933 to 29.9 per cent. in 1947, and in the females it decreased from 69.4 per cent. to 68.2 per cent. Thus, taking the sexes together, the Australian-born element increased from 28.5 per cent. of the total in 1933 to 40.6 per cent. in 1947.

(a) Native of India. (b) Includes Fijians, Maoris and Papuans, and, in 1947, Torres Strait Islanders who were previously classified as full-blood aboriginals and accordingly not counted in the Australian population.

After exclusion of Torres Strait Islanders from the figures for 1947 in this table, for the reason already stated, it will be seen that during the period from 1933 to 1947 the Australian-born element in the full-blood non-European males increased from 23 per cent. in 1933 to 39.1 per cent. in 1947, and in the females it decreased from 69.5 per cent. to 68.3 per cent., so that, taking the sexes together, the Australian-born element increased from 33.8 per cent. of the total in 1933 to 48.9 per cent. in 1947.

12. Full-blood Non-Europeans Born outside Australia. — (i) Comparative Numbers,

Censuses, 1921 to 1947.—In the case of full-blood non-Europeans born outside Australia, the numbers recorded at the Census are affected considerably by the inclusion of non-Europeans in the migratory group, who were mostly on ships in Australian waters at the date of the Census and did not belong to the permanent population. In the following table showing the number and percentage of full-blood non-Europeans born outside Australia who were recorded at each of the Censuses, 1921 to 1947, the ex-Australian-born element in the migratory group has been deducted. Comparative figures for 1911 are not available.

FULL-BLOOD NON-EUROPEANS BORN OUTSIDE AUSTRALIA: NUMBERS AND PROPORTIONS, CENSUSES, 1921 TO 1947.

(Ex-Australian-born of Migratory Group Excluded.)

			1:	921.	1	933.		947.
	Sex.		Number.	Percentage of Total Full-blood Non-Europeans.	Number.	Percentage of Total Full-blood Non-Europeans.	Number.	Percentage of Total Full-blood Non-Europeans.
Males Females		 	19,769 1,162	86.84 30.89	11,364 1,365	77.00 30.55	5,955 1,566	$51.36 \\ 22.76$
Pers	ons	 	20,931	78.90	12,729	66.21	7,521	40.71

These results reveal successive decreases in the number of males who were both of oversea birth and full-blood non-European race, while the number of females increased. However, in both cases, they represented a much smaller proportion of all full-blood Europeans in 1947 than in 1921.

(ii) Birthplaces. — For the full-blood non-Europeans recorded at the 1947 Census, the country stated for race represented in the majority of cases the country of birth, as might be expected. The correspondence is greater if "race" is considered in relation to *continent* of birth. This relationship is shown in the following table, which refers to the races reviewed in the preceding section.

FULL-BLOOD NON-EUROPEANS BORN OUTSIDE AUSTRALIA ACCORDING TO CONTINENT OF BIRTH, 30th JUNE, 1947.

(a) Native of India.

(b) Includes Fijians, Maoris, Papuans and Torres Strait Islanders.

The migratory element has been omitted from the table above in order to avoid inflation of the numbers of persons resident for less than five years. Of the non-Europeans shown in the table, a large proportion was represented by residents of long standing. Males who had lived in Australia for

40 years or more, for example, formed 48.13 per cent. of all non-European males born overseas. Within this group, and at practically all the other periods of residence shown, Chinese were the most numerous of the individual races enumerated.

HALF-CASTE NON-EUROPEANS.

13. Principal Half-caste Groups in Australia.—Of the total half-caste non-Europeans in Australia at 30th June, 1947, 27,179, or 80.6 per cent., were half-caste Australian aboriginals. The corresponding percentage at 30th June, 1933, was 76.2. Of the total increase of 6,668 which occurred

between 1933 and 1947, 6,559, or 98.4 per cent., were half-caste aboriginals.

The next table shows the number of half-castes of the principal groups in Australia in Census years from 1911 to 1947. Although classed as half-caste non-Europeans, they are persons who have European blood to the extent of one-half.

(a) Native of India. (b) Includes half-caste Fijians, Maoris and Papuans, and, in 1947, half-caste Torres Strait Islanders who were previously classified as half-caste Australian aborlginals.

14. Numbers in States and Territories.— The following table gives the number of half-castes in each State and Territory at the latest Census in comparison with those at previous Censuses. Ignoring the Australian Capital Territory, where the numbers are small, the relative increases in the numbers of half-castes have been greatest in the States of Queensland, South Australia, Western

Australia and in the Northern Territory. During the latest intercensal period the number of half-castes in the Northern Territory increased by 70.5 per cent., in Western Australia by 37.8 per cent., in South Australia by 33.4 per cent., and in Queensland by 31.9 per cent., while for Australia as a whole the increase represented 24.6 per cent.

HALF-CASTE NON-EUROPEANS IN EACH STATE AND TERRITORY, CENSUSES, 1911 TO 1947.

Australia	. 7,592	6,962	9,154	8,462	14,027	13,039	17,525	16,209	

The number of half-caste non-Europeans in Australia at the Census of the 30th June, 1947, was 33,734, of whom 17,525 were males and 16,209 were

females. These figures represent an increase of 3,498 males and 3,170 females on the corresponding figures at the Census of 1933.

15. Numbers in Urban and Rural Divisions.—The following table shows the distribution of half-castes between the urban and rural divisions throughout Australia. Of the half-castes other than

Australian aboriginals, 36.96 per cent. were in capital cities, 20.90 per cent. in urban provincial areas, 41.10 per cent. in rural areas and 1.04 per cent. in the migratory group.

(a) Native of India.

(b) Includes half-caste Papuans and Torres Strait Islanders.

Details of the ethnic origin of the half-caste non-Europeans in each State and Territory as recorded at the Census of the 30th June, 1947, are given in the next table. In the case of half-castes it is not necessary to make the adjustment, such as was made in the case of full-bloods, to account for those on board ships in Australian waters.

(a) Native of India.

18. Half-castes Born in Australia.—Of the 33,734 half-caste persons in Australia in June, 1947, aboriginals are omitted, the proportion of Australia 33,154, or 98.28 per cent., were stated to have been born among the half-castes is 91.23 per cent.

born in Australia. If half-caste Australian aboriginals are omitted, the proportion of Australian-

⁽b) Includes half-caste Fijians, Maoris, Papuans and Torres Strait Islanders.

CHAPTER XVII.

RELIGIOUS CREEDS OF THE POPULATION.

NATURE OF THE INQUIRY.

- 1. Form of Inquiry.—Section 21 of the Census and Statistics Act 1905-1949 provides that "no person shall be liable to any penalty for omitting or refusing to state the religious denomination or sect to which he belongs or adheres," although for refusal to reply to any other inquiry contained in the Census Schedule a penalty of £10 is provided. the 1921 Census the question on the Personal Slip consisted merely of the word "religion" with a blank space following it for the insertion of the particulars. Of the 5,435,734 persons for whom particulars were received at the 1921 Census, 46,990 refused to state their religion and 45,990 persons gave no reply to the question on religion. At the 1933 Census the question on the Householder's Schedule and the Personal Slip read: "Religion.— State the full name of the religious denomination. There is no legal obligation to answer this question." Of the 6,629,839 persons for whom particulars were received at this Census, 848,948 gave no reply to the question on religion. The very large increase between 1933 and 1921 in the number of persons who apparently were unwilling to answer the inquiry is to be attributed to the explicit statement in the Householder's Schedule and Per-• sonal Slip in 1933 that an answer was not obligatory. In 1947 the question was framed in similar language to that used in 1933 and again a very large number of persons, namely 824,824 out of a total of 7,579,358 persons enumerated, failed to state their religion.
- 2. Adequacy of the Data.—Owing to the very large number of persons who failed to give any particulars regarding religion at the last two Censuses, and the varying percentages of such persons on the total population at each of the two Census dates, it is not possible to define precisely the composition of the population in terms of religious creed, or to make entirely satisfactory intercensal comparisons with the numbers of persons adhering to the various religious denominations.
- 3. Tabulation of the Results.—For convenience of compilation and review, the particulars about religious creeds have been divided into two main groups—Christian and Non-Christian—and a third group comprising Indefinite, No religion and No Reply. In Part XVI. of the Detailed Tables of the Census (see pp. 869-928), particulars are given for the principal denominations and sects in the first two of these groups. Including "No Reply", particulars are given under 44 headings. The detailed tabulations in Part XVI. give particulars of religion for each sex in conjunction with age and conjugal condition for Australia as a whole and for each State and Territory separately, and in conjunction with occupational status and occupation orders for Australia as a whole. In the same Part tables are also given showing the numbers of male and female adherents recorded in the metropolitan, urban provincial and rural areas of the several States and Territories and of Australia as a whole.

GENERAL VIEW OF RESULTS.

4. Population according to Religious Creeds.—The data relating to religions show that 6,672,936 persons, representing 88.04 per cent. of the total population, gave definite adherence to some Christian religion, and 36,562, or 48 per 10,000 of the population, were definitely stated to belong to some non-Christian sect; 18,708, or 25 per 10,000 persons, stated their religion in indefinite terms; 26,328, or 35 per 10,000 persons, stated definitely that they had no religion; and 824,824, or 1,088 per 10,000, failed to give any information as to their religious belief.

Of 6,672,936 persons included in the Christian group, 2,957,032, representing 44.31 per cent. of the Christian group and 39.01 per cent. of the total population, indicated adherence to the Church of England. Next in order of number of adherents was the Roman Catholic Church, with 1,569,726, consisting of 613,186 who described themselves on the schedules as "Roman Catholic" and 956,540 as "Catholic". It is presumed that the great majority of the latter were adherents of the Roman Catholic Church. Taken together these Catholics represented 23.52 per cent. of the Christian group, and 20.71 per

cent. of the total population. The adherents of the Methodist Church were the next largest group. At the previous three Censuses the numbers of Methodists recorded were slightly less than the numbers of Presbyterians, but in 1947 the Methodists recorded exceeded the latter by 127,885 persons. The total number of Methodists in 1947 was 871,425 persons, representing 13.06 per cent. of the Christian group and 11.50 per cent. of the total population. The number of Presbyterians recorded in 1947 was 743,540, representing 11.14 per cent. of the Christian group and 9.81 per cent. of the total population. Among the numerically smaller denominations were—Baptist, 113,527 persons, representing 1.50 per cent. of the total population; Church of Christ,

71,771 persons, representing 0.95 per cent. of the total population; Lutheran, 66,891 persons, representing 0.88 per cent. of the total population; Congregational, 63,243 persons, representing 0.83 per cent. of the total population; Salvation Army, 37,572 persons, representing 0.50 per cent. of the total population.

Of 36,562 persons included in the non-Christian group, 32,019, representing 87.57 per cent. of that group and 0.42 per cent. of the total population, were classified as Hebrew.

The following table shows the numerical distribution of the population according to religious creeds in the States and Territories of Australia:—

The next table shows the proportion which each religious creed bore to the total population. The table reveals some striking deviations amongst the State figures from the proportions for Australia as a whole. Amongst the numerically larger denominations the proportion of adherents of the Church of England in Tasmania was very high and in South Australia very low. The proportion of Roman Catholics in South Australia was also particularly low, and was highest in Queensland. Methodists were in great strength in South Australia

tralia and under-average in New South Wales, whilst there was a high proportion of Presbyterians in Victoria and a small percentage in South Australia.

Amongst the numerically smaller denominations, Baptist, Church of Christ, Congregational, Lutheran and Salvation Army were more strongly represented proportionally in South Australia than in any other State.

The proportion failing to reply was highest in South Australia and lowest in Western Australia.

The proportions of the adherents to each religious creed found in the several States and Territories are shown in the following table. Generally, but with some exceptions, the largest proportions of adherents are in the more populous States. Deviations from this order were occasioned by the weak representation of adherents of the Church of England, the Roman Catholic and Presbyterian

Churches in South Australia, and the very great strength of Methodism in that State. Other important exceptions to this rule are the Church of Christ, which is unusually strong in Victoria and South Australia, and the Lutheran Church, which has a relatively large membership in South Australia and Oueensland.

5. Census Comparisons, 1921 to 1947.— In Section 2 above it was pointed out that, because of the very large increase between 1921 and 1933 in the number of persons who apparently were unwilling to answer the inquiry as to religion, no really satisfactory comparison can be made between 1933 and previous Census years. It was hoped that by adopting a similar form of question in 1947 to that used in 1933 safe conclusions might be drawn as to relative changes in the numbers of persons adhering to the various denominations, but much

uncertainty still exists in the data available for comparison owing to significant variations in the proportions of those failing to reply (in the various States) at the two Census dates. The following table sets out for each of the three Census years from 1921 to 1947 the absolute numbers recorded, the proportion per cent. which the number in each category represented of the total number who answered the question, and the masculinity of each category.

RELIGIOUS CREEDS OF THE POPULATION: NUMBERS, PROPORTIONAL DISTRIBUTION AND MASCULINITY, AUSTRALIA, CENSUSES, 1921 TO 1947.

The greatest numerical increase amongst the denominations since 1933 was recorded by the Church of England, followed by the Roman Catholic Church. Methodist, Presbyterian and Church of Christ followed next in order.

Amongst the denominations with the largest number of adherents the greatest percentage increase was recorded by the Methodist Church, namely 27.40 per cent., followed by the Roman Catholic Church with 21.78 per cent. The Church of England increased by 15.28 per cent. and the Presbyterian Church by 4.25 per cent.

High proportional increases amongst the less numerous denominations were Hebrew, 35.98 per cent.; Seventh Day Adventist, 25.67 per cent.; and Salvation Army, 20.38 per cent.

The Christian group as a whole increased by 16.50 per cent., and the population by 14.32 per cent. It is interesting to note that the numbers failing to reply declined in 1947 by 2.84 per cent. compared with 1933. In assessing the relative increases in denominational totals since 1933 it should be remembered that proportionally to the total population the number of those failing to reply in 1947 was approximately 145,000 less than in 1933.

6. Masculinity of Adherents.—In the following table the masculinity figures for 1947 are shown for each State and Territory of Australia:—

MASCULINITY OF ADHERENTS OF RELIGIOUS CREEDS, 30th JUNE, 1947.

For Australia as a whole there were eight denominations in the Christian group with an excess of females, viz.:—Baptist, Roman Catholic, Church of Christ, Congregational, Methodist, Presbyterian, Salvation Army, and Seventh Day Adventist. Generally where there is an excess of females in the total results the excess is common to all States, though not to the Territories where the numbers involved are small. In the Roman Catholic

Church, although there is an excess of females in the aggregate, there is a predominance of males in Queensland and Western Australia in conformity with the high masculinity of the population of those States. Apart from the Hebrews the masculinity among the non-Christians is high because they consist mainly of Asiatic races, many of which have few female representatives in Australia.

CREED IN RELATION TO AGE, CONJUGAL CONDITION AND OCCUPATIONAL STATUS.

7. Religious Creed and Age.—In conjunction with religion all males and females were tabulated in quinquennial age groups. These particulars for Australia as a whole, and for each State and Territory, will be found in Part XVI. of the Detailed Tables of the Census, pp. 884–921.

In the following tables the results relating to age for the whole of Australia have been summarized in six groups. After adjustment for persons of unspecified ages, the numbers under the various denominations in these age groups were as follows:—

RELIGIOUS CREEDS AND AGES OF THE POPULATION, AUSTRALIA, 30th JUNE, 1947.

Amongst the more numerous denominations the Roman Catholic Church had the largest proportion of young persons under 20, namely 35.24 per cent., compared with 32.89 per cent. for Methodist, 31.58 per cent. for Church of England and 29.94 per cent. for Presbyterian. In the Christian group the highest

proportion of adherents under 20 was recorded in the Salvation Army, 40.59 per cent., and the least in Congregational, 28.76 per cent.

The proportions of the total population in each age group represented by the adherents of each religious creed are given in the following table:—

RELIGIOUS CREEDS AND AGES OF THE POPULATION: PERCENTAGE DISTRIBUTION, AUSTRALIA, 30th JUNE, 1947.

It is interesting to note that the proportion of no replies to the question on religion was particularly high in the youngest age group, and that it declined in each succeeding age group specified in the table, except that of 20 to 39 years.

8. Religious Creed and Conjugal Condition.—The conjugal condition of the adherents of the various religious denominations was tabulated for males and females separately for each State and Territory, and the result may be found in Part XVI. of the Detailed Tables of the Census, pp. 884-921.

The following table shows for Australia as a whole the number of persons belonging to each creed under the following headings:-(i) Never Married; (ii) Married; (iii) Widowed; (iv) Divorced; and (v) Conjugal Condition Not Stated. This table is followed by another in which the numbers of persons, omitting the "not stated", are reduced to percentages of the total number of adherents of each denomination.

RELIGIOUS CREEDS AND CONJUGAL CONDITION OF THE POPULATION, AUSTRALIA, 30th JUNE, 1947.

Note.—These results have been obtained by excluding all persons whose conjugal condition was not stated.

The most striking feature amongst the Christian group in the foregoing table is the high proportion of never married and consequently the low proportion of married persons amongst Roman Catholics, the Salvation Army and Lutherans.

9. Religious Creed and Occupational Status (including those "Not at Work").

—Details of the occupational status of males and females separately, and for both sexes combined,

for Australia as a whole in categories of religious creed will be found in Part XVI. of the Detailed Tables of the Census, pp. 922–926. Omitting those persons for whom occupational status was not stated and also children and others to whom the classification was not applicable, and so confining attention to those for whom the necessary information was definitely stated, the proportions under the principal categories were as shown below:—

RELIGIOUS CREEDS AND OCCUPATIONAL STATUS OF THE POPULATION IN THE WORK FORCE, PERCENTAGE DISTRIBUTION, AUSTRALIA, 30th JUNE, 1947.

The percentages show that of the males in the Christian group 8.04 per cent. were employers. The denominations in which a proportion of employers above the average was recorded were-Church of Christ, Congregational, Lutheran, Methodist, Presbyterian, and Seventh Day Adventist. denominations which had a percentage above the average of males who were engaged on their own account but who did not employ labour were— Lutheran, Methodist, Presbyterian and Seventh Day Adventist. The proportion of persons described as assisting but not receiving wages was particularly high among Lutherans. The proportion belonging to the wage-earning class was above the Christian

average among Baptists, Roman Catholics, Church of Christ, Church of England, Congregational, and Salvation Army.

Among the females in the Christian group Church of England, Lutherans and Presbyterians had a proportion of employers above the average. Church of England, Congregationalists, Lutherans, Presbyterians and Seventh Day Adventists had a proportion of females engaged "on own account" above the average for females in the Christian group, whereas female wage and salary earners were above the average among Baptists, Roman Catholics, Church of Christ, Congregationalists, Methodists and Salvation Army.

A comparison of the percentages given in the next table with similar results for the several States (see second table in Section 4 of this Chapter) will show that the following Christian denominations have a greater relative strength in the capital cities than in other parts:—Baptist, Roman Catholic, Church of Christ, Church of England, Congregational and

Salvation Army. The Lutherans have the smallest proportion of all Christian denominations in the capital cities, only 15.34 per cent. being recorded therein, whereas of the total population 50.72 per cent. was in the metropolitan areas. Almost 93 per cent. of the Hebrews were recorded in the metropolitan areas.

11. Census Comparisons, Metropolitan Areas, 1921 to 1947.—The following table permits a view of certain changes in the structure of the metropolitan population, in terms of religious creed, from 1921 to 1947. It will be seen that there has been considerable diversity in the growth of the various groups over the period. Only three groups — Lutherans, Methodists and Roman Catholics—showed a percentage increase greater than that of the Christian group as a whole, while the number of Congregationalists has actually

declined since 1921. Excluding no replies, Lutherans, Methodists and Roman Catholics were the only denominations which recorded larger proportions of the metropolitan population in 1947 than in 1921. Masculinity between 1921 and 1947 increased for all Christian denominations other than Congregational, Lutheran and Presbyterian. In all these comparisons, however, the weakness of the basis of comparison, referred to in earlier sections of this chapter, should be kept in mind.

CHAPTER XVIII.

INDUSTRY.

EXPLANATORY INTRODUCTION.

1. Significance and Complexities of Industrial and Occupational Statistics.— Statistics of the economic activities of the population derived from the Census are among the more important sources of information for the study of many problems associated with the national These statistics, in effect, furnish an inventory of the human resources of the country, showing the number and characteristics of persons engaged in economic production, their occupations, and their distribution among the branches of economic activity. Apart from their usefulness in providing quantitative information for tracing the course of economic development and for estimating unknown elements of the national income, industrial and occupational classifications are particularly valuable in the analysis of current data relating to the labour force, employment possibilities, unemployment, labour markets, and the placement and migration of workers.

As was pointed out in previous Reports, the collection and classification of the economic activities of the population are amongst the most complex of investigations that come within the ambit of the Census. The problem of classification is never completely solved. It is complicated by the development of new fields of industrial enterprise and by the splitting and overlapping of fields previously conventionally definable, by the emergence of new occupations, crafts and callings, by further specialization and division of labour, and by the growing social requirement for a more adequate and detailed knowledge of the facts of economic life.

After considering the different systems of classification of the gainfully occupied population, the Committee of Statistical Experts of the League of Nations in 1938 accepted the view, already expressed by other conferences of statisticians that, in order to obtain an adequate picture of the economic and social structure of the community, it is necessary to classify the occupied population in three ways, according to industry, occupation and occupational status. In 1933 the latter characteristic was referred to as "grade of occupation". It is important to stress the distinction between the statistical terms "industry" and "occupation", since the difference is not always sufficiently appreciated, the terms being frequently used as though they were synonymous. "Industry" in the statistical sense is defined as any single branch of productive activity, trade or service. It is concerned with the activities of persons, firms or businesses considered as a group, producing the same commodity or commodities, performing the same process or processes, or providing the same type of service. All persons engaged in any such sphere of economic activity are classified industrially as belonging to the particular branch in question, irrespective of their personal occupation within the industry, examples of which are: Building, Coke Manufacture, Goldmining, Poultry-raising, Medicine. "Occupation", on the other hand, is defined as the trade, profession, or type of work or service performed by the individual. The occupational classification of a person may be determined by reference among other things to the materials treated, the processes carried out, the conditions of work, or the experience, training and skill required. Examples of occupations are: Carpenter, Steward, Stoker, Moulder, Surgeon.

The distinction between the concepts lying behind the two terms is sharpened by keeping in mind certain important objects in classifying the population in its working capacity. One of the objects of classification by industries is to show the absolute and relative importance of the various branches of industry. The main object of classification by occupation is to secure a clearly-defined appreciation of the particular functions which persons in the community perform.

Occupational status refers to the classification distinguishing employers, persons conducting their own businesses, etc., without employing others, employees, and helpers not in receipt of salary or wage.

2. The Form of Inquiry at the Various Censuses.—The questions covering economic condition and status asked at the 1947 Census were identical with those asked in 1933, and were substantially similar to those asked in 1911 and 1921. In 1947 there was a re-arrangement in the form of the questions which provided at the head of the inquiry a separate column replies by the various types of persons not engaged in industry, such as pensioners, dependants, etc. Having completed the entry in this column no further "not applicable" entries were necessary to the questions regarding occupation, industry or occupational status. A question concerning income or earnings was inserted on the Census Schedule for the first time in 1933, but it was not repeated in 1947 as it was considered that more accurate statistics of income were available from the returns of income tax furnished to the Commissioner of Taxation. Whereas in 1911 and 1921 the question seeking information about the "industry' (as distinct from the "occupation") in which persons were engaged took the form of an inquiry as to "profession, occupation or craft", or to "occupation of present employer (if any)", in 1933 and 1947 the question specifically asked that, if the person were engaged in an "industry, trade or service", the reply should state the branch of the industry, trade or service. The question as to the craft or calling to which the person was attached, INDUSTRY.

if engaged in industry, trade or service, whether or not actually employed at such craft or calling at the time of the Census, was kept distinct. The replies to these two questions thus permitted not only the tabulation separately of data on "industry" and "craft" (which was not done at previous Censuses), but also permitted a better and more detailed classification than was hitherto possible. Instead, therefore, of the data on economic condition and status for 1933 and 1947 being confined to a single Part and to one Chapter of the Statistician's

Report (as were the data in 1911 and 1921), the detailed tables are spread over several Parts and their general significance examined in as many separate Chapters of the Report. The present Chapter in this Report is concerned with the data on industry.

The full form of the inquiry into economic condition and status in 1947, as set out with substantial identity on the Personal Slip and the Householder's Schedule, was as follows (see also Chapter II. for reproductions of the Census Schedule and Personal Slip):—

(13) OCCUPATIONAL STATUS.

(i) For those not engaged in an industry, business, trade or service who are—
Children not attending school, write "C."

Mainly dependent on pension or superannuation, write "P."

Inmates of institutions (e.g., for invalids and the aged, gaols, reformatories, &c.) write

(i) For those not engaged in an industry, business, trade or service who are—
Full-time students or so
Of independent means,
Engaged in unpaid hor
Others not engaged in the engaged in

Full-time students or scholars, write "S."
Of independent means, write "M."
Engaged in unpaid home duties, write "H.D."
Others not engaged in industry, &c., write
"N.A."

(ii) For those who are usually engaged in an industry, business, trade or service but out of a job at time of the Census—

Persons answering these questions must also answer questions (b) and (c) of Part (iii) below.

(a) State the period (in number of working days, or weeks, or months) since last working.

(b) If not at present actively seeking a job state reason exactly; for example, Sickness, Accident, On strike, Locked-out, Resting, &c.

(c) If able and willing to work but unable to secure employment, write "U." (If only temporarily laid-off and expecting to resume former job, write "U.L.")

(iii) For those who are engaged in an industry, business, trade or service at the time of the Census—

(a) Grade.—If at present employing others in your own trade or business, write "E." If conducting own business or farm without employing others (except casually), write "O." If an employee working for wages or salary (including apprentices), write "W." If helping but not receiving wages or salary, write "H."

(b) Occupation or Craft.—State in precise (or award) terms the present occupation, craft or calling; for example, "Builder's Labourer," "Clothing Machinist," "Motor Mechanic," "Electrical Fitter," &c. Avoid wherever possible general terms such as "Labourer," "Miner," "Machinist," "Farmer," "Public Servant," &c. For employers write "Employer" only if not also working at some defined occupation. For foremen, write "Foreman" only if not also exercising recognized trade qualifications.

If unemployed or temporarily absent from work, write occupation or craft in which usually engaged.

(c) Industry, Trade or Service.—State the exact branch of industry, business, trade, or service in which at present engaged or employed; for example, "Dairy Farming," "Coal Mining," "Woollen Mills," "Retail Grocery," "Road Construction," &c. If employed by a government department or other public body state its name. For employees (other than domestics) state the exact branch of the industry or trade of the employer; for paid housekeepers and domestic servants in private households, write "P.H."

If unemployed or temporarily absent from work state industry, trade or service in which usually engaged.

Young persons seeking work but not previously employed were instructed to record themselves as being usually engaged in an industry, business, trade or service but unemployed at the time of the Census. Persons working regularly but for considerably less than the normal working hours were instructed to exclude themselves from industry, business, trade or service unless their earnings from such work formed their principal means of livelihood.

3. The Economically Active Population.—

Prior to the Census in 1933 it was customary to classify persons of independent means, retired persons and pensioners to their previous industry whenever stated, but in modern Census practice the population is usually classified according to its economically

active and inactive elements. The economically active population is defined in most countries according to one or other of two main concepts, (a) the gainfully occupied, and (b) the labour or work force. The former measure is based on the usual or customary activity of persons of working age, and is nominally independent of activity at a given time such as a Census date. A "gainful worker" is a person who usually, or for a large part of his time, works at an occupation for which he is remunerated directly or indirectly, in cash or in kind.

The labour or work force on the other hand is defined primarily on the basis of activities during a stated period, and includes all persons who were either employed or seeking employment at the time of a Census, regardless of their usual activities or occupational status.

At recent Censuses in Australia attempts have been made to measure the actual size of the work force at a specified date. It will be observed from a perusal of the form of inquiry in Section 2 that only those persons who were engaged in an industry, business, trade or service, including those not at work, at the time of the Census, were asked in 1947 to furnish particulars of their economic activities, and they were instructed to state the occupation and branch of industry in which engaged. There is evidence from the tabulations, however, that some seasonal workers did not interpret this question literally. (See Section 3 of Chapter XX. of this Report.) The term "work force" in the tables in this Chapter comprises persons of all ages who were employers, self-employed, wage and salary earners, unemployed persons, and all those who were helping in any industry, business, trade or service, but not in receipt of wage or salary. The inactive population, or those persons not in the work force, consists of persons engaged in unpaid home duties,

children not attending school, full-time students, inmates of institutions, persons of independent means, pensioners, and others not engaged in industry. The foregoing classification presents difficulties of comparison with the figures in earlier Reports where the population was broadly distributed between bread-winners and dependants with persons of independent means and pensioners classified as bread-winners. A similar difficulty arises in presenting comparable figures of persons engaged in the various industries as persons of independent means and pensioners, who had hitherto been classified according to their previous industry or to their independent or dependent groups, whichever was stated, were specifically instructed at the last two Censuses to record themselves as person of independent means or pensioners and were classified accordingly.

A new Classification was drawn up for the 1947 Census and details will be found in the Detailed Tables of the Census, Part XVII.—Industry.

GENERAL VIEW OF THE COMPOSITION OF THE POPULATION BY INDUSTRIES.

4. Persons in the Work Force and Others.

—The total number of persons in the work force disclosed by the Census results in 1947 was 3,196,431, of whom 2,479,269 were males and 717,162 were females. The remainder of the population consisting of persons of independent means, pensioners

and dependants, and totalling 4,382,927, comprising 1,318,101 males and 3,064,826 females, were classed as being not in the work force.

The numbers of persons in the work force and others in each State and Territory at the date of the Census are given in the following table:—

NUMBERS OF PERSONS IN THE WORK FORCE AND OTHERS, 30th JUNE, 1947.

		Males.			Females.			Persons.

INDUSTRY.

The figures in the foregoing table show that of the States Victoria had the highest proportion of males in the work force, followed by South Australia and New South Wales. As with males, Victoria had by far the highest proportion of females in the work force among the States, followed by New South Wales. In Tasmania the proportions of males and females engaged in industry were the lowest amongst the States, whilst in the Territories the proportions of both sexes engaged were very high compared with those of the States.

5. Relative Importance of Industries as Judged by Numbers Engaged.—The tables which appear in the following Sections provide a general view of Australia's industrial structure in 1947, insofar as the view can be presented by the number of persons engaged in or attached to various categories of industry, business, trade or service.

As already mentioned a new classification of industries was adopted for the 1947 Census and, while not differing very materially in general conformation from that used at the Census in 1933, it did contain one important departure in principle in that inadequate and nil replies to the question on industry were classified respectively to two indefinite orders, namely:—L. Industry Inadequately Defined, and M. Industry Not Stated, and no attempt was made as at former Censuses to allocate these types of replies to their appropriate industry titles from an examination of other entries on the Census Schedule, or from specialized knowledge of industry available from other sources.

For the purposes of analysis in this Report and to facilitate comparison of the numbers of persons engaged in industry orders and sub-orders with those of previous Censuses it was considered advisable to undertake a distribution of the comparatively large number of persons classified to indefinite industry in each State and Territory and the Commonwealth. A cross tabulation of industries and occupations provided a comprehensive summary of the occupations of all persons engaged in or attached to defined industries. As occupational particulars were recorded for practically all persons of indefinite industry, the numbers of the latter were distributed throughout defined industries pro rata according to occupations, for example, carpenters in indefinite industries were distributed among defined industries in proportion to the number of carpenters recorded therein.

The first two tables show the distribution of males and females according to the various orders of industry including the indefinite orders, and the following two tables present similar information after the distribution of the indefinite orders. In the Sections following dealing with the principal industries comprised in the various orders of industries the figures in all cases are inclusive of the numbers distributed from the indefinite orders.

6. Distribution of Male and Female Population by Industry Category.—The following tables show for each sex the recorded numbers in each industry order, including the indefinite orders, in the several States and Territories:—

NUMBERS OF MALES IN INDUSTRY ORDERS(a), 30th JUNE, 1947.

(a) After distribution of numbers recorded in indefinite orders.

It will be seen from these tables that about $6\frac{1}{2}$ in every 10 of the male population and slightly less than 2 in every 10 of the female population in 1947 were in the work force, or in other words there were nearly $3\frac{1}{2}$ males to every female engaged in industry. If children are excluded the number of males rises to $8\frac{3}{4}$ and the number of females to $2\frac{1}{2}$ out of every 10 males and females respectively in the population aged 15 years and over.

The largest proportion of the total male population of Australia was engaged in Manufacturing, namely, 18.76 per cent, followed next by that of 12.68 per cent. in Primary Production, most of the latter being engaged in Agricultural, Pastoral and Dairying pursuits. Other groups of industries in which there were large proportions of males engaged were Commerce, Building and Construction, Transport and Storage, and Public Authority (N.E.I.) and Professional Activities in that order.

Amongst the States, New South Wales had higher proportions of its male population engaged in all classes of industry than those for Australia as a whole with the exception of Primary Production, Commerce, and Communication. Victoria had a greater percentage of its male population in the

work force than any other State and had the highest proportions engaged in Manufacturing and Commerce, but was below the Australian average in Primary Production, Mining and Quarrying, Building and Construction, and Transport and Storage. Queensland was lightly represented in Manufacture and Commerce, but had the highest proportions in Primary Production and Building and Construction, whilst South Australia had high proportions in Manufacturing, Commerce, and Transport and The two remaining States of Western Australia and Tasmania were also lightly represented in Manufacturing, but the former had the highest proportions in Mining and Transport and Storage, and Tasmania had comparatively high proportions in Primary Production, Mining, and Building and Construction.

Amongst the female population, the largest proportion was engaged in Manufacturing, namely, 5.43 per cent., followed by those in Public Authority (N.E.I.) and Professional Activities, 3.94 per cent.; Commerce, 3.73 per cent.; and Amusement, Hotels, Cafés, Personal Service, etc., 3.66 per cent. In these four classes of industry were engaged more than 88 per cent. of the female work force. Of the

States, Western Australia had the highest proportions of females engaged in Public Authority (N.E.I.) and Professional Activities and in Commerce, Victoria in Manufacturing, and Queensland in Amusement, Hotels, Cafés, Personal Service, etc.

The following table shows the distribution by States and Territories of males and females combined who in 1947 were engaged in or attached to (including those not at work) the principal divisions of industry, business, trade or service. The lower portion of the table shows the proportions

among the States and Territories of the numbers in each category of industry. These proportions largely reflect, of course, the disparities in the sizes of the populations and more particularly the work force populations in the several States and Territories, but notable differences in the industrial structure (as measured by numbers engaged) are observed when the percentages for each category of industry are compared with the percentages for all industries combined.

ANALYSIS OF THE NUMBERS ENGAGED ACCORDING TO INDUSTRY.

(After distribution of numbers recorded in indefinite orders.)

7. The Primary Production Group.—The numbers and proportions of males and females engaged in or attached to the four sub-divisions of

PERSONS ENGAGED IN PRIMARY PRODUCTION: NUMBERS AND PROPORTIONAL DISTRIBUTION, AUSTRALIA, 30th JUNE, 1947.

