#### CHAPTER 6

## DEMOGRAPHY

This chapter deals with the size, growth, geographic location and characteristics of the population and with components of population change, namely births, deaths, marriage, divorce and international migration.

The sources of the statistics in this chapter are population censuses, population surveys, State and Territorial registers of births, deaths and marriages, records of courts dealing with divorce, and other administrative records such as passenger cards required from international travellers and records of electoral roll and family allowance transfers.

With the proclamation of the Constitution Alteration (Aboriginals) 1967 on 10 August 1967, the provision in Section 127 of the Constitution requiring the exclusion of Aboriginals in reckoning the numbers of the people of the Commonwealth or of a State or other part of the Commonwealth was repealed. Accordingly, population and vital statistics for all dates subsequent to 10 August 1967 no longer exclude full-blood Aboriginals. Also, estimates for periods back to 30 June 1961 have been revised to include Aboriginals.

A list of publications of the Australian Bureau of Statistics which contain detailed population statistics is given at the end of this chapter.

#### THE POPULATION

## The population census

Basic enumerations of the population have been made since the early days of settlement in Australia. The early enumerations were known as 'musters'. A census conducted in New South Wales in 1828 became the first in a series of regular censuses in that colony. Periodic censuses were taken in the other Australian colonies. The first simultaneous censuses of all the Australian colonies was taken in 1881. The first national census was taken in 1911. It was followed by others in 1921, 1933, 1947, 1954, 1961 and at five yearly intervals thereafter. A special article on early censuses appears in Year Book No. 15 of 1922. A special article outlining the history, purposes, legal basis, organisation and publication of results of population censuses appears in Year Book No. 53 of 1967, pp 164–170.

Every census from 1881 has inquired into age, sex, marital status, birthplace, nationality, citizenship and occupation. A wide variety of other topics has been included from time to time.

The most recent census in Australia was conducted on 30 June 1976. In addition to the basic demographic topics mentioned above, questions were asked on income (included for the first time since 1933); the effects of handicaps; child care arrangements; and mortgage repayments. This Year Book contains only preliminary data on age, marital status, place of birth (Australia or overseas) because the main processing of the census data was delayed for 12 months following government decisions on financial restraint. To effect further savings, the Government decided to process only a sample of the schedules at the main processing stage. The sample included all the schedules from the Northern Territory and from non-private dwellings (e.g. hotels, hospitals, jails), together with 50 per cent of the remaining householders' schedules.

The population census in Australia is de facto, i.e. persons are enumerated where they spend census night even though that may not be where they usually live. Visitors to Australia are enumerated if they are in Australia on census night, regardless of the duration of their stay. Australians out of the country are excluded, as are foreign diplomatic personnel and their families.

Despite elaborate arrangements aimed at obtaining complete coverage, it is not possible to ensure that a census schedule is returned for every individual. Some error inevitably remains for various reasons (e.g. inadvertent omission of very young children, missed dwellings or occupied dwellings mistakenly taken as unoccupied). Since 1966, sample surveys have been taken soon after each census to discover the approximate extent of under-enumeration and the effects on the census results of misstatement or non-reply to specific questions. From these studies it appears that under-enumeration has increased over the most recent censuses. Under-enumeration at the 1976 census is estimated to have been 2.7 per cent, details of which are available in the Bureau publication *Population of States and Territories Adjusted for Under Enumeration as shown by Post Enumeration Survey* (2409.0). Underenumeration varies from location to location and for populations of different ages and other characteristics. These and similar problems are common to all population censuses and, although under-enumeration has increased in Australia since the 1971 census, it is of a similar order to that experienced by comparable countries.

## Population estimates

The census enumeration, adjusted for under-enumeration, forms the basis for quarterly estimates of the population prepared by sex and State. These are calculated by updating for subsequent births and deaths and for overseas arrivals and departures and interstate movements. Age estimates are prepared annually for each State and Territory. Small area estimates are also made annually.

From 1976, and retrospectively to June 1971, the overseas migration component is defined as the excess of overseas arrivals over overseas departures, classified as permanent and long-term. Long-term includes visits to or absences from Australia lasting one year or longer. Previously, all overseas movement was included. Since 1961, interstate movement which enters the calculation of population estimates for the States and Territories has excluded holiday, business or other short term movements. Thus, quarterly seasonal changes due to short term overseas movement are reflected in Australian and State population figures prior to 1971 but not thereafter, and quarterly seasonal movements due to interstate holiday travel are reflected in population figures prior to 1961 but not thereafter.