			Ma	ales.	Fen	nales.	Persons.	
Sub-Order.	Number.	Per 1,000 of Male Population.	Number.	Per 1,000 of Female Population.	Number.	Per 1,000 of Total Population.		
Fishing Hunting and Trapping Agriculture, Grazing and Dairying Forestry	•••		$10,580 \\ 5,967 \\ 440,156 \\ 24,653$	2.79 1.57 115.91 6.49	76 12 24,539 50	0.02 0.00 6.49 0.01	10,656 5,979 464,695 24,703	1.40 0.79 61.31 3.26
Total			481,356	126.76	24,677	6.52	506,033	66.76

From this table it will be seen that roughly oneeighth of the male population was engaged in or attached to activities in the field of primary production. Females engaged in this field were relatively few and of the males therein the great majority were following agricultural, grazing or dairying pursuits.

The proportion of the male population engaged in Fishing, Hunting and Trapping was exactly the same in 1947 as in 1933, namely 4.36 per 1,000 of the total. The numbers recorded in Forestry were less than in 1933, but this was the result of the transfer of males engaged in forest sawmilling to the manufacturing group of Furniture, Woodworking, etc., in the classification adopted for 1947. In the main activity of the primary production group—Agriculture, Grazing and Dairying—there was a substantial decrease in the number of males engaged from 531,749 in 1933 to 440,156 in 1947, or a decline of 16.7

per cent. All of the States recorded reduced numbers in this industry, but the extent of the decline was only 12.5 per cent. in Queensland, whilst in Western Australia it was as high as 24 per cent. Apart from 13,848 fewer helpers, the reduction in the number of males engaged in rural industry was confined to wage-earners, but in this connexion it should be remembered that the number of wage-earners in 1933 included 37,359 unemployed males and 19,231 males engaged only part-time, compared with only 13,034 males not at work in this industry in 1947.

It is not possible to indicate precisely the numbers engaged in the separate activities of agriculture, grazing and dairying, respectively, as a number of farmers combine agriculture with grazing or dairying or with both, and returned their industry on the Census Schedule as that of mixed farmer. A convenient grouping in a condensed form of the actual returns received in 1947 is shown below:—

PERSONS ENGAGED IN AGRICULTURE, GRAZING AND DAIRYING: NUMBERS AND PROPORTIONAL DISTRIBUTION, AUSTRALIA, 30th JUNE, 1947.

			Ма	iles.	Fem	nales.	Per	sons.

The number of persons engaged in or attached to mining and quarrying in 1933 was 68,987 or 10.41 per 1,000 of the population, but this figure included approximately 17,500 unemployed wage-earners,

equal to 2.64 per 1,000 of the population. Although the proportions of persons actively engaged in mining generally were practically the same at the two Census dates the numbers in gold mining declined from 20,490 in 1933 to 11,816 in 1947, whilst those in coal mining increased from slightly more than 18,000 (after deleting the unemployed) in 1933 to 25,926 in 1947. Persons engaged in silver, lead and zinc mining increased from 5,851 in 1933 to 6,971 in 1947, but there was a diminution in the numbers engaged in the mining for tin and copper. There was little alteration in the proportions of those engaged in quarrying at the two Census dates.

According to the annual production returns there were in 1901 approximately 71,000 persons engaged in gold mining in Australia, but the numbers declined rapidly thereafter to 6,100 in 1929 owing to the exhaustion of the more easily worked deposits and the unprofitableness of gold mining during the era of high prices following the 1914-18 War. Stimulated by the enhanced price of gold following the heavy depreciation of Australian currency in 1931, marked development occurred in the industry, prospectors were attracted, and employment rose to 33,000 in 1935. After that year the numbers gradually declined and then fell swiftly, with the diversion of man-power during the 1939-45 War, to 7,015 in 1944. The numbers rose each year thereafter to 11,816 recorded at the Census in 1947.

The long-period experience of the black coalmining industry in Australia has been almost exactly the reverse of that of the gold-mining industry.

In general, the industry has faced no problem of depleted resources, except in the relative sense of more costly winning of high-grade coals for particular mines or districts. According to annual production statistics, the average number of persons employed in coal-mining in the period 1901–1906 was 19,790. This number increased progressively to 21,997 in 1911, 26,972 in 1921, and to its peak of 31,774 in 1927. Thereafter the number decreased to 20,770 in 1929 and 18,525 in 1933. Since the last Census the numbers engaged have steadily increased each year with a few exceptions to 25,926 persons recorded at the Census in 1947.

The total number of persons engaged in mining in Australia in 1901 was 113,462 or 29.92 per 1,000 of the population. The proportion of the population so engaged declined during the years to 21.09 in 1911, 9.74 in 1921, and 6.39 in 1929. The number recorded at the Census of 1947 was 53,794 persons or 7.10 per 1,000 of the total population.

9. The Manufacturing Industry Group.— The numbers and proportions of each sex engaged in or attached to the various sub-orders of the manufacturing industry in 1947 are shown in the following table. Details relating to the numbers recorded in individual industries falling within each sub-order will be found in the Detailed Tables of the Census, Part XVII.

INDUSTRY.

The greatest number of persons in any industry order in Australia at the Census in 1947 was engaged in Manufacturing, the proportion of the work force so engaged being 28.7 per cent. for males and females combined. According to the latest Year-Book of the United Nations this percentage was higher than those obtaining around 1940 in the United States and Canada, but was less than those in the following European countries for the years specified: United Kingdom 1931, Western Germany 1946, Belgium 1930, Czechoslovakia 1946, and Sweden 1945. Since 1933 there has been rapid development in manufacturing in Australia, and the number of persons engaged therein has increased by 371,996 from 545,732 in 1933 to 917,728 in 1947, or by 68 per cent., the increases for males and females being 75 and 48 per cent. respectively. For all industries in Australia the total increase during the same intercensal period was 476,979 or 17.5 per cent.

Amongst the males the principal increases since 1933 in the numbers engaged have been in Founding, Engineering and Metalworking, 93,000; Manufacture, Assembly and Repair of Vehicles, 59,000; Food

and Drink, 41,000; Furniture, Fittings, Woodworking, etc., 30,000; Textiles, 16,000; Paper, Printing, etc., 15,000; and Cement, Bricks, Glass, etc., 13,000.

The largest increase of females since 1933 also occurred in Founding, Engineering and Metalworking, 17,000, followed by Food and Drink, 11,000, Textiles, 8,000, Clothing (including Boots and Shoes), 8,000, and Paper, Printing, etc., 7,000.

10. The Building and Construction Group.

—At the Census in 1933 the construction industry was included under the Industrial group, but in the Classification adopted for the 1947 Census it was given the status of a major group in accordance with practice in most other countries. This group is divided into two main categories, namely, the construction and repair of buildings, and the construction and maintenance of roads, bridges, railways, tramways, harbour and river works, telegraph and telephone lines, sewers, water mains, dams, drainage projects, etc. The numbers and proportions of each sex engaged in these divisions in 1947 are shown in the following table:—

PERSONS ENGAGED IN BUILDING AND CONSTRUCTION: NUMBERS AND PROPORTIONAL DISTRIBUTION, AUSTRALIA, 30th JUNE, 1947.

		Ма	les.	Fen	ales.	Persons.	
Sub-Order.		Number.	Per 1,000 of Male Population.	Number.	Per 1,000 of Female Population.	Number.	Per 1,000 of Total Population.
Inadequately Defined	 (other	139,998	0.04 36.86	 1,048	0.28	147 141,046	0.02 18.61
than Buildings)	(оптет	125,004	32.92	451	0.12	125,455	16.55
Total	• •	265,149	69.82	1,499	0.40	266,648	35.18

There are very few females engaged in Building and Construction, but the industry is an important avenue of employment for males. In 1933 there were 107,804 males engaged in the construction and repair of buildings or 32.02 per 1,000 of the male population, compared with 139,998 in 1947 or 36.86 per 1,000 males in Australia. The number of males engaged in or attached to the construction and maintenance of roads, bridges, etc., was 218,888 in 1933 and 125,004 in 1947, but these figures are not strictly comparable. It will be remembered that there was considerable unemployment in Australia at the time of the Census in 1933, and 165,000 labourers whose industry was not stated on the

Census Schedules were allocated to this branch of the industry owing to the fact that construction and repair work of the types included under this heading were practically all that was offering for the absorption of the unemployed. Amongst these labourers 92,000 were unemployed and 34,000 were employed only part-time.

In the construction and repair of buildings the number unemployed in 1933 was 47,000 and nearly 12,000 were employed part-time, whereas only 9,068 males, who are usually engaged in the Building and Construction Industry, were not at work at the Census in 1947.

11. The Transport and Storage Group.— The numbers and proportions of persons engaged in Storage are shown in the following table:-

or attached to the five sub-orders of Transport and

PERSONS ENGAGED IN TRANSPORT AND STORAGE: NUMBERS AND PROPORTIONAL DISTRIBUTION, AUSTRALIA, 30th JUNE, 1947.

		l	Ma	iles.	Fen	nales.	Persons.	
Sub-Order.	Sub-Order,					Per 1,000 of Female Population.	Number.	Per 1,000 of Total Population.
Inadequately Defined			4,613	1.21	366	$0.10 \\ 1.46$	4,979 124.257	0.66 16.39
Road Transport and Storage Shipping	• •	• •	$\begin{array}{c c} 118,731 \\ 27,359 \end{array}$	$egin{array}{c c} 31.26 \ 7.21 \end{array}$	5,526 $1,830$	0.48	29,189	3.85
Loading and Discharging Vessels			21,333 23.198	6.11	79	0.02	23,277	3.07
Rail Transport	• •		74,402	19.60	6,127	1.62	80,529	10.63
Air Transport	••	• •	6,198	1.63	1,764	0.47	7,962	1.05
Total			254,501	67.02	15,692	4.15	270,193	35.65

Although the number of females engaged in the Transport and Storage group has more than trebled since 1933 the numbers in 1947 amounted to only 15,692 or 4.15 per 1,000 of all females in Australia.

The number of males engaged in 1947 was 254,501 or 67.02 per 1,000 of the male population in Australia compared with 189,669 or 56.33 per 1,000 males in Australia in 1933. Included in the number of males in 1947 are 23,000 engaged in motor engineering and 1,300 engaged in storage, who in 1933 would have been classified to Manufacturing and Commerce, respectively, but these additions in 1947 are offset to some extent by the exclusion of maintenance workers on railways and tramways who were classified to Building and Construction in 1947.

Since 1933 the principal increases in the number of males engaged in the Transport and Storage group have occurred in motor garages, motor bus and taxi services, 13,000, loading and discharging vessels, 9,000, and air transport, 6,000.

12. The Communication Group.—In the classification adopted for the Census in 1947 Communication was given major rank whereas formerly it was included under Transport and Communication. The principal activities in this group are the postal, telegraph and telephone services. number of females engaged in the group in 1947 was 16,391 or more than double the number in 1933, namely, 7,278, whilst the number of males increased from 23,857 in 1933 to 36,461 in 1947.

13. The Finance and Property Group.— The Commerce and Finance group in the Classification of 1933 was subdivided in 1947 and Finance and Property became a major order of industry. The numbers and proportions of persons engaged in the three sub-orders of the group in 1947 are shown in the following table:-

PERSONS ENGAGED IN FINANCE AND PROPERTY: NUMBERS AND PROPORTIONAL DISTRIBUTION, AUSTRALIA, 30th JUNE, 1947.

			Ma	iles,	Females.		Persons,	
Sub-Order.			Number.	Per 1,000 of Male Population.	Number.	Per 1,000 of Female Population.	Number.	Per 1,000 of Total Population.
Banking		••	25,588 16,347 13,600	6.74 4.30 3.58	7,294 9,442 7,617	1.93 2.50 2.01	32,882 $25,789$ $21,217$	4.34 3.40 2.80
Total	••		55,535	14.62	24,353	6.44	79,888	10.54

The number of males engaged in Finance and Property in 1933 was 45,183 or 13.42 per 1,000 of the male population and the number of females was 10,903 or 3.34 per 1,000 females in Australia. It will be seen that females engaged in this group have more than doubled since 1933 whilst the males have increased by only 23 per cent. Amongst the sub-orders the largest increases of both males and females since 1933 occurred in banking.

14. The Commerce Group.—The Commerce group in the 1947 Classification was limited to the operations of wholesale and retail trade. In addition to these activities the Classification used in 1933 included Finance and Property and Storage in this group. As already mentioned the former is a separate industry order and the latter is included with the Transport group in 1947. Included in the category of wholesale trade are establishments

primarily engaged in wholesale dealing in commodities, manufacturers' distributors, exporters and importers, agents and commodity brokers, buyers and marketing boards. Retail dealing is defined as the selling of merchandise in retail stores for consumption or utilization and includes persons

engaged in second-hand dealing and the delivery of newspapers and household supplies as well as hawkers, barrowmen, etc. The numbers and proportions of persons engaged in or attached to wholesale and retail trade are shown in the following table:—

PERSONS ENGAGED IN COMMERCE: NUMBERS AND PROPORTIONAL DISTRIBUTION, AUSTRALIA, 30th JUNE, 1947.

	Ma	ales.	Fen	nales.	Persons.	
Sub-Order.	Number.	Per 1,000 of Male Population.	Number.	Per 1,000 of Female Population.	Number.	Per 1,000 of Total Population.
Inadequately Defined	2,604	0.68	1,206	0.32	3,810	0.50
Primary Produce Dealing, &c.)	93,383	24.59	25,075	6.63	118,458	15.63
Live-stock and Primary Produce Dealing, &c	22,356	5.89	4,060	1.07	26,416	3.49
Retail Trade	178,346	46.97	110,501	29.22	288,847	38.11
Total	296,689	78.13	140,842	37.24	437,531	57.73

The number of males engaged in Commerce in 1933 was 295,033 or 87.62 per 1,000 of the male population whilst the number of females engaged was 102,880 or 31.53 per 1,000 females in Australia. As the number of persons engaged per 1,000 of the population was 60.02 in 1933 it will be observed that employment in the Commerce group has declined relatively to the population since 1933. The decline was confined to the males, as females have increased fairly substantially both in actual numbers and in proportion to the female population. There were approximately twice as many persons engaged in retail trade as in wholesale trade, but the proportions varied considerably between the sexes. Details of the numbers of males and females engaged in the various categories of wholesale and retail dealing will be found in the Detailed Tables of the Census, Part XVII.—Industry. In general the greatest numbers of persons engaged in wholesale trade were found in fuel, meat, fish and dairy products, groceries, timber, motor vehicles, and soft goods in that order, whilst of the numbers engaged in retail trade, nearly half were in food stores and more than one-third in department, general, clothing, etc., stores. More than half of the females engaged in retail trade were in department and general stores and in drapery, clothing and footwear establishments. It is not possible to define precisely the actual numbers of persons engaged in the sale of the various commodities as this industry is frequently returned on the Census Schedule as general and undefined dealing in merchandise.

15. The Public Authority (N.E.I.) and Professional Activities Group.—The next table shows the number of persons engaged in or attached to various services of Public Administration and the Professions. For details of persons in individual fields of service within each of the subgroups enumerated below reference should be made to Part XVII.

PERSONS ENGAGED IN PUBLIC AUTHORITY (N.E.I.) AND PROFESSIONAL ACTIVITIES: NUMBERS AND PROPORTIONAL DISTRIBUTION, AUSTRALIA, 30th JUNE, 1947.

		Ma	les.	Fen	nales.	Persons.	
Sub-Order.	Sub-Order.					Number.	Per 1,000 of Total Population.
Public Authority Activities (N.E.I.)		67,136	17.68	29,392	7.77	96,528	12.74
Defence—Enlisted Personnel		39,363	10.37	650	0.17	40,013	5.28
" Civilian Employees		12,108	3.19	2,835	0.75	14,943	1.97
Law, Order and Public Safety		20,228	5.33	6,548	1.73	26,776	3.53
Religion and Social Welfare		11,532	3.03	8,763	2.32	20,295	2.68
Health, Hospitals, &c		26,650	7.02	56,203	14.86	82,853	10.93
Education		28,083	7.39	38,503	10.18	66,586	8.78
Other Professional		12,483	3.29	6,246	1.65	18,729	2.47
Total		217,583	57.30	149,140	39.43	366,723	48.38

It should be pointed out that the numbers shown in the sub-order, Public Authority Activities (N.E.I.), by no means exhausts the numbers engaged

in or attached to all the various fields of governmental service (Commonwealth, State or Local) in Australia. Public Authority Activities comprise all those in administrative fields of general government, local government and foreign consular services, if not included elsewhere. Actually the number of persons engaged in or attached to fields of service under Public Authority in 1947 in some sub-orders (Defence; Law, Order and Public Safety; Religion and Social Welfare; Health, Hospitals, etc.; and Education) was considerably more than that in the sub-order Public Authority Activities (N.E.I.). In all fields of governmental activity in Australia, including administration, transport services, factories, postal services, education, public works and other services, the total number of

persons engaged at 30th June, 1947, was 564,000, consisting of 472,000 males and 92,000 females. These totals had risen to 577,000 males and 115,000 females in June, 1952.

Of the groups in the table other than Public Authority Activities (N.E.I.), there were no very marked changes in the proportions engaged in 1933 and 1947.

16. The Amusement, Hotels, Cafes, Personal Service, etc., Group.—The number and proportion of persons engaged in or attached to the fields of Amusement, Hotels, Cafés and Personal Service are shown in the following table:—

PERSONS ENGAGED IN AMUSEMENT, HOTELS, CAFES, PERSONAL SERVICE, ETC.: NUMBERS AND PROPORTIONAL DISTRIBUTION, AUSTRALIA, 30th JUNE, 1947.

There were more than three males to every female engaged in Amusement, Sport and Recreation in 1947. Males were largely engaged in horse racing, motion pictures, parks, gardens and recreation grounds, and wireless broadcasting in that order, whilst females were principally found in motion pictures and wireless broadcasting. Since 1933 there has not been a great deal of expansion in this field.

In the Section dealing with Hotels, Cafés and Personal Service, the number of females engaged was almost twice that of males, but the ratio of females to males has declined perceptibly since 1933, when there were nearly four times as many females as males engaged. Males increased in every individual industry of Hotels, Cafés and Personal Service since the last Census except in hairdressing, but the number of females in the section as a whole declined considerably from 192,506 or 59.00 per 1,000 females in 1933 to 130,244 or 34.44 per 1,000 females in 1947. The decline was confined to the field of private domestic service, where the numbers engaged dropped from 126,288 in 1933 to 41,897 in 1947. Between 1933 and 1947 the number of females increased in hotels, boarding houses and restaurants, more than doubled in laundries, and nearly trebled in hairdressing and beauty parlours.

COMPARATIVE CENSUS RESULTS OF NUMBERS ENGAGED IN INDUSTRY ORDERS.

The following table provides a conspectus of the changes in the numbers and percentages of the Australian population in the various orders of industry from 1901 to 1947. The table has been slightly recast from that appearing in the 1933 Report to permit of changes in classification already indicated in Section 3. As data regarding the previous industry of persons of independent means

and pensioners are no longer available, it was con-

17. Census Comparisons, 1901 to 1947.—

sidered inadvisable to continue indefinitely the adjustment of the recorded figures by distributing those persons pro rata throughout industry, and consequently the adjusted figures for 1933 in the earlier Report have been deleted. It will be evident that the figures from 1933 onwards will not be strictly comparable with earlier Census figures owing to the different statistical treatment accorded to persons of independent means and pensioners.

above figures of the work force differ therefore from those shown in the table on page 41 from which these persons, numbering 68,000 in 1911 and 92,000 in 1921, have been deducted.

A discussion of the long and short period shifts between the population groups in this table will be found in Section 6 of Chapter IX.

AGE CONSTITUTION OF INDUSTRY GROUPS.

18. Industry Order and Age of Males.— In the following table the male population of Australia is distributed according to industry order and age. It was explained in Section 5 that 172,730 males of ill-defined and not stated industry were distributed according to their occupations in proportion to the numbers following identical occupations in any of the defined industry orders. For the purpose of this table the ages of these males should have been spread according to the age representation of such occupations within each industry group, but in the absence of the necessary details they were distributed *pro rata* to the five yearly age groupings recorded in each specified industry group. Obviously some distortion has been introduced into the figures by the adoption of varying methods for distributing the

numbers and ages of such a large proportion of the male working population, but it is considered that the extent of the distortion does not seriously impair the value of the table with ages presented in five-yearly groupings.

Of the total number of males in Australia aged 15 to 64 years, 2,375,824, or 93.27 per cent., were engaged in an industry, business, trade or service at the time of the Census. The maximum numbers of males enumerated in Primary Production, Manufacturing, Communication and Public Authority (N.E.I.) and Professional Services were in the age group 20 to 24 years, in Transport and Storage and Commerce in the 30 to 34 years group, and in Mining and Quarrying, Building and Construction, Finance and Property, and Amusement, Hotels, Cafés, Personal Service, etc., in the 35 to 39 years group. Higher proportions of males were in the younger ages 15 to 39 years in Manufacturing, Com-

munication, Commerce, Transport and Storage, and Finance and Property, whilst in Amusement, etc., Building and Construction, Public Authority (N.E.I.) and Professional Activities, Mining and Quarrying, and Primary Production, the proportion of males was higher in the older ages 40 to 64 years.

19. Industry Order and Age of Females.— Industry orders in conjunction with ages in quinquennial groups are shown for the female population of Australia in the following table. It should be remembered that the comments made in Section 18 in regard to males of ill-defined industry refer also to the distribution of the numbers and ages of 59,804 females whose industry was either not stated or described inadequately.

The number of females in the work force was 717,162 or 18.96 per cent. of the total female population compared with a similar percentage for males of 65.29 per cent. Almost half of the females engaged in industry consists of girls and young women from 15 to 24 years of age. The greatest number recorded was in the age group 15 to 19 years, where the proportion was approximately 80 per cent. of males in industry at corresponding ages. Females of 20 to 24 years were the next most numerous group and those of 25 to 29 years followed next in order, but the number in the latter group was less

than half of that recorded in the age group 20 to 24 years. Females are engaged principally in Manufacturing, Public Authority (N.E.I.) and Professional Activities, Commerce and Amusement, &c. In these orders of industry more than 88 per cent. of the total female work force was recorded in 1947. Of females aged 15 to 64 years in the work force approximately two out of every three engaged in Manufacturing and Commerce were under the age of 30 years, whilst a majority of those in Amusement, Hotels, Cafés, Personal Service, etc., were of more mature years.

CHAPTER XIX.

OCCUPATION.

EXPLANATORY INTRODUCTION.

1. The Form of Inquiry in 1947.—At the Census in 1947 persons who were engaged in an industry, business, trade or service were required to state in precise terms their present occupation, craft or calling; those unemployed or temporarily absent from work were required to state the occupation or craft in which they were usually engaged. Persons of independent means, pensioners, inmates of institutions and those engaged in unpaid home duties or full-time studies, together with part-time workers—unless they looked to their earnings from such work for their main livelihood—were not required to answer the occupation question.

The form of inquiry regarding occupation as contained in question 13 of the Census Schedule is reproduced in Section 2 of Chapter XVIII.

2. The Classification of Occupations.—

The task of classifying occupations of the population into groups so chosen as to bring together like types would be a difficult operation even if all occupations were recorded in precise terms on the Census Schedule. It is made more difficult by the failure of many persons to state exact descriptions or specific occupations either from carelessness or a lack of knowledge of occupational designation. Difficulty also arises from the nature of the occupations themselves. Some occupational descriptions are clear-cut, but others are indefinite or have dual or triple meanings. Moreover there is a lack of uniformity in occupational terms; they vary as between industrial units, localities and States. In some cases different titles are used to designate the same occupation, in others, the same designation is applied to unlike occupations. A source of ambiguity is the use of union titles to designate occupation, particularly the titles of unions organized on an industry basis covering a variety of occupations.

The deficiencies noted above are characteristic of census data on occupations. It is generally accepted that the same degree of accuracy cannot be achieved in statistics of occupations as in statistics compiled from other items on the Census Schedule which lend themselves to standardization of a relatively simple and concise nature.

The Classification of Occupations adopted for the 1933 Census needed revision in the light of changes in conditions between that year and 1947. The new Classification drawn up for the 1947 Census embodied new features both of consolidation and coding designed to overcome some of the difficulties already referred to. From a sample of returns collected for the Occupation Survey made in Australia in 1945 some 3,000 occupational descriptions were determined and arranged in an alphabetical Index of Occupations according to exact descriptions and key-words. Key-words were introduced to simplify coding by grouping together under a particular title a large number of occupational descriptions which contained a common descriptive word (or key-word). The number of occupational titles included in the classification was reduced to 219, partly because this was considered, on the investigation made, to be the practicable limit to the number of occupations that could be clearly identified from replies to the question relating to occupation on the Census Schedule. It was considered that occupational data on this limited basis could best be clarified and expanded (within the limits of information on the schedules) by tabulating occupation in conjunction with industry. Although in publication the number of occupational titles had

to be further reduced to 210, a considerably larger number of individual occupations can be identified by study of the cross tabulation. Readers of these tables for technical purposes or specific detail should read the tables in the light of the coding instructions used at the Census.

While the cross-classification of a limited range of occupations with industry yields much valuable data not otherwise available, it necessarily does so at the sacrifice of some useful detail as to individual occupations. It is intended to re-expand considerably the list of occupations at the next Census. The details of the Classification will be found in the Detailed Tables of the Census, Part XVIII., Occupation, Table 2.

3. The Work Force of 1947.—As already indicated, persons engaged in any industry, business, trade or service, including those usually engaged therein but out of a job at the time of the Census, are included in the work force. Persons of independent means, pensioners, females engaged in un-

paid home duties, full-time students, permanent inmates of institutions, and others not engaged in industry are excluded from the work force. Persons working regularly but for considerably less than normal working hours were also instructed on the Census Schedule in 1947 to exclude themselves from the work force unless their earnings from such work formed their principal means of livelihood.

Statistics in this Chapter relate to the occupations of 2,479,269 males and 717,162 females who comprised the work force at the date of the Census of 1947. In Sections 5 to 13 the particulars are shown for males and females in three categories, namely: (a) Total in the work force—including 22,379 males and 6,634 females whose occupational status was not stated in the Census Schedules; (b) employer or self-employed; and (c) employee in receipt of wage or salary.

The distribution of the persons in the work force, according to occupational status, will be found in Chapter XX.

GENERAL VIEW OF OCCUPATIONAL STATISTICS.

4. Summary of Occupations.—A general summary of the occupations derived from the Census returns of 1947, according to industry, is given below. In reviewing the particulars of the various categories or orders allowance should be made for certain defects in the Classification which arose in the operation of the new code introduced in 1947, and from difficulty in identifying occupations from Census descriptions. Special features to

be considered have been noted throughout this Chapter, for example, the classification of rural occupations in Orders 4 to 7 as well as in Order 0, the inclusion of professional engineers with craftsmen in Order 5, wholesale and retail sales workers in Order 2 as well as in Order 3, and the overlapping of some constituent occupational titles in Orders 5, 6 and 7.

(a) As recorded. The totals shown for Industry Orders in this table differ from those shown from page 182 onwards in Chapter XVIII. owing to the distribution therein of Indefinite and Not Stated Industry Orders.

ANALYSIS OF PRINCIPAL OCCUPATIONS ACCORDING TO INDUSTRY.

(In the following Sections, Indefinite and Not Stated Industries have not been distributed to specific industries as was done in Chapter XVIII.)

Details of individual occupations classified by both industry and occupational status are shown in the following Sections of this Chapter. For convenience of presentation the occupations are grouped under the orders and sub-orders of the Classification of Occupations adopted in 1947.

5. Rural, Fishing and Hunting Occupations (Order 0).—(i) General—This combina-

tion was designed to enumerate persons actually engaged in the operations of farming, forestry, fishing, hunting and trapping. In accordance with the basic principle of the classification, other classes of occupations—professional, commercial, clerical etc.—in the primary industries were not allocated to this Order but were assembled with like occupations in other Orders.

(ii) Rural Occupations.—Rural occupations were classified in four groups, namely, farmers, graziers and other farm workers, n.e.i.; farm contractors;

shearers; and drovers and stockmen. A brief industrial distribution is shown below:—

RURAL OCCUPATIONS, AUSTRALIA, 30th JUNE, 1947.

The rural group shown above comprised 404,521 males and 21,846 females, of whom 400,363 males and 21,747 females were engaged in agriculture, grazing and dairying industries. In the case of 273 males and 11 females, industry was inadequately described or not stated. Rural occupations allocated to industries other than agriculture, grazing or dairying were concerned with the treatment of rural products at meat works or milk factories, fruit and vegetable drying, wine making, chaff-cutting, dam and well sinking or fencing, live-stock and primary produce dealing or the retail distribution of milk.

Rural occupations classified in Occupation Orders other than Order 0 include a number of farm

"proprietors" in Order 2. It is probable that these were coded according to description, before it was decided to code all farm proprietors to Order 0. Other rural occupations omitted from Order 0 were:—Rural managers coded to managers; rural foremen and rural overseers coded to foremen; some growers of fruit, vegetables, etc., mostly in South and Western Australia, coded to gardeners; wool and skin classers and pressers occupied on farms; and labourers on farms. The following table gives particulars of such of these occupations as were recorded in agricultural, grazing and dairying industries:—

RURAL OCCUPATIONS IN OTHER OCCUPATION ORDERS, AUSTRALIA, 30th JUNE, 1947.

						Agricu	ıltural, Grazing a	nd Dairying In	dustry.

The number of shearers recorded at the Census was 5,492, of whom 896 were not at work. The latter included shearers resting or travelling between jobs or awaiting commencement of shearing in the districts where they intended to shear. Shearing, a seasonal occupation, was not in full swing at Census date except in the warmer districts.

(iii) Forest and Timber Workers, Fishermen and Trappers.—The occupations of forest and timber workers which are in the nature of primary productive activities are not readily distinguishable, by

means of census information, from occupations in post-primary treatment of, or trade in, forest products. Moreover, the designation "timber worker" is applied frequently to members of an industrial organization bearing this title, which embraces workers in factories and timber yards as well as in forests.

The males classified as forest and other timber workers, n.e.i., in Order 0 numbered 25,078, of whom 16,033 were in the industry sub-group, Forestry.

Trappers, Hunters	5,832	13	3,915	11	1,454	2

Some occupations in the fishing industry were coded to Orders other than Order 0, namely, proprietors and managers, 103 males and 2 females, and ships' officers, 52 males in Order 2; engineers, 42 males, and other craftsmen (such as divers), 358 males in Order 5; seamen, 720 males, and other operatives (including pearl-shellers), 213 males and 7 females in Order 6.

6. Professional and Semi-professional Occupations (Order 1).—(i) General—Professional and semi-professional occupations consist of twenty occupational titles. An omission from this Order is the "engineer" with professional qualifications. The term "engineer" in its true sense designates a professional occupation but is popularly applied to craftsmen as well as to professional workers. The latter, representing only a minority of

those described as engineer, could not be identified from information on Census Schedules and consequently engineers of all types have been classified as craftsmen in Order 5.

Apart from engineers, small numbers of other persons exercising professional qualifications were not classified in Order 1 but under alternative descriptions in Order 2 as proprietors, directors or managers. These include, for example, proprietors with industrial classification such as medicine, dentistry or legal profession in private practice, hospitals, schools and colleges, civil engineering and surveying, architecture, publication of newspapers and periodicals and photography.

(ii) Teaching Occupations.—Details of the numbers engaged in teaching occupations are shown in the following table:—

TEACHING OCCUPATIONS, AUSTRALIA, 30th JUNE, 1947.

In addition to persons coded here, teachers of specified subjects such as music and dancing were included with musicians and dancers.

(iii) Medical and Health Occupations.—Particulars of the six groups of occupations included under health are shown below:—

The number of medical practitioners recorded at the Census was 6,644, of whom 579 or 8.7 per cent. were women, and the number of dentists was 2,902, of whom 77 or 2.7 per cent. were women. The average population per medical practitioner was 1,141 and the average per dentist was 2,612.

Nurses and orderlies, who numbered 2,919 males and 37,784 females, form the largest group of medical and health occupations. The number includes trainees and members of Voluntary Aid Detachments. Some nurses are also included in occupation groups such as proprietors and matrons. In the industry group of health, hospitals, etc., 721 females were recorded as matrons. On the other hand, it may be assumed that the majority of the females coded as nurses and orderlies in medicine and dentistry (private practice) would have been more appropriately classified as professionals' attendants and receptionists.

The title of pharmacists and industrial chemists is comprised of such descriptions as chemist, dispenser, druggist and pharmacist, also pharmacy apprentice and industrial chemistry trainee. A number of persons in similar occupations were enumerated as proprietors or managers in retail trade in drugs and chemicals.

(iv) Religious and Social Welfare Occupations.— The two occupational groups, clergy and other religious workers and social workers, n.e.i., are exclusive of members of religious orders stated to be engaged in the care of the sick, teaching, etc., and classified according to actual occupation, namely, nurse, teacher, etc.

In the matter of occupational status practically all religious and social welfare workers were classified in census tabulations as employee on wage or salary.

RELIGIOUS AND SOCIAL WELFARE OCCUPATIONS, AUSTRALIA, 30th JUNE, 1947.

	Total in W	ork Force.	Employer or	Self-employed.	Employee on W	Vage or Salary.

(vi) Metallurgists and Constructional Occupations.—Metallurgists and assayers formed a relatively small group of professional workers. Constructional occupations of a professional nature in Order 1 are architects, surveyors and draftsmen. Architects include naval architects as well as architects of buildings and works. Surveyors embrace all types of surveyors, except those described as fire or loss or insurance surveyors, and draftsmen comprise all kinds of draftsmen, including map compilers, mechanical draftsmen and legal draftsmen.

7. Administrative Occupations (Order 2).

- —(i) General—Administrative occupations consist of three titles, namely, proprietors and directors, managers, and ships' officers, radio officers and aircraft officers.
- (ii) Proprietors, Directors, etc., n.e.i.—The classification of proprietors as an occupational group presents special difficulties. The term itself does not designate occupation, and, in many cases, the occupation titles written in Census Schedules do not

provide adequate information for identification of proprietors on an occupational basis.

In the Classification the following occupational descriptions were included under proprietors, directors, etc., n.e.i.:—

- (a) Certain descriptions specifically listed in the Index such as hotelkeeper, master builder, exporter, director, caterer, boarding house keeper, publisher, etc., and
- (b) descriptions by employers and self-employed persons in such terms as business, employer, manufacturer, proprietor, builder or maker.

As explained earlier in this Chapter most farm proprietors were classified with farming occupations in Order 0.

Professionals and craftsmen who were employers or self-employed were enumerated for the most part according to normal occupation and not as proprietor. Census tabulations also indicate that "proprietors" in some industries were dispersed under alternative descriptions amongst various occupational titles, a notable example being "proprietors" in wholesale and retail trade (see "shop-keepers and other sales workers" in Section 8 (iii) of this Chapter). In reviewing the industrial classification of proprietors and managers reference should be made to any kindred occupation title and comment thereon.

The majority of females classified as proprietors, etc., were boarding or lodging house keepers. The number, 16,494, includes some housewives, who were classified as boarding or lodging house keepers where there were three or more boarders or lodgers in a household and no other person was described in the Census Schedule as boarding or lodging house keeper.

(iii) Managers.—The title of managers includes—
(a) descriptions consisting of the one word
"manager"; (b) farm and rural managers; and
(c) other descriptions containing the word
"manager" where the balance of the description does not indicate a specific occupation.