Estimates of the population as at 30 June 1971 and 30 June 1976 are based on the population as counted at the time of those censuses with an adjustment for under-enumeration. The estimate of the population as at 30 June 1971 is 12,937.2 thousand compared with the counted population of 12,755.6 thousand. The population as at 30 June 1976, taking account of under-enumeration, is estimated at 13,915.5 thousand. While adjustments will be made to the estimates of the age and sex of the population of each State and of the population of each local government area, it is not possible to adjust all the statistical material derived from the census.

The quarterly estimates from June 1971 to June 1976 have also been revised to take into account the 1976 census and to allow for under-enumeration at that and the preceding census.

Mean populations, by sex, are calculated for calendar and financial years to the formula—

Mean population = 
$$\frac{a + 4b + 2c + 4d + e}{12}$$

where a is the population at the end of the quarter immediately preceding the twelve month period, and b, c, d and e are the populations at the end of each of the four succeeding quarters.

## Size and growth of Australia's population

When Europeans first settled in Australia, the Aboriginal population is believed to have been at least 300,000. The Aboriginal population suffered a drastic decline in numbers over the next 145 years so that by 1933 it is estimated to have totalled about 67,000. It has since risen (to about 116,000 in 1971), and the current rate of growth exceeds 2 per cent a year.

The population of Australia reached 1 million in 1858, 5 million in 1918 and 14 million in January 1977.

In the period 1861 to 1977, natural increase has been the major element in population growth, and immigration the most variable. In the years 1861 to 1890, total growth on average exceeded 3 per cent a year and natural increase 2 per cent. The rate of natural increase declined during the last decade of the nineteenth century and the first decade of the twentieth century, and this, together with a near cessation of immigration during that period, reduced the rate of growth from 3.70 per cent in 1861-70 to 1.63 per cent in 1901-10.

The 1914-18 war was the dominating influence in the decade 1911-1920: during the war and immediate post-war years the birth rate rose and immigration was resumed. In the economic depression of the 1930s, however, natural increase fell to its lowest level ever and immigration ceased; indeed, in some years, overseas departures exceeded arrivals.

With the outbreak of the 1939-45 war, Australia entered a new phase. The immediate effect of the war was to increase the number of marriages and births. The increasing births more than offset the rise in deaths due to war casualties and higher civilian death rates. Migration in these years was negligible.

—The period 1947 to 1961 was marked by a continued high natural increase and a resumption of immigration, the latter resulting in very high net gains in each of the four years 1949 to 1952.

Between 1961 and 1970, net migration continued at about the same level as in the previous decade, but there were declines in the crude birth rate and the rate of natural increase. The years since 1971 have been characterised by a reduced rate of natural increase due to a decline in the birth rate and lower levels of net migration; together, these have resulted in the lowest rate of population growth for 30 years. In 1976, the rate of growth was 1.02 per cent, of which 0.83 per cent was due to natural increase and 0.18 per cent to net migration. (The discrepancy between the rate of growth and the component parts is due to intercensal adjustment.) The total population at 30 June 1977 was estimated to be 14,074,000.

1976			(d)13,991.2	0.83	0.18	1.02

(a) Excludes full-blood Aboriginals prior to 1961. (b) The average annual rates of population growth for periods greater than one year are calculated on the compound interest principle. The rates refer to the population at the beginning of the period. Discrepancies between the sum of the rate of growth due to natural increase and net migration and the rate of total growth are due to intercensal adjustment. (c) From 30 June 1971, net migration is defined as the excess of overseas arrivals over overseas departures classified as permanent and long term movement. (Long term includes visits to and absences from Australia lasting one year or longer.) From 30 June 1933 to 30 June 1971, net migration represents the excess of all arrivals over all departures. Prior to 30 June 1933, net migration includes discrepancies disclosed by the various censuses, which were corrected by adjusting recorded overseas departures. (d) These population estimates and rates of growth incorporate revisions resulting from an examination of evidence of under-enumeration in the 1976 and 1971 censuses. The estimated population at 31 December 1970 used to compute rates of growth thereafter was 12,799,600.

## Projections of the population

Projections of Australia's population are made using the component method in which a base population is brought forward year by year by applying assumptions about future trends of fertility, mortality and the characteristics of overseas migration.

The projections given here cover the years 1978 to 2001 and are based on provisional estimates of the population for 1977. The assumptions used in the projections are as follows:

Fertility. Rates were chosen on the assumptions that first births will stabilise by about 1981 at a level somewhat lower than that experienced by recent generations of women; that the proportion of women with one child who will have a second child will remain more or less the same; and that the falling off in fertility rates among women who have 3 or more children will continue until 1984. The overall effect will be a further small decline of fertility followed by a rise to replacement level in 1984. Constant rates are assumed thereafter.

Mortality. It is assumed that the 1970-72 age specific mortality rates will continue to apply for the duration of the projections except that infant mortality is assumed to decline by about 1.5 per cent per annum.

Migration. Net immigration has been projected at an illustrative level of 50,000 persons per year. The age-sex composition is based on the pattern of permanent arrivals and departures in the 5 years 1971 to 1975.

According to these projections the population will number 16.5 million in 2001 without further immigration; this represents an average annual rate of growth of 0.7 per cent. With net immigration at 50,000 persons per year, the population will be 18 million and the rate of growth will be 1.0 per cent a year. The proportion of persons aged 65 and over will increase from the present level of about 9 per cent to 9.7 per cent in 2001, and the proportion of children aged under 15 will decline from the present level of 26.7 per cent to 23.4 per cent in 2001.

PROJECTED POPULATION OF AUSTRALIA: 1978 TO 2001

30 June	e—			Excluding migration after 30 June 1977	Resulting from net immigration at the illustrative level of 50,000 persons a year after 30 June 1977	Including net immigration at the illustrative level of 50,000 persons a year after 30 June 1977

## Location of the population

For historical, climatic and economic reasons the population of Australia is concentrated in capital cities and other major towns, mainly on the south and east coast of the continent. In June 1976, 69.7 per cent of the population lived in the six State capital cities and five other major towns of 100,000 or more persons (metropolitan statistical divisions and statistical districts). Of these, only Canberra is located inland. The percentage of the population living in rural areas has declined over the years as the major cities and towns have attracted most of the population growth; there have been periods when the rural population has actually declined in numbers. This trend, however, appears to have slowed considerably since 1971.

POPULATION IN CAPITAL CITIES AND OTHER MAJOR TOWNS OF 100,000 PERSONS OR MORE(a):
30 JUNE 1976

		(10	ou per	sons)		
Sydney .	•					3,094.4
Melbourne.						2,672.2
Brisbane .						985.9
Adelaide .						912.1
Perth .						820.1
Newcastle .						370.5
Wollongong						218.9
Canberra .						201.8
Hobart .						164.5
Geelong .						135.6
Gold Coast						122.2
Total						9,698.2
Percentage of	total p	opula	tion			69.69

<sup>(</sup>a) Metropolitan statistical divisions and statistical districts of 100,000 persons or more.

The percentage of the population living in major cities and towns varies considerably between States. Victoria and New South Wales have the highest percentage (75.0 per cent) followed by South Australia (72.3 per cent), Western Australia (70.1 per cent), Queensland (52.5 per cent) and Tasmania (40.4 per cent).

Two of the State capital cities exceed 1 million people: Sydney, N.S.W., with an estimated 3,094,400 people, and Melbourne, Victoria, with 2,672,200 people.

While there has been a continuous growth in all States this century, there has been a noticeably higher rate of growth in Western Australia and the two territories, the Australian Capital Territory and the Northern Territory. Tasmania has had the least growth.

<sup>(</sup>a) Part of New South Wales before 1911. (b) Figures before 1961 exclude full-blood Aboriginals, later figures do not. The estimates from June 1971 for each State and Territory are made from the 1971 census results, with augmented adjustments for under-enumeration to make the total balance with the estimates for Australia made retrospectively from 1976. (c) Provisional figures.

## General characteristics of the population

If we present the age composition of the population in the form of a pyramid, the increase in the birth rate in the 1940s and 1950s can be readily seen in the broadening at ages 15 to 30. The stabilisation of the number of births in the 1960s and 1970s is reflected in a more even structure at younger ages. Postwar immigration, which at least in the earlier years was characterised by a preponderance of men in the working ages, appears as a corresponding 'bulge' from about 35 upwards.

Although the numbers of men and women aged 15 and over are nearly equal, there are more single men than single women and there are more widows than widowers. The first phenomenon is attributable to women generally marrying about 2 years younger than men, and the second to their greater longevity. In 1976, 29 per cent of the male population aged 15 and over was single, 64 per cent married (excluding 2.2 per cent married but recorded as permanently separated), 2.7 per cent widowed and 2 per cent divorced. For females the figures were 21 per cent single, 62.5 per cent married (excluding 2.7 per cent married but permanently separated), 11 per cent widowed and 2.5 per cent divorced.

In 1976, people born overseas made up 20 per cent of the population, about the same as 1971 but an increase on earlier censuses.