(iv) Ships' Officers, Radio Officers, Aircraft Officers.—Ships' officers, radio officers and aircraft officers include, in addition to those named, such

descriptions as ferry master, navigator, pilot, purser. The one-word description "officer" was coded to officers in Order 3.

8. Commercial and Clerical Occupations (Order 3).—(i) General—The statistics of occupations in Order 3 are discussed below in two sections, clerical and semi-clerical occupations, and selling and broking occupations.

(ii) Clerical and Semi-clerical Occupations.—The duties of clerical workers are multifarious and census descriptions are somewhat indefinite or ambiguous and do not always provide a satisfactory basis for classification into specific occupation groups. More-

over, collective rather than individual designations were furnished in respect of many occupations in banking and railway and other public services, for example, bank officer, railway officer, public servant, postal assistant or postal official. In view of these facts, a summary showing the industry classification of all clerical occupations combined and a list of the total numbers in each of the twenty-two groups have been substituted below in place of the usual statements for each occupation group. Statements for a few of the clerical groups are shown later.

Total		225,142	186,052	3,842	668	218,108	182,403

Seventy-two per cent. of the male clerical workers were comprised in three titles, namely, clerks, n.e.i., 123,467; officers, n.e.i., 21,212; and public servants, n.e.i., 17,252; and 70 per cent. of the females were classified in two occupational titles, namely, typists and shorthand writers, 70,743; and clerks, n.e.i., 58,869.

Clerical occupations consist predominantly of employees. There were only 3,842 male and 668 female employers or self-employed in the clerical group, of whom 3,068 males and 86 females were accountants, auditors or bookkeepers, and 219 males and 376 females were librarians. Employers and self-employed persons in accountancy, etc., and librarians are included also in the administrative group of proprietors, directors, n.e.i., which comprised 266 males and 5 females in accountancy and

auditing and 67 male and 73 female proprietors of libraries and reading rooms.

Male clerical workers represented 63 per cent. of all males occupied in post, telegraph and telephone services, and female clerical workers 90 per cent. of the females in this industry group. Corresponding proportions in defence—civilian employees and public authority activities, n.e.i., were males 68 per cent., females 85 per cent.; in banking, males 82 per cent., females 90 per cent.; and in insurance, males 50 per cent., females 94 per cent. In manufacturing, clerical occupations represented less than 6 per cent. of the male workers and 18 per cent. of female workers; in commerce the proportions were males 9 per cent. and females 32 per cent. Particulars of the industrial classification of the clerical occupational groups of collectors, officers and inspectors are shown below:-

The title of ticket, etc., collectors consists mainly of workers in transport industries, described as ticket collector, ticket checker or ticket examiner (see also the titles of operatives such as conductors, viewers, checkers and examiners). Collectors, n.e.i., include collectors of salvage, etc., but also the descriptions "collector" (one word) and "licensed collector"; consequently it overlaps the commercial occupation title of auctioneers, agents, travellers, which includes collectors of rents, rates, insurance, debts, etc.

The group of officers, n.e.i., is comprised for the most part of "officers" in banking (so described according to industrial union title) and in postal, telegraph and telephone services and other public authority activities. It is probable that some occupations in this group are similar to those classified

as ships' officers, radio officers, aircraft officers in Order 2.

The title of inspectors (excluding police) contains a variety of occupations, such as inspectors of accounts, banking, schools, buildings, factory products and other commodities, inspectors concerned with the administration of regulations, and inspectors in transport services.

(iii) Selling and Broking Occupations.—Persons engaged in selling and broking occupations consist of buyers, auctioneers, agents, travellers, ordermen, bookmakers, butchers, café and canteen workers, n.e.i., and shopkeepers and other sales workers.

The following table gives a brief classification by industry of each of these groups except the last-mentioned which is discussed later:—

As stated above, collectors of rents, debts, etc., have been included in the group, auctioneers, agents and travellers.

The number of butchers recorded in this group is exclusive of butchers classified according to such

descriptions as proprietor, manager, foreman or butcher's shop (other sales worker). Particulars of such occupations in the industry, Retail trade in butchers' meat, are shown below:—

BUTCHERS RECORDED IN OTHER OCCUPATION ORDERS, AUSTRALIA, 30th JUNE, 1947.

					Industry—Retail Trade in Butchers' Meat.

The list of occupational descriptions coded to shopkeepers and other sales workers contains the following:—Dealer, merchant, retailer, shopkeeper, storekeeper, trader, vendor, wholesaler, pharmacy, baker's shop, butcher's shop, cake shop, draper,

grocer, fruiterer, ironmonger, stationer, tobacconist, etc. But many persons to whom such descriptions might be applied were classified, under alternative designations, to other occupation titles of which examples are quoted in the following table:—

SHOPKEPERS AND OTHER SALES WORKERS IN OTHER OCCUPATION ORDERS, AUSTRALIA, 30th JUNE, 1947.

			Total in Work Force.		Employer or Self-employed.		Employee on Wage or Salary.	
Occupation.			Males.	Females.	Males.	Females.	Males.	Females.
Industry Group—Commerce— Proprietors, Directors, &c., n.e.i. Managers Buyers Auctioneers, Agents, Travellers			19,605 14,312 2,301 13,242	3,799 1,488 563 168	17,895 827 453 4,426	3,693 155 13 90	1,621 13,387 1,785 8,515	95 1,311 539 71

It is apparent that there was extensive overlapping in the occupational classification of shopkeepers and other sales workers.

9. Domestic and Protective Service Occupations (Order 4).—This group includes occupations concerned with the maintenance of households, the preparation and serving of food, the protection of life and property and the rendering of personal services.

The following table gives a brief classification by industry of a number of occupation titles which contain a majority of the indoor domestic service workers in private households, hotels and transport services:—

SPECIFIED DOMESTIC SERVICE WORKERS, AUSTRALIA, 30th JUNE, 1947.

Industry.	House- keepers.	Matrons.	Cod	oks.	Wai	iters.	Stew	ards.	Domestic	Servants.

The number of males recorded as barmen was 6,876 and females 3,993. Practically all of these persons were wage-earners employed in licensed hotels.

The numbers recorded in the occupations shown in the table above and as bar attendants totalled 24,825 males and 91,501 females, of whom 628 males and 39,336 females were occupied in private domestic

service, and 15,157 males and 30,477 females in hotels, boarding houses, restaurants and club houses. Male employers or self-employed in these groups numbered only 294, including 235 cooks, and females 305, including 228 matrons and 64 cooks. Particulars of other groups in Order 4 are shown below:—

The occupation group of gardeners, greenkeepers and groundsmen contains 2,983 males and 56 females in the industry group, Agriculture, grazing and dairying; of these, 1,368 males and 20 females were employers or self-employed persons. Many such gardeners were engaged in the production of vegetables, fruit and flowers for market and belong more properly to the occupation group "farmers, graziers and other farm workers".

As indicated earlier in this Chapter the number of professionals' attendants shown above should be supplemented by those classified, under alternative descriptions, as nurses and orderlies.

It is probable also that the number of lift drivers is understated because some descriptions of the occupation might have been omitted from the list assigned to this group.

10. Craftsmen (Order 5).—(i) General—The Order of Craftsmen consists of 54 craft and manual occupations requiring extensive periods of training and usually involving a high degree of skill in connexion with production, construction, repair or maintenance.

(ii) Foremen, n.e.i.—Foremen, n.e.i., includes (a) certain descriptions indexed to this group, such as berthing master, clerk of works, deputy, mine deputy, shift boss, ganger, floor walker, overlooker, yardmaster; (b) farm and rural foremen; and (c) other descriptions containing one of the words, foreman, overseer, supervisor or superintendent, which could not be coded to a specific occupation. If a description containing the word "foreman" also included a specific occupational term it was coded according to such term; thus, foreman carpenter was coded to carpenters, etc. A classification of this group according to industry is shown in the following table:—

(iii) Building and Constructional Craftsmen.— Particulars of six groups of building and constructional craftsmen are shown in the following table. In addition, some craftsmen occupied in building and construction were classified in such groups as foremen, electricians, fitters, etc., or in the residual group "other craftsmen" which contains descriptions such as building tradesman, floorlayer, roofer, rooflayer, tiler, slater, etc.

The industrial classification of the building and constructional craftsmen in the foregoing table shows that 76,670 males, of whom 13,219 were employers or self-employed, were allocated to the industry group, building and construction, and 29,373 males, of whom 2,703 were employers or self-employed, to manufacturing industries. In addition, the category, "industry inadequately described", included 2,982 carpenters in carpentering (undefined), 4,774 painters, etc., in painting (undefined) and 6,669 plumbers and gasfitters in plumbing and gasfitting (undefined); of these, 580 carpenters, 1,607 painters, etc., and 2,225 plumbers and gasfitters were employers or self-employed.

(iv) Mechanics, Fitters, Turners and Engineers.—Craftsmen classified as mechanics, fitters and turners and various types of engineers, including professional engineers, were comprised in twelve occupational titles, covering 176,066 males and 525 females, in Order 5. Many Census descriptions did not provide adequate information for precise classification of these craftsmen according to the nature of their work, nor for the identification of professional engineers. A summary of the numbers in these broad occupational groups is shown in the following table:—

MECHANICS, FITTERS AND TURNERS, AND ENGINEERS; GROUP TOTALS, AUSTRALIA, 30th JUNE, 1947.

Occupations.	Total in Work Force.		Employer or Self-employed.		Employee on Wage or Salary.

The group of technicians, n.e.i., includes descriptions consisting of the one word, technician, and research, technical and X-ray assistants. Broadcasting, radio, telephone, electrical and motor technicians were classified with mechanics (see preceding sub-section).

(vi) Printing Craftsmen. — Printing craftsmen were classified in three occupation titles, namely, printers; compositors, linotype operators; and stereotypers, process engravers, engravers (so described). A classification of this group by industry is shown in the following table:—

(vii) *Drivers.*—For the classification of drivers, five separate titles were provided, namely, four in Order 5, Craftsmen, and one in Order 6, Operatives. Upon tabulation it became apparent that the classification did not yield a satisfactory distribution of the various types of engine drivers, and the three groups, stationary engine drivers, locomotive drivers, and engine drivers (so described), were combined as

engine drivers (including locomotive drivers) in order to reduce overlapping. The group in Order 6 consists for the most part of transport (except locomotive) drivers and, with engine drivers, represents approximately 96½ per cent. of the aggregate number of drivers recorded at the Census. Particulars of the drivers enumerated in Order 5 and Order 6 are shown below:—

DRIVERS, ETC.: GROUP TOTALS, AUSTRALIA, 30th JUNE, 1947.

	Total in W	ork Force.	Employer or S	elf-employed.	Employee on Wage or Salary.		
. Occupation.	Males.	Females.	Males.	Females.	Males.	Females.

Drivers (transport), n.e.i. (excluding Locomotive Drivers)	102,690	361	21,399	100	76,913	247	

The number of women enumerated as drivers was 398. With few exceptions they were transport drivers; 100 were employers or self-employed,

including 94 in the road transport industry group.

An industrial classification of drivers is shown in the following table:—

(ix) Other Craftsmen.—A brief distribution by industry of the occupations in the Classification consisting of miscellaneous craftsmen, designers and repairers, and other craftsmen is given in the next table.

In the classification of workers in tailoring and bootmaking those described as foreman, tailor, boot maker or repairer were enumerated as craftsmen, whilst cutters, pressers, hand, n.e.i. (coat, trousers and vest), trimmers, etc., were coded to operatives. Repairers of boots, 4,477, and of rails, 2,403, represented nearly 71 per cent. of the work force recorded in repairers. Other workers similarly engaged in the construction and maintenance of rail tracks were classed as packers or fettlers in Order 6 or as labourers in Order 7.

The group of other craftsmen includes such descriptions as diver, hammersmith, gem setter, manufacturing jeweller, as well as some building and constructional craft occupations.

[•] See also "Boot Makers (so described)" on preceding page.

11. Operatives (Order 6).—(i) General— The number of titles included under Operatives in Order 6 consists of 58 occupations covering 514,065 males and 145,374 females. It is possible that the more highly-skilled operations of such descriptions as cutter, machinist, trimmer, builder, etc., classified to this Order might have been more appropriately coded to craftsmen, but the line of demarkation in many of these fields is difficult to determine.

[†] See also "Packers" in Section 11 (v) and "Fettlers" in Section 11 (vii) of this Chapter.

(ii) Tradesmen's Assistants.—Operatives in this group consist of assistants to metal and constructional craftsmen, fitters, engineers and electricians. by industry:—

In the following table 51,125 males included in the group, practically all wage-earners, are distributed by industry:—

CLASSIFICATION OF MALES RECORDED AS TRADESMEN'S ASSISTANTS, AUSTRALIA, 30th JUNE, 1947.

Industry.	Black- smiths' Strikers,	Boiler- makers' Assist- ants.	Moulders' Assist- ants.	Welders' Assist- ants.	Iron- workers' Assist- ants.	Fitters' Assist- ants.	Engi- neers' Assist- ants.	Electri- cians' Assist- ants.	Builders' Labour- ers.	Trades- men's Assist- ants, n.e.i.
Founding, engineering and metal- working (including shipbuilding) Manufacture, assembly and repair of railway locomotives and rolling stock (including railway work-	661	1,335	617	73	788	1,539	487	2 35	669	818
shops)	749	1,705	188	133	17	2,223	20	84	386	866
Other manufacturing	182	201	29	44	89	1,802	308	492	1,281	3,269
Building and construction	134	66	9	36	38	334	55	176	19,281	1,001
Other, including not stated	272	269	104	34	137	975	165	34 0	4,120	2,289
Total	1,998	3,576	947	320	1,069	6,873	1,035	1,327	25,737	8,243
Employee on wage or salary	1,963	3,520	935	313	1,035	6,758	1,014	1,306	24,298	8,080

Builders' labourers include, in addition to those so described, assistants to bricklayers, carpenters, painters, plumbers, glaziers, etc. Some of these were not occupied in building, but in manufacturing, such as founding, engineering and metal working or the manufacture, assembly and repair of railway locomotives and rolling stock and other vehicles. The number of male builders' labourers assigned to the industry group, building and construction, was 19,281, and in the category "industry inadequately described" there were 894 whose industry was returned as carpentering, paint-

ing or plumbing (undefined) (see also labourers in building and construction industry in Section 12 of this Chapter).

The total number of females classified in the group of tradesmen's assistants was 777, of whom 766 were assigned to tradesmen's assistants, n.e.i.

(iii) Firemen and Greasers.—Firemen (not fire brigades) and greasers were enumerated in four occupational descriptions shown below. These workers, with one exception, were males and only five were recorded as employer or self-employed:—

CLASSIFICATION OF MALES RECORDED AS FIREMEN AND GREASERS, AUSTRALIA, 30th JUNE, 1947.

Indu	ıstry.				Firemen (not Fire Brigades).	Furnacemen, Stokers.	Locomotive Cleaners, Boiler Cleaners.	Oilers, Machinery.

The majority of firemen were employed in rail and shipping transport services. There were 4,080 furnacemen and stokers in manufacturing industries

and 380 were employed in benevolent institutions, hospitals and schools.

(iv) Drivers (Transport), Conductors and Guards.—A distribution by industry of a subsidiary group of operatives entitled drivers, conductors and guards is shown in the following table. The

classification of drivers (transport), n.e.i., already shown in conjunction with other groups of drivers in Section 10 (vii) of this Chapter, is not repeated here:—

DRIVERS (TRANSPORT), CONDUCTORS AND GUARDS, AUSTRALIA, 30th JUNE, 1947.

See Section 10 (vii) of this Chapter.

Tram guards are included with conductors. The majority of conductors, male and female, were occupied in tramway, motor bus and car services. Most of the males classified as guards were employed in rail service; others were engaged in protective services,

for example, 138 civilian employees in defence services and 36 in prisons and reformatory institutions.

(v) Storemen, Packers and Wrappers.—Particulars of storemen, packers and wrappers, classified under four titles of operatives, are shown below:—

STOREMEN, PACKERS AND WRAPPERS, AUSTRALIA, 30th JUNE, 1947.

^{*} See also "Repairers", Section 10 (ix) and "Fettlers", Section 11 (vil) of this Chapter.

The description "storemen" designates workers occupied in the storage of goods, etc., or the supervision of goods in storage rather than sales workers in wholesale or retail trade. The occupational term "packer", which usually designates packers of goods for transportation or preservation, is used in some parts of Australia to designate workers occupied in the construction and maintenance of rail tracks. Particulars of such workers classified as packers and under other occupational titles are referred to in Section 11 (vii) of this Chapter.

(vi) Dressmakers and Milliners. — Dressmakers and milliners are shown in the next table according to occupational status. Workers in this group are employed mainly in the manufacture of clothing, and to a lesser extent in wholesale and retail trade. In addition to the numbers shown in the table, 486 males and 555 females were recorded as proprietors and managers in the industry group, dressmaking, millinery, embroidery and lace.

DRESSMAKERS AND MILLINERS, AUSTRALIA, 30th JUNE, 1947.

Milliners	72	4,083	36	593	33	3,321	

(vii) Miscellaneous and Ill-defined Operatives.— Twenty-seven groups of operatives are listed below in alphabetical order. Some of these groups, namely, assemblers, cutters, finishers, machinists, pressers and trimmers, classified according to a particular occupational term, cover a variety of occupations which cannot be fully identified by means of the cross-classification of occupations with industry.

The remaining groups of operatives, seven in number, present a break-up of miscellaneous and indefinite occupational descriptions.

The occupation of chainmen includes surveyors' assistants and surveyors' labourers.

The occupational descriptions coded to fettlers were—fettler (except fettlers engaged in certain manufacturing processes and so described, namely, textile fettlers) lengthman and platelayer. group consists mainly of men engaged in laying and repairing rail tracks, but it does not cover all persons in this occupation. Many were described in the Census Schedules by other designations and were coded accordingly as repairers, packers or labourers. Workers enumerated under these titles in the industry group, construction works and maintenance (railways and tramways) were, 7,190 fettlers, 2,403 repairers, 518 packers and 5,144 labourers. Workers in similar occupations are to be found also in certain other industries where rail tracks are used for haulage of minerals, timber, sugar cane, etc. Gangers in charge of "gangs" of fettlers were classified as foremen.

The occupational title of miners (so described) is exclusive of mining workers described in Census Schedules by other designations, such as machinists, prospectors, wheelers, and a substantial number of workers coded to "other mine workers", which title was subsequently merged with miscellaneous and ill-defined operatives.

Viewers, checkers and examiners in the industry, Rail service, form the largest item of the industrial classification of these occupations. Checkers of tickets and luggage as well as examiners of trains and other railway equipment are included herein.

The occupations of makers, n.e.i., and builders, n.e.i., include descriptions using the word "maker" or "builder" as a separate word or the last part of one word (for example, boat builder or boatbuilder) which were not indexed elsewhere, and the one-word descriptions "maker" or "builder" of occupational status other than employer or self-employed (see also proprietors, etc., n.e.i., in Section 7 (ii)).

Most of the workers classified as builders, n.e.i., were employed in the manufacture, assembly and repair of vehicles, in ship and boat building, in the construction and repair of buildings and other construction works.

12. Labourers (Order 7).—The Order of Labourers is composed of wharf labourers and three other groups, particulars of which have been combined in the table below, namely labourers (so described) consisting of one-word descriptions, labourers, n.e.i., containing descriptions of two or more words, coded according to the key word "labourer", and other labouring occupations containing such descriptions as handyman, groom, yardman, pick and shovel man, main or pipe layer, road worker, drainer, loader, lumper, etc. Labourers classified as farm workers, timber workers, fishermen, trappers, chainmen, and tradesmen's assistants are excluded from this Order.

13. Occupation Indefinite or Not Stated (Order 8).—Included in this Order were 81,436 males and 26,688 females whose occupations were either not stated or were described in indefinite terms which generally precluded classification to more specific occupations without recourse to other evidence on the Census Schedules. Amongst these

persons, industry was also not stated in the case of 20,061 males and 10,002 females, whilst of the latter occupational status was also not recorded for 5,242 males and 2,959 females. A condensed distribution of the persons enumerated in this Order by industry and occupational status is given in the next table:—

AGE CONSTITUTION OF OCCUPATION ORDERS.

14. Occupation of Males and Females by Age Groups.—The following tables summarize details shown in Tables 5 and 6 of Part XVIII. of the Detailed Tables of the Census, in which males and females respectively are classified according to particular occupations, and by groups of comple-

mentary occupations, in conjunction with age. "Not stated" ages have, however, been distributed as described in Chapter X. The tables below give, in addition, the percentage which the number in each age group of each occupation order bears to the total of all ages in the group.

Occupation Indefinite or Not Stated	1.63	38.39	42.27	16.66	1.05	100.00	
Total Females in Work Force	0.86	32.21	46.83	17.86	2.24	100.00	
Females not in Work Force	30.19	3.85	33.54	22.25	10.17	100.00	
GRAND TOTAL	24.63	9.23	36.06	21.41	8.67	100.00	

The tables reveal significant differences in the age structure of the males and females in the work force. Approximately one-third of the female work force were minors, compared with only 12 per cent. for males, whilst at the older ages from 45 years onwards the positions were reversed, males representing 33 per cent. and females 20 per cent. of the respective work forces.

Of the males in indefinite occupations there was a particularly high percentage of minors. The proportions of males aged 65 years and over in rural, etc., and administrative occupations were about double the average for all occupations in this age group. Males in administrative occupations were barely found amongst minors, but they had the highest proportion in the age group 45 to 64 years.

Operatives, professional workers and craftsmen in that order were most prominently represented in the age group 21 to 44 years, with percentages greater than the average for all occupations in this group.

Considerably more than half the females in administrative occupations and nearly half of those in rural, etc., occupations were aged 45 years or older. Amongst minors the highest proportion in any occupation order was in commercial and clerical occupations, if labourers be excluded owing to the small number of females following this occupation. In the age group 21 to 44 years, professional workers, operatives and craftsmen, in that order, were most prominently represented.

CHAPTER XX.

OCCUPATIONAL STATUS.

EXPLANATORY INTRODUCTION.

1. Significance of Occupational Status Statistics.—Among the statistics which a modern community requires for the fuller understanding of its social and economic problems, and for the elaboration of measures directed towards their solution, are those which show the numbers of the population in terms of occupational status or grade of occupation, i.e. employers, self-employed persons, employees (on wage or salary), helpers (not on wage or salary), persons not at work and those not in the work force. In previous Census Reports and publications the title "Grade of Occupation" was adopted to cover the classification of the population in this manner, but in the presentation of the results of the 1947 Census, in conformity with more recent practice in other countries, the title "Occupational Status" has been substituted. Although no significant changes have been made in the internal items of the classification they have been rearranged in order to define more clearly the principle of the "work force" as applied to these statistics, mention of which is made in Section 3 of Chapter XVIII. of this Report.

At the Census of 1891 all the States except Queensland and Western Australia published particulars of occupational status in conjunction with occupation. At the Census of 1901 similar information was published by all the States except Queensland. At the Censuses of 1911, 1921, 1933 and 1947, comparable particulars were published for all States, with somewhat fuller differentiation in 1933 than at other Censuses. In Section 2 of Chapter XVIII. reference was made to the form of inquiry in 1947 concerning occupational status. The questions were arranged in three main groups to cater separately for (i) those not engaged in an industry, business,

trade or service, i.e. all those not in the work force, (ii) those usually engaged in an industry, business, trade or service but for various reasons out of a job at the time of the Census, and (iii) those engaged in an industry, business, trade or service at the time of the Census. Persons answering either of the first two sections of the questions were automatically classified from an occupational status viewpoint as (i) not in the work force and (ii) not at work respectively. Those to whom section (iii) applied were instructed to answer part (a), Grade, as follows:—"If at present employing others in your own trade or business, write 'E'. If conducting own business or farm without employing others (except casually), write 'O'. If an employee working for wages or salary (including apprentices), write 'W'. If helping but not receiving wages or salary, write 'H'." Further instructions printed on the Schedule were as follows:--" Where partners are conducting their own business or farm without employing others (except casually) each partner should write 'O'. Where employing others each should write 'E'."

Managers, secretaries and similar classes of executives in receipt of salary as employees should not describe themselves as employers merely because they have the right to engage and dismiss staff.

Employees or relatives should not be described as "helping but not receiving wage or salary" unless they are assisting in the operation of a business or farm for a substantial part of their time, and are not more correctly classified under one of the headings in part (i) of question 13 (Not in the work force).

Special instructions were also given for clergy and members of religious orders.

2. Classification and Tabulation of the Data.—In the Detailed Tables of the Census, Part XIX., tables are published giving details of the population classified according to occupational status, and in conjunction with age and conjugal condition. Particulars of occupational status in conjunction with other features of the Census statistics (birthplace, dependent children, etc.)

are shown in Parts dealing with those statistics. Whereas in the tables in Part XIX. the numbers for which occupational status was not stated are shown as such, in the tables in this Chapter they have been distributed *pro rata* among the classifications in the work force, as cross tabulations with industry and occupation showed that in almost all such cases the persons were in the work force.

GENERAL VIEW OF OCCUPATIONAL STATUS STATISTICS.

3. Occupational Status Structure of the Population in 1947.—Even though obvious misstatements can be detected and allowed for in the classification and tabulation of data collected in a census, the results as published must substantially reflect the information supplied by persons filling in the returns, whether or not the answers received accurately represent the facts sought to be established. The inquiry relating to occupational status, for instance, while framed to discover, inter alia, how many persons were at work and how many persons were usually engaged in an industry, business, trade or service but were out of a job at the time of the Census, could not anticipate the interpretations which people would place upon these descriptions of occupational status.

The instructions required all persons who were usually engaged in an industry, business, trade or service but were out of a job at the time of the Census, to record themselves as such and to state not only the reason for being out of a job but the period since last working. Those recording themselves as employers, self-employed, employees or helpers were persons who were at work at the time of the Census or so regarded themselves, who

were not out of employment at that time and in respect of whom there was a "nil" return or no entry as to the period since last working. The interpretation in regard to those recorded in each of the classes in the latter category is that they were actually at work on 30th June, 1947, and consequently their combined numbers represented the maximum figure of employment as at the date of the Census. From an examination of the tabulations relating to industry and occupation, however, it is probable that some seasonal and casual workers (e.g. shearers, cane-cutters, wharf labourers, etc.) who were not actually at work on the day of the Census, regarded themselves as regularly employed and, therefore, did not record any period since last working. In that case the total number of persons recorded as employers, self-employed, employees or helpers would represent something more than the equivalent of maximum employment on 30th June, 1947.

The first table below presents, in terms of the main occupational status groups, a picture of the structure of the Australian male and female population as a whole in the work force at 30th June, 1947:—

OCCUPATIONAL STATUS OF THE POPULATION IN THE WORK FORCE: NUMBERS AND PROPORTIONAL DISTRIBUTION, AUSTRALIA, 30th JUNE, 1947.

		Number.		Proportion per cent. of Total.			
Occupational Status.	Males.	Females.	Persons.	Males.	Females.	Persons.	
At Work—							
Employer	198,704	24,626	223,330	8.01	3.44	6.99	
Self-employed	345,743	44,991	390,734	13.95	6.27	12.22	
Employee (on wage or salary)	1,843,765	626,094	2,469,859	74.37	87.30	77.27	
Helper (not on wage or salary)	24,443	4,536	28,979	0.98	0.63	0.91	
Total	2,412,655	700,247	3,112,902	97.31	97.64	97.39	
Not at Work (a)	66,614	16,915	83,529	2.69	2.36	2.61	
Total in Work Force	2,479,269	717,162	3,196,431	100.00	100.00	100.00	

⁽a) Includes persons who were (1) unable to secure employment; (2) temporarily laid off from their jobs; and (3) not actively seeking work at the time of the Census on account of sickness or accident, industrial dispute, resting between jobs, or for any other reason.

It will be seen that employees (on wage or salary) represented 77.27 per cent. or more than three-quarters of all persons in the work force. The comparable proportion in New Zealand, according to the Census taken in that Dominion on 25th September, 1945, was 80.08 per cent. Employers as a whole, as shown by the table above, represented 6.99 per cent. and self-employed persons 12.22 per cent. The corresponding proportions in New Zealand in 1945 were 8.27 per cent. and 9.64 per cent. It will also be

observed that males were proportionately greater than females among employers and self-employed, but that females were proportionately greater than males among employees (on wage or salary). An almost identical relationship in this respect was revealed in the New Zealand Census of 1945.

The next two tables show, for males and females respectively, the structure of the whole population in each State and Territory at 30th June, 1947, in terms of occupational status:—

OCCUPATIONAL STATUS OF MALES: NUMBERS AND PROPORTIONAL DISTRIBUTION, 30th JUNE, 1947.

Occupational Status.	New South Wales.	Victoria.	Queensland.	South Australia.	Western Australia.	Tasmania.	Northern Territory.	Australian Capital Territory.	Australia.

As a proportion of the total male population, male employers were more numerous and males self-employed less numerous in 1911 in all States than in any other Census year for which occupational status data were obtained, the one exception being male employers in New South Wales, who were proportionately more numerous in 1891. In 1921, on the other hand, male employers were less numerous and males self-employed more numerous than in any other Census year, the only exception in this case being male employers in Victoria, who were proportionately less numerous in 1947 than at any other Census.

When the proportions of the two grades are combined it will be seen that male employers and selfemployed together became progressively numerous in each successive Census year in New South Wales. A similar tendency, though not generally progressive, was evident in Victoria, South Australia and Tasmania. In Queensland and Western Australia, the evidence, as far as available, showed a tendency in the opposite direction up till 1933, but in 1947 the proportional representation of employers and self-employed combined declined in both of these States, the decline in Western Australia being of the same order as that in the other States. In 1947, in all States except Queensland the proportion of employers and self-employed had reached the lowest level recorded at any Census over the period 1891 to 1947.

Reductions in the proportions of male employers and self-employed were accompanied by compensating increases in the proportion of male employees (on wage or salary), but such increases in 1921 and 1933 were considerably reduced by the rise in the proportion of unemployed males in all States as the result of the depressed economic conditions in those years.

The proportion of males employed as helpers (not on wage or salary) whilst relatively important, particularly in Victoria, South Australia and Tasmania, up till the 1911 Census, has since declined until in 1947 in all of the States the proportion was less than 1 per cent. of the total male population.

Changes in the proportion of those not at work over the period 1891 to 1947 were not characterized by any particular long-period trend since the conditions affecting employment and unemployment were not alike at the several Census dates, nor were they necessarily identical in all States at a particular Census date. The relatively high proportion not at work in 1921 and the record proportion in 1933 reflect the severity of the depressed economic conditions prevailing in those years, whilst the proportion in 1947, which is the lowest recorded in all States except Queensland at any Census, reflects the improvement in employment opportunities since the end of the 1939–45 War.

The proportion of males not in the work force, consisting of children not attending school, full-time students, pensioners, persons of independent means, inmates of institutions and others not engaged in industry, which represented generally a little over a third of the total male population in each State, does not show any marked changes over the period 1891 to 1947 except in the case of Western Australia, where the proportion increased progressively from 24.63 per cent. in 1901 to 34.65 per cent. in 1921. The relatively low proportions shown for this State at the Censuses of 1901 and to a lesser degree in 1911 can be attributed to the influx of male workers following the important discoveries of gold during the 1890's. From 1921 onwards, however, the proportion of males not in the work force in Western Australia was very much the same as those in the other States.

As regards the female population, the proportions of employers and self-employed combined during the period 1891 to 1947 showed a general tendency downward in all States, the proportions in 1901 being highest in all States for which data were obtained and those in 1947 being the lowest recorded in all States.

The proportion of female employees (on wage or salary) on the other hand showed a general tendency to increase over the period, but this movement was more attributable to increases in the total female work force rather than to changes in the proportions of employers and self-employed as was the case in the male population.

Except in the earlier Census years of 1891 and 1901, the proportions of females employed as helpers (not on wage or salary) were relatively unimportant. Following a general decline from 1901 to 1911 there has been a gradual decrease to insignificant proportions in all States. The proportions of females not at work generally followed the same pattern as those for males.

OCCUPATIONAL STATUS IN INDUSTRIES.

(After distribution of numbers recorded in indefinite industry orders or whose occupational status was not stated.)

5. Industry Groups by Occupational Status.—The next two tables show, for males and females respectively, how the numbers engaged in or attached to the main orders of industry were distributed throughout Australia as a whole according to occupational status. The numbers are also

expressed (i) as the proportion per cent. Which the number in each occupational status in each industry order represented of the total in the same industry order, and (ii) as the proportion per cent. Which the number in each occupational status in each industry order represented of the total in the same occupational status.

The table for males is characterized by several interesting features. As a proportion of all males engaged in or attached to the respective industries, employers and self-employed workers were relatively more numerous in Fishing and Trapping and in the Agricultural, Grazing and Dairying

industries, as also were unpaid helpers, than were males in the same occupational status in other industries, and the employees (on wage or salary) were correspondingly less numerous. Taking the total number in each occupational status in the whole male population, it will be seen that nearly 87 per cent. of unpaid helpers, nearly 29 per cent. of all employers, and 58 per cent. of all self-employed workers, were engaged in the Agricultural, Grazing and Dairying industries, and that these industries absorbed a correspondingly small proportion of all male wage and salary earning employees. Over 46 per cent. of all male wage and salary earning employees and nearly 27 per cent. of all male employers were engaged in or attached to Manufacturing and Building and Construction industries, whilst Commerce absorbed over 21 per cent. of all male employers.

Amongst female employers and also self-employed workers, the highest proportions were engaged in Amusement, Hotels, Cafés, Personal Service, etc., followed in both instances by Commerce, then by Agriculture, Grazing and Dairying and then by Manufacturing, whilst the largest proportions of employees on wages or salaries were engaged in Manufacturing (30.68 per cent.), Public Authority (N.E.I.) and Professional Activities (22.52 per cent.), Commerce (19.31 per cent.), and Amusement,

Hotels, Cafés, Personal Service, etc. (17.15 per cent.). Corresponding percentages of employees on wages or salaries in 1933 were Personal and Domestic Service, Entertainment, etc. (35.22 per cent.), Manufacturing, etc. (22.32 per cent.), and Public Administration and Professional (18.53 per cent.).

Of female helpers (not on wage or salary), the number of whom was relatively small, over 53 per cent. were engaged in Agriculture, Grazing and Dairying and 21.32 per cent. in Commerce.

Of females usually engaged in an industry, business, trade or service but not at work at the time of the Census, over 28 per cent. belonged to the Amusement, Hotels, Cafés, Personal Service, etc., group, 27 per cent. to Manufacturing and nearly 22 per cent. to Public Authority (N.E.I.) and Professional Activities.

The following table shows, for Australia as a whole, the proportional distribution of persons in the work force (males and females combined) according to occupational status by industry orders:—

Total	6.99	12.22	77.27	0.91	97.39	2.61	100.00

(a) See note to table on page 237.

This table shows that of all persons directly engaged in or normally attached to the social and productive services of the community in 1947, 77.27 per cent. were employees (on wage or salary). The corresponding percentage in 1933 was 59.43 but the high proportion of persons not at work in 1933 (17.65 per cent. as compared with 2.61 per cent. in 1947), most of whom would have been employees (on wage or salary), must be taken into account when considering any change in the proportions in these two Census years.

6. Geographical Distribution of Occupational Status in the Primary Industry Group.

The tables within this Section of the present Chapter show the distribution of the numbers of males and females in each occupational status among the several States and Territories. The tables first presented give the figures for the whole field of primary production; those which follow cover successively (a) Fishing, Hunting and Trapping, (b) Agriculture, Grazing and Dairying, and (c) Forestry.

The States with the highest and lowest percentages respectively in each occupational status for males were as follows:-Employers, Queensland 13.66 per cent., Victoria 11.08 per cent.; self-employed, Victoria 52.59 per cent., Queensland 38.34 per cent.; employees (on wage or salary), Tasmania 39.74 per cent., Victoria 28.74 per cent.; helpers (not on wage or salary), Victoria 5.69 per cent., New South Wales 3.94 per cent.; not at work, Queensland 4.79 per cent., Victoria 1.90 per cent. As a proportion of all engaged in Primary Production in Australia, employers represented 12.29 per cent. in 1947 compared with 18.29 per cent. in 1933; self-employed persons were 44.77 per cent. in 1947 and 29.81 per

cent. in 1933; employees (on wage or salary) were 35.39 per cent. in 1947 and 38.49 per cent. in 1933; helpers (not on wage or salary) were 4.48 per cent. in 1947 and 6.21 per cent. in 1933; and those not at work were 3.07 per cent. in 1947 and 7.07 per cent. in 1933. The striking feature revealed by these comparisons was the large increase in 1947 in the proportion of self-employed persons in Primary Production which was accompanied by a general decrease in each other occupational status. This movement is reflected in the figures for all States.

The following are similar tables for Fishing, Hunting and Trapping; Agriculture, Grazing and Dairying; and Forestry, showing numbers and percentages for both males and females:—

(a) See note to table on page 237.

Among males engaged in Fishing, Hunting and Trapping the proportions of self-employed were high in all States but particularly so in South Australia (75.05 per cent.) and Victoria (70.65 per cent.), whilst the proportions of employees (on wage or salary) were correspondingly low. Employers and helpers (not on wage or salary) were also relatively low, but the number not at work, though numerically small, was proportionately greater than in any other specific industry order.

Among males in Agriculture, Grazing and Dairying in the States, employers as a proportion of all those engaged in this industry group were highest in Western Australia and lowest in Victoria; self-employed, highest in Victoria and lowest in Queensland; employees (on wage or salary), highest in

Queensland and lowest in Victoria; helpers (not on wage or salary), highest in Victoria and lowest in New South Wales; and those not at work highest in Queensland and lowest in Tasmania. Among females, whose numbers throughout were much smaller than those of males, the most interesting feature was the change in the relative proportions of employers and employees (on wage or salary) in 1947 as compared with 1933. In 1933, for Australia as a whole, employers represented 40.18 per cent. of all females engaged in Agriculture, Grazing and Dairying, but in 1947 the proportion was reduced to 21.25 per cent., whilst employees (on wage or salary) increased from 16.23 per cent. in 1933 to 32.93 per cent. in 1947. All States showed a similar movement.

7. Geographical Distribution of Occupa- for States and Territories particulars concerning

tional Status in Mining and Quarrying males and females respectively in the Mining and Industries.—In the next two tables will be found Quarrying industries by occupational status:—

(a) See note to table on page 237.

Among males in Mining and Quarrying there were, due to the different types of mining and quarrying principally carried on in the various States, considerably more disparities between the States in the proportions of employers, self-employed and employees (on wage or salary) than were shown in the other industry orders. Numerically, however, employers and to a lesser degree self-employed were relatively few as, apart from prospecting and some

working partnership ventures, the mining industry in Australia is now mainly operated by public companies.

8. Geographical Distribution of Occupational Status in the Manufacturing Group.

The Manufacturing group, which represented 28.73 per cent. of all males and 28.65 per cent. of all females in the work force in Australia, showed a fairly uniform distribution in regard to occupational status in the several States. The proportion of employers was highest in Western Australia and lowest in South Australia for males, and highest in Queensland and lowest in South Australia for females; self-employed were highest in Queensland both for males and females, lowest in South Australia

tralia for males and in New South Wales and Victoria for females; employees (on wage or salary) were highest in South Australia and lowest in Queensland both for males and females.

9. Geographical Distribution of Occupational Status in the Building and Construction Group.—The next two tables show for States and Territories particulars for males and females respectively in the Building and Construction group by occupational status:—

(a) See note to table on page 237.

In the Building and Construction group, the proportion of male employers in Australia was 6.73 per cent., self-employed almost equal with 6.37 per cent., employees (on wage or salary) 83.42 per cent., and those not at work 3.42 per cent. Victoria had

the highest proportion of employers, 7.37 per cent., and Western Australia the lowest, 6.01 per cent. Of self-employed, South Australia had the highest proportion, 6.98 per cent., and Tasmania the lowest, 5.27 per cent., whilst Tasmania had the highest

proportion of employees (on wage or salary), 85.47 per cent., and Queensland the lowest, 82.10 per cent. Females employed in the Building and Construction group were relatively few and 94 per cent. were employees (on wage or salary). A large majority of the latter were engaged in clerical occupations.

10. Geographical Distribution of Occupational Status in the Transport and Storage Group.—In the next two tables will be found for States and Territories particulars concerning males and females respectively in the Transport and Storage group by occupational status:—

(a) See note to table on page 237.

The outstanding feature of the Transport and Storage group, as compared with the Manufacturing and Building and Construction groups, is the relatively more important place self-employed males had in comparison with employers. In Queensland in particular the proportion of self-employed males was nearly double that of employers.

11. Geographical Distribution of Occupational Status in the Communication Group.

—Particulars of the occupational status of males and females in the Communication group are shown for States and Territories in the following two tables:—

(a) See note to table on page 237.

Of males engaged in the Communication group, which consists mainly of the operation of Post, Telegraph and Telephone services, the numbers of employers and self-employed were almost negligible whilst in the case of females none were recorded. The proportion of employees (on wage or salary) for Australia as a whole was 99.23 per cent. of males and 98.54 per cent. of females.

12. Geographical Distribution of Occupational Status in the Finance and Property

Group.—The next two tables show for States and Territories particulars concerning males and females respectively in the Finance and Property group by occupational status:—

(a) See note to table on page 237.

In the Finance and Property group, which includes Banking, Insurance and Other Offices, Agencies, etc., the proportional distribution according to occupational status was very similar in the several States both for males and females. Employers and selfemployed, however, were almost entirely confined to "Other Offices, Agencies, etc.", in which the two combined represented nearly half those engaged in such businesses, whilst those engaged in banking and insurance were nearly all employees (on wage or salary).

13. Geographical Distribution of Occupa- particulars concerning males and females respectional Status in the Commerce Group.— tively in the Commerce group by occupational The next two tables show for States and Territories status:—

Both male and female employers and selfemployed represented relatively high proportions of all those engaged in Commerce as compared with other specific industrial fields, their combined proportions being exceeded only in the primary production industries and in the field of amusement, hotels, cafés, personal service, etc. The proportion of female employers, however, was only about one-third of that of employers amongst males, and self-employed less than half that of self-employed males. Approximately three-quarters of the male employers and self-employed in Commerce were engaged in retail trade, while over 96 per cent. of the female employers and self-employed were similarly engaged.

14. Geographical Distribution of Occupational Status in the Public Authority and Professional Group.—The next two tables show for States and Territories particulars concerning males and females respectively in the Public Authority and Professional group by occupational status:—

(a) See note to table on page 237.

Within the composite field of Public Authority and Professional Activities, employers and workers on own account are for obvious reasons not found at all in public administration proper, in the services of defence, in the spheres of religion and social welfare, and over the larger part of the activities of education. The percentages for such grades shown in the table above in consequence lose significance when compared with the corresponding percentages in the tables for the spheres in which private enterprise is predominant. Among the pro-

fessions in which male employers and workers on own account were prominent were the legal profession, in which employers were more than four times the number of self-employed; the medical profession, in which self-employed were greatly in excess of employers; the dental profession, in which employers were more than twice the number of self-employed; and the accountancy profession, in which employers were again considerably more numerous than self-employed.

(a) See note to table on page 237.

Much of the same kind of observation as applies to males also applies to females in the composite field of Public Authority and Professional Activities. Private hospitals were alone a field of any importance for female employers; but self-employed females were prominent in the spheres of tutoring and teaching of music, languages and the arts, and in private nursing.

15. Geographical Distribution of Occupational Status in the Amusement, Hotels, Cafes, Personal Service, etc., Group.—The next two tables show for States and Territories particulars concerning males and females respectively in the Amusement, Hotels, Cafés, Personal Service, etc., group by occupational status:—

Employers and self-employed represented comparatively high proportions of all males engaged in the sphere of amusement, hotels, cafés, personal service, etc., employers being most prominent in hotels and in cafés, whilst self-employed pre-

dominated in hairdressing, boarding and lodging houses and in activities connected with racing and other professional sport. Hotels also accounted for nearly one-quarter of the male employees on wages or salaries.

Among females, self-employed represented almost the same proportion to the total females engaged in amusement, hotels, cafés, personal service, etc., as did the self-employed among males but considerable disparities were noticeable in the proportions in the various States, Victoria being the highest with 16.49 per cent. and Tasmania lowest with 8.97 per cent. The proportion of female employers, however, was less than one-third of that for males and in this case the proportions in the several States were fairly consistent.

Nearly 30 per cent. of the female employers were hotelkeepers, 26 per cent. were hairdressers, 21 per cent. were café proprietors and nearly 20 per cent. were boarding and lodging house keepers. Of females self-employed, over 86 per cent. were boarding and lodging house keepers, whilst of employees (on wage or salary), over 41 per cent. were engaged in private domestic service and 21 per cent. were employed in hotels.

OCCUPATIONAL STATUS IN CONJUNCTION WITH AGE.

16. Occupational Status and Age of Males.—The following table gives for quinquennial age groups after distribution of not stated

ages as described in Chapter X., Age, the numbers and proportional distribution of males according to occupational status:—

In the case of employers, self-employed and employees (on wage or salary), the numbers increase with age to a maximum and then regularly diminish. In the case of helpers (not on wage or salary), and those not at work in 1947, the proportions of which were both considerably less than at previous Censuses, this pattern was altered a little by slight fluctuations in the middle and higher age groups. The maximum in employers was reached in the age group 40–44 in 1947; the maximum was also in that age group in 1911 and 1933, but was in the age group 35–39 in 1921. The maximum in self-employed was in the age group 35–39 in 1947 as opposed to the age groups 40–44 in 1911 and 1933, and 30–34 in 1921. The maximum in employees (on wage or salary) was reached in the age group 20–24

in 1947 as it was in 1911 and 1933, but in 1921 it was in the age group 15–19. The maximum in helpers (not on wage or salary) was reached in the age group 15–19 in 1947 and in those not at work in the age group 20–24, which was the case in both instances at each previous Census. The group embracing males not in the work force in 1947 diminished from ages 0–4 to ages 35–39 (to 30–34 in 1911 and 1933, to 40–44 in 1921), then increased regularly to ages 70 and over (70 and over in 1911 and 1933, to 65–69 in 1921).

17. Occupational Status and Age of Females.—The next table gives for quinquennial age groups the numbers and proportional distribution of females by occupational status:—

Omitting the females not in the work force, the regular increase by successive age groups to a maximum and subsequent decline were noticeable in all grades. This was also the case in 1933 and 1921, and in 1911 except for those self-employed. It will be observed that the numbers of helpers (not on wage or salary) and employees (on wage or salary) rose more

sharply to a maximum in age group 15–19, and that those not at work also rose more sharply to a maximum in age group 20–24, than employers, who attained a maximum in age group 45–49, and self-employed who reached a maximum in age group 55–59.

OCCUPATIONAL STATUS IN CONJUNCTION WITH CONJUGAL CONDITION.

18. Occupational Status and Conjugal Condition of Males.—Detailed tables of occupational status in conjunction with conjugal condition for males, females and persons will be found for Australia and for each State and Territory in

Part XIX. of the Detailed Tables of the Census, pages 1531 to 1559. In the table immediately below is given a summary for males in Australia after distribution of "Not Stated" conjugal conditions as in Chapter XI., Conjugal Condition.

OCCUPATIONAL STATUS AND CONJUGAL CONDITION OF MALES: NUMBERS AND PROPORTIONAL DISTRIBUTION, AUSTRALIA, 30th JUNE, 1947.

		I	-			·

Excluding the never married not in the work force (mainly children under 14 years), male employees (on wage or salary) were represented by the greatest number among the never married, the married and the divorced. They took second place after those not in the work force among the widowed. Self-employed took second place among the married

and the never married and third place after those not in the work force and employees on wages or salaries, among the widowed and divorced.

The greatest proportions of the male helpers (not on wage or salary) and those not in the work force (mainly children) were bachelors, and the greatest proportions of employers, self-employed, employees (on wage or salary) and those not at work were married males. Taking the percentages shown under each of the conjugal condition designations, helpers without wages had the highest representation under never married, employers under married, those not in the work force under widowed, and those not at work under divorced.

19. Occupational Status and Conjugal Condition of Females.—In the next table is given a summary for females in Australia:—

OCCUPATIONAL STATUS AND CONJUGAL CONDITION OF FEMALES: NUMBERS AND PROPORTIONAL DISTRIBUTION, AUSTRALIA, 30th JUNE, 1947.

(a) See note to table on page 237.

Females classed as not in the work force, who include pensioners, females of private means, children and wives, mothers, and others performing home duties, greatly predominated among the never married, the married and the widowed, but were slightly less than the number of employees (on wage or salary) among the divorced. Employees (on wage or salary) predominated among the divorced and ranked second in each other conjugal condition designation, whilst self-employed ranked third throughout.

The greatest proportions of the female employees (on wage or salary), of helpers (not on wage or salary) and those not at work were spinsters, and of employers, self-employed and those not in the work force were married. Taking the percentages shown under each of the conjugal condition designations, females not at work ranked highest of the never married, followed by employees (on wage or salary) and helpers (not on wage or salary). Females not in the work force ranked highest of the married, employers highest of the widowed, and those not at work highest of the divorced.

DISTRIBUTION OF OCCUPATIONAL STATUS BY METROPOLITAN AND EXTRA-METROPOLITAN AREAS.

20. Metropolitan Males in Occupational Status.—Detailed tables of the occupational status of the population by Metropolitan, Urban Provincial and Rural Divisions of Australia as a whole and of the States and Territories, for males and females born in Australia and born outside Australia, appear in Part XIX. of the Detailed Tables of the Census,

pages 1527 to 1530. The following table shows for each Metropolitan Division the number of males who belonged to each occupational status, the proportion per cent. of the metropolitan males in each occupational status, and the proportion of males in each occupational status who were enumerated in each metropolis at 30th June, 1947:—

OCCUPATIONAL STATUS OF METROPOLITAN MALES: NUMBERS AND PROPORTIONAL DISTRIBUTION, 30th JUNE, 1947.

The capital cities with the highest and lowest percentages respectively of males in each occupational status were as follows:-Employer, Melbourne 4.74 per cent., Hobart 4.19 per cent.; self-employed, Brisbane 5.09 per cent., Hobart 3.91 per cent.; employee (on wage or salary), Melbourne 57.78 per cent., Perth 50.02 per cent.; helper (not on wage or salary), Brisbane 0.12 per cent., Melbourne 0.07 per cent.; not at work, Brisbane 2.85 per cent., Melbourne 1.36 per cent.; those not in the work force, Perth 38.06 per cent., Melbourne 31.79 per cent. The most notable changes as compared with are the substantially lower percentages shown for those not at work in 1947. For the metropolitan areas generally there was little difference for the two Census years in the proportions of employers and self-employed combined although, in 1947, the proportion of employers for the metropolitan areas as a whole was slightly higher and for self-employed correspondingly lower. The proportion of employees (on wage or salary) was substantially higher as an offset to the large decrease in those not at work, whilst that of males not in the work force decreased by a little over 3 per cent.

The last portion of the table above shows the proportion which the males in the metropolitan area represented of the total number of males in the same grade in the State. The percentages given for Australia represent the ratio per cent. of the total for each grade in the six capital cities to the total for the same grade in Australia as a whole.

In every State (except for employers in Victoria) male employers and self-employed were relatively less strongly represented in the metropolitan than in the extra-metropolitan areas. In New South Wales, Victoria, South Australia and Western Australia employees (on wage or salary) were more strongly represented in the metropolitan areas. In New South Wales, Queensland and Tasmania those not at work were relatively fewer in the metropolitan areas whilst very small proportions of helpers (not on wage or salary) were to be found in the metropolitan areas generally. Those not in the work force were more strongly represented in the metropolitan area in Victoria, South Australia and Western Australia.

In all States the proportions shown for employers in the metropolitan areas were substantially higher in 1947 than in 1933, and, with the exception of Western Australia, the proportions of self-employed were lower. Because of the abnormally high unemployment in all States in 1933, a direct comparison of employees (on wage or salary) in the two Census years is difficult to assess but, taking the movements of other occupational status into consideration, it would seem that the proportion in the metropolitan area in 1947 was slightly lower than it was in 1933.

21. Metropolitan Females in Occupational Status.—The following is a table for females similar to that for males in Section 20 above:—

OCCUPATIONAL STATUS OF METROPOLITAN FEMALES: NUMBERS AND PROPORTIONAL DISTRIBUTION, 30th JUNE, 1947.

(a) See note to table on page 237.

38.40

61.14

61.28

51.53

The capital cities with the highest and lowest percentages respectively in each occupational status, excluding female helpers (not on wage or salary) (who were numerically unimportant) were as follows:—Employer, Melbourne 0.71 per cent., Adelaide 0.51 per cent.; self-employed, Melbourne 1.42 per cent., Adelaide 0.98 per cent.; employee (on wage or salary), Melbourne 21.84 per cent., Perth 18.26 per cent.; not at work, Brisbane 0.65 per cent., Adelaide 0.36 per cent.; not in the work force, Adelaide 79.70 per cent., Melbourne 75.55 per cent. Employers and employees (on wage or salary) increased in proportion between 1933 and 1947, whilst self-employed females not at work and those not in the work force showed proportional decreases.

GRAND TOTAL

From the last portion of the table which shows the proportional representation between the metropolitan and extra-metropolitan areas, it will be seen that in each occupational status for females in the work force other than helpers the metropolitan proportion was higher in New South Wales, Victoria, South Australia and Western Australia but, with the exception of employees (on wage or salary) in Queensland, less in Queensland and Tasmania. In only Victoria, South Australia and Western Australia did the proportions of females in the metropolitan area who were not in the work force exceed those in the extra-metropolitan area. As between 1933 and 1947, for all capital cities taken together, the metropolitan proportions of female employers, self-employed, employees (on wage or salary) and those not in the work force increased, the increase in the proportion of employers being substantial—from 35.90 per cent. in 1933 to 49.36 per cent. in 1947—whilst those for helpers (not on wage or salary) and females not at work decreased.

57.63

31.30

52.73

22. Extra-metropolitan Males in Occupational Status.—The next table shows the number and proportion of males in each occupa-

tional status in the extra-metropolitan areas of Australia:—

(a) See note to table on page 237.

Excluding the Territories, the highest and lowest percentages respectively of males in each occupational status were as follows:—Employer, South Australia 7.17 per cent., New South Wales 5.32 per cent.; self-employed, South Australia 17.84 per cent., New South Wales 11.63 per cent.; employees (on wage or salary), New South Wales 42.78 per cent., Victoria 38.02 per cent.; helpers (not on wage or salary), Victoria 1.64 per cent., New South Wales 0.87 per cent.; not at work, Queensland 2.51 per cent.; South

Australia 1.21 per cent.; not in the work force, Tasmania 38.27 per cent., South Australia 33.76 per cent.

As between 1933 and 1947, the proportion of employers decreased in all States, whilst self-employed increased in all States except New South Wales and Western Australia. Employees (on wage or salary) also increased in all States, mainly in proportion to the general decrease in those not at work and in helpers (not on wage or salary).

23. Extra-metropolitan Females in Occupational Status.—The following table shows the number and proportion of females in each occupa-

tional status in the extra-metropolitan areas of Australia:—

OCCUPATIONAL STATUS OF EXTRA-METROPOLITAN FEMALES: NUMBERS AND PROPORTIONAL DISTRIBUTION, 30th JUNE, 1947.

	Extra-metropolitan Female Population of-								
Occupational Status.	New South Wales.	Victoria.	Queens- land.	South Australia.	Western Australia.	Tasmania.	Northern Territory.	Australian Capital Territory.	Australia.

(a) See note to table on page 237.

Omitting those not in the work force (mainly dependants), female employees (on wage or salary) were by far the most numerous, representing 11.90 per cent. of the extra-metropolitan population of Australia and varying in the States between 12.48 per cent. in Victoria and 10.21 per cent. in South Australia. Self-employed were next in numerical importance followed by employers, not at work, and

helpers (not on wage or salary), respectively, in all States. In comparison with 1933 the proportions in 1947 show substantial increases in employees (on wage or salary) in all States and general decreases in each other occupational status, although helpers (not on wage or salary) showed slight increases in Queensland and Western Australia.

24. Metropolitan and Extra-metropolitan metropolitan and extra-metropolitan population in Comparisons.—The table which follows affords a comparison of the number and proportion of the

each occupational status:-

OCCUPATIONAL STATUS OF POPULATION IN METROPOLITAN AND EXTRA-METROPOLITAN AREAS: NUMBERS AND PROPORTIONAL DISTRIBUTION, AUSTRALIA, 30th JUNE, 1947.

CHAPTER XXI.

DWELLINGS.

SCOPE OF INQUIRY.

- 1. **General.**—Particulars relative to dwellings have been collected at every Census taken in Australia with the exception of the New South Wales Censuses of 1833 and 1836, but owing to differences in the subjects of inquiry, and in the classification of the data, comparable results have been difficult to obtain.
- **2. The Form of Inquiry.**—At each of the Censuses from 1911 to 1933 the questions on the Schedule relating to the description of the dwelling were substantially the same, but in 1947 the inquiry was extended to cover facilities in the dwelling, the date of building, and the extent of sharing.

The questions under the heading "Description of Dwelling" in the Householder's Schedule of 1947 were as follows:—

- "1. Class of Dwelling.
 - 2. Materials of which Outer Walls and Roof are Built.
 - 3. Number of Rooms.
 - 4. Sleeping Out.
 - 5. Occupancy.
 - 6. Weekly Rent.
 - 7. Gas, Electricity and Water Supply.
 - 8. Toilet, Washing and Cooking Facilities.
 - 9. Date of Building."

In the instructions issued with the Householder's Schedule the following directions were given:—

- "1. Class of Dwelling.—State whether this schedule relates to a private house, shared house, tenement, flat, shared flat, hotel, coffee palace, boarding or lodging house, caretaker's quarters, religious or educational institution, military or naval establishment, charitable institution, hospital, penal institution, etc. Where it relates to an institution, give the name of the institution. Occupiers of semi-detached houses should write 'Private house'.
- 2. Materials of which Outer Walls and Roof are Built.—These may be stone, brick, brick-veneer, concrete, iron, fibro-cement, wood, lath and plaster, etc. If built of different materials state the material most largely used.
- 3. Number of Rooms.—Include kitchen and permanently enclosed sleep-out, but not bathroom, pantry, laundry or storehouse. In caretaker's quarters include only those rooms actually occupied by the caretaker's household.

- **4. Sleeping Out.**—Include only persons who sleep out throughout the year on verandahs (**not** enclosed sleep-outs).
- **5. Occupancy.** An occupier paying interest on a mortgage on his dwelling should enter 'owner'.
- 6. Weekly Rent.—If the occupier is a tenant or sub-tenant state the rent per week actually paid for the dwelling occupied, furnished (if so rented) or unfurnished. The rent should include any rates such as garbage, sanitation or water (other than excess water) payable separately by the tenant. If part of a house is let to sub-tenants the principal tenant should include only the proportion of the headrent applicable to that part of the house not sub-let. If the occupier is a caretaker, state the unfurnished rental value per week as accurately as possible. The average weekly payments on account of a purchase by instalments should not be inserted. If the dwelling is **not** rented an answer to this question is not required.
- 7. Gas, Electricity and Water Supply.

 —An occupier of a shared house (or flat) or of a tenement should answer the questions regarding the supply of (i) electricity, (ii) gas, and (iii) running water only in relation to the occupier's own dwelling.
- 8. Toilet, Washing and Cooking Facilities.—An occupier of a shared house (or flat) or of a tenement should answer the questions regarding the provision of (i) a bathroom, (ii) a flush toilet, (iii) a laundry, and (iv) cooking facilities only in relation to the occupier's own dwelling. Occupiers were asked to indicate if facilities within their dwellings were shared by another household.
- **9. Date of Building.**—If unable to state whether the dwelling was built before or after the 30th June, 1933, inquiry should be made of the owner, house agent, or other person from whom the information could probably be obtained."

In addition to this information, two other questions on the Householder's Schedule were of special significance so far as statistics of dwellings are concerned. Each individual was required to state his or her relation to the head of the household, and provision was also made for the recording of the number of persons who were inmates of the dwelling on the date of the Census.

The only buildings enumerated were those which were either used or were intended for use as dwellings. Shops, offices, stores, churches, schools, etc., in which no one resided were not enumerated. In all cases dwellings occupied or usually occupied solely by full-blood aboriginals have been excluded from the tabulation.

- **3. Tabulation of the Data.**—Further details relating to dwellings will be found in the Detailed Tables of the Census, Parts XX. to XXVII. Particulars of the sex, age, conjugal condition, occupational status, industry, and dependent children of the householder have been tabulated in conjunction with the nature of occupancy, and detailed tables based on these combinations appear in Part XXVII. The detailed tables for States and Territories are also contained in Part XXVII. Detailed information relating to dwellings in the local government areas of the States and Territories will be found in Parts XX. to XXVI.
- **4. Definition of Terms.**—For Census purposes terms used in the tables and text throughout this Chapter are defined as follows:—

Dwelling is a room or a collection of rooms occupied by a household group living together as a family unit, whether comprising the whole or only part of a house or other building. If used for habitation, temporary structures such as tents, etc., are enumerated as dwellings and are shown as private houses.

Family used in the headings to the tables means a household group living together as a family unit.

Private House (Shared by Two or More Families) is a private house shared by two or more family units for which only one Householder's Schedule was received, instead of separate Schedules for each portion occupied separately. Figures shown under this heading represent not "occupied dwellings" as defined for Census purposes, but "houses" occupied by more than one family.

Share of Private House is a portion of a shared private house which is occupied separately, and for which a separate Householder's Schedule was furnished. "Shares" are correctly described as dwellings

for Census purposes.

Flat is part of a house or other building ordinarily intended for occupation by a separate family group and is a self-contained unit with both cooking and bathing facilities.

Tenement is part of a house or other building ordinarily intended for occupation by a separate family group but is not a self-contained unit and consists in the main of a room or rooms with cooking facilities.

Dwellings Being Built relate to unoccupied dwellings of all types being built at 30th June, 1947, and are not identical with the number of houses under construction at the time of the Census as some of the latter were occupied before completion.

Unoccupied Dwellings include "week-end" and holiday dwellings, and other dwellings temporarily

unoccupied on the night of the Census.

GENERAL VIEW OF STATISTICS OF DWELLINGS.

5. Dwellings Occupied, Unoccupied and Being Built.—The total number of dwellings recorded throughout Australia at the Census of 1947 was 1,989,694, of which 1,907,895 were occupied dwellings, 47,041 unoccupied dwellings, and 34,758 dwellings in course of erection. At earlier Censuses examination of the collectors' returns afforded evidence that the enumeration of unoccupied dwellings and dwellings being built was carried out in a more or less perfunctory manner with consequent understatement of both of these items. In 1947 Collectors were provided with a special form to record the number of dwellings being built, and

it is believed that the number of such dwellings enumerated was fairly complete. In the detailed analysis of the information relating to dwellings, occupied dwellings only have been dealt with. Ships, boats, and other craft, the occupants of which were enumerated at the Census, are also omitted from this Chapter and from the Parts of the Detailed Tables of the Census referred to in Section 3.

The number and proportional distribution of dwellings recorded as occupied, unoccupied, and being built in each of the States and Territories at 30th June, 1947, were as follows:—

DWELLINGS OCCUPIED, UNOCCUPIED, AND BEING BUILT: NUMBERS AND PROPORTIONAL DISTRIBUTION, 30th JUNE, 1947.

		İ	Nun	aber.	,	Percentage.					
State or Terri	tory.	 Occupied.	Unoccupied.	Being Built.	Total.	Occupied.	Unoccupied.	Being Built.	Total.

(a) See definitions in Section 4.

Amongst the six States, Tasmania had the highest proportion of both unoccupied dwellings and dwellings being built, while Queensland had the next highest proportion of unoccupied dwellings and Victoria occupied a similar position in regard to dwellings being built. 6. Census Comparison of Occupied Dwellings, 1911 to 1947.—The next two tables show respectively the number of occupied dwellings in

each State and Territory at the last four Census dates and ratios to 1901:—

NUMBER OF OCCUPIED DWELLINGS, CENSUSES, 1911 TO 1947.

Australian Capital		\mathbf{tory}	 		100	119	451	818
Australia			 	100	124	155	208	256

Number of dwellings in 1901 = 100.

It is interesting to note that, while in 1901 there were only 4,093 more private dwellings in New South Wales than in Victoria (237,448 to 233,355), there were in 1947, 214,675 more in New South Wales (732,510 to 517,835). Of the six States, New South Wales shows the highest proportional increase between 1901 and 1947 and Tasmania the

lowest. Between 1933 and 1947, however, the greatest proportional increase was shown by Queensland.

7. Density of Population and Occupied Dwellings.—The next table shows for divisions in each State and Territory the density of population and occupied dwellings:—

DENSITY OF POPULATION AND OCCUPIED DWELLINGS IN URBAN AND RURAL DIVISIONS, 30th JUNE, 1947.

CLASS OF DWELLING.

8. Number at 30th June, 1947.—In the following table all occupied dwellings are distributed according to class of dwelling, that is, whether the building was used as a private house, hotel, boarding house, etc. In 1947, the classification of dwellings was extended to include particulars of portions of shared houses occupied separately by household groups but, as has already been mentioned in Section 4, in a number of cases only one Householder's Schedule was returned for

the whole of the shared house instead of a separate schedule for each portion occupied separately. These dwellings are shown in the tables as private houses (shared by two or more families) and represent not "occupied dwellings" as defined for Census purposes, but "houses" occupied by more than one family. In cases where separate schedules were returned, such portions of shared houses are, of course, shown correctly in the tables as separate dwellings under the heading "Share of Private House".

Wagon and Camp	2,219	1,010	1,335	561	420	112	207	9	5,873

(a) See definitions in Section 4.

Private houses and shares thereof represented 90.4 per cent. of all occupied dwellings in Australia at the Census of 1947, whilst flats and tenements combined were 7.8 per cent., and boarding houses, hotels and other occupied dwellings were 1.8 per cent. The most interesting changes since 1933 were the increase from 75,152 to 149,560 in the number of flats and tenements, and the slight decrease

1596.—**19**

from 6,598 to 6,316 in the number of hotels in Australia.

Although there were 127,000 more persons in the metropolitan areas of Australia than in the extrametropolitan areas, private houses (one family) in the latter areas were greater by 105,000, but 85 per cent. of the flats, 87 per cent. of the tenements, and 72 per cent. of the boarding houses were situated in the metropolitan areas. Sharing, represented by

private houses (shared by two or more families) and shares of private houses, was likewise largely confined to the capital cities.

9. Number built since 30th June, 1947.—Building operations since the Census have been largely confined to the erection of private houses. There has been some activity in the building of

flats, particularly in New South Wales, and in the construction of shops with and without dwellings attached, hotels and boarding houses, but the numbers completed to 30th June, 1952, have been comparatively small. Details of the private houses and flats erected in each State since 30th June, 1947, are as follows:—

NUMBERS OF PRIVATE HOUSES AND FLATS ERECTED SINCE THE CENSUS OF 1947.

Year ended	30th June.	New South Wales.	Victoria.	Queensland.	South Australia.	Western Australia.	Tasmania.	Australian Capital Territory.	Australia.

1951–52		1,225	416	29		215	21	100	2,006

Of the 295,186 new houses completed since the Census, 101,561 have outer walls of brick, brick-

veneer, concrete or stone, 109,638 of wood, and 80,108 of fibro cement.

INMATES OF DWELLINGS.

10. Number and Proportional Distribution of Inmates in each Class of Dwelling.—
The distribution of the population of Australia according to the class of dwelling in which enumerated is shown in the next table. Of the total population, 92.71 per cent. were enumerated

in private dwellings—houses, flats and tenements—whilst 552,598 persons, or 7.29 per cent. of the population, spent Census night in hotels, boarding houses, hospitals, institutions, etc., or on ships, etc., or were camping out.

(a) See definitions in Section 4.

The average number of inmates per occupied private house, excluding shared houses, in Australia was 3.87 and per flat or tenement 2.67, compared with 4.15 and 2.76 inmates respectively in 1933. The average numbers of inmates of private houses (one family) in the various States in 1947 differed little in each case from the Australian average.

12. Percentage Distribution of Inmates in each Class of Dwelling.—An interesting percentage distribution of the population according to class of dwelling in which enumerated is shown

below for each State and Territory. The proportion of the population living in private dwellings was remarkably consistent throughout the States. The lowest proportion was in Western Australia and consequently the number of persons in hotels, boarding houses, etc., in that State was high in comparison with other States. Other significant features of the table are the high proportion of persons in boarding houses in the Australian Capital Territory, in flats in New South Wales, and in shares of private houses in South Australia.

PERCENTAGE DISTRIBUTION OF INMATES IN OCCUPIED DWELLINGS, 30th JUNE, 1947.

Class of Dwelling.	New South Wales.	Victoria.	Queensland.	South Australia.	Western Australla.	Tasmania.	Northern Territory.	Australian Capital Territory.	Australia.

(a) See definitions in Section 4. (b) Includes migratory population, persons living in wagons, vans, &c., and campers-out. (c) Naval or military establishments, 6.68 per cent.; migratory, 1.27 per cent.; campers-out, 4.08 per cent. (d) Naval or military establishments, 3.41 per cent.

13. Inmates of Private Houses (One Family) and of Flats according to Size of Dwelling.—The next table shows for each State and Territory the number and percentage distribution of persons enumerated in private houses (one family) according to size of house. It is interesting o note that private houses of four to six rooms,

which represented 79.3 per cent. of the private houses (one family) in Australia, accommodated 79.9 per cent. of the inmates of private houses. The greatest number of inmates were in five-roomed houses, and there were 343,000 more people in six-roomed than in four-roomed houses.

INMATES OF PRIVATE HOUSES (ONE FAMILY) ACCORDING TO NUMBER OF ROOMS, 30th JUNE, 1947.

In the following table similar details are given for flats (including shares of flats). Nearly 83 per cent. of the inmates of flats were in dwellings of three to five rooms. Practically half of these inmates were

in four-roomed dwellings, and the inmates in fiveroomed flats were more numerous than in those of three rooms:—

(a) See definitions in Section 4.

Amongst private houses (one family), four-inmate dwellings were the most numerous, followed very closely by those with three inmates. Two and five-inmate dwellings came next in that order. Two-inmate dwellings were most numerous amongst

flats and shares of private houses, with three-inmate dwellings next in each case. Tenements were largely distributed between dwellings of one and two inmates.

NUMBER OF ROOMS.

15. Occupied Dwellings Classified According to Rooms.—For Census purposes, the kitchen and any permanently enclosed sleep-out or portion of a verandah were included in the number of rooms in the dwelling, but the bathroom, pantry,

laundry and storehouse were not included unless generally used for sleeping. In the table below the principal classes of occupied dwellings in Australia are distributed according to number of rooms:—

OCCUPIED DWELLINGS ACCORDING TO NUMBER OF ROOMS, AUSTRALIA, 30th JUNE, 1947.