The proportion of the population of working age (taken as 15 to 64) increased between 1971 and 1976, particularly among those aged 15-44 who, as a proportion of the total population, increased from 42.9 per cent to 44.2 per cent.

Although there was also a rise in the number of persons in the population aged under 15, these young dependents made up a reduced percentage of the total population: 27.2 per cent in 1976 as compared with 28.8 per cent in 1971. The numbers aged 65 and over, i.e. the aged dependent group, increased from 8.3 per cent to 8.7 per cent.

(a) Preliminary

The masculinity of the population is expressed as the number of males per 100 females. This ratio is influenced by the age structure: masculinity at birth is about 105.5, but higher male mortality gradually erodes the difference so that by about age 50 the numbers of males and females tend to be equal, and the ratio progressively declines thereafter. Immigration, with its large proportion of young adult males, also affects the masculinity of the population.

## The Aboriginal population

A brief account was given of the Australian Aboriginal population, its origin and its numbers as estimated from time to time in Year Book No. 17, pages 951-61. A special article by A. R. Radcliffe Brown dealing with the estimated number and distribution of the Aboriginal population at the date of the first settlement of European people in the continent appeared in Year Book No. 23, pages 687-696. That article arrived at an estimated minimum Aboriginal population of 251,000, based on the evidence available at the time; however estimates of upwards of 300,000 persons have since been assessed.

The task of collecting data on the Aboriginal population is singularly difficult, raising problems of coverage, definition and reporting. For this reason, statistics, even of the total Aboriginal population, should be treated with caution. This applies particularly to comparison of the changes in numbers from one census to another which can be affected by social attitudes and by changes made in the nature of the question in an attempt to improve coverage and reporting. For the censuses of 1971 and 1976 the question was designed to distinguish those persons who identify themselves as Aboriginals or Torres Strait Islanders.

ABORIGINALS AND TORRES STRAIT ISLANDERS IN AUSTRALIA, 30 JUNE 1971

Australian Capital Te	rritory			255
Total Australia				115,953

<sup>(</sup>a) Definition of Aboriginals and Torres Strait Islanders based on the race to which each person considers himself to belong and is not comparable with previous data.

Compared with the rest of the Australian population, Aboriginal women have very high rates of fertility and Aboriginal people at all ages suffer high rates of mortality. At the time of the 1971 census, the average issue of married Aboriginal women was 4.1 children (excluding still-born children). Acknowledging the probability of high reporting error among this group, this represents a total fertility rate of perhaps twice the rate of the population as a whole. The expectation of life at birth for Aboriginal Australians may be as low as 50 years, compared with 72 years for the rest of the population.

## Internal migration

The 5-yearly censuses and occasional internal migration surveys (conducted in conjunction with the quarterly population survey) are the main source of information for internal migration. Estimates of interstate migration are obtained from address changes notified to the Electoral Office and the Department of Social Security.

The 1976 census set out to measure internal migration by asking respondents where they usually lived and where they had lived 5 years before. An additional question was added to the 1976 census which asked where the respondents had lived one year before.

Internal migration surveys were conducted in respect of each of the twelve-month periods ending 30 April between 1970 and 1974 and for the twelve-month periods ended 31 December between 1974 and 31 January 1977. In these surveys, the usual place of residence of respondents at the beginning and end of the reference period was ascertained. Estimates were made of the number and characteristics of those who changed their residence. (Because the estimates are based on information from occupants of a small sample of dwellings, the imprecision due to sampling variability should be kept in mind. Standard errors of estimates are published in the detailed bulletins providing the survey results. These bulletins are listed at the end of this chapter).

The internal migration surveys show that about 15 to 17 per cent of all persons aged 15 and over change their residence within a twelve-month period. Of those who change their residence, slightly over 50 per cent remain within the same capital city, slightly over 10 per cent are interstate movements and about 4 per cent are movements between State capital cities.

The New South Wales net internal migration loss reached a peak in 1973-74 when there was a net loss of 20,600 persons aged 15 and over; the State capital, Sydney, lost an estimated 26,600 persons in this age group. Smaller losses have been recorded since then. In contrast, Queensland and its capital, Brisbane, experienced net gains from internal migration until the most recent twelve months ended January 1977, when Brisbane had a net loss.

While the pattern of net migration gain or loss has varied over the years, the age and sex composition of those who changed residence has been rather consistent: the masculinity ratio remains around 50 to 51 per cent, and movers show a concentration in the ages 20 to 34 (59 per cent of all movers in the twelve-month period ended January 1977).

<sup>(</sup>a) Non-institutionalised civilians aged 15 years and over at the time of the survey whose usual residence at the end of the survey year was in another State or Territory than at the beginning of the year and who were resident in Australia on both dates.

(b) Necessarily, but contrary to normal practice, the population (non-institutionalised civilians aged 15 years and over) is that at the end of the period.

(c) Very small estimate subject to sampling variability too high for most practical uses.

## VITAL STATISTICS

Registration of vital events, i.e. births, deaths and marriages, has been compulsory throughout Australia since 1856. The total number of these occurrences is available for each year since the 1860s and more detailed information since the 1910s. The number of divorces has been published since 1891, but other details have been published on a consistent basis only since the 1950s.

Crude rates are the number of vital events per thousand of the mean population of a particular year. Natural increase is the excess of births over deaths. In 1976, births numbered 227,810, deaths 112,662 and the natural increase was 115,148. The rate of natural increase for that year was 8.27 per thousand of the mean population made up of crude birth rate 16.37 and crude death rate 8.10. This represented a considerable decline since 1951–55 when the birth rate was 22.86, the death rate 9.25 and natural increase 13.61. There were 109,974 marriages in 1976, a crude rate of 7.90. Divorces numbered 60,775 bringing the crude divorce rate to 4.37. This exceptionally high number of divorces occurred in the first year of operation of the family law court and may not be indicative of a trend.

(a) Excludes particulars of full-blood Aboriginals before 1966.

## Births and fertility

Special interest attaches to fertility as an element of population change. Fertility has varied over the years more than mortality and has had considerable impact on the population structure. Extensive studies have revealed patterns of fertility which justify attempts to predict the numbers of future births.

### Live births

Comprehensive statistics of live births are available since the 1910s. These include information about sex of the children, the incidence of multiple births, marital status of the parents, the number of previous issue to the mother's existing marriage, the duration of marriage, the age of parents and their country of birth.

With rare exceptions, statistics indicate an excess of male over female births. The number of male births per hundred female births in Australia is about 105.5. In 1975 there were 119,850 male births and 113,162 female births, a masculinity ratio of 105.91.

(a) Excludes particulars of full-blood Aboriginals before 1966.

The proportion of children born to parents not married to each other at the time of birth has been increasing. In 1951-55, 3.9 per cent of births were ex-nuptial. In 1975 there were 23,570 exnuptial births, 10.1 per cent of all births. However the number of ex-nuptial births and the crude ex-nuptial birth rate has fallen since 1972.

About 1 per cent of confinements result in twin births and about one in 10,000 in triplets. Quadruplets occur about once in 250,000 confinements. The likelihood of multiple confinement is about 0.9 per cent for the first nuptial confinement, rising to about 1 per cent at the second confinement and to as much as 1.5 per cent at the fourth and subsequent confinements. The incidence of multiple births rises with age of mother.

Since the 1950s, there has been a decline in the proportion, and since 1971 in the number, of women having three or more children to their marriage. During the 1950s the median age of mother at first nuptial birth declined, but in recent years it has risen slightly. In 1975, median age at first birth was 23.95 years. Since 1971, there has been a decline in the number and proportion of confinements occurring in the first year of marriage. There were fewer births to marriages of 10 years duration and longer.

## **Fertility**

General fertility rates, which are the number of births to women of any age per thousand females aged 15-44, are the simplest measure of fertility. These have been calculated for the three years' births around each census from 1881 and provide a consistent series for nuptial and exnuptial fertility as well as for total fertility.

The rates show a substantial decline in fertility over the total period with a low point in 1932-34 and a minor recovery peaking in 1960-62. The decline has been greater among married women, the rate for 1970-72 being only 40 per cent of the 1880-82 rate. The differences are explained by the increased marriage proportions. Ex-nuptial fertility in 1970-72 was higher than previously.

Age specific birth rates provide a measure of changing patterns of fertility within the fertile ages. The sum of these rates, the total fertility rate, is a more useful measure of change than the general fertility rate since it takes into account the changing age structure of the population within the fertile ages. The total fertility rate represents the number of children a woman would bear in her lifetime if she experienced the rates of the year shown. Fertility at older ages has declined since the 1950s and for all age groups except 15-19 from the 1960s. Since 1971, fertility at 15-19 has also fallen. The total fertility rate, which rose in the 1950s, has since declined and in 1975 was 2.224.

<sup>(</sup>a) Number of births per 1,000 women in each age group. Excludes particulars of full-blood Aboriginals before 1966. (b) The sum of the age specific rates divided by 1,000. This is the number of children a woman would bear in her lifetime if she experienced the rates of the year shown.