(a) See definitions in Section 4.

Eighty-eight per cent. of the private houses (one family) in Australia at the 30th June, 1947, contained six rooms or less, the respective percentages being—Under four rooms, 9 per cent.; four rooms,

22 per cent.; five rooms, 33 per cent.; and six rooms, 24 per cent. Although precise comparisons are not possible owing to the number of portions of private houses occupied by separate households in 1947,

the increase in the number of private houses since 1933 has been mainly in dwellings of from four to six rooms. In a comparison between all private houses in 1933 and private houses (one family) in 1947, five-roomed houses showed the largest numerical increase followed by those of six rooms. There was little change in the numbers of private houses containing three and seven rooms at the two Census dates, but private houses of less than three rooms and those of eight or more rooms have declined substantially since 1933.

Of the flats, 90 per cent. were of five rooms or less, 7 per cent. being of one and two rooms, 23 per

cent. of three rooms, 39 per cent. of four rooms, and 21 per cent. of five rooms.

Nearly 40 per cent. of the hotels in Australia contained 21 rooms or more, and 51 per cent. had from eleven to twenty rooms. Seventy-two per cent. of boarding houses consisted of dwellings of from five to ten rooms, and 23 per cent. had eleven rooms or more.

16. Private Houses and Flats Classified According to Rooms.—The number of occupied private houses (one family) and the proportional distribution according to number of rooms are shown below:—

In every State except Western Australia, where four-roomed dwellings were slightly in excess, private houses (one family) of five rooms were most numerous. As already stated, private houses of four to six rooms represented 79.31 per cent. of the total private houses in Australia. The only notable departure from this figure was in Queensland where private houses of four to six rooms represented only 72.44 per cent. of the total, but this State has a higher

proportion of houses with more than six rooms than any other State. The number of private houses with less than four rooms was highest proportionally in Western Australia and lowest in the more settled State of Victoria. The majority of these smaller houses are situated in the rural areas, and it is believed that many of them are temporary structures to be replaced by larger permanent buildings as settlement advances.

DWELLINGS.

285

A classification similar to the foregoing is shown for flats (including shares of flats) in the following table:—

OCCUPIED FLATS (INCLUDING SHARES OF FLATS) ACCORDING TO NUMBER OF ROOMS, 30th JUNE, 1947.

Flats of four rooms were the most numerous in all States, and, for the Commonwealth as a whole, represented 39 per cent. of the total number of flats. Amongst the States, Tasmania had the smallest proportion of flats of less than three rooms

and the highest proportion of flats of more than five rooms.

17. Inmates per Room in Private Houses and Flats.—In the next table the average number of inmates per room in private houses (one family) is shown for each State and Territory:—

AVERAGE NUMBER OF INMATES PER ROOM IN PRIVATE HOUSES (ONE FAMILY), 30th JUNE, 1947.

	Total		0.78	0.73	0.75	0.73	0.81	0.78	1.02	0.76	0.76

Except in the case of the larger flats in a couple of States, the average numbers of inmates per room in private houses (one family) and in flats decreased consistently in each State as the numbers of rooms increased. The averages for Australia as a whole declined from 1.59 inmates for houses of one

room to a minimum of 0.41 inmates for houses of eleven or more rooms, whilst the range for flats of the same sizes was 1.71 to 0.36 inmates per room. Except for dwellings of one room the density in flats was less than for private houses for all sizes of dwellings.

The average number of inmates per room in flats (including shares of flats) is shown in the following table:—

AVERAGE NUMBER OF INMATES PER ROOM IN FLATS (INCLUDING SHARES OF FLATS), 30th JUNE, 1947.

PERSONS SLEEPING OUT ON VERANDAHS (NOT ENCLOSED SLEEP-OUTS).

18. Number in Private Dwellings.—In private dwellings in Australia at 30th June, 1947, the number of persons sleeping out throughout the year on verandahs or in sleep-outs which were not permanently enclosed was 209,760 compared with 274,885 in 1933.

At 30th June, 1947, persons were sleeping out on the verandahs, etc., of 129,475 occupied private dwellings, or in almost 7 per cent. of all such dwellings. One person was sleeping out in each of 77,086 dwellings, two persons in 35,166 dwellings, three persons in 10,385 dwellings, four persons in 4,448 dwellings, five persons in 1,474 dwellings, six persons in 587 dwellings, seven persons in 208 dwellings, eight persons in 79 dwellings, and nine or more persons in 42 dwellings.

More than 77 per cent. of the persons sleeping out were in occupied private dwellings consisting of

four, five and six rooms, the respective numbers therein being 59,128, 63,656 and 36,698 persons. Amongst the States, New South Wales had the greatest number of persons sleeping out, namely 88,429 and Queensland was next with 58,779 persons, but in relation to the population the most important States were Queensland, Western Australia and New South Wales in that order. The divisional distribution of persons sleeping out was as follows:—Metropolitan 78,928 persons, urban provincial 46,617 persons, and rural 84,215 persons.

19. Number in Dwellings other than Private.—In addition to the foregoing particulars there were also 8,627 persons sleeping out in dwellings other than private. Statistics of persons sleeping out do not include those persons occupying permanently enclosed sleep-outs who are regarded for Census purposes as inmates of rooms.

MATERIALS OF OUTER WALLS AND ROOFS.

20. Material of Outer Walls of Private Houses and Flats.—In the following table private houses (one family) are classified according

to the material of which the outer walls were built:—

The figures in the foregoing table indicate that wood has been the most extensively used material in the construction of the outer walls of private houses (one family) in Australia. Of the total in 1947, 51 per cent. had walls of wood, 30.44 per cent. walls of brick, 6.77 per cent. walls of fibro cement, 4.46 per cent. walls of stone, and 3.92 per cent. walls of iron. The balance of 3.41 per cent. was made up of other materials. It is of interest to note that private houses in Australia with walls of fibro cement have increased from 1.62 per cent. of the total in 1933 to 6.77 per cent. of the total in 1947. The order of preference of the four materials most largely used in the States, which is governed to some extent by local conditions and accessibility, was as

follows:—New South Wales—brick, wood, fibro cement and iron; Victoria—wood, brick, fibro cement and concrete; Queensland—wood, iron, fibro cement and calico, canvas, etc.; South Australia—brick, stone, iron and wood; Western Australia—brick, wood, iron and fibro cement; and Tasmania—wood, brick, stone and fibro cement. Approximately 52 per cent. of the brick private houses (one family) and 58 per cent. of those of fibro cement were erected in New South Wales and 77 per cent. of the stone houses in South Australia.

In the next table flats (including shares of flats) are classified according to the material of which the outer walls were built:—

OCCUPIED FLATS (INCLUDING SHARES OF FLATS) ACCORDING TO MATERIAL OF OUTER WALLS, 30th JUNE, 1947.

Materials of Outer Wa	ılls.	New South Wales.	Victoria.	Queensland.	South Australia.	Western Australia.	Tasmania.	Northern Territory.	Australian Capital Territory.	Australia.

For Australia as a whole the greatest proportion of flats (including shares of flats) has been built with outer walls of brick, and this obtains for all States except Queensland where wooden flats predominate.

21. Material of Outer Walls and Number of Rooms of Private Houses.—Particulars for

Australia and the States and Territories in respect of materials of outer walls and number of rooms of occupied private houses (one family) and flats (including shares of flats) appear in the Detailed Tables of the Census, Part XXVII. A summary of occupied private houses (one family) for Australia is given in the following table:—

OCCUPIED PRIVATE HOUSES (ONE FAMILY) ACCORDING TO MATERIAL OF OUTER WALLS AND NUMBER OF ROOMS, AUSTRALIA, 30th JUNE, 1947.

It will be remembered from the figures in a previous table that wooden and brick houses represented more than 81 per cent. of all private houses (one family) in Australia at the date of the Census in 1947. These two materials of wood and brick constituted 40.6 per cent. of the outer walls of private houses (one family) containing one and two rooms, 82.8 per cent. of those of three to six rooms, and 85.7 per cent. of private houses of more than six

rooms. Nearly 20 per cent. of private houses containing one and two rooms were dwellings with walls of calico, canvas and hessian (mainly tents).

22. Materials of Roofs of Private Houses.

—Occupied private houses (one family) are tabulated in the following table for each State and Territory according to the materials of which the roofs have been constructed:—

OCCUPIED PRIVATE HOUSES (ONE FAMILY) ACCORDING TO MATERIAL OF ROOF, 30th JUNE, 1947.

Material of Roof.	New South Wales.	Victoria.	Queensland.	South Australia.	Western Australia.	Tasmania.	Northern Territory.	Australian Capital Territory.	Australia.
Iron	373,985	273,855	210,357	125,868	83,269	49,222	1,724	810	1,119,090

Not Stated	4,087	5,528	3,637	1,667	1,682	680	75	25 .	17,381
Total	599,870	440,144	236,809	141,337	108,274	53,237	2,462	3,120	1,585,253

More than 71 per cent. of private houses (one family) had roofs of iron, and this roofing material was the most extensively used in each of the States. Outside the metropolitan areas approximately 88 per cent. of private houses (one family) had iron roofs. Tiles occupied second place amongst roofing material. Nearly 21 per cent. of private houses of Australia had tile roofs. Tiles were mainly con-

fined to the metropolitan areas and so were slates, which was the third largest material used in the construction of roofs of private houses. The proportions of the principal materials used in the construction of roofs of private houses in the metropolitan areas were—iron 50.3 per cent., tiles 38.1 per cent., and slates 8.6 per cent.

23. Materials of Outer Walls and Roofs of Private Houses.—A classification of the private houses (one family) of Australia according to the

materials of the outer walls and the roofs is shown below:—

OCCUPIED PRIVATE HOUSES (ONE FAMILY) ACCORDING TO MATERIALS OF OUTER WALLS AND ROOFS, AUSTRALIA, 30th JUNE, 1947.

It will be seen from the table that more than 88 per cent. of the wooden private houses (one family) in Australia had roofs of iron. The roofs of brick houses were distributed as follows:—Tiles 48.1 per cent., iron 39.2 per cent., and slate 11.6

per cent. Fibro cement houses had roofs principally of iron (65 per cent.) and tiles (20.4 per cent.), whilst stone and iron houses were supplied almost wholly with iron roofs.

FACILITIES.

24. Facilities in Private Houses.—At the Census in 1947 householders were asked for the first time to state whether their dwellings were supplied with electricity, gas and running water, and whether they had certain essential facilities, such as a bathroom, flush toilet, laundry and cooking

facilities. In addition they were asked to indicate the means of cooking mostly used. Particulars tabulated for private houses (one family) in the urban and rural divisions of Australia are shown below:—

OCCUPIED PRIVATE HOUSES (ONE FAMILY) ACCORDING TO FACILITIES IN URBAN AND RURAL DIVISIONS OF AUSTRALIA, 30th JUNE, 1947.

Total Private Houses (On		mily)	 	739,870	284,133	561,250	1,585,253

Practically all of the private houses (one family) in the metropolitan areas of Australia were supplied with electricity, running water and bathrooms, but there was approximately one in six without a flush toilet, one in seven without gas, and one in eleven without a laundry. In the urban provincial areas the provision of electricity, running water and bathrooms was proportionally not much less than that in the metropolitan areas, but there were roughly as many houses without gas, flush toilets and laundries in the urban provincial areas as there were in the metropolitan areas, even though the total number of houses in the former areas was only 40 per cent. of that of the latter. In rural areas approximately half of the private houses were supplied with electricity and running water, and about four-fifths had bathrooms, but only about 10 per cent. had flush toilets and 4 per cent. had a gas supply. As would be expected practically all private houses (one family) throughout Australia had cooking facilities. Gas and its appliances were the predominant means of cooking in metropolitan areas, and wood, coal and coke stoves in outside areas.

The pattern of facilities in flats corresponded closely with that of private houses (one family), particularly in the metropolitan areas where flats were largely located. Particulars of facilities in each of the classes of occupied private dwellings in Australia will be found in the Detailed Tables of the Census, Part XXVII.

DATE OF BUILDING.

A question was included on the 1947 Census Schedule asking whether the dwelling was built before or after the 30th June, 1933, the date of the previous Census. The results obtained for private houses (one family) in the principal divisions of the States are shown in the following table. For Australia as a whole 349,162 private houses (one family), or 22.7 per cent. of all such houses for which details were furnished, had been built since 30th June, 1933. The corresponding figure for flats was 34.3 per cent. Relatively more private houses (one family) had been built in Queensland since 1933,

namely 29.4 per cent., than in any other State. Western Australia, with 27.4 per cent., came next. Private houses erected since 1933 constituted about half of all such houses in the Australian Capital Territory.

The proportion of private houses (one family) built in Australia since 1933 was highest in the rural divisions, and lowest in the metropolitan divisions. It is believed that greater replacement of temporary structures by permanent houses in the urban provincial and rural divisions was responsible for these results.

NATURE OF OCCUPANCY.

26. Nature of Occupancy of Private Houses and Flats.—The classification adopted for the nature of occupancy tabulation was as follows:—
(a) owners, (b) purchasers by instalments, (c) tenants, (d) other and not stated. The indefinite group (d) comprised about 4 per cent. of the total. The data relative to nature of occupancy were tabulated in conjunction with the number of rooms in and date of building of private houses (one family) and flats (including shares of flats) and with the age, conjugal condition and sex, occupa-

tional status, industry, and number of dependent children of the householder. Detailed tables in respect of private houses (one family) and flats for the States and Territories are contained in the Detailed Tables of the Census, Part XXVII. Particulars of occupancy for the same two classes of private dwellings are shown for Local Government areas in the various States in Parts XX. to XXV.

In the following table private houses (one family) in the States and Territories are classified by nature of occupancy:—

OCCUPIED PRIVATE HOUSES (ONE FAMILY) ACCORDING TO NATURE OF OCCUPANCY, 30th JUNE, 1947.

Nature of Occupancy.	New South Wales.	Victoria.	Queens- land.	South Australia.	Western Australia.	Tasmania.	Northern Territory.	Australian Capital Territory.	Australia.
Owner	280,761 52,960 240,994	218,655 39,629 166,674	138,320 18,535 64,280	71,260 15,930 48,667	55,896 10,091 37,405	26,686 3,882 19,992	658 7 1,360	401 170 2,473	792,637 141,204 581,845
Other Methods of Occupancy (a) Total	25,155 599,870	15,186 440,144	15,674 236,809	5,480	4,882 108,274	53,237	$\begin{array}{c} 437 \\ \hline 2,462 \end{array}$	3,120	$\frac{69,567}{1,585,253}$

(a) Includes "not stated".

The number of private houses (one family) in Australia occupied by tenants was 581,845, and the number occupied by owners 792,637, a difference of 210,792. In every State private houses (one family) occupied by owners were in excess of the number occupied by tenants.

Leaving out of account occupied houses in the indefinite group "other methods of occupancy", and combining owners and purchasers by instal-

ments, it may be said that 61.6 per cent. of the private houses (one family) in Australia were either owned or were being purchased by the occupants, while the balance, 38.4 per cent., were occupied by tenants. The corresponding proportions in 1933 for private houses were respectively 59.0 and 41.0 per cent. Occupied flats (including shares of flats) are classified by nature of occupancy in the next table:—

OCCUPIED FLATS (INCLUDING SHARES OF FLATS) ACCORDING TO NATURE OF OCCUPANCY, 30th JUNE, 1947.

Nature of Occupancy.	New South Wales.	Victoria.	Queens- land.	South Australia.	Western Australia.	Tasmania.	Northern Territory.	Australian Capital Territory.	Australia.
Owner Purchaser by Instalments Tenant Other Methods of Occupancy (a)	4,492 217 58,918 823	2,491 91 20,206 258	2,071 89 10,034 270	867 59 4,183 67	387 25 3,563 46	371 22 1,639 32	58 5	107 7	10,680 503 98,708 1,508
Total	64,450	23,046	12,464	5,176	4,021	2,064	64	114	111,399

(a) Includes " not stated ".

Omitting occupied flats in the indefinite group, 89.8 per cent. of the flats (including shares of flats) in Australia in 1947 were occupied by tenants.

27. Nature of Occupancy and Number of Rooms.—Nature of occupancy in conjunction with number of rooms is dealt with in summary form for occupied private houses (one family) in the following table:—

OCCUPIED PRIVATE HOUSES (ONE FAMILY) ACCORDING TO NATURE OF OCCUPANCY AND NUMBER OF ROOMS, AUSTRALIA, 30th JUNE, 1947.

Nu	mber of R	ooms.		Owner.	Purchaser by Instalments.	Tenant.	Other Methods of Occupancy.(a)	Total.
1 and 2	•••	•••		27,995	714	20,514	13,376	62,599
3 to 6				$636,\!112$	129,246	$521,\!159$	41,127	1,327,644
7 to 9				116,561	10,967	37,519	9,676	174,723
10 and over				10,131	184	1,599	2,002	13,916
Not Stated				1,838	93	1,054	3,386	6,371
Total			-	792,637	141,204	581,845	69,567	1,585,253

(a) Includes "not stated".

In all sizes of private houses (one family) there were more owners than tenants, but ownership was much more pronounced in houses with more than six rooms. Approximately 80 per cent. of the owner-occupied private houses (one family) had three to six rooms, but nearly 92 per cent. of the private houses occupied by instalment purchasers and nearly 90 per cent. of those occupied by tenants had that number of rooms.

28. Nature of Occupancy and Age of Householder.—In the next table private houses (one family) and flats (including shares of flats) are classified according to nature of occupancy in conjunction with age of householder:-

OCCUPIED PRIVATE HOUSES (ONE FAMILY) AND FLATS (INCLUDING SHARES OF FLATS) ACCORDING TO NATURE OF OCCUPANCY AND AGE OF HOUSEHOLDER, AUSTRALIA, 30th JUNE, 1947.

						Nature of O	ecupancy.

				-	-	-		-			<u> </u>

It will be observed from the table that the percentages of owner-occupiers of private houses (one family) increase consistently with age, and conversely the percentages of tenants of private houses decline consistently with age. Assuming equal distribution of single ages throughout the five-yearly groupings, average ages of occupiers of private houses derived from the table were approximately as follows:—Owner-occupiers 53 years, instalment-purchasers 44 years, and tenants 45 years.

DWELLINGS.

29. Nature of Occupancy and Conjugal Condition and Sex of Householder.—The next table shows a classification of private houses

(one family) according to nature of occupancy in conjunction with the conjugal condition and sex of the householder:—

OCCUPIED PRIVATE HOUSES (ONE FAMILY) ACCORDING TO NATURE OF OCCUPANCY AND CONJUGAL CONDITION AND SEX OF HOUSEHOLDER, AUSTRALIA, 30th JUNE, 1947.

(a) Includes "not stated".

Ignoring those whose conjugal condition was not stated, 6.6 per cent. of the householders occupying private houses (one family) were unmarried, 80.9 per cent. married, 11.8 per cent. widowed, and 0.7 per cent. divorced. It is interesting to note the differences in the proportions of male and female householders according to conjugal condition. Ninety-one per cent. of male householders were married compared with only 14.6 per cent. of females, of whom more than half were permanently separated from their husbands. On the other hand, 65.8 per cent. of female householders were widows, but only 3.6 per cent. of male householders were widowers. The proportions of

never married householders were males 5.1 per cent. and females 16.5 per cent., and of divorced householders, males 0.7 per cent. and females 3.1 per cent.

Of the householders in each conjugal condition, 60.1 per cent. of the unmarried, 57.8 per cent. of the married, 66.8 per cent. of the widowed, and 43.6 per cent. of the divorced were the owners of or were purchasing the dwellings in which they resided. There were more owner-occupiers proportionally amongst the females than the males.

In the following table the sex and conjugal condition of householders in flats (including shares of flats) are shown:—

OCCUPIED FLATS (INCLUDING SHARES OF FLATS) ACCORDING TO NATURE OF OCCUPANCY AND CONJUGAL CONDITION AND SEX OF HOUSEHOLDER, AUSTRALIA, 30th JUNE, 1947.

(a) Includes "not stated".

Omitting those in the indefinite group nearly 90 per cent. of the flats (including shares of flats) were occupied by tenants. Of the small number of owner-occupiers there were proportionally twice as many females as males.

Excluding those whose conjugal condition was not stated, 9.7 per cent. of the householders occupying flats were unmarried, 74.4 per cent. were married, 13.3 per cent. were widowed, and 2.6 per cent. divorced. In comparison with particulars for private houses, there were not very marked

differences in the proportions of flats occupied by males of varying conjugal condition, but there was a much smaller proportion of widow-occupiers and larger proportions of unmarried and divorced female occupiers of flats than of private houses.

30. Nature of Occupancy and Dependent Children of Householder.—The following table classifies householders of private houses (one family) and flats (including shares of flats) according to nature of occupancy and number of dependent children:—

It will be observed that 53.6 per cent. of the private houses (one family) and 66.6 per cent. of the flats (including shares of flats) in Australia had no dependent children under 16 years enumerated therein at the date of the Census, and only 13.5 per cent. of the private houses and 3.7 per cent. of the flats had three or more dependent children amongst the inmates. There were proportionally less dependent children in private houses (one family) occupied by owners than in those occupied by tenants or instalment-purchasers, but it should be

remembered that owner-occupiers were on the average some eight or nine years older than the other two classes of occupiers, and probably a higher proportion of their children had attained age 16 by 1947.

31. Nature of Occupancy and Industry of Householder.—The next table classifies householders occupying private houses (one family) and flats (including shares of flats) according to their industry and nature of occupancy:—

(a) Includes "not stated".

Amongst householders of private houses engaged in industry the greatest proportion of owner-occupiers was in the Agricultural, Grazing and Dairying industries followed by those in Mining and Quarrying. Apart from the above there were not very wide ranges of percentage differences of occupancy amongst those engaged in other industries.

Householders engaged in Other Primary Industries, Commerce, and Finance and Property were amongst the highest proportions of owner-occupiers, those engaged in Communication and Manufacturing were highest amongst instalment-purchasers, and those engaged in Amusement, Hotels, etc., and Transport were highest among tenants.

32. Nature of Occupancy and Occupatable the situation and nature of occupancy of

private houses (one family) and the occupational tional Status of Householder.—In the next status of the householder are shown in coniunction:-

(a) Includes "not stated".

In the metropolitan divisions of Australia the numbers of owners and tenants of private houses (one family) were almost the same; in urban provincial divisions there were 35 per cent. more owners than tenants; and in rural divisions there were more than twice as many owners as tenants. The proportions of householders in private houses who were instalment-purchasers were 12.64 per cent. in the metropolitan divisions, 8.91 per cent. in the urban provincial divisions, and only 3.98 per cent. in rural divisions.

From the next table, where the particulars of occupational status of householders are reduced to percentages according to occupancy, it will be seen that of all employers who were householders of private houses (one family) in Australia in 1947, 68.37 per cent. were owner-occupiers, compared with 67.99 per cent. for self-employed persons, and 35.95 per cent. for employees (on wage or salary).

RENT.

33. Rents of Private Dwellings in 1933 and 1947.—Information tabulated concerning rent was restricted to the actual amounts paid per week by tenants occupying unfurnished private dwellings. Detailed tabulations of rents of private houses (one family) and of flats (including shares

of flats) in States and divisions of States appear in the Detailed Tables of the Census, Part XXVII., and similar details for local government areas in the States in Parts XX. to XXV. In the following table private dwellings in Australia are classified according to rentals in 1933 and 1947:—

TENANTED PRIVATE DWELLINGS ACCORDING TO WEEKLY RENT (UNFURNISHED), AUSTRALIA, CENSUSES, 1933 AND 1947.

(a) See definitions in Section 4.

Average rentals paid for all tenanted private houses (one family) in Australia increased by 5s. 7d. between 1933 and 1947, or by nearly 33 per cent. The increase was highest in the metropolitan areas, namely 6s. 1d., and lowest in the rural areas, 4s. 3d. Although exact comparisons are not possible owing

to the combination of particulars for flats and tenements in 1933, it is obvious from the figures recorded in 1947 that the increase in average rentals for flats was much more than for private houses, and was probably of the order of 60 per cent. Some portion of the additional

increase was due to the higher proportion of new dwellings among the flats. Of the tenanted flats in 1947 nearly 36 per cent. had been built since 1933 compared with only 16 per cent. of tenanted private houses (one family). It will be remembered that as a result of governmental action to control prices rents were pegged early in the course of the 1939–45 War, and the regulations were still in force at the time of the Census. Thus the rise in the rental group of the "C" Series Retail Price Index from the September quarter of 1939 to

the December quarter of 1947 was only 1 per cent. compared with an increase of 33.3 per cent. in the combined weighted average for all groups of the Index.

34. Rents of Private Houses and Flats According to Number of Rooms.—The following table gives a brief summary of the number of private houses (one family) occupied by tenants grouped according to the number of rooms and rentals:—

TENANTED PRIVATE HOUSES (ONE FAMILY) ACCORDING TO WEEKLY RENT (UNFURNISHED) AND NUMBER OF ROOMS, AUSTRALIA, 30th JUNE, 1947.

It will be observed that private houses (one family) occupied by tenants consist in the main of dwellings of from three to six rooms. Of the total of this category the rent payable was not stated for 64,747 dwellings, or $12\frac{1}{2}$ per cent. of the total. Omitting the not stated, the table shows that about 42 per cent. of the dwellings of three to six rooms

was within the range of 20s. and under 30s. Of the remainder the rent payable was under 20s. for 36 per cent., and 30s. or over for 22 per cent. of the total.

The next table shows the number of flats (including shares of flats) occupied by tenants grouped according to the number of rooms and rentals:—

TENANTED FLATS (INCLUDING SHARES OF FLATS) ACCORDING TO WEEKLY RENT (UNFURNISHED) AND NUMBER OF ROOMS, AUSTRALIA, 30th JUNE, 1947.

For 21 per cent. of the tenanted flats containing three to six rooms the rent was not stated. Of those for which rentals were stated, nearly 51 per cent. had a weekly rent of from 30s. to 45s., whilst 27 per cent. had rentals under 30s., and 22 per cent. rentals of more than 45s. per week.

35. Average Weekly Rent of Private Houses and Flats.—Full details of the average

weekly rent paid by tenants in private houses (one family) and flats (including shares of flats) with various numbers of rooms in the States and Territories may be found in the Detailed Tables of the Census, Part XXVII. The following table presents a summary of the average rent per week payable for private houses (one family) occupied by tenants:—

AVERAGE WEEKLY RENT (UNFURNISHED) OF TENANTED PRIVATE HOUSES (ONE FAMILY), 30th JUNE, 1947.

Number of Rooms		New South Wales.	Victoria.	Queensland.	South Australia.	Western Australia.	Tasmania.	Northern Territory.	Australian Capital Territory.	Australia.
		s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.

Total	••	23 7	24 1	20 3	19 0	19 2	17 8	11 10	28 0	22 7

The average rent per week for all private houses (one family) in Australia occupied by tenants was 22s. 7d. Of the States, Victoria recorded the highest average with 24s. 1d. and Tasmania the lowest with 17s. 8d. It will be noted that there are

significant differences in the average rentals in Victoria and New South Wales compared with those of the other States.

The next table shows a similar summary for occupied flats (including shares of flats):—

AVERAGE WEEKLY RENT (UNFURNISHED) OF TENANTED FLATS (INCLUDING SHARES OF FLATS), 30th JUNE, 1947.

Number of Room	18.	New South Wales.	Victoria.	Queensland.	South Australia.	Western Australia.	Tasmania.	Northern Territory.	Australian Capital Territory.	Australia.
		s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.
1 and 2		26 3	28 3	22 4	20 6	22 5	18 9	21 3	15 0	25 10
3 to 6		36 3	41 4	29 5	30 8	31 2	29 6	20 1	30 11	36 6
7 to 9		70 7	77 3	38 0	46 2	43 10	36 8 .			68 1
10 and over		120 11	115 7	20 0	70 0					115 6
Total		36 4	41 6	29 2	30 4	30 11	29 2	20 2	3 0 8	36 7

The average rentals for flats (including shares of flats) in the States of Australia were considerably higher than the averages for private houses (one family). As was the case in private houses, flats in Victoria had the highest average rentals; and those in Tasmania and Queensland the lowest.

Differences in average rentals in New South Wales and Victoria and those of the other States were likewise very marked in flats.

36. Rentals of Private Houses of Three to Six Rooms with Walls of Wood, Brick or Stone,—In the following table the number of

tenanted private houses (one family) of three to six rooms with walls of wood, brick or stone are distributed by divisions of States. This group of occupied dwellings comprised 80 per cent. of all tenanted private houses (one family) in Australia at the date of the Census:—

As regards tenant-occupied private houses (one family) of three to six rooms with walls of wood, brick or stone, Queensland had the lowest percentages amongst the States of houses of three and four rooms and the highest percentage of six-roomed

houses. Western Australia, on the other hand, had the highest percentages of three and four-roomed private houses and the lowest percentages of houses with five and six rooms. Victoria had the highest proportion of five-roomed tenanted private houses. The next table shows the average weekly rent of private houses of three to six rooms with walls of wood, brick or stone:—

AVERAGE WEEKLY RENT (UNFURNISHED) OF TENANTED PRIVATE HOUSES (ONE FAMILY) OF THREE TO SIX ROOMS WITH WALLS OF WOOD, BRICK OR STONE IN URBAN AND RURAL DIVISIONS, 30th JUNE, 1947.

If brick houses in Brisbane are excluded owing to the comparatively small number in that city, Victoria had the highest average rentals amongst the States for brick and wooden houses in the metropolitan areas and for wooden houses in rural areas; New South Wales had the highest averages for brick houses in both the urban provincial and rural areas; and Queensland the highest for wooden houses in urban provincial areas.

DWELLINGS IN METROPOLITAN DIVISIONS.

37. Dwellings Occupied, Unoccupied and Being Built.—The following table affords a comparison of the dwellings occupied, unoccupied, and

in course of erection in each of the metropolitan divisions of Australia in 1947:—

METROPOLITAN DWELLINGS OCCUPIED, UNOCCUPIED AND BEING BUILT, 30th JUNE, 1947.

Of the private houses (one family) in the metropolitan areas of Australia, those of from three to six rooms represented 86.7 per cent. Amongst the capitals, Brisbane with 77.9 per cent. and Hobart with 83.2 per cent. were appreciably lower than the Australian metropolitan average, and Perth with 90.4 per cent. was much higher.

Three to six-roomed flats in the metropolitan areas represented 90.3 per cent. of the total, and there

were no marked divergencies from this percentage in any of the States.

40. Material of Outer Walls of Private Houses and Flats.—The next table gives particulars of the principal materials used in the construction of the outer walls of private houses (one family) and flats (including shares of flats) in the metropolitan areas:—

METROPOLITAN OCCUPIED PRIVATE HOUSES (ONE FAMILY) AND FLATS (INCLUDING SHARES OF FLATS) ACCORDING TO MATERIAL OF OUTER WALLS, 30th JUNE, 1947.

					21,242	7,357	4,729	3,409	1,265	94,822		

The materials mainly used in the construction of the outer walls of private houses (one family) in the metropolitan areas of Australia were brick and wood. Dwellings with walls of these materials accounted for 91.1 per cent. of the total private houses. Private houses (one family) with walls of brick represented 53.9 per cent. of the total for metropolitan areas combined, and also predominated in Sydney, Adelaide and Perth, but in Melbourne, Brisbane and Hobart wooden houses were most numerous. In Brisbane wooden dwellings represented 89.1 per cent. of all private houses (one family).

In the case of flats in metropolitan areas, dwellings with walls of brick predominated in all capitals except Brisbane, where wooden flats were most numerous.

It is of interest to note that more than 58 per cent. of the private houses and flats with walls of fibro cement in the metropolitan areas are situated in Sydney, and nearly 70 per cent. of the stone dwellings in Adelaide.

41. Nature of Occupancy of Private Houses and Flats.—The nature of occupancy is shown for private houses (one family) and flats (including shares of flats) in the metropolitan areas in the next table:—

METROPOLITAN OCCUPIED PRIVATE HOUSES (ONE FAMILY) AND FLATS (INCLUDING SHARES OF FLATS) ACCORDING TO NATURE OF OCCUPANCY, 30th JUNE, 1947.

Nature of Occupancy.	Sydney and Suburbs.	Melbourne and Suburbs.	Brisbane and Suburbs.	Adelaide and Suburbs.	Perth and Suburbs.	Hobart and Suburbs.	Total Metropolitan

(a) Includes "not stated".

Leaving out of account the group "other methods of occupancy", 43.7 per cent. of the private houses (one family) in the metropolitan areas were occupied by owners, 12.8 per cent. by purchasers under instalment systems, and 43.5 per cent. by tenants. The percentages of private houses (one family) in each

of the capital cities occupied by owners and instalment-purchasers in combination were Sydney 51.3 per cent., Melbourne 54.6 per cent., Brisbane 69.7 per cent., Adelaide 62.5 per cent., Perth 62.8 per cent., and Hobart 58.7 per cent. FAMILIES. 305

CHAPTER XXII.

FAMILIES.

GENERAL SIGNIFICANCE OF STATISTICS CONCERNING FAMILIES.

1. Value of the Statistics.—Information concerning the numbers, size and various characteristics of families from time to time is a fundamental requirement for a study of demographic trends, which have assumed considerable importance in view of the long decline and recent recovery in the birth-rate and of the social and economic implications of these movements. Complete and reliable statistics concerning families are obtainable only by means of a Census. At a Census, moreover, the inquiry can be extended to include various characteristics for the purpose of showing significant differences in family structure between regions, in particular the influence of urbanization, and between various groups that may be distinguishable in the population. In this way, the influence of sociological, political, economic and cultural forces likely to influence the growth of families may be gauged and some idea of the future level and qualitative composition of the population obtained. The knowledge of the trend in population and family structure so provided by the Census has important public uses when applied to the problems of housing, food health, immigration, requirements, defence, education and other social services.

There are, however, limitations to the value of Census data in that although they may be tabulated in respect of many significant relationships they still show the position only as it actually exists at the dates of the various Censuses, which in the case of Australia in recent years have been more widely spaced than normally. is possible by using the Census particulars relating to age or date of birth of each child to reconstruct the family structure of the population for intercensal years or specified periods of marriage, as was the procedure adopted in the Family Census of Great Britain in 1946. This, however, involves an immense amount of work in tabulation. The usual Census, therefore, has only limited application for some purposes, such as providing population data that may be related to annual records of births. This deficiency is not important if the Census is taken at frequent intervals. It is possible, in any case, to prepare approximate estimates of the number and size of families in the population which serve to maintain the basic Census information up to date.

The Census itself is thus valuable in providing the basis of such estimates in the first instance and the means of correcting them eventually.

2. Nature of the Statistics.—The choice of the unit to be used in the definition of a family is wide, as is instanced by the differing definitions adopted in other countries and also within countries from Census to Census. Thus, outside Australia the "family" has related variously to the related members of a household, all or living children of married persons, the dependent children of the head of a household and so on.

Although as explained below, there have been some minor variations in practice, the family group adopted for the purposes of Australian Censuses has been basically that of husband and wife and their issue, which is regarded as extending to all live-born children, whether living or deceased at the time of The question asked in 1947, for the Census. example, was: "Children Born to Existing Marriage.—State the number of children, both living and dead, from existing marriage (not including children from any previous marriage)— **Living** . . . **Dead** (excluding still-born) . . . ". Statistics of dependent children as distinct from the issue of husbands or wives have also been compiled at each Census from 1921 onwards. Those for 1947 will be found in Chapter XII. preceding and in Part XI. of the Detailed Tables of the Census.

At the Censuses of 1911 and 1921 particulars of families were collected for all husbands and wives, but in 1947 those permanently separated (whether legally or otherwise) were not required to give particulars of their issue. In 1921, although the information was collected for all married, widowed and divorced persons, the tabulations under the heading of "Families" were confined to husbands and wives enumerated in the same dwelling on Census night. The Census of 1911 provided a further important difference in procedure in that not only did the inquiry concerning issue extend to widowed and divorced persons, who were excluded from the scope of the 1947 Census, but unlike 1921, tabulations in regard to the average issue of such persons were made. A feature of the 1921 Census that may be mentioned is that, in addition to the statistics relating to issue, information was collected

for the only time in Australia regarding the birthplaces of the parents of the Australian population. In 1933, owing to the need for economy and the abnormal conditions existing at the time, the question regarding issue was omitted from the Census Schedule, although that relating to duration of existing marriage was retained. Data published under the heading of "Families" on this occasion related to husbands and wives who were enumerated together without reference to their issue, except for some classifications according to dependent children.

Not only have there been variations in the types of families included in the Census, but also the basis on which children have been counted has differed. In both 1911 and 1921 particulars of issue of both existing and previous marriages were collected, but in the main were tabulated in respect of the combined issue of all marriages. On the occasion of the 1947 Census, the inquiry related to children of existing marriages only. These differences are important and should be borne in mind when comparisons are being made between the results of the various Censuses.

3. Details of Tabulations.—At all three Censuses, 1911, 1921 and 1947, husbands and wives were classified according to relative ages, age in conjunction with issue, inclusive of issue of former marriages mainly at the first two Censuses, and, for wives only in 1911 and 1921, according to duration of existing marriage in conjunction with the issue of such marriages. Data regarding the average issue of widowed and divorced persons according to age were published for the 1911 Census. Also in 1911 a special tabulation, for married females only, was made showing the numbers with each issue according to five-yearly age groups in conjunction with five-yearly duration groups. Tabulations relating to other characteristics of husbands and wives extended in 1911 and 1921 to relative religions and birthplaces and, for husbands, to occupation classified in conjunction with grade of occupation, while various tables, details of which will be found in the Families Chapters of previous Reports and in the respective Parts of the Detailed Tables of the Census, were also prepared for these characteristics in relation to issue. Corresponding tabulations were omitted in 1947. In 1947, however, in view of the value of the information for the purpose of analysing annual fertility data according to various inherent relationships, the data relating to age and to duration and issue of marriage were classified in considerable detail, a triple-entry table on the lines of that available for 1911 being compiled but on an extended basis to cover each individual age, duration and issue. Owing to considerations of space, it has not been practicable to publish these tabulations in detail. The data published for 1947 will be found in Part XXVIII. of the Detailed Tables of the Census and in the various tables of this Chapter.

In 1921 and 1947 particulars were collected for living and deceased children separately. It is believed that by framing the inquiry in this form misunderstandings that may otherwise have occurred as to the necessity of including deceased children were avoided to a great extent. No particulars were compiled for living as distinct from deceased issue, however, all tabulations being made on the basis of total children living or dead.

As mentioned in the preceding Section, no particulars of issue are available for the 1933 Census. The tabulations under the heading of "Families" related to husbands and wives enumerated together, who were classified according to age, duration of existing marriage and dependent children (wives only), relative ages, birthplaces and religions, and for husbands according to age in conjunction with income and dependent children.

4. Accuracy of the Statistics.—The existence of mis-statements as to age has already been referred to in Chapter X., Age. These mis-statements occur in the married as well as the single population, but as the age data in this Chapter are shown only in five-yearly groups, any inaccuracies that may be present are probably only slight. As mentioned in Section 16 below, individual durations of marriage are also liable to some mis-statement, but again the five-yearly groupings adopted in this Chapter should avoid errors of consequence.

Owing to the classification of an unduly high proportion of cases of "not stated" issue as issue 0", the recorded results for 1921 overstate the actual numbers childless and consequently understate the numbers with children and the average issue. In 1947, in many instances where the older married persons were concerned, replies to the question relating to the number of their children were omitted from the Schedule and were classified "not stated". various tabulations as the Of all husbands and wives, 87,812 and 86,503 respectively so failed to state their issue. It is apparent that in a large proportion of these cases the correct reply should have been to state the number of children as "0" or "none". This deficiency in the numbers recorded as childless has been investigated on various bases and some approximate indications of the true degree of childlessness in 1947 are included in relevant Sections. As there does not appear to be any completely satisfactory method of adjusting the Census results for the errors involved, however, the tables in this Chapter relating to issue show the numbers either as enumerated or after a proportionate distribution of the cases of "not stated" issue. The results shown for 1947 in the form of average issue are exclusive of "not stated" issue, and consequently are slightly overstated at the older ages and longer durations of marriage. indicated in more detail in later Sections, however, the corresponding numbers of childless husbands and wives are more seriously affected and need to be interpreted with due caution.

COMPARISONS BETWEEN CENSUSES.

5. Numbers included in the Scope of the Various Censuses.—In view of the varying practices mentioned, a brief indication of the scope of the Census in each case is desirable. This may be provided by comparisons between the results for persons whose issue was enumerated and for those who although they could have had issue were either not required to furnish their particulars or not included in the tabulation of "families".

The following table accordingly shows, for the three Censuses at which particulars of families, inclusive of issue, were tabulated, the numbers in the various conjugal groups who were or at some time had been married and their proportion of the total of such married, widowed or divorced persons. Persons who had never married are disregarded herein as the proportion having issue is very small.

⁽a) Includes persons permanently separated (whether legally or otherwise). The numbers so included in 1911 and 1921 are not available but those for 1947 are shown above in the second line of the table, being married persons whose families were not enumerated.

(b) Particulars of families collected in 1911 and 1921 but tabulated for 1911 only.

(c) Husbands and wives enumerated apart.

(d) Persons permanently separated (whether legally or otherwise).

Note.—The results above for each conjugal condition are as recorded, before distribution of "not stated" conjugal condition.

The coverage of families was complete in the Census of 1911, which as mentioned included in its scope all married, widowed and divorced persons. At the Census of 1921 the tabulations related to only 73.03 per cent. of all women who were or had been married and to only 79.22 per cent. of ever married males. The section of married persons omitted from the 1921 tabulations, being husbands and wives enumerated apart on Census night, formed 13.58 and 12.52 per cent. of the total married, widowed or divorced groups for males and females respectively. On the whole it is not thought that family composition, except so far permanently separated couples are concerned, would be very different from the experience shown in the tabulations. In 1947, the proportion of couples permanently separated and excluded from the scope of the inquiry concerning families was recorded as 3.11 and 3.25 per cent. of males and females respectively, and the tabulations covered 89.65 and 80.65 per cent. respectively of males and females in the whole married, widowed or divorced groups.

far as the types of families enumerated are concerned, there do not appear to be any differences on the whole that would affect comparisons between the results of the three Censuses.

6. Average Size of Families.—Comparative results for the average size of family of the married persons indicated in the preceding table at the Censuses of 1911, 1921 and 1947 are shown in the following table:—

HUSBANDS AND WIVES(a): AVERAGE ISSUE OF EXISTING AND ALL MARRIAGES, AUSTRALIA, CENSUSES, 1911, 1921 AND 1947.

		Husb	ands.	Wives.			
Cens	sus.	Existing Marriages.	All Marriages.	Existing Marriages.	All Marriages.		
1911		(b)	3.91	3.78	3.93		
1921		$3.\hat{2}2$	3.38	3.22	3. 34		
1947	[2.36	(b)	2.36	(b)		

(a) For 1911 includes all husbands and wives but in 1921 excludes husbands and wives not enumerated together and in 1947 excludes persons who were permanently separated (whether legally or otherwise).

(b) Not available.

Results for average issue in 1911 not included in the table above but which may be of interest as the only recorded data of this nature for Australia are—Widowers 4.84, widows 5.75, and divorced males and females 2.35 and 2.82 respectively.

For the three sets of records that can be compared, the inclusion of children of former marriages increases average issue for wives by 4.0 per cent. in 1911 and 3.7 per cent. in 1921, and for husbands by 5.0 per cent. in 1921. The only indication of the trend in average issue that is provided on a comparable basis for the whole period is in respect of the average issue of existing marriages of wives, which fell from 3.78 in 1911 to 3.22 in 1921 and 2.36 in 1947. The 1921 and 1947 averages represent only 85.19 and 62.43 per cent. respectively of the 1911 level.

7. Issue according to Geographical Divisions and Characteristics of Husbands and

Wives.—Various comparisons of interest showing details of families of different sizes can be made from Census to Census in respect of differential fertility experiences according to geographical divisions and various characteristics of husbands and wives. These, however, involve considerable detail and for reasons of space can only be published in this Chapter in summary form. The principal comparisons of this nature will be found in the relevant Sections which follow. There are no data for 1947, however, which would provide comparisons with previous Censuses so far as issue according to religion, birthplace or occupation is concerned. It is thus not possible to determine the extent to which changes in family size have occurred in such social and economic groups.

AGES OF HUSBANDS AND WIVES.

8. Relative Ages of Husbands and Wives Enumerated Together. — Of the 1,692,913 married males and 1,686,885 married females (excluding those permanently separated) at the 1947 Census, 1,570,135 couples were enumerated in the same dwelling. As at previous Censuses, it has been possible to tabulate the relative ages of those husbands and wives enumerated together. In Part XXVIII.

of the Detailed Tables of the Census the relative ages of husbands and wives in Australia and in the various States and Territories are shown singly from 15 to 20 years, grouped for ages 21 to 24, and thereafter in quinquennial groups, but in the following table ages have been reduced to broader groups.

RELATIVE AGES OF HUSBANDS AND WIVES ENUMERATED TOGETHER, AUSTRALIA, 30th JUNE, 1947.

			Age of Wife last Birthday (Years).								
Age of Husband last Birthday (Years).			15–19.	20-24.	25–29.	30–44.	4564.	65 and over.	Not Stated.	Total Husbands.

The relationship between the ages of husbands and wives has an important influence on their capacity to bear children. While perhaps a more refined correlation between joint age and fertility may be found, it is evident from a comparison of fertility rates based on birth registrations

according to relative ages of parents, which can be calculated for Census years, that the younger the joint age the more fertile is a marriage, although the age of the mother is the dominating factor. The relative age composition of married couples is, therefore, of importance in studies of family size.

FAMILIES.

The proportional changes that have occurred between 1921 and 1947, both post-war years, in the

numbers in each of the age groups shown in the preceding table are set out below:—

RELATIVE AGES OF HUSBANDS AND WIVES ENUMERATED TOGETHER, AUSTRALIA: PERCENTAGE CHANGES BETWEEN 1921 AND 1947.

			Age of Wife last Birthday (Years).									
Age of Husband last Birthday (Years).		15–19. 20	20–24.	25–29.	30–44.	45-64.	65 and over.	Not Stated.	Total Husbands.

Nore.—Figures represent percentage increases or, where preceded by a minus sign (-), percentage decreases from 1921 to 1947.

These results reflect the recent tendency towards earlier marriage and are of particular significance in showing a pronounced concentration the groups of highest fertility, namely those in which young wives are associated with young husbands. Thus, the numbers in most of the groups comprising husbands under 30 years with wives under 25 years have increased between 1921 and 1947 at a much greater rate than has the whole group of husbands and wives collectively. In all other groups of specified joint ages, except ages 45 upwards which reflect the ageing of the population and which also probably have been augmented by widowed and divorced persons who re-married, either the percentage increase has been less than the overall average or a decrease has occurred. A marked tendency towards the elimination of large disparities between the ages of husbands and wives is apparent from the smallness of the increases or from the decreases recorded at older in association with younger ages.

The general trend towards younger age at marriage may have an important influence on the future level of fertility. At the least it increases the length of the reproductive period within marriage while, of more importance, marriage is commenced at ages which are physiologically most favorable to childbirth. While as a general rule fertility rates increase with each fall in age at marriage, it is not necessarily true, however, that lowering of the average age at marriage will raise fertility. It is to be borne in mind in this connexion that those marrying at the younger ages are in the nature of a select group with a high proportion of fertile women due to the inclusion of those who had already conceived before marriage and also probably of others having a favorable attitude to childbearing. If the numbers marrying at the younger ages are increased, the additional numbers most probably will

not represent groups of this nature and need not necessarily, therefore, experience higher fertility than if marriage was deferred to a slightly older age.

The various relationships between the ages of husbands and wives are seen to be of considerable interest from the viewpoint of fertility and are examined further in the remaining tables of this Section.

The numbers and proportions of husbands with wives in the same age group as themselves, or whose wives belonged to a lower or higher age group, together with similar information concerning husbands' ages in relation to those of their wives, are shown in the Families Chapters of previous Reports. These particulars, expressing only a fiveyearly group relationship between the ages of husbands and wives, provide only approximate comparisons and the tables are not repeated herein. It will suffice to mention that comparisons made between the various Censuses in this form clearly indicate a trend towards closer correspondence between the ages of husbands and wives, which has already been shown by the comparative changes between 1921 and 1947 set out in the second table of this Section. The proportion of husbands and wives recorded in the same age group has increased steadily since 1911 and these increases have been common to most age groups of husbands and wives. On the other hand, with some exceptions in 1921, the proportions of husbands and wives with partners in younger or older age groups have decreased continuously. These decreases have again been spread throughout most of the individual age groups. In considering the significance of these various results, however, it is to be noted carefully that they do not purport to show the proportion of husbands or wives who are younger than, of the same age as, or older than, their partners. Such relationships are examined next. It may first be remarked, however, that the closer agreement between the ages of married couples may be in part a reflection of the more balanced sex composition of the population enabling men and women to marry partners of a more suitable age than in the earlier periods of Australian history, when there was a marked surplus of males. This early high masculinity has declined progressively until the position has now been reached of an approximate equality in the numbers of each sex in the population. Thus, in 1911 there were 107.99 males to every 100 females, but by 1947 this ratio had fallen to 100.41 males per 100 females.

At the 1933 and 1947 Censuses, the relative ages of husbands and wives were tabulated according to individual ages throughout instead of single ages to 20 years only and age groups thereafter as at previous Censuses. The 1933 results have not been analysed but on the basis of the 1947 data a classification has been made of husbands and wives according to whether they are actually younger, of the same age, or older than their partners. In the following table the numbers and proportions of husbands in Australia at the 1947 Census are shown on this basis:—

WIVES' AGES IN RELATION TO THOSE OF THEIR HUSBANDS(a), AUSTRALIA, 30th JUNE, 1947.

(a) Husbands who were enumerated with their wives.

The classification of husbands and wives on the basis of single ages as above gives results which differ considerably from those published in previous Reports in which age groups only were used. Thus the number of husbands and wives in 1947 who were of the same age is seen to form only 10.06 per cent. of the total husbands and wives enumerated together, compared with the 39.00 per cent. of husbands and wives represented by those who were recorded in the same age group. Husbands with wives younger than themselves com-

prised 72.97 per cent. of the total, whereas those whose wives belonged to a lower age group formed only 52.39 per cent. Husbands who married women older than themselves were 16.97 per cent. of the total, compared with a corresponding percentage of 8.61 for husbands having wives in higher age groups.

With a few exceptions, there was a regular progression from ages 15-19 years to 95-99 years in the proportions of husbands in each of the three classifications shown, the percentage of husbands with younger wives rising from 31.87 to 97.14 and of

those whose wives were of the same age or older falling respectively from 27.89 to 1.73 and from 40.24 to 2.86, the last group in which husbands were recorded in the former case being 90–94 years.

The number and proportion of wives in 1947 whose husbands were younger, of the same age, or older than themselves are shown for Australia in the following table:—

(a) Wives who were enumerated with their husbands.

The figures in this table show a continuous increase with age in the proportion of wives whose husbands were younger than themselves, and also successive decreases with age in the proportion of wives with older husbands. The proportion of wives whose husbands were of the same age averaged over all

ages 10.06 per cent., and did not diverge greatly from this figure between the ages 25 and 84 years.

The average ages of wives whose husbands were of the ages specified are shown for States and Territories in the following table:—

AVERAGE AGES OF THE WIVES OF HUSBANDS(a) OF STATED AGES, 30th JUNE, 1947.

Tota	l, Stated	l Ages	41.7	42.4	41.4	42.4	41.6	41.0	35.5	39.4	41.9	

The averages indicated in this and the next table probably vary slightly from the truth, since they have been computed on the assumption that the average age for any group is the central point of that group, e.g., the average age for group 40–44 years last birthday equalled $42\frac{1}{2}$ years. In subsequent tables where the differences between average ages are dealt with this error practically disappears.

Leaving out of account the Territories, where the numbers concerned are unimportant, the averages for the several States do not differ materially throughout the table. The average age for all wives of specified ages, who were enumerated with

husbands whose ages were also stated, ranged between 41.0 years in Tasmania and 42.4 years in Victoria and South Australia. Compared with 1933 the average age of wives for Australia as a whole, 41.9 years, and in Western Australia, 41.6 years, showed no change, but that of wives in Tasmania decreased from 42.1 years to 41.0 years. In the other States it increased or decreased by varying periods of less than six months.

The following table gives similar particulars concerning the average ages of husbands whose wives were of the ages specified.

AVERAGE AGES OF THE HUSBANDS OF WIVES(a) OF STATED AGES, 30th JUNE, 1947.

(a) Wives who were enumerated with their husbands.

As in the case of wives, the differences in the average ages of husbands in the States over the range of ages specified for wives were not marked. The average age for husbands of all ages, who were enumerated with wives whose ages were also stated, ranged between 44.5 years in Tasmania and 45.6 years in Victoria and differed little from the corresponding averages at the Census of 1933, except in Tasmania, where the average age decreased from 45.8 to 44.5 years. The average age for husbands in Australia, 45.2 years, was only slightly lower than the corresponding average of 45.4 in 1933.

A comparison of the figures in this and the preceding table shows that the average age of husbands in Australia exceeded the average age of wives by 3.3 years. The corresponding average differences for the States in years were as follows:—Queensland, 3.7; Western Australia, 3.6; Tasmania, 3.5; New South Wales, 3.3; Victoria, 3.2; and South Australia, 3.1.

The figures in the two preceding tables enable a computation to be made of the average differences in age of husbands and wives in the various age groups. The results for Australia are given in the following table.

313

(a) Husbands who were enumerated with their wives.

On the average, husbands in the age groups 15–19 and 20–24 years had wives older than themselves, although only by a very small margin in the latter case, while husbands in higher age groups were on the average older than their wives. There was a continuous progression with age in the average differences between the ages of husbands and their wives. Wives of each age under 80 years were younger on the average than their husbands and from age 80 years onwards older than their husbands. The regular progression with age noted in the case of husbands is also in evidence in the case of wives.

9. Ages of Husbands and Wives Enumerated Apart.—Of the total number recorded as married in 1947 the number of husbands

whose wives were absent from them on the night of the Census was 122,778, or 7.25 per cent., and the number of wives whose husbands were absent from them 116,750, or 6.92 per cent., the difference representing the excess of married males over females in Australia. The large number of husbands and wives apart at the time of the Census was no doubt due to the temporary absence from home of husbands for business or other reasons, as the figures exclude the judicially separated and others who may be said to have separated permanently, the combined totals of whom were recorded as 58,722 males and 67,890 females. The proportions of absentees for the sexes differed in the States, as will be seen from the following table:-

PERCENTAGE OF ABSENTEES, 30th JUNE, 1947.

Particulars.	New South Wales.	Victoria.	Queensland.	South Australia.	Western Australia.	Tasmania.	Northern Territory.	Australian Capital Territory.	Australia.
Married Males whose wives were absent Married Females whose husbands were absent	7.22	6.19	8.42	6.06 6.04	10.06 8.15	6.96 6.39	47.43 14.03	14.97 7.87	7.25 6.92

In Queensland and Western Australia, which lie partly within the tropics, and are also of more recent settlement, the percentages shown for husbands whose wives were absent and for wives whose husbands were absent, were higher than in the other States of Australia. In all States, wives whose husbands were absent were proportionately lower than husbands whose wives were absent. The relationship between absence and age is shown for husbands and wives separately in the next table:—

ABSENCE AND AGE, AUSTRALIA, 30th JUNE, 1947.

					Husbands in each wer	Age Group whose Wives re absent.	Wives in each Age Group whose Husbands were absent.

T	'otal				122,778	7.25	116,750	6.92		

A feature of the figures in this table is the regular variation with age in the proportion of absentees. Commencing at the age group 15–19 years, the number of husbands whose wives were absent diminished proportionally to age group 35–39 years,

and from there onwards increased. The proportion of wives whose husbands were absent also decreased by successive age groups from the earliest age group 15–19 years to the group 35–39 years, and then rose as in the case of husbands.

ISSUE OF HUSBANDS AND WIVES.

10. Issue of Husbands.—As a demographic item expressive of the power of reproduction under given circumstances, statistics relative to issue, whether of husbands or wives, must be studied in conjunction with age, and this is done in this

Chapter and in greater detail in the Detailed Tables of the Census, Part XXVIII. The frequency distribution of issue, irrespective of age, is, however, of importance and interest, and is given for husbands by States and Territories in the next table.

(a) Excludes husbands who were permanently separated (whether legally or otherwise) from their wives. The figures include a proportionate allocation of married males who did not state their conjugal condition, while those who did not state their issue have also been distributed proportionately throughout. No correction has been made above for the understatement of childlessness referred to in Section 4.

The figures above are as adjusted by the proportionate distribution of cases of "not stated" conjugal condition over the various conjugal conditions as referred to in Chapter XI., Conjugal Condition. The numbers childless are understated, and the numbers with issue overstated, due to the inclusion in "not stated" issue of a number of persons who were actually childless, the "not stated" group being distributed above proportionately without correction for this fact. These results are more complete than the recorded data and are more appropriate than the latter for the calculation of fertility rates from birth statistics. The understatement in childlessness is not very serious in the results above. It is estimated that, if corrected, the recorded proportion of 17.34 per cent. for Australia, for example, would be increased to about 19 per cent. No adjustments for this factor have been attempted in the tables of this Chapter.

The proportions in the foregoing table exhibit some irregularity in the case of the Territories, due to the smallness of the numbers concerned, but in the States there is a marked regularity in the proportions for successive total issues, while the proportions for the various States for any given issue do not vary greatly from the average for Australia. The most marked deviations occur in Tasmania, where the proportions of husbands with issue of less than four children were appreciably lower than the average for Australia, whereas the

proportions with issue of four or more were in all cases above the average. Much the same applies to Queensland, but the proportions are lower than the Australian experience only for husbands with up to two children. It is shown in a subsequent table that the average issue per husband is highest in Tasmania, followed by Queensland, and lowest in In Victoria, with a few exceptions, the proportions of husbands with issue of up to two children were higher, and the proportion with issue of more than two children lower than in any other The proportions of husbands in the States in 1947 who had issue of less than five were as follows:-Victoria 87.85 per cent., South Australia 87.80 per cent., New South Wales 86.29 per cent., Western Australia 86.00 per cent., Queensland 83.81 per cent., and Tasmania 81.85 per cent. The corresponding percentage for Australia was 86.35. Australia, as a whole, and in each State, the percentage of husbands who had issue less than four increased considerably between 1911 and 1947.

It should be noted that total issue in the above table relates to issue from the existing marriage, all children born alive of that marriage, whether surviving or dead at the date of the Census, being included.

11. Issue of Wives.—Corresponding to the total issue table for husbands in Section 10, the next table gives for wives the number and proportion per cent. for each degree of total issue.

(a) Excludes wives who were permanently separated (whether legally or otherwise) from their husbands. The figures include a proportionate allocation of married females who did not state their conjugal condition, while those who did not state their issue have also been distributed proportionately throughout. No correction has been made above for the understatement of childlessness referred to in Section 4.

The remarks made in the preceding Section relating to the distribution of cases of "not stated" conjugal condition and issue and the understatement of childlessness apply in a similar manner to the figures above for wives. Compared with the proportion of 17.30 per cent. of all wives in Australia recorded as childless, the true proportion, as for husbands, is estimated to be in the region of 19 per cent. As in the case of husbands the proportions of wives with issue less than four in Tasmania and with less than three in Queensland were below the average for Australia, while in Tasmania the proportions with issue above three were above the average for each successive number, and the same was true of Queensland for issue above two. The

average issue per wife was highest in Tasmania, with Queensland next, and lowest in Victoria, with South Australia very slightly higher.

The proportions of wives who had issue of less than five were as follows:—Victoria 87.78 per cent., South Australia 87.74 per cent., New South Wales 86.24 per cent., Western Australia 85.99 per cent., Queensland 83.73 per cent., Tasmania 81.76 per cent., and Australia as a whole 86.28 per cent. These percentages are substantially higher than the corresponding percentages for 1921.

12. Comparative Results for Issue at Various Censuses.—The particulars of issue according to each number of children published for 1911 and 1921 in the respective Families Chapters

and Parts related mainly to the issue of all marriages of a husband or wife and not only that of the existing marriage, which is the basis of the 1947 results. Although tables in terms of average issue of existing marriages were published in 1921 for wives, these results were obtained by means of a tabulation of issue in the aggregate without a dissection into families of each individual size. However, for 1911 full details of the issue of existing marriages of wives were published in an appendix to the Report on the Census, entitled "Mathematical"

Theory of Population", pp. 338–339. It is possible, therefore, to make comparisons between the results for the 1911 and 1921 Censuses for both husbands and wives only on the basis of issue of all marriages and between those of 1911 and 1947 only for issue of existing marriages for wives. In the following table the numbers and proportional distributions of wives according to issue, on all available bases, in 1911, 1921 and 1947, are shown for Australia:—

WIVES(a): NUMBERS AND PROPORTIONAL DISTRIBUTION ACCORDING TO ISSUE, AUSTRALIA, CENSUSES, 1911, 1921 AND 1947.

(a) For 1911 includes all wives, but in 1921 excludes wives enumerated apart from their husbands and in 1947 excludes wives permanently separated (whether legally or otherwise) from their husbands. The figures for 1947 include a proportionate allocation of married females who did not state their conjugal condition while those who did not state their issue have been distributed proportionately throughout. Cases of "Not Stated" issue of existing marriages in 1911 have also been distributed over the specified issues, while iu 1921 wives who failed to state their issue were assigned issue before tabulation. (b) No correction has been made for the overstatement and understatement of childlessness in 1921 and 1947 respectively, referred to in Section 4. (c) Percentage of total wives who stated their issue.

The decline in the average size of family between 1911 and 1947 shown by the table in Section 6 can be further examined by means of the comparative figures above. Bearing in mind that due to the inclusion of children of former marriages the 1921 figures overstate issue by about 4 per cent. in comparison with those of 1911 and 1947 relating to existing marriages only, it will be seen that accurate comparisons between the three Censuses are not possible. Nevertheless, it would appear that the proportion of childless wives has increased, as have also the proportions of wives having smaller families of up to three children, whereas the proportion fell

for each number of children from four upwards. The age distribution of the population is, however, an important factor in determining family structure, and it is to be remembered in interpreting the results above that the age composition of the Australian population had undergone considerable change between 1911 and 1947. The effect of age on issue is examined in Section 13 following. As previously mentioned, the figures for childless wives in 1947 are understated, while those for the 1921 Census are on the contrary overstated. Reference may be made to Section 14 in which the results for childlessness are discussed in more detail.

ISSUE IN RELATION TO AGE, DURATION OF EXISTING MARRIAGE AND AGE AT MARRIAGE.

13. Age and Average Issue.—In the follow- of various ages enumerated in the States and ing table are given the average issues of husbands Territories of Australia:—

AVERAGE ISSUE OF EXISTING MARRIAGE ACCORDING TO AGE OF HUSBAND(a), 30th JUNE, 1947.

(a) Excludes husbands who were permanently separated (whether legally or otherwise) from their wives or who did not state their issue. No correction has been made above for the overstatement in average issue referred to in Section 4.

In this and the succeeding tables the expression 0.00 is used where there were husbands or wives in a particular category but no issue. Where blanks occur there were no husbands or wives. As indicated in Section 10 of this Chapter particulars of age are requisite for any complete study of the question of issue. Examples of this necessity are afforded by the figures in this table. Comparing the averages for all ages it will be noticed that the average for Australia (2.36) was higher than the average for New South Wales (2.35), but if the successive age groups are compared it will be found that except in the unimportant ages under 20 years, age groups 55-59 to 70-74 years, and "unspecified" ages, in each of which there was a difference in favour of Australia, the averages throughout were uniformly higher for New South Wales. apparent anomaly is largely due to the different age constitution of the married male population in New South Wales as compared with Australia as a whole. With few exceptions the average issue of husbands in the States increases con-

sistently with age, while the variations the average issue at the more important ages between the various States, except for Victoria where the average issue was relatively low, were confined within fairly narrow limits. In practically all age groups to 75-79 years inclusive, husbands in Tasmania had the highest average issue of the States, while at the remaining ages Queensland had the highest. In a majority of the groups husbands in Victoria had the lowest average issue. In each of the States, and in Australia, the highest average issues for husbands are to be found in the advanced ages, which suggests that fertility is not a bar to long life although, of course, these averages are primarily a reflection of the higher levels of the birth-rate obtaining in the periods when these persons would have had their children. The average issue for all husbands irrespective of age was less for each State and for Australia in 1947 than in 1921, the respective averages for Australia being 2.36 and 3.22.

The next table gives the average issue for wives of various ages in the States and Territories.

(a) Excludes wives who were permanently separated (whether legally or otherwise) from their husbands or who did not state their issue. No correction has been made above for the overstatement in average issue referred to in Section 4.

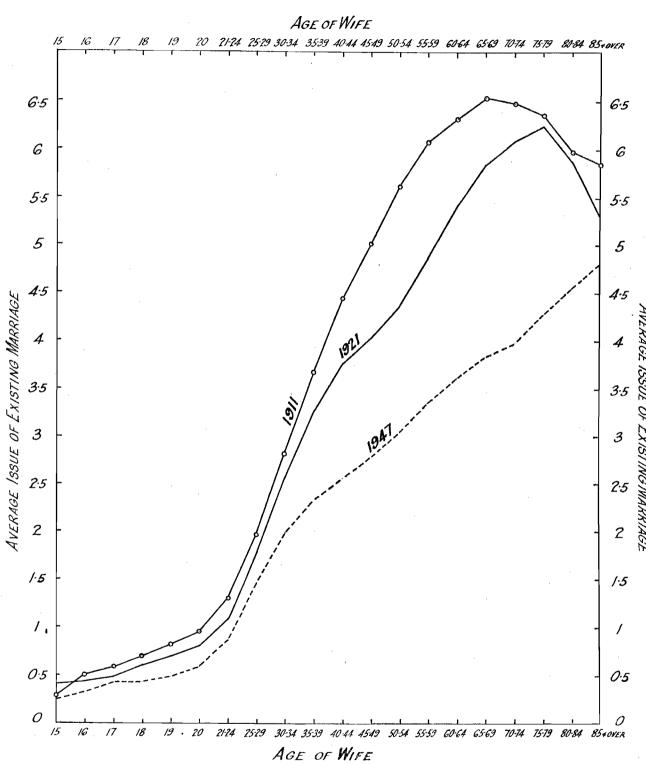

Wives in Tasmania had the highest average issue amongst the States for all ages except from 80 years upwards. At these ages average greatest for wives in Queensland. the other States in no case did the relative averages vary greatly. As in the case of husbands, the highest average issues in the States were recorded at the most advanced ages, the average issue for wives in Australia as a whole exhibiting a regular increase from the youngest to the oldest age group. The regular increase in the average issue of wives from age 45 onwards, which may be accepted as about the age limit for fertility, may suggest a continued diminution in the average issue of wives reaching the limit of fertility, or a higher death rate amongst those having small families. However, as has been noted in connexion with the average issue of husbands, the progression of the averages beyond the limits of fertility is due in a large measure to a continued decline in the size of the family. This conclusion is also supported by a comparison of the average issues for 1911, 1921 and 1947, which show a pro-

gressive decline in each of the States at practically all the important ages.

Corrected on the age distribution of all wives in Australia, excluding those permanently separated (whether legally or otherwise) from their husbands or who did not state their issue, to eliminate the effect of differences in the age constitution of wives in the various States, the average issues for 1947 become as follows:—Tasmania, 2.76; Queensland, 2.58; Western Australia, 2.45; New South Wales, 2.37; South Australia, 2.26; Victoria, 2.23.

The proportions of families of different sizes corresponding to the average issues shown for Australia in the preceding table are illustrated in the graph on page 319.

14. Comparative Results for Issue in relation to Age at Various Censuses.—(i) Average Issue.—Comparisons between the average issue of existing marriages according to age can be made between all three Censuses 1911, 1921 and 1947, but for wives only. For existing and previous

AVERAGE ISSUE OF WIVES ACCORDING TO AGE AUSTRALIA, CENSUSES 1911-1947 (EXISTING MARRIAGE ONLY)

marriages combined, particulars of average issue and wives in 1911 and 1921. The various results according to age are available for both husbands for wives are shown in the following table:—

(a) For 1911 includes all wives, but in 1921 excludes wives enumerated apart from their husbands, and in 1947 excludes wives permanently separated (whether legally or otherwise) from their husbands. The average issues relate to wives who stated their issue except in 1921 when those who failed to state their respectively, referred to in Section 4.

In the table above, wives who did not state their issue are treated in a similar manner to that in subsequent tables relating to duration of marriage. These various inter-related results expressed in the form of average issue or proportional distribution are thus on a comparable basis throughout for each Census, although they vary from Census to Census. In the 1947 tabulations relating to duration of marriage, no distribution of "not stated" issue was made because such allocations would necessarily have had to be made for each age in the first instance and were considered unwarranted from the viewpoint of the work involved and the fact that the resulting distributions would have been of doubtful accuracy in any case. For 1947, therefore, as also in the 1911 figures relating to existing and previous marriages combined, wives who did not state their issue have been excluded entirely from the calculation of averages and proportions shown from Section 12 onwards. In 1921 such persons were assigned issue before tabulation, while in the remaining case above, that of existing marriages in 1911, the results exclude "not stated" issue except in a few instances where they have been calculated from the only data available, namely, that published in the table on pp. 338-339 of the Mathematical Theory of Population, in which cases of "not stated" issue were distributed proportionately by a method outlined in the text preceding the table.

The long-term comparisons provided by the figures above show that the fall in average issue recorded at the Censuses of 1921 and 1947 compared with 1911 was experienced in all age groups of wives and has, therefore,

occurred independently of changes in the age structure of the population. This decline was at about the same rate in the youngest age group, under 20 years, which includes a high proportion of fertile women, as for all wives as a whole. average issue, 0.46 per wife in this age group, represented a fall of 37 per cent. from the 1911 level at these ages, compared with a drop between 1911 and 1947 of 38 per cent. in average issue for all ages collectively. At the ages 20-24 and 25-29 years, which are the most fertile, the average issue was 0.84 and 1.46 respectively or 33 and 26 per cent. lower than the corresponding averages in 1911. It is to be remembered, of course, that the fertility experience of women is incomplete at these ages and the results do not necessarily provide a guide as to the ultimate fertility of the women concerned. The reproductive history of women from, say, age 45 onwards, on the other hand, is complete. The changes have been very marked at the more elderly ages and, bearing in mind the understatement and overstatement in average issue in 1921 and 1947 respectively, it is apparent that the greater part of the decline in average issue has occurred since 1921. The changes at the older ages, from 45 years onwards, are, therefore, of importance, and are considered in detail in Section 15 following.