The gross reproduction rate is derived from total fertility and the ratio of female to total births. It indicates the number of female children who would be born on average to women supposing the rates from which it was calculated were to apply throughout the reproductive period. It is an indication of the extent to which the population is reproducing itself except that it does not allow for females who failed to survive to the end of the childbearing period. The net reproduction rate allows for such mortality. It is obtained by multiplying the age-specific rates by the survivor proportions in the corresponding age group of the stationary or life table population. Mortality in childhood and young adulthood is now so low that there is little difference between current gross and net reproduction rates. In 1975 the gross and net reproduction rates were at their lowest level since the 1930s.

Fertility of Australian Marriages. This series is designed to show the pattern of fertility within marriage. Births in each year and at each duration of marriage to parents who were married in Australia are related (per thousand) to the Australian marriages a relevant number of years earlier.

The sum of these rates for all durations is the index of current marriage fertility and indicates the number of children marriages would produce according to the recorded fertility of that year.

Fertility in the first two to three years of marriage has fallen very substantially. For instance, fertility in the first year of marriage fell from 369 births per thousand marriages in 1956-60 to 185 in 1975. There has also been a substantial decline for marriages of ten years duration or longer from 292 per thousand at durations 10-14 years in 1956-60 to 135 per thousand in 1975. At longer durations the fall is proportionally greater still. There has been no rise at medium duration to compensate for the decline early and late in marriage. The index of current marriage fertility declined from the equivalent of 2.7 children per marriage in 1956-60 to 1.8 in 1975.

The annual rates accumulated according to year of marriage show the experience of successive marriage cohorts. These marriage cohort tables demonstrate an increasing delay by couples in having their first child. The marriages of 1955-56 had 1,262 children per thousand marriages by the end of the fourth year of marriage, compared with 1,314 for those married in 1960-61, and 926 for those married in 1971-72.

(a) Cumulated number of births per thousand marriages. From 1966 includes births of Aboriginals where parents were legally married and excludes births of tribal marriages.

## Mortality

The number of deaths per year is now in excess of 100,000 a year and rising. This is not only as a result of the overall growth of the population, but also because of the advanced age of an increasing proportion of the population. The crude death rate, which fell from over 12 per 1,000 at the beginning of the century to 7.91 per 1,000 in 1976, can be expected to rise slowly as a result of further aging of the population, unless there is a more than off-setting drop in age specific death rates.

#### General Mortality

Between 1953-55 and 1960-62, mortality declined at most ages. Since then there has been little further change, except for infant mortality which has continued to fall. Indeed at some ages there have been small rises in age specific mortality. For instance, for males aged 15-19 the rate rose from 1.23 per 1,000 in 1960-62 to 1.54 in 1970-72, and for ages 20-24 it rose from 1.62 to 1.83.

Mortality is greater for males than for females at every age. It is relatively high in the first year of life (15.99 per 1,000 males and 11.88 per 1,000 females in 1975), very low in childhood and young adulthood, and then rises in middle and old age.

<sup>(</sup>a) Number of deaths per 1,000 of population of the same age group and sex. The populations used in the calculation of these rates are based on census populations at 30 June 1954, 1961, 1966 and 1971 and estimates at 30 June for later years.

(b) Excludes particulars of full-blood Aboriginals prior to 1965-67. (c) Average annual rate per 1,000 of census population, based on deaths in the three year period, i.e. census year and the years preceding and following it. (d) Infant deaths per 1,000 live births.

#### Perinatal Mortality

Perinatal deaths comprise foetal deaths (stillbirths) and neonatal deaths (deaths within 28 days after birth). From 1972, statistics of stillbirths have been compiled on the basis of amended legislation in all States which provides for all foetal deaths of at least 20 weeks gestation or 400 grams weight to be registered. Previously, the statistics were based on a minimum of 28 weeks gestation. Neonatal deaths account for about 70 per cent of all deaths occurring within the first year of life.

In 1975 there were 4,744 perinatal deaths registered in Australia, which continued the decline in numbers and rates since 1972, the first year in which perinatal deaths were tabulated uniformly throughout Australia. Of these 4,744 deaths, 2,414 were foetal deaths and 2,330 were neonatal deaths

The neonatal death rate continued its long historical decline, falling from 16.45 per 1,000 live births in 1951-55 to 10.00 per 1,000 in 1975. In the same period the total infant mortality rate fell from 23.34 to 14.27.