A graphical comparison between the results of the Censuses of 1911, 1921 and 1947 for average issue of existing marriages of wives according to age is shown on the previous page. The proportional distribution of wives in each age group according to number of children as recorded at the 1947 Census will be seen in the graph on page 319.

(ii) Proportions Childless.—Variations in the distribution of husbands and wives according to the number of their children are, perhaps, of more significance than changes in average issue. As indicated in Section 12, comparisons relating to individual family sizes cannot be made on a uniform basis for all Censuses, but comparable data are available for 1911 and 1947 in respect of the issue of existing marriages of wives, and for 1911 and 1921 for the issue of existing and previous marriages combined, for husbands as well as wives. These are set out in the relevant Parts and Reports on the

Census, including the appendix *Mathematical Theory of Population*. On account of considerations of space, they cannot be repeated in detail in this Chapter but changes in the family size structure for those women whose fertility experience is complete are examined in the next Section, while the number of childless wives and their proportions of total wives in each age group, which have a special significance in connexion with changes in average issue, are shown in the following table for Australia as at the Censuses of 1911, 1921 and 1947:—

(a) For 1911 includes all wives, but in 1921 excludes wives enumerated apart from their husbands and in 1947 excludes wives who were permanently separated (whether legally or otherwise) from their husbands. (b) No correction has been made for the overstatement and understatement of childlessness in 1921 and 1947 respectively, referred to in Section 4. (c) Percentage of wives who stated their issue.

The changes recorded between the various Censuses in the proportions childless are of considerable interest. As between 1911 and 1921, the proportions of wives childless, taking into consideration all the children born to married women during their lifetime and not only those of their existing marriages, rose in all groups. If the older ages, at which there is little or no likelihood of a first child being born, are considered, the increases appear to be, however, too great to be accepted as reliable. It has been explained in Section 4 that the figures for childlessness in 1921 were affected by the treatment of "not stated" issue. A comparison between the results for childlessness in existing marriages as between 1911 and 1947 is also to be made with caution, since, as already indicated, at the older ages in 1947 the degree of childlessness is understated due to the high proportion of childless married women who omitted a reply altogether to the question on issue. Between ages 45 and 65 years, for example, the recorded figures show a pronounced rise in childlessness from 10.07 per cent. amongst the oldest group of wives to 13.15 per cent. amongst those aged 45–49 years. While it is not practicable to estimate accurately the extent of the understatement in

childlessness, it is thought that the proportions childless would actually have varied very little from a level of 16 per cent. amongst wives of these ages.

On the whole, so far as the figures can be accepted or corrected, the indications are of a steady increase in childlessness in married women between 1911 and 1947 at all ages.

15. Size of Completed Families.—(i) Australia.—Data tabulated in age groups afford a valuable means of determining the completed fertility of marriages. In the case of married women, for example, the reproductive period has been practically, even if not wholly, passed by the time the age of 45 years is reached. For certain aspects such as the proportions childless the family structure is almost certainly complete by the age of 45 years. The experience of married women in the age group 45-49 years may, therefore, give as close an indication as is possible of the completed fertility of a population. The average issue of wives aged 45-49 years in 1911, 1921 and 1947, considering existing marriages only, was 5.02, 4.02 and 2.77 respectively. In the next higher age group, 50-54 years, the corresponding averages were 5.62, 4.36 and 3.03 respectively. Taking the combined issue of existing and

previous marriages, which gives a more accurate representation of completed fertility, the respective average issues in the age groups in question in 1911 and 1921, no data being available for 1947, were as follows:—45-49 years, 5.25 and 4.19; 50-54, 5.92 and 4.57. It is not likely that the considerable differences shown between the average issues for these two successive age groups are due to additional births occurring at the older ages. The proportions represented by the various ages at marriage and the factor of mortality, which possibly affects married women differently according to the size of their family, may exert an important influence on these experiences, the net effect of which may be to lower or raise average issue as the age increases. Considering the two extremes of wives (those who were childless and those with six or more children) who are most likely to be affected by these two factors, the variations in the proportions per cent., based on issue of existing and previous marriages combined as the more appropriate measure, which were recorded at the Census of 1911 from ages 45-49 years to the next higher age group were as follows:—Childless, 8.50 to 8.00; six or more children, 44.43 to 53.07. These results indicate that in the years leading up to the 1911 Census at least the factors of age at marriage and of mortality could be important in their effect on childlessness at these ages. The extent of the changes in the proportions with six or more children again suggests the possibility of special influences. It is thought, however, that the variations are due primarily to the declining fertility of the later generation of married women, born 45 to 49 years before the Census concerned, in comparison with that of the earlier generation born 50 to 54 years before the same Census. The 45-49 age group appears, therefore, the more appropriate basis for the measurement of the complete size of families. At the same time the broader age group 45-54 years has been adopted for purposes of tabulation of data relating to family size in some countries, as at the 1941 Census of Canada. Data in this form, therefore, may also be useful for comparative purposes. In the table below, family size distributions for Australia are shown according to both groupings. Results for the higher age groups in each case have also been included for the purpose of showing broadly the changes in fertility that have been experienced by successive generations or cohorts of married women. The effects of differing proportions according to age at marriage and of mortality as factors in these changes are to be remembered, however.

(a) For 1947 excludes wives who were permanently separated (whether legally or otherwise) from their husbands or who did not state their issue. The figure have not been corrected for the understatement of childlessness in 1947 referred to in Section 4. (b) At 1947 Census. (c) At 1911 Census.

325

It is to be noted that the figures above relate to issue of existing marriages only. The exclusion of children of previous marriages does not affect the results for average issue materially, but at the older ages concerned those for wives with no children would be varied considerably if allowance were made for children of former marriages. Reference may be made to the table in sub-section (ii) of the preceding Section which shows the proportions of wives childless according to both sets of data. The remaining results above, however, are probably not so affected by the occurrence of marriage or remarriage at these ages.

The figures for childlessness at the very old ages are probably not to be trusted. In the table above a proportion of 15.32 per cent. in the earliest group considered, for example, appears very high in relation to the level of about 11 per cent. amongst women born during 1856-66. The reduction in childlessness amongst women aged 55-59 to 65-69 years in 1947 is to be viewed with suspicion because of the deficiencies in the data. Compared with wives aged 60-64 years, the next three youngest groups in 1947 showed successive rises in childlessness reaching a percentage of 13.15 for those aged 45-49 years. Approximate corrections made to the 1947 Census data for the understatement of childlessness suggest that in Australia there has been little change from a level of 16 per cent. childless amongst these groups of women. In considering trends in childlessness, however, account must be taken not only of age but also of age at marriage. This latter factor is examined in Sections 18 and 19.

The average number of children in completed families is seen to have fallen continuously from the very high levels of the preceding century to 2.77 in 1947. This decline is one of the most remarkable of the results revealed by the Census and has important social and economic implications, particularly as the average of only 2.77 children recorded in the completed family would probably not have sufficed for replacement of the Australian population under the conditions experienced. No precise calculation of the level of reproduction represented by this experience can be made as the Census results are available in respect only of issue of wives, exclusive of those permanently separated from their husbands. This level would, however, be between the two extremes obtained, on the one hand, by disregarding the issue of women who were permanently separated, widowed or divorced and, on the other, by assuming the same average issue for this group as recorded for wives at the 1947 Census. approximate calculation of these levels may be made as follows:-The actual mortality of the particular generation of women aged 45-49 years in 1947 is not known, but assuming that it can be represented by the mortality experience of the years 1920-22, which are approximately mid-way between the Census and the period in which the women were born, there would have been, for every 100 women born in that period, 79.7 survivors to ages 45–49 years in 1947. In 1947, 75.6 per cent. of women at these

ages were married, not counting those permanently separated from their husbands, and 87.4 per cent. been married at some time, that were either still married, whether separated or not, or were widowed or divorced. Of 100 females born during 1897 to 1902, therefore, 60.3 and 69.7 respectively in 1947 would have been married or would have been either married, widowed or divorced. The number of children that would have been produced by the original 100 females according to the two extremes assumed would, therefore, have been 167 and 193 respectively, of whom 81 and 94 respectively would have been girls. In both these calculations no account has been taken of the issue of women who had never married nor of children of any former marriages, but it is clear that even if allowance were made for the children so omitted, those women who had reached the ages of 45-49 years in 1947, and are, therefore, the latest generation whose completed fertility can be measured, had probably not replaced themselves. If the more favorable mortality experience of 1946-48 is substituted for that of 1920-22, the corresponding number of girls per 100 females born in 1897 to 1902 would be approximately 92 and 106. The actual level of reproduction would be much closer to the higher than the lower of these two results and it would, therefore, appear that even if this particular group of women had not in fact replaced themselves, actual and prospective improvements in mortality alone, without any increase in fertility and nuptiality experiences, would probably have been sufficient to raise reproduction above the level required for replacement of the population. The birth-rate has, however, since declined further, although as may be seen from the results of following Sections some recovery has been made in family size in marriages of more recent years.

A review of the decline in the birth-rate in Australia will be found in the Report of the November, 1944, Session of the National Health and Medical Research Council of Australia. More recently, the medical aspects of the downward trend in the birthrate in Great Britain have been investigated by the Biological and Medical Committee appointed to assist the Royal Commission on Population in Great Britain, and by the Royal College of Obstetricians and Gynaecologists which conducted a special inquiry into family limitation at the request of the Commission. It may be mentioned here briefly that in its Reports the Biological and Medical Committee referred to such factors as recent advances in medicine, which have reduced the power of infection to damage fecundity, improvements in standards of nutrition and physical development and the substantial reductions in stillbirth rates as having tended to raise the level of fertility, and on the other hand to various features of modern urban and industrial life which may have an unfavorable influence on reproductivity. The Committee concluded that while the possibility of a decline in the physiological capacity of women to reproduce during the past decades cannot be excluded there is no definite evidence that such a decline has occurred and that "the observed reduction in the average size of family has been due, in much the greater part at least, to the spread of deliberate family limitation". Those conclusions, apply, no doubt, to the Australian experience, which has followed the general pattern of declining fertility observed in all Western countries.

As in these other countries, the fall in average size of family in Australia has been accompanied by a radical change in the structure of the family. In considering these changes as revealed by the 1947 Census results it may be noted that the numbers recorded with one or more children are not affected by the inaccuracies present

between the childless group and that of the "not stated" issues. Expressed as percentages of all wives, or of wives who stated their issue as in the table above, the proportions of families of different sizes are thus not affected in relation to each other. Nevertheless they are somewhat inaccurate in absolute terms and it may be desirable, therefore, to consider the proportionate distribution of families of different sizes as percentages of the total of fertile wives, that is, those who have borne at least one child. These proportions are shown for Australia in the following table according to the five-yearly and ten-yearly age groups employed in the preceding table:—

SIZE OF COMPLETED FAMILIES: PROPORTIONAL DISTRIBUTION ACCORDING TO ISSUE OF FERTILE WIVES⁽⁶⁾ AGED 45 YEARS AND OVER, AUSTRALIA, 30th JUNE, 1947.

(a) For 1947 excludes wives who were permanently separated (whether legally or otherwise) from their husbands or who did not state their issue (b) At 1947 Census. (c) At 1911 Census.

Amongst these productive marriages, the pattern is seen to be that of a sustained growth in the proportions of wives with an only child or with two children. Families of three children have also increased continuously although not to so pronounced an extent. For wives who were still living at the 1947 Census, the most popular number of children for a family for some decades was three or four but the proportions were gradually changing in favour of the two-children family until the latter became the most frequent size when the proportion of married women born during the period 1877–82 who had two children

rose to 15.72 per cent. of the total or 17.54 per cent. of fertile wives. Amongst married women in the next older group, the most fashionable size of family had been three children, which formed 14.53 per cent. of the total or 16.43 per cent. of fertile wives. The trend towards smaller families reduced the proportion of families of five children from 11.37 per cent. of total or 12.90 per cent. of fertile wives who were born during the years 1862–67 to 6.67 per cent. of total or 7.68 per cent. of fertile wives aged 45–49 years in 1947, again considering only wives who were living at the 1947 Census. The fall in the proportions of wives with six or more children

over the same period was even more pronounced. These larger families comprised 34.95 per cent. of total wives, equivalent to 39.67 per cent. of fertile wives for the group of women born during the period 1862-67, compared with corresponding percentages of only 10.96 and 12.61 for married women aged 45-49 years in 1947, the most recent group whose fertility can be assumed to be completed. It is to be borne in mind that these results provide only broad indications of trends in family size. Comparisons between the various groups are affected by differences in their composition as regards age at marriage and by the fact that, owing to the selective operation of mortality, the fertility of the earlier generations of wives included in the tables who had survived to the two Censuses concerned may not be representative of the experience of all the women born during the same periods.

(ii) International Comparisons. — Comparisons between completed fertility experiences in Australia and those of other countries are informative from various viewpoints. They may be made, for example, with the object of showing whether the

decline in the birth-rate over past years has been more serious in Australia than in other countries whose populations generally are of a similar composition. Again, where Census information is available on a more complete basis in other countries, in some of which, for example, the reproductive histories of women have been enumerated as from the date of first marriage and in some cases also for widowed and divorced persons, it is possible to obtain information on additional aspects of the family pattern which is not provided by the 1947 Australian data.

The average number of children and the proportional distribution according to families of different sizes for Australian wives aged 45–54 years in 1947 which are set out in the preceding sub-section are shown in the following table in conjunction with the corresponding results for certain other countries in as comparable a form as possible. Except in the case of Canada, where results are available for 1941 only, data for early Censuses of each country have been included in order to show how the size of the completed family has been affected over various long periods of a generation or more.

(a) Women who did not state their issue have been excluded throughout except in the case of Australia in 1911, when they were distributed proportionally.

(b) Issue relates to live-born children of married women by existing marriages. For Australia wives permanently separated (whether legally or otherwise) from their husbands were excluded in 1947, as were, for Great Britain in 1911, wives not enumerated with their husbands. No correction has been made to the Australian figures for 1947 for the understatement of childlessness referred to in the letterpress. (c) See letterpress. (d) Issue relates to children ever born alive to married, widowed and divorced women. (e) Relates to ages 45-49 years in 1951 (I per cent. Sample Tables). For 1911 and 1946 the age grouping 45-54 years is approximate only. (f) Issue relates to children ever born alive to married women, excluding in 1948 widowed and divorced women whose first marriages ended before they were 45 years of age and in 1951 all widowed and divorced women. (g) Issue relates to live-born children of native white women who were married once and whose husbands were members of the household in which the women were cnumerated. (h) Issue relates to children ever born alive to native white women who were married, widowed or divorced at the time of the Census.

Comparisons between the years and countries shown are affected by differences in the scope of the respective Censuses, indicated in the footnotes to the table, and also in age at marriage. It would appear, however, that in 1911 there was, on the basis of the experience of women of ages 45 to 54 years, who could be regarded as having passed the reproductive stage, much less childlessness in Australia than in Great Britain, the proportions childless being 11.41 and 14.11 per cent. respec-

tively. In each case children of existing marriages only have been counted, the higher proportion of non-fertile married women in Great Britain being probably a reflection of the greater degree of urbanization in that country. The United States of America showed the lowest level of child-lessness about this time, with a percentage of 9.51 in 1910 for women who had been married once and who were enumerated in the same household as their husbands. If widowed and divorced are included

and account taken of children of previous marriages, the proportion childless in 1910 in the United States was only slightly higher at 9.72 per cent. By 1940 the experience of the United States was much closer to that of Australia, the proportion childless of women married only once and whose husbands were members of the household having risen to 15.17 per cent. Although only 12.51 per cent. of married women were recorded in Australia in 1947 as unproductive, this proportion is increased to about 16 per cent. when allowance is made for the understatement referred to in Section 4. The level of infertility in the United States in 1940 was 15.88 per cent. for ever married women, allowing for all the children born during their lifetime.

In Australia average issue per married woman aged 45–54 years declined from 5.26 in 1911 to 2.89 in 1947, a fall of 45.06 per cent., and in the United States per woman married once and enumerated with her husband from 4.63 in 1910 to 3.07 per cent. in 1940, a much lower drop of 33.69 per cent. The greater decline in the average size of the completed family in Australia was reflected in a more rapid decrease in the proportion of Australian families of five or more children, which fell from 55.28 per cent. of the total in 1911 to only 19.33 per cent. in 1947. In the United States, families of five or more children formed 45.25 and 23.43 per cent. of the total in 1910 and 1940 respectively, but while the

former proportion was below that for Australia in 1911 the latter was above the Australian level in 1947. It will be observed that in each country, other than Great Britain, for which relatively recent information is available, the most popular size of family was two children. Next followed families of three children, except in the United States where married women with only one child in 1940 were more numerous than those with three children. In Great Britain in 1951, wives with an only child were predominant.

The results shown on a dual basis for the United States in the table above are of interest in that they indicate that there is on the whole only a small difference in the composition of the completed family of women whose marriages were unbroken, that is, those who had not been married more than once and whose husbands were reported as members of the household, and of that of all married, widowed and divorced women collectively, the differences that do exist being in the direction of slightly smaller families for the latter group.

16. Duration and Issue of Existing Marriages of Wives.—(i) 1947 Census Results.—In the following table the average issue from existing marriages is shown in suitable duration periods for wives in Australia and each State and Territory separately:—

AVERAGE ISSUE OF EXISTING MARRIAGE ACCORDING TO DURATION OF MARRIAGE OF WIFE(a), 30th JUNE, 1947.

(a) Excludes wives who were permanently separated (whether legally or otherwise) from their husbands or who did not state their issue.

Amongst the States the average issues from existing marriages were highest throughout the various duration groups in Tasmania and Queensland in that order, and lowest in Victoria and South Australia. Corrected on the basis of all wives in Australia, excluding those permanently separated (whether legally or otherwise) from their husbands or who did not state their issue, to eliminate the effect of differences in the duration of marriage periods, the average issue per wife becomes as follows:—

Tasmania, 2.63; Queensland, 2.56; Western Australia, 2.47; New South Wales, 2.34; South Australia, 2.27; and Victoria, 2.26. Compared with 1921 the average issue for each duration period was much lower in every State. In the case of Australia as a whole the differences in favour of 1921 rose progressively with each successive age group, the maximum difference of 2.74 being recorded at durations 45 years and over.

(ii) Comparative Results for Various Censuses.— Particulars of the average issue of wives according to duration of existing marriages, in five-

yearly groups, are shown for Australia in the following table as at the Censuses of 1911, 1921 and 1947:—

AVERAGE ISSUE OF EXISTING MARRIAGE ACCORDING TO DURATION OF MARRIAGE OF WIFE(a), AUSTRALIA, CENSUSES, 1911, 1921 AND 1947.

(a) For 1911 includes all wives, but in 1921 excludes wives enumerated apart from their husbands, and in 1947 excludes wives who were permanently separated (whether legally or otherwise) from their husbands. The average issues relate to wives who stated their issue except in 1921, when those who failed to state their issue were assigned issue prior to tabulation.

(b) No correction has been made for the understatement and overstatement in average issue in 1921 and 1947 respectively, referred to in Section 4.

The figures in the table above relate only to issue of existing marriages. They do not represent the complete issue of women, which should take account of all the children born to a woman during her lifetime, inclusive of children by previous marriages. They are, however, comparable from Census to Census and show that between 1911 and 1921 the decreases in average issue in each duration group were relatively slow but during the next 26 years, from 1921 to 1947, became very pronounced. The decline in average issue was proportionately greatest in long established marriages, in which the reductions in average issue increased continuously up to duration 30-34 years, following which the ratio of average issue in 1947 to that in 1911 rose for each succeeding group. The smallest decline relatively was in the more recent marriages of 0-4 years' duration. The slowing down of the decline in average issue in this group is due to the relatively high fertility of post-war marriages. This can be seen by tracing the fertility histories of marriages of successive years by means of annual records of births classified according to duration of marriage. Results of this nature show that the number of children per marriage during the first five years of marriage had for many years been declining almost continuously, the lowest level being recorded in respect of marriages contracted in the war years 1941-42. The numbers of children to marriages of each succeeding year rose progressively. experiences of these marriages as at the end of 1947 correspond, in reverse order, to those recorded for wives at each duration 0 to 4 years at the 1947 Census. Continuing the experience of marriages of the first post-war years 1945-46 to the end of 1950, the number of children per marriage of this group by the end of the first five years reached a level above that of marriages contracted in the latter part of the 1920's. As five years is too short a period of observation, however, it cannot be adduced from

this evidence to what extent the relatively high level of fertility recorded for post-war marriages represents an increase of a permanent character, on the one hand, or a drawing on the future under favorable economic conditions, on the other. The Census itself can provide little information on the trend in post-war marriages as, although the reproductive experiences of women married in each individual year before the 1947 Census are available separately, the results are of doubtful reliability owing to the fact that many persons who were married less than a year returned their duration of marriage as one year instead of "0" years. Some bias may, therefore, be present in the results for issue at these durations. Also, no comparisons can be made with the experience at corresponding durations at previous Censuses, when duration of marriage was tabulated in five-yearly groups only.

In interpreting the results above, it is to be noted that duration of marriage is not the only influence on average issue. As the duration lengthens, relatively more of the older wives die or become widowed due to the increase in mortality with age. Consequently greater proportion of wives who married at the younger ages is represented. Furthermore, mortality may have a varying effect according to size of family. On the whole, there is probably a considerable exaggeration of issue at the longer durations in comparison with those recorded over shorter periods of marriage. In Section 17, following, however, the data for 1947 are shown in age groups, on the basis of which comparisons can be made with results published in similar form for the previous Censuses of 1911 and 1921, while in Section 18 average issue for each duration group in 1947 is shown after standardization for age at

17. Age, Duration and Average Issue of Existing Marriages of Wives.—(i) 1947 Census Results.—The next table gives the average issue of

wives from existing marriages by ages of wives for the States and Territories appear in the Detailed and duration of marriage in combination. Details Tables of the Census, Part XXVIII.

(a) Excludes wives who were permanently separated (whether legally or otherwise) from their husbands or who did not state their issue.

The regular progression in the issue figures in this table affords further evidence of the decline in the birth-rate in Australia. Taking the separate age groups, it will be seen that the average issue increases by successive duration groups to the extreme limits of the table. Assuming that fertility is practically non-existent beyond the duration group 30-34 years, it follows that the average issue for this and succeeding duration groups would be nearly equal, if the birth-rates were not subject to a continuous increase or diminution or if no other factors applied. With each increase in duration, however, younger ages at marriage are represented, which would contribute to higher fertility but on the whole it would seem that the figures indicate a declining birth-rate for the cohorts or generations of wives concerned. In this connexion it is also of interest to note that the averages in 1947 were lower than the corresponding averages in 1921.

(ii) Comparison between Results of 1911 and 1947 Censuses.—Data regarding issue in which wives are classified according to age in conjunction with duration of marriage are valuable for comparative purposes because the effect of differences in duration of and age at marriage is removed. In the following table, in order to obtain comparisons which show trends over as long a period as possible, the results for average issue of wives in the preceding table for 1947 are expressed as percentages of the corresponding results in 1911, the earliest Census year for which information concerning issue is available:—

AVERAGE ISSUE OF EXISTING MARRIAGE ACCORDING TO AGE OF WIFE (a) IN CONJUNCTION WITH DURATION OF MARRIAGE, AUSTRALIA.

(a) Wives who did not state their issue are excluded. Otherwise the results for 1911 and 1947 include all wives except in 1947 those who were permanently separated (whether legally or otherwise) from their husbands.

For ages below 40-44 years, the ratio of average issue in 1947 to that in 1911 is shown above to decrease on the whole as the duration of marriage The regular progression in these percentages at first downwards and thence upwards as the extreme durations are approached, which has been noted when considering all ages in combination, is only slightly in evidence at these earlier ages but becomes more apparent from ages 40 to 44 onwards. Unless some other factor which is not apparent is responsible, the explanation of this feature appears to be that, so far as completed families are concerned, the forces responsible for the decline in the birth-rate did not affect, in ultimate family size, those women who married early in life as greatly as those who married at a later age, one factor, of course, which tended to sustain the level of fertility for early marriages being the relatively high incidence of births arising from pre-marital conception. On the other hand, for women under 40 years of age, the fall in average issue between 1911 and 1947 has been greatest for those married at the youngest ages.

For practically all age groups the relative decline in average issue was lowest in the duration group of less than five years. For wives aged 45-49 years average issue in this group was actually greater in 1947 than in 1911 but because of the smallness of the figures from which the percentage was calculated, as also in the case of other percentages at the higher ages at marriage, no significance is necessarily attached to this increase. The results for durations under five years are of importance as they suggest that the slowing down of the fall in family size noted for recent marriages was not confined to a particular section of women but to women who married at various ages and probably also to those who married during war years as well as those who married after the war. A large proportion of these women would have suffered some disruption of family life during the war, which would have unfavorably affected the level of average issue recorded in 1947 for the first five years of marriage.

18. Age at Marriage, Duration and Issue of Existing Marriages of Wives.—(i) Average Issue.—In the two tables of the preceding Section, the average issue of married women according to age at marriage in relation to various combinations of duration of marriage and age at the Census can be seen by reading the figures diagonally. These results for age at marriage, however, can be derived according to very broad groups only. are most significant from the viewpoint of fertility, it is desirable that a more refined grouping should be available. Information concerning age marriage was not directly collected tabulated at the 1947 Census but triple-entry tabulations in respect of age at Census, duration of existing marriage and issue are available according to single ages and durations and for each degree From these particulars, tabulations issue. according to individual ages at marriage can be readily derived. Thus, wives aged 20 years last birthday with duration of existing marriage one year would have been married within a two-yearly period from just over 18 years to just under 20 years. This age represents broadly an average age of 19 years exactly rather than age 19 years last birthday, which is an average of $19\frac{1}{2}$ years approximately. It is also to be noted that for women married more than once the data derived in this manner relate to age at last marriage.

The average issue of wives in Australia at the 1947 Census in five-yearly groups based on such individual ages at marriage in conjunction with each successive duration of marriage is illustrated in the graph on the next page. A summary of these results, in five-yearly groups for both age at marriage and duration of existing marriage, is shown in the following table:—

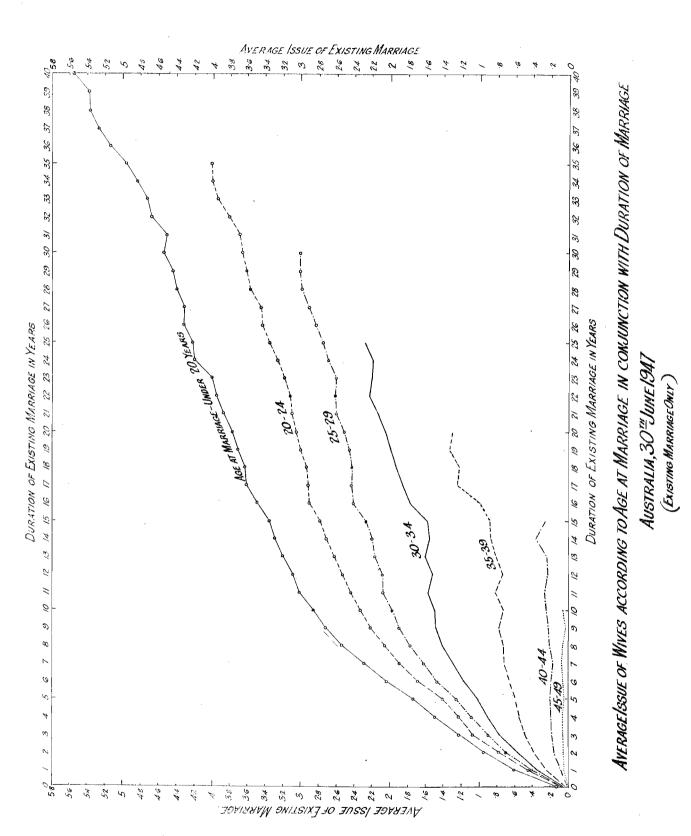

AVERAGE ISSUE OF EXISTING MARRIAGE ACCORDING TO AGE OF WIFE(a) AT MARRIAGE IN CONJUNCTION WITH DURATION OF MARRIAGE, AUSTRALIA, 30th JUNE, 1947.

(a) Excludes wives who were permanently separated (whether legally or otherwise) from their husbands or who did not state their issue.

Note.—Age at marriage above is expressed in the form of average age, not age last birthday. Thus, age at marriage 20 years is regarded as an average of ages from just over 19 years to just under 21 years. In the case of women married more than once, this age is as at the last marriage contracted.

The age at which a woman marries is shown by this table and the graph referred to above to have a predominant influence on the size of her family, not only ultimately, but also at the various stages of married life. The average issue of wives thus falls successively for each duration group shown with each increase in age at marriage. In the completed family, considering women who had been married 20 to 24 years, for example, an average difference of five years between the three most

FAMILIES. .

important groups of marriage ages, under 20 years, 20-24 years and 25-29 years, represented falls of 0.81 and 0.55 respectively in the average number of children born. For marriage ages 25-29 years the completed family comprised 2.61 children after 20 to 24 years of marriage, a level so low that it would not have been sufficient for replacement. For later marriage ages, re-marriages become increasingly important and average issue is understated owing to the omission of children of previous marriages. However, the effect of postponement of marriage, due not only to physiological reasons but probably also to a less favorable attitude to size of family, is again seen in the decreases in average issue from one age group to the next. Ĭt apparent from these results that from the viewpoint of replacement of the population those women who marry at ages within the first two groups, under 20 and 20-24 years, are by far the most important.

For the most fertile group, namely, wives married before the age of 20 years, the occurrence of a large number of births conceived before marriage results in a relatively high proportion of fertile women. Thus in the year 1947 more than 60 per cent. of first births to married mothers aged less than 20 years occurred before the end of the first nine months of marriage. The social class or occupation of men and women also has a direct bearing on the fertility of those married young. No data relating to the differential fertility of such groups are available for Australia, but the experience of the 1911 Census of England and Wales indicated that the more fertile occupational groups also tended generally to marry earlier than less fertile groups. If this experience is still true, the women comprised the earliest marriage age groups would include two particularly fertile elements. from these special factors bearing particularly on the fertility of those who marry youngest, there is, of course, a general decline in physiological capacity to reproduce which is experienced by women as they grow older.

The results in the table above enable the effects of mortality on the age at marriage composition to be removed from the figures for average issue according to duration of existing marriage which are set out in the tables of Section 16. This can be done by standardizing the results above for age at marriage, a convenient basis being the distribution of the original marriages in series of years corresponding to the duration groups employed. This was the procedure adopted in standardizing the corresponding data of the 1946 Family Census of Great Britain and has the advantage of correcting the unduly high proportion of wives who married at the younger ages, and the consequent exaggeration of the fertility of the wives who had been married longest, without eliminating the effect on family size of changes in age at marriage over the period reviewed. The results for Australia are of an approximate nature only, as the procedure disregards immigration. After standardization the average issues of wives in Australia according to duration of existing marriage at the Census of 1947 set out in the tables of Section 16 are, so far as available, as follows:-Durations 0-4 years, 0.66; 5-9 years, 1.64; 10-14 years, 2.24; 15-19 years, 2.62; 20-24 years, 2.83; 25-29 years, 3.09; 30-34 years, 3.41; 35-39 years, 3.82. The decline in fertility from the high levels of the more remote periods to those of recent years is thus seen to have proceeded at a slower rate than is indicated by the figures before standardization. the necessary data are not available in full it is not practicable to standardize the results of the 1911 and 1921 Censuses in the same manner.

(ii) Proportions Childless.—The proportions of wives who were childless in Australia at the 1947 Census classified according to the same combinations of age at marriage and duration of existing marriage as in the preceding table are shown below:—

CHILDLESS WIVES(a): PROPORTION PER CENT. OF TOTAL WIVES(a) ACCORDING TO AGE AT MARRIAGE IN CONJUNCTION WITH DURATION OF EXISTING MARRIAGE, AUSTRALIA, 30th JUNE, 1947.

(a) Excludes wives who were permanently separated (whether legally or otherwise) from their husbands or who did not state their issue.

Note.—Age at marriage above is expressed in the form of average age, not age last birthday. Thus, age at marriage 20 years is regarded as an average of ages from just over 19 years to just under 21 years. In the case of women married more than once this age is as at the last marriage contracted. No correction has been made for the understatement in childlessness referred to in Section 4.

The variations in family size according to age at marriage, referred to in relation to average issue the preceding sub-section, are even more strikingly shown by the results for childlessness. the recorded data, regarding durations 20-24 years as sufficiently long for the purpose of indicating completed fertility, less than 1 per cent. of wives who married before the age of 20 years and only 1.85 per cent. of those married at ages 20-24 years had not borne a child. When an approximate allowance is made for the understatement in childlessness, the latter proportion becomes 4 per cent., while the former is unchanged. Both on recorded and corrected data, the percentage of childlessness rose with each subsequent increase in marriage age, until, at the oldest ages at marriage considered, all wives were infertile, disregarding children of any former marriage.

Of marriages contracted during the five years preceding the Census, just two-thirds of those in which the bride was under 20 years were productive by the Census date, but this proportion fell steeply at the older marriage ages. Because of the misstatement already referred to in the numbers at the first few individual durations within this group, there is some doubt as to the reliability of the relevant data for childlessness, but the results recorded for the marriage age group under 20 years show successive decreases from 88.79 per cent. for wives married less than one year to 10.67 per cent. in the fifth year of marriage. For durations 0-4 years combined, the percentage of non-fertile wives increased from 21.47 for those who were only 15 when they married to 36.71 for those married at 19 years of age.

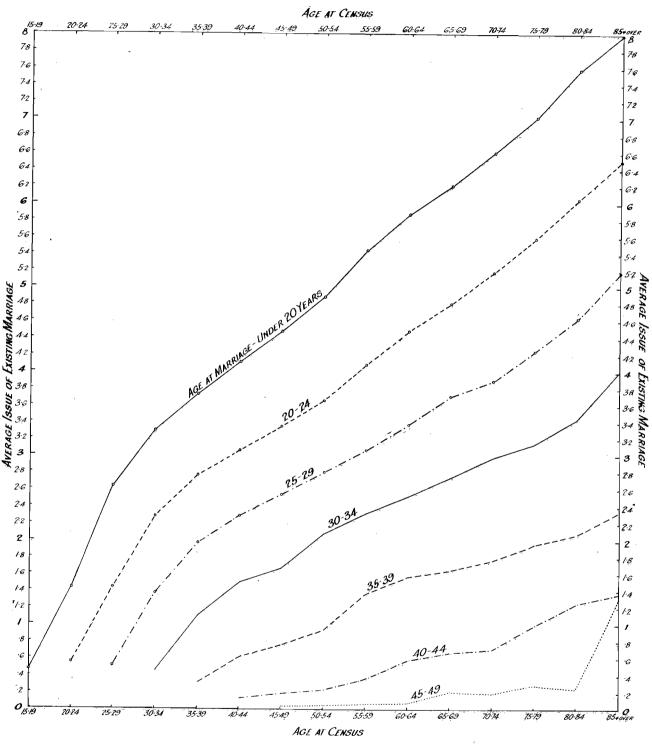

Considering the completed fertility of successive cohorts of wives from those married in the earliest periods of 45 years or more before the Census to those married 20 to 24 years ago, it will be seen that on the whole the proportions childless have increased steadily for all ages at marriage although for wives married before 20 years of age, amongst whom the proportions childless were very small, decreases were recorded in the latest two groups of marriages. Corrected for the understatement previously referred to, these proportions show the same trends in childlessness as the recorded data, although generally at much higher levels.