1961-65				2,946	12.5
1966-70				2,563	10.6
1971-75				2,772	10.8
Annual tot	als—			-	
1971				2,519	9.0
1972(b)				3,089	11.5
1973				2,924	11.7
1974				2,914	11.8
1975				2,414	10.3

(a) Excludes particulars of full-blood Aboriginals before 1966. (b) Prior to 1972 based on foetal deaths of minimum 28 weeks of gestation. Since 1972 includes foetal deaths of at least 20 weeks of gestation or 400 grammes weight.

## Life expectancy

Life tables are measures of life expectancy compiled from the death rates prevailing over a period. They form the basis for the *stationary population* which is the population that would result from a constant number of births each year which had been subject at each age to the life table mortality rates.

Since 1921, official life tables have been calculated from the separate male and female populations as enumerated at the census, and the deaths of the three years around the census. Earlier life tables were compiled for decennial periods 1881–90, 1891–1900 and 1901–10. Life tables have also been prepared in recent years using annual age estimates and the deaths of a particular year.

A key value in life tables is the expectation of life remaining at each age. Expectation of life—particularly at birth—improved at every age in the first half of this century. Since 1953-55 changes have been small. In the period 1901-10 to 1970-72, expectation of life at birth rose from 55.20 years to 67.90 for males and from 58.84 to 74.60 for females.

The inverse of the expectation of life at birth is sometimes called *the true death rate*. This rate is a measure of mortality unaffected by the current age structure of the population, and is therefore a better measure of change than crude death rates. Since 1953-55 there has been little change in the true death rate, indicating that most of the variation in crude rates has been due to changes in the population age structure.

TRUE DEATH RATES

			True death rate(a)			
Period			Males	Females		
1953-55		<u> </u>	 14.89	13.75		
1960-62			14.72	13.48

Note. e = complete expectation of life at specified age

## Marriages

The Australian Marriage Act 1961-1973 came into operation on 1 September 1963, placing the marriage laws throughout Australia on a uniform basis. Marriages may be celebrated by a minister of religion registered as an authorised celebrant, or by a district registrar or other person authorised by the Attorney-General. The minimum marriageable age is 18 years for males and 16 years for females. A judge or magistrate may, in exceptional circumstances, make an order authorising a male who has attained 16 years or a female who has attained 14 years to marry a person of marriageable age.

In 1975, 86 per cent of grooms and 87 per cent of brides were marrying for the first time; 3 per cent were widowers and 4 per cent widows; and 10 per cent had been divorced. The proportion of divorced persons was an increase on previous years.

Median age at first marriage declined during the 1950s and 1960s but has changed little recently. In 1975 it was 23.37 years for males and 20.97 for females. In 1975, 7.11 per cent of grooms and 30.28 per cent of brides married under the age of 20.

Marriage rates of the marriageable population provide a more exact measure of changing marriage patterns than the crude marriage rate. Marriage rates have been calculated for the three years around the census per thousand single, widowed and divorced males, females and persons. The rates for 1970-72 of 70.34 for males, 67.11 for females and 68.69 for persons contrast with much lower rates in earlier times, particularly in the case of males.

#### Divorce

The Matrimonial Causes Act of 1959-66 provided for dissolution of marriage on one or more of 14 grounds. It also provided for nullity of marriage and for judicial separation. This Act, which came into operation in 1961, replaced separate State and Territory legislation. The Family Law Act 1975, which came into operation on 5 January 1976, provides for a single ground for divorce—irretrievable breakdown of marriage—and for nullity of marriage on the ground that the marriage is void.

With the exception of a preliminary total figure for divorces and dissolutions granted under Family Law legislation during 1976, the statistics presented in the tables relate to divorces granted under the Matrimonial Causes Act or under previous State or Territory legislation. The first table includes all types of divorce: dissolution, nullity and judicial separation. The remaining tables relate to dissolution only.

When comparing the number and rate of decrees granted from year to year it should be borne in mind that the availability of judges to hear petitions lodged can affect the number of decrees granted. A rise in one year may be due wholly or in part to the clearing of a backlog of cases from an earlier year.

#### Duration of Marriage, Age at Marriage and Age at Divorce

Marriages which were dissolved in 1975 lasted on average 11.40 years. Of the 24,257 marriages which were dissolved, 9.90 per cent had lasted less than five years, 52.50 between five and fourteen years and 37.60 more than fifteen years.

The median age at marriage of divorcing husbands had been 23.49 years and of wives 21.19 years. Of husbands, 11.61 per cent had been aged under 20 at marriage and 54.94 per cent aged 20-24; of wives 39.45 per cent had been aged under age 20 and 44.10 per cent between 20-24.