The results of the 1911 Census relative to durations 20 years and longer, which refer to women married prior to 1892, are of particular interest because in the nineteenth century the practice of family limitation is not thought to have operated to any important degree and the reproductive experiences of women married in those times can, therefore, be used to obtain an approximation to the degree of involuntary childlessness, some knowledge of which is necessary for an adequate interpretation of trends in childlessness. A standard

which can be used conveniently is that of the age distribution of marriages that would from the Australian marriage rates of the pre-war 1939. No tabulations were made in 1911 directly according to age at marriage but the proportions childless, or "sterility ratios", according to age at marriage at various durations can be derived from data shown in Table CXVIII. on page 330, and curves of the nature shown in Figure 90 on page 329, of the Mathematical Theory of Populatian appended to the 1911 Census Report. On applying the sterility ratios so derived to the standard distribution of first marriages according to the experience of 1939, proportions childless are obtained for wives according to period of existing marriage as follows:-Married 1890-91, 8.9 per cent.; married 1880-81, 8.2 per cent.; and married 1870-71, 7.9 per cent. The earliest of these proportions is the most likely to represent the actual degree of involuntary childlessness. Because of the exclusion of children of any previous marriage and the fact that lower proportions have been recorded in various other countries, the real level is probably lower. It is also to be remembered that the factor of mortality, which has been referred to previously, may influence the results to some extent. These estimates are of considerable interest as they suggest that the level of involuntary childlessness may be much lower than has hitherto been generally thought. question is discussed in more detail in a report published recently by the Biological and Medical Committee of the Royal Commission on Population, in which a similar calculation for England and Wales is set out. This Committee pointed out that various factors have tended to reduce the extent of involuntary childlessness since the nineteenth century and that therefore the proportions as calculated for these early periods may be somewhat lower for women marrying at present or who will marry in the future. It is of interest to observe that the conclusion reached by the Committee was that, without allowing for the effects of any improvement in the facilities for the diagnosis and treatment of infecundity or in the extent of their utilization by the public in the future, "of a typical group of women marrying at various ages in the proportions implied by 1938 marriage rates probably between 5 per cent. and 8 per cent. on the average are likely to be involuntarily childless".

19. Age at Marriage, Age at Census and Issue of Existing Marriages of Wives.—

(i) Average Issue.—An alternative arrangement of the triple-entry data tabulated by age, duration of marriage and issue at the 1947 Census is that in which average issue of wives is classified according to age at marriage in conjunction with age at Census. In this form the results directly provide an analysis, in terms of different ages at marriage, of the fertility experiences shown

AVERAGE ISSUE OF WIVES ACCORDING TO AGE AT MARRIAGE IN CONJUNCTION WITH AGE AT CENSUS

AUSTRALIA, 30 *** JUNE 1947

(Existing Marriage Only)

according to age at the Census in various tables of this Chapter. The following table gives particulars

of the average issue of wives in Australia at the 1947 Census classified in this manner:—

(a) Excludes wives who were permanently separated (whether legally or otherwise) from their husbands or who did not state their issue.

Note.—Age at marriage is expressed in the form of average age, not age last birthday. Thus, age at marriage 20 years is regarded as an average of ages from just over 19 years to just under 21 years. In the case of women married more than once, this age is as at the last marriage contracted.

The results above are shown in graphical form on the previous page. Their features are necessarily similar to those shown by the relationship between age at marriage and duration of marriage. For all ages at the Census, average issues declined with each increase in age at marriage in the groupings adopted. In the completed families of wives aged 45–49 years at the Census, women married before 20 years of age had on the average one more child than those married at 20–24 years, who in turn had 0.81 more children than those in the next marriage age group. In the latter group, aged 25–29 years at marriage, the average issue at ages 45–49 years, when the child-bearing period had been

passed, was only 2.54. This level was lower still than the average of 2.61 for women of similar ages at marriage after 20 to 24 years of marriage, who, as has already been indicated, had not replaced themselves in the population. The women in question, being aged 45–49 years at the 1947 Census, were on the average somewhat younger than the latter group and their completed fertility history, therefore, provides a further indication of the downward trend in fertility in the past.

(ii) *Proportions Childless*.—The proportions of the wives included in the preceding table who were childless are shown in the following table:—

CHILDLESS WIVES(a): PROPORTION PER CENT. OF TOTAL WIVES(a) ACCORDING TO AGE AT MARRIAGE IN CONJUNCTION WITH AGE AT CENSUS, AUSTRALIA, 30th JUNE, 1947.

(a) Excludes wives who were permanently separated (whether legally or otherwise) from their husbands or who did not state their issue.

Note.—Age at marriage above is expressed in the form of average age, not age last birthday. Thus, age at marriage 20 years is regarded as an average of ages from just over 19 years to just under 21 years. In the case of women married more than once, this age is as at the last marriage contracted. No correction has been made for the understatement in childlessness referred to in Section 4.

These figures again necessarily reflect trends similar to those shown when age at marriage is related to duration of marriage. These trends are discussed in more detail in Section 18. The understatement in the proportions recorded without children is important from the age group 45-49 onwards.

Approximate corrections made for this understatement indicate that while a rise in childlessness appears to have occurred, for all ages at marriage, from earlier generations of wives to those aged 45–49 years in 1947, this rise has been generally at a much slower rate than indicated by the recorded figures.

ISSUE OF HUSBANDS AND WIVES IN RELATION TO AGE IN METROPOLITAN AND EXTRA-METROPOLITAN AREAS.

20. Metropolitan Results.—(i) 1947 Census Results.—The average issues for husbands of each

age who were enumerated in metropolitan areas of Australia are shown in the next table.

(a) Excludes husbands who were permanently separated (whether legally or otherwise) from their wives or who did not state their issue.

Taking the average issues for all ages and each age group individually, it will be seen that husbands enumerated in Hobart had a higher average issue than husbands enumerated in Perth, who in common with those in Brisbane at ages 25-29 and 30-34 had the next highest average issue from ages 25-29 to 65-69 years inclusive. From age 70 years onwards, either the highest or second highest averages were recorded in Brisbane. Taking the age groups separately, a number of other instances will be noted in which the order of average issue in the States is not the same as for all ages collectively, but if the averages for separate ages are compared, it will be found that from ages 40-44 years onwards, where naturally the average issues are highest, Brisbane husbands in three of the ten comparable groups had a higher average issue than Hobart husbands. As remarked in reference to earlier tables, these apparent anomalies are due largely to the influence of age constitution. Husbands enumerated in Melbourne had the lowest average issues for eight groups, and husbands enumerated in New South Wales the lowest average issues for three groups. Compared with 1921, the average issues of husbands in the metropolitan areas showed a considerable decline.

Similar information is contained in the next table in respect of wives who were enumerated in the metropolitan areas of Australia.

Total		2.03	2.01	2.22	2.05	2.25	2.28	2.06

(a) Excludes wives who were permanently separated (whether legally or otherwise) from their husbands or who did not state their issue.

The average issues for wives in capital cities followed the order for husbands similarly located. Thus wives enumerated in Hobart and Perth generally had the highest average issues, and wives enumerated in Melbourne and Sydney the lowest average issues. As in the case of husbands, the average issues for wives declined greatly between 1921 and 1947. Corrected, on the basis of wives in the total metropolitan area of Australia, for differences in age constitution the average issues of wives in the metropolitan areas are—Hobart 2.34, Perth 2.25, Brisbane 2.21, Adelaide 2.03, Sydney 2.03, Melbourne 2.01. Compared with similar results for the several States the issues of wives in the metro-

politan areas are low, the average for the six capital cities being 2.06, compared with 2.36 for Australia as a whole.

(ii) Comparative Results for Wives at Various Censuses.—As particulars of metropolitan families in 1911 are available only in respect of all children, inclusive of those of previous marriages, comparable figures for issue of existing marriages, which is the basis on which the data for 1947 were tabulated, cannot be shown for the three Censuses of 1911, 1921 and 1947. The results that are available for families in the metropolitan areas of Australia as a whole at each of these Censuses are shown in the following table according to age of wife.

AVERAGE ISSUE ACCORDING TO AGE OF WIFE (a) IN METROPOLITAN AREAS, AUSTRALIA, CENSUSES, 1911, 1921 AND 1947.

(a) For 1911 includes all wives, but in 1921 excludes wives enumerated apart from their husbands and in 1947 excludes wives who were permanently separated (whether legally or otherwise) from their husbands.

The average issues relate to wives who stated their issue except in 1921, when those who failed to state their issue were assigned issue prior to tabulation.

(b) Not available.

(c) Ages 21-24 years.

It is possible to compare metropolitan experiences with those of Australia as a whole in respect only of issue of all marriages, inclusive of children of former marriages, at the Censuses of 1911 and 1921 and of issue of existing marriages at the Censuses of 1921 and 1947. For these various groups, the average size of famliy in metropolitan areas was in each age group lower than the corresponding level Australia. Including children of former marriages, the average issue of wives in metropolitan parts of Australia in 1921 represented 83.67 per cent. of that in 1911, while, counting children of existing marriages only, the average issue of wives in 1947 in the same areas was 73.57 of the 1921 average. Corresponding ratios for Australia as a whole were 84.99 and 73.29 per cent. Thus, while the downward trend has been much the same in metropolitan areas as elsewhere, between 1911 and 1921 the fall in fertility was slightly less over Australia as a whole than in the metropolitan areas, but between 1921 and 1947 the position was reversed by a very small margin. The greater proportional fall in the average issue of wives in metropolitan areas during the intercensal period

1911 to 1921 was experienced in all age groups other than those between 45–59 years, while the very slight relative improvement noted in the size of family in those areas between 1921 and 1947 in comparison with Australia as a whole occurred mainly at ages under 45 years.

Because of the differences in size of family as between metropolitan and extra-metropolitan areas, the marked trend in Australia towards urbanization that has been noted in Section 7 of Chapter IX., Growth and Characteristics of the Population of Australia, assumes great importance from the viewpoint of its possible effects on future reproduction levels.

21. Metropolitan and Extra-Metropolitan Results.—The following table presents a comparative view for each age of the average issues of husbands and wives in metropolitan and extrametropolitan areas of Australia. The metropolitan division shown in the table embraces the capital cities and suburbs of the six States, and the extrametropolitan area the remainder of Australia. The migratory population is included in the extrametropolitan population.

⁽a) Excludes husbands and wives who were permanently separated (whether legally or otherwise) or who did not state their issue

The average issues for each age group were highest for both husbands and wives in the extrametropolitan areas of Australia, and lowest for those

in metropolitan divisions. The relationship between average issue of wives in these two divisions can be seen also from the following graph.

, AVERAGE ISSUE OF WIVES ACCORDING TO AGE METROPOLITAN AND EXTRA METROPOLITAN AREAS AUSTRALIA,30 JUNE 1947 (EXISTINGMARKIAGE_ONLY)

CHAPTER XXIII.

TROPICAL AND NON-TROPICAL REGIONS.

CLASSIFICATION OF THE DATA.

1. Availability of Statistics.—No separate Part of the Detailed Tables of the Census is devoted to statistics of the population in tropical and non-tropical regions, but, in various Parts, particulars

are given separately for the tropical and non-tropical parts of Queensland, Western Australia and the Northern Territory, and also for those States which are wholly in the temperate regions.

GENERAL VIEW OF THE POPULATION IN TROPICAL AND NON-TROPICAL REGIONS.

2. Area, Population and Dwellings.—The following table presents a comparative summary of the area, population, and dwellings in the tropical

and non-tropical regions of Australia in 1933 and 1947:—

AREA, POPULATION AND DWELLINGS IN TROPICAL AND NON-TROPICAL REGIONS, CENSUSES, 1933 AND 1947.

That part of Australia which lies within the tropics comprises 1,149,320 square miles, or 38.64 per cent. of the total area of 2,974,581 square miles, but contained only 267,257 persons, or 3.53 per cent. of the total population, in 1947. This represents a slight decrease on the corresponding figure of 3.78 per cent. in 1933. The density of population in the tropical regions was, therefore, 0.23 persons per square mile, or 23 people per 100 square miles, as compared with 4.01 persons per square mile in the temperate parts.

The tropical part of Queensland had 253,375 persons or 94.80 per cent. of the total population of tropical Australia. Thus, the tropical part of Queensland had an average of 71 people to every 100 square miles, as against 274 people per 100 square miles in the non-tropical and more southern part of the State. The tropical part of Western Australia had an average of about 14 persons, and of the Northern Territory about 20 persons, per 1,000 square miles.

The average number of inmates per occupied private dwelling in the tropical part of Australia was 3.77, against 3.75 in the temperate part, the corresponding figures in 1933 being 4.00 and 4.09 respectively. As the average number of rooms per occupied private dwelling was only 4.58 in the tropical part compared with 4.89 in the temperate part, the average number of inmates per room was greater in the tropical part (0.83 persons per room) than in the temperate part (0.77 persons per room).

The average weekly rent of private dwellings occupied by tenants was 18s. 9d. (4s. 1d. per week per room, or an increase of 6d. per week per room since 1933) in tropical Australia, while in the temperate part the average weekly rent was 24s. 4d. (5s. per week per room, or an increase of 1s. 6d. per week per room since 1933).

3. Age.—The age constitution of males and females in the tropical and non-tropical regions is given in the next table. In this section unspecified ages have been distributed proportionally over ages fifteen years and upwards.

AGES OF THE POPULATION IN TROPICAL AND NON-TROPICAL REGIONS: NUMBERS AND PROPORTIONAL DISTRIBUTION, 30th JUNE, 1947.

An interesting view of the age constitution of males is obtained by examination of those age groups which represent approximately the working ages and the dependent ages of childhood and

senility. A comparison on this basis between the male population of the tropical and non-tropical regions of Australia is given below:—

MALES AT WORKING AND DEPENDENT AGES IN TROPICAL AND NON-TROPICAL REGIONS:
NUMBERS AND PROPORTIONAL DISTRIBUTION, CENSUSES, 1933 AND 1947.

It is interesting to note that the percentages of children and males of working age in tropical and non-tropical areas have been moving closer together since 1921, when marked differences in opposite directions were recorded. The percentage of males aged 65 and over is increasing more rapidly in non-tropical than in tropical regions. The figures given in Section 5 below relating to conjugal condition

show that the proportion of unmarried males over 15 years of age was much higher in the tropical than in other parts of Australia.

In the case of females, a useful comparison is obtained by grouping ages in relation to child-bearing. Such a comparison is furnished in the following table:—

FEMALES OF REPRODUCTIVE AND NON-REPRODUCTIVE AGES IN TROPICAL AND NON-TROPICAL REGIONS: NUMBERS AND PROPORTIONAL DISTRIBUTION, CENSUSES, 1933 AND 1947.

				Number a	at Ages—			Percentage	e at Ages—		
Region.			0-14.	15-44.	45 and over.	Total.	0-14.	15–44.	45 and over.	Total.

Australia- 1933 1947	 ••		894,643 931,294	1,5 4 8,369 1,712,983	819,716 1,137,711	3,262,728 3,781,988	27.42 24.63	47.46 45.29	25.12 30.08	100.00	

The proportion of women in the tropical areas who were in the child-bearing age group was higher in 1947 than the corresponding proportion in the non-tropical areas. Women aged 45 years and over enumerated in non-tropical areas represented 30.28 per cent. of the total so recorded as

against a corresponding figure of only 24.14 per cent. for women in tropical areas. This difference is slightly less marked than in 1933, when the percentages were 25.36 for women in non-tropical regions and 18.10 for women in tropical regions.

4. Masculinity.—The following table shows the masculinity of the population in various age groups in tropical and non-tropical regions:—

MASCULINITY OF THE POPULATION ACCORDING TO AGE IN TROPICAL AND NON-TROPICAL REGIONS, CENSUSES, 1933 AND 1947.

(Males per 100 Females.)

30 - 34			157.15	114.27	103.94	98.48							
35 – 39			136.39	128.67	94.85	102.70	Adults and Mino	rs					
40-44			151.80	140.60	99.94	107.23	Under 21		105.14	106.51	103.30	103.34	
45 - 49			161.42	141.68	103.41	101.82	21 and over		153.20	129.55	101.55	97.92	
50-54			167.33	133.97	103.95	94.28		•					
		j					Total		131.73	120.41	102.22	99.74	

The decrease in the masculinity of the population in tropical regions from 131.73 in 1933 to 120.41 in 1947 is reflected in all age groups except the younger ages 0 to 9 years and 15 to 19 years and shows that the pioneering stage in these regions is gradually being passed. The increase in the number of females over 15 years of age in the tropical regions from 72,694 in 1933 to 85,459 in 1947 consists largely of

an increase in the number of married women from 42,886 to 55,538.

5. Conjugal Condition.—The following table classifies the population in the two regions according to conjugal condition, after distribution of "not stated" ages and conjugal condition as described in Chapter XI.:—

CONJUGAL CONDITION OF THE POPULATION IN TROPICAL AND NON-TROPICAL REGIONS: NUMBERS AND PROPORTIONAL DISTRIBUTION, CENSUSES, 1933 AND 1947.

GRAND TOTAL	146,003	121,254	267,257	3,651,367	3,660,734	7,312,101	•					

The percentages given above show that, while in the non-tropical parts of Australia 62.48 per cent. of all males over 15 years of age were married in 1947, in the tropical parts 54.49 per cent. only of such males were married. It may be noticed, too, that the number of married men in the tropical parts exceeded the married women by 3,742, or by 6.7 per cent. These circumstances suggest that conditions in parts of the tropical areas of Australia are still unattractive to women. Of the females

over 15 years of age in 1947, 64.99 per cent. of those in the tropical regions were married, against 61.66 per cent. in other parts, the corresponding percentages in 1933 being 59.00 per cent. and 54.67 per cent. respectively.

6. Dependent Children.—The following table shows the population in tropical and non-tropical regions in 1933 and 1947 classified according to dependent children:—

PERSONS WITH DEPENDENT CHILDREN UNDER SIXTEEN YEARS OF AGE IN TROPICAL AND NON-TROPICAL REGIONS, CENSUSES, 1933 AND 1947.

The average number of dependent children per person with dependent children in 1947 was 2.12 in the tropical regions as against 1.97 in the non-tropical regions, a decrease of 0.24 in each region

when compared with 1933.

7. Birthplace.—The following table shows an analysis of the population in the two regions according to the country of birth:—

The figures given in the table above show some interesting contrasts in the composition of the populations of the tropical and non-tropical regions from the aspect of birthplaces. It is not surprising that people born in Asia should represent a larger part of the population in the tropics than in other parts, but it is interesting to notice that persons born in Europe were also relatively more numerous in the tropics. As a necessary counterpart, the Australianborn element was relatively smaller in the tropics than in the temperate parts, but the difference was more pronounced in the case of males than of females. In 1933, Australian-born males represented 84.97 per cent. of all males in the non-tropical regions and 75.95 per cent. of all males in the tropical regions, but in 1947 these proportions had increased to 89.14 per cent. and 86.01 per cent. respectively, the increase in the Australian-born proportion being considerably higher in the tropical than in the nontropical regions. Among females a similar, though not so marked, increase in the Australian-born proportion is shown, the respective percentages being—non-tropical regions, 88.31 per cent. in 1933 and 91.38 per cent. in 1947; tropical regions 85.58

per cent. in 1933 and 90.47 per cent. in 1947. The proportion of persons born in the British Isles decreased in the tropical regions from 11.52 per cent. in 1933 to 6.52 per cent. in 1947 and also in the non-tropical regions from 10.75 per cent. in 1933 to 7.19 per cent. in 1947. In the tropical areas persons born in Asia numbered 4,104, or 1.64 per cent. of the total tropical population in 1933, but in 1947 the number had decreased to 1,371 persons, or 0.51 per cent. of the population, the difference being mainly due to the large decrease in the number recorded as born in Japan and China. In the nontropical regions, although the number of persons born in Asia increased from 20,455 in 1933 to 22,725 in 1947, the proportion to the total population remained practically the same.

8. Nationality.—The following table shows the population in 1933 and 1947 classified according to nationality. It is not considered necessary to show here every nationality which is represented, but further details may be found in the Detailed Tables of the Census, Part XIV., pp. 785–787.

Note.—The numbers given above include persons on ships in Australian waters. A number of non-European foreign nationals in the tropical regions of Australia have been admitted temporarily to engage in fishing for pearl, bêche-de-mer, etc.

Foreign nationalities were, relatively to the respective populations, much more numerous in the tropical than in the non-tropical part of Australia in 1933 and to a lesser degree in 1947. Between 1933 and 1947 the number of persons of foreign nationality recorded in the tropical regions decreased

from 9,802 to 2,547 or by 74.02 per cent., whilst in the non-tropical areas the decrease was from 50,458 to 36,106 persons or only 28.44 per cent. The decrease in the tropical areas was common to all nationalities represented but was most marked with regard to numbers among the Italians, Japanese and Chinese.

9. Race.—The following table shows the population in tropical and non-tropical regions classified according to race:—

RACES OF THE POPULATION IN TROPICAL AND NON-TROPICAL REGIONS: NUMBERS AND PROPORTIONAL DISTRIBUTION, CENSUSES, 1933 AND 1947.

⁽a) Native of India. (b) Includes Fijians, Maorís and, in 1947, Torres Strait Islanders. (c) Includes half-caste Torres Strait Islanders.

NOTE.—The numbers given above include persons on ships in Australian waters. A number of non-Europeans in the tropical regions of Australia have been admitted temporarily to engage in fishing for pearl, bêche-de-mer, etc.

In 1947 there were more full-blood non-Europeans in the non-tropical than in the tropical part of Australia, but they represented a much larger proportion of the total population in the tropical than in the non-tropical regions. In the tropical part full-blood non-European males represented 1.78 per cent. of the total male population in 1947, and full-blood

non-European females represented 1.24 per cent. of the total female population, whereas in the nontropical regions the similar proportions were males 0.33 per cent. and females 0.15 per cent. In the case of half-castes, of whom the greater part were half-caste Australian aboriginals, the position was similar. In the tropical regions half-caste males and females together represented 2.35 per cent. of the total population, while in the non-tropical parts they represented only 0.38 per cent.

10. Religious Creed.—The following table shows the populations of the tropical and non-tropical regions classified according to religious creed:—

Christian	98.05 0.94 0.21 0.80	98.47 0.41 0.33 0.79	99.60 0.16 0.08 0.16	99.37 0.14 0.26 0.23	98.74 0.60 0.15 0.51	98.89 0.28 0.30 0.53	98.87 0.55 0.18 0.40	98.54 0.61 0.29 0.56	99.31 0.43 0.14 0.12	99.03 0.49 0.26 0.22	99.09 0.49 0.16 0.26	98.79 0.55 0.28 0.38
Total, Specified	100.00	100.00	100.00	100.00	100.00	100.00	100.00	100.00	100.00	100.00	100.00	100.00

The most interesting feature of this comparison is that between 1933 and 1947 the proportion of Christians decreased in the non-tropical areas whilst non-Christians, those whose religion was indefinite and those with no religion all increased. In the tropical regions the proportion of Christians increased, non-Christians decreased, those whose religion was indefinite increased and those with no religion remained practically the same.

Among the Christians the only denomination which had a proportion appreciably higher in the tropical part than elsewhere in 1947 was the Roman Catholic Church. Taken together, the Roman Catholics and Catholics so described on individual Census schedules—who were considered to be mostly

Roman Catholics—represented 31.85 per cent. of all Christians in the tropical regions as against 23.22 per cent. in the non-tropical regions. Relatively to the total Christians, adherents of the Church of England were more numerous in the non-tropical than in the tropical part, and Presbyterians were slightly more numerous in tropical than in non-tropical regions. The Methodists, however, who represented 13.11 per cent. of the population in non-tropical part, accounted for only 11.74 per cent. in the tropical part.

11. Industry.—The following table gives a comparison, under an abridged list of headings, of the industries of the population of the tropical and non-tropical parts of Australia:—

INDUSTRY OF THE POPULATION IN TROPICAL AND NON-TROPICAL REGIONS: NUMBERS AND PROPORTIONAL DISTRIBUTION, 30th JUNE, 1947.

Persons Not in Work Force	46,770	101,924	148,694	1,271,331	2,962,902	4,234,233						
GRAND TOTAL	146,003	121,254	267,257	3,651,367	3,660,734	7,312,101						

The percentages given above show the greater relative importance of the primary industries in the tropical regions compared with the non-tropical parts. In the former, primary production represented 30.80 per cent. of all males in the work force and in the latter only 18.94 per cent. Apart from primary industries, the only industries tabulated

above which show greater relative numbers in the tropical than in the non-tropical regions are mining, building and construction, transport and storage, and amusement, etc. Of the females in the work force in the tropics 29.10 per cent. were engaged in hotels, cafés, personal service, etc., as against only 17.86 per cent. in the non-tropical regions.

12. Occupational Status.—The next table and non-tropical regions classified according to shows for 1933 and 1947 the population in tropical occupational status:—

(a) Includes persons who were (1) unable to secure employment; (2) temporarily laid off from their jobs; and (3) not actively seeking work at the time of the Census on account of sickness or accident, industrial dispute, resting between jobs, or for any other reason.

In 1947, 67.96 per cent. of the male population in the tropical regions was in the work force, a proportion 2.78 per cent. in excess of that for the nontropical areas, whilst females in the work force represented only 15.94 per cent. of the female population as against 19.06 per cent. in non-tropical areas.

CHAPTER XXIV.

GEOGRAPHICAL DISTRIBUTION.

1. General.—The data derived from the Census of 1947 have been published in full detail for the States and Territories of Australia in the Detailed Tables of the Census, Parts I. to XXVIII. In addition, summarized results have been published for metropolitan, urban provincial and rural divisions of the States, and also for local government areas. In the case of the Northern Territory, where the town of Darwin alone is incorporated under local government, police districts have been substituted. In 1911 the metropolitan areas of Melbourne and Brisbane consisted of the territory within a circle of 10 miles radius from the General Post Office in each city, while in the other States local government areas or parts thereof were joined together to make up the metropolitan areas. The adoption of a radius as a boundary in 1911 having intensified the difficulties of collection, the metropolitan area of each State in 1921 and in each subsequent Census was formed from appropriate local government areas. composition of the metropolitan, urban provincial and rural divisions of the States and Territories at the Censuses of 1933 and 1947 was as follows:-

Metropolitan Division.—The capital cities of the States and adjoining urban municipal areas within boundaries used for Census purposes at the dates of the respective Censuses. At the 1947 Census, the metropolitan division of Victoria included areas (with a population of 30,490 persons) which in 1933 were included in the rural division. In the remaining States the boundaries of the metropolitan divisions were identical in 1933 and 1947.

Urban Provincial Division.—The capital cities of the Territories, and, in States other than Tasmania, cities and towns outside the metropolitan division which were separately incorporated. In Tasmania, where most of the towns included are not separately incorporated, boundaries were determined for Census purposes. In New South Wales a number of towns

which in 1933 were separately incorporated have since been included in shires and transferred to the rural division.

Rural Division.—The remaining portion of each State and Territory. The rural divisions are affected by the intercensal changes in the areas of the metropolitan and urban provincial divisions and, therefore, represent only a broad general classification based on administrative principles rather than geographical. instance, in New South Wales most of the increase in population shown for the rural division in 1947 was due to abolition of municipalities which in 1933 were separately incorporated and, therefore, classified as urban provincial; in Victoria a large part of the decrease in population shown for the rural division was due to transfer in 1947 to the metropolitan division of adjoining urban parts of shire areas.

The metropolitan areas of Queensland and South Australia in 1933 and in 1947 consisted of complete local government areas, but to obtain suitable areas in the other States it was found necessary to include only portions of certain local government areas which embraced the more distant suburbs. With the object of presenting a key to the geographical distribution of data thus achieved and for the purpose of indicating graphically the density of the population in the various areas, the series of maps contained in this Chapter has been prepared. The first map is that of the Commonwealth of Australia, which shows graphically the density of the population in each of the component States and Territories. density results have been obtained by dividing the population in each case by the area expressed in square miles.

2. Density of Population.—The maps included in this Chapter prove that little more than the coastal fringe of Australia has any considerable population, and that even the population on the coast is to be found mainly in the east and south-east of the Continent.

The area, population and density of the population of the States and Territories separately are shown in the following table:—

AREA, POPULATION AND DENSITY OF POPULATION, 30th JUNE, 1947.

	34.4	TD			Area in Square	Popula	tion (excluding Mig	ratory).	Density (Number
	state or	Territory.			Miles.	Males.	Females.	Persons.	of Persons per Square Mile).
New South Wales			., .		309,433	1,485,575	1,491,921	2,977,496	9.62
Victoria					87,884	1,010,774	1,040,076	2,050,850	23.34
Queensland					670,500	565,763	538,765	1,104,528	1.65
South Australia					380,070	318,505	325,867	644,372	1.70
Western Australia					975,920	255,424	244,075	499,499	0.51
Tasmania				• •	26,215	128,580	127,795	256,375	9.78
Northern Territory					523,620	7,249	3,481	10,730	0.02
Australian Capital	Terri	tory	• •	٠.	939	9,092	7,813	16,905	18.00
Australia					2,974,581	3,780,962	3,779,793	7,560,755	2.54

In addition to the population included in the preceding table there were tabulated under the designation "migratory" 18,603 persons on board ships, railway trains and aircraft. Of this number 16,408 were males and 2,195 were females.

The order of the States in respect to density of population was: Victoria (23.34), Tasmania (9.78), New South Wales (9.62), South Australia (1.70), Queensland (1.65), Western Australia (0.51). The figures in parentheses denote persons per square mile. Between 1933 and 1947 the density of the population of Australia increased from 2.22 persons to 2.54 persons per square mile. The limitations to the use of this simple arithmetical density when considering the question of an optimum population are mentioned in Section 5 (i), Chapter IX.

A defect in any graphical representation of density by the method of cross-hatching is the uniformity of hatching or shading which is necessarily applied to the whole unit of area adopted for the purpose of representation. Thus, when the unit is a State, the hatching is the same for the whole area, notwithstanding that some parts may be uninhabited and other parts densely populated. Even when smaller units are employed it is not possible entirely to eliminate this defect. In the present case the subsidiary areas adopted to indicate the distribution of the population in the several States and capital cities are local government areas.

3. Centre of Area and Centre of Population.—The centre of area and centre of population for each State and Territory, and for Australia as a whole, are given in the next table. The determination of the centre of population at each Census is of considerable value as indicating the trend of the population within intercensal periods, but as work of this kind was not undertaken in connexion with any Census earlier than that of 1911 comparisons are necessarily confined to the last three Census periods. The latitude and longitude of the centres of area and population in the States and Territories at each Census from 1911 to 1947 are given below:—

LATITUDE AND LONGITUDE OF CENTRES OF AREA AND POPULATION, 1911 TO 1947.

The centre of population determined for Australia as at the date of the Census of 1947 lay practically in a direct line drawn from Sydney to Perth and was appreciably closer to Melbourne than to Sydney. Between 1911 and 1921 the centre of population moved slightly west from 145 degrees 34 minutes to 145 degrees 33 minutes east longitude and north from 33 degrees 57 minutes to 33 degrees 47 minutes south latitude whilst between 1921 and 1933 the movement was again west from 145 degrees 33 minutes to 145 degrees 28 minutes east longitude but south from 33 degrees 47 minutes to 33 degrees 53 minutes south latitude. Between 1933 and 1947 the previous westerly movements have been offset by an easterly movement from 145 degrees 28 minutes to 145 degrees 41 minutes east longitude whilst the southerly movement during the period 1921 to 1933 has been reversed by an appreciable northerly movement from 33 degrees 53 minutes to 33 degrees 40 minutes south latitude. Between 1933 and 1947 the centre of population in each of the mainland States again moved closer to its capital city. These movements are attributable to the relatively high increase in the population of the metropolitan area in each State and indicate the extent to which these areas are developing in relation to the provincial and rural areas of the States. In Tasmania the movement was slightly north towards Launceston and away from Hobart.

4. Census Maps.—(i) The Commonwealth of Australia.—The map of Australia inserted at the end of this Chapter shows the average density of the population in each of the States and in the internal Territories, and, except for the Australian Capital Territory, indicates the positions in each case of the centres of area of population referred to in the previous section. The degrees of density represented by the different examples of hatching in the maps relating to Australia, the States, and the Northern and Australian Capital Territories are as follows:—

Blank.—Averaging less than 1 person to 8 square miles.

Diamix.	TITCIAE	51118	1033	man 1)CI 3	on to	o squa	IC IIIII	cs.

J. —Av	eraging	128	pers	ons or o	ver		quare i	nile.	,,		•	"

The area, population and density of population in each State and Territory will be found in Section 2 above.

(ii) The States.—The maps of the States at the end of this Chapter show the boundaries of local government areas which have been hatched according to the scale shown above. Municipalities outside of the metropolitan area are represented by a circle where the population averaged 128 persons or more per square mile, and by a square where the population averaged less than 128 persons per square mile. Areas within each State not hatched had a population averaging less than one person to 8 square miles. Areas not incorporated under local government represented 125,407 square miles out of a total area of 309,433 square miles in New South Wales, 69 out of 87,884 square miles in Victoria, 1,150 out of 670,500 square miles in Queensland, and 326,156

out of 380,070 square miles in South Australia. There are no unincorporated areas in Western Australia and Tasmania.

- (iii) Northern Territory and Australian Capital Territory.—The map of the Northern Territory at the end of the Chapter shows the boundaries of the police districts as constituted at the date of the Census in 1947. The town of Darwin was the only part of the territory incorporated under local government. The map of the Australian Capital Territory shows the division of the Territory into districts as at 30th June, 1947.
- (iv) Metropolitan Areas.—In the maps relating to the metropolitan areas of the States the hatching to indicate density has been based on the number of persons per acre in accordance with the following scale:—

A.—Averaging less than 1 person to 4 acres. B. from 1 person to 4 acres to less than 1 person to 2 acres. ,, C. — 1 2 1 1 " " ,, " " D.— 1 1 2 1 " " ,, ,, ,, ,, ,, E.— 2 1 1 F. — 8 ,, " ,, 8 G.— 1 16 1 " " " ,, ,, ,, " H.— 16 1 1 :, 32 persons and over to 1 acre.

The maps for each capital city and suburbs show the boundaries of the several municipalities, shires, district councils, road districts, or parts thereof which for Census purposes have been adopted as the metropolitan areas of each State. The hatching on the maps indicates the density of the population in accordance with the scale above. Where the space in a map was insufficient to accommodate the name of the municipality a small letter has been inserted. These substitute letters, with the names of the

municipalities to which they refer, will be found at the side of each map.

5. Local Government Areas.—The following tables show firstly for each State and Territory the area, the number and density of the population and of occupied dwellings, and the number of inmates per occupied private dwelling in each local government area at the time of the Census, and secondly similar information for metropolitan local government areas in each State:—

NEW SOUTH WALES.—AREA, NUMBER AND DENSITY OF THE POPULATION AND OCCUPIED DWELLINGS IN EACH LOCAL GOVERNMENT AREA, 30th JUNE, 1947.