At time of divorce, the median age of husbands was 36.31 years and of wives 33.40 years. A total of 25.44 per cent of husbands and 37.23 per cent of wives were aged under 30 years when the marriage was dissolved.

## Children of the Marriage

For the years to which the Matrimonial Causes Act have applied, children of the marriage are defined as living children under the age of 21 at the time of the petition. Under previous legislation there were differences between States.

In 1975 there were no children (under 21 years at the time of the petition) involved in 32 per cent of the dissolutions granted; 23 per cent involved one child; 25 per cent two children; and 20 per cent three or more children.

### INTERNATIONAL MIGRATION

Statistics of overseas arrivals and departures are compiled from incoming and outgoing passenger cards which are collected from all travellers under the *Migration Act* 1958–1973. Earlier statistics were obtained from passenger lists required under various Acts.

Since 1924, overseas travellers have been classified into two principal categories which distinguish movements for short terms from movements for longer periods (including permanent movements). Revised questions for travellers were introduced in 1958 and again in 1974. The 1958 revision enabled the separation, after 1959, of permanent from other long-term movements and also the identification of former settlers departing. The 1974 revisions improved the classification without change of principle. The principal categories of overseas movement are:

Permanent—consists of persons arriving with the stated intention of settling permanently in Australia (settlers), and Australian residents (including former settlers) departing with the stated intention of residing permanently abroad. Before 1974, former settlers were not so classified unless they had spent at least 12 months in Australia.

Long-term—consists of overseas visitors arriving and Australian residents departing with the stated intention of staying in Australia or abroad respectively for 12 months or more; and visitors departing and residents returning who have stayed in Australia or abroad respectively for 12 months or more. Until 1974, Australian residents were classified as long-term only if their time spent abroad included a period of 12 months in any one country. Their classification is now governed solely by their total absence from Australia.

Short-term—consists of overseas visitors arriving and Australian residents departing whose intended or actual period of stay in Australia or abroad respectively is less than twelve months.

The classification of overseas movements is based on statements made by the traveller on arrival in or departure from Australia. The statistics represent the travellers' intention at the time of arrival or departure; travellers may subsequently change their intentions, and this must be borne in mind in interpreting statistics.

A comparison of overseas arrivals and departures in 1976 with those in 1950 indicates a present predominance of tourists, thereby also accounting for the great increase in the volume of travel, now mostly by air. In 1950 there were 250,404 arrivals and 97,899 departures, compared with 1,641,636 arrivals (up 656 per cent) and 1,602,156 departures (up 1637 per cent) in 1976. Total arrivals remained at the 1950 levels until the early 1960s and total departures increased only slowly. In 1950, short-term

movement accounted for 30.3 per cent of arrivals and 78.7 per cent of departures. The percentages had increased to 91.4 per cent and 92.8 per cent respectively in 1976. An upsurge of international tourism, particularly by Australian residents, occurred in the 1970s. The volume of sea travel has changed little over the period (the figures exclude pleasure cruises in the south west Pacific beginning and ending in Australia), so that in 1976 only 2.4 per cent of arrivals and 2.5 per cent of departures had travelled by ship. Net gain, i.e. the excess of total arrivals over total departures, until recently provided a satisfactory measure of the population gain from international migration. In recent years, however, distortions arising from seasonality of short-term arrivals and departures have become very large. For the purpose of estimating the population of Australia and the States and Territories, therefore, the migration component of population growth has been measured since 1 July 1971 by reference to permanent and long term movements only.

## Migration to Australia

Migration to Australia is regulated by the Migration Act 1958-1973 which came into force on 1 June 1959. Any person entering Australia after the commencement of the Act without having been granted an entry permit or who is not within an exempted class is a prohibited immigrant. Exempted persons include diplomatic, consular and trade representatives of other countries, and seamen who enter with leave while their ships are in Australian ports.

Prior to January 1975, citizens of the United Kingdom and Ireland were able to travel to Australia without obtaining any authority to do so; but, with the introduction of a non-discriminatory policy, they are now required to meet the same requirements as all other prospective migrants. Because of reciprocal arrangements on travel between the Australian and New Zealand governments, New Zealanders may come to Australia and Australian citizens may enter New Zealand as they wish.

Immigration has contributed substantially to Australia's post war population growth. In the post-war years, some 3.35 million migrants have arrived, of which an estimated 80 per cent settled. They and those of their children born in Australia have been responsible for about half of Australia's post war population growth.

Over the last few years there has been a substantial fall in immigration. Annual migrant intake fell from a peak of 185,000 in 1969-70 to a 30-year record low of 52,000 in 1975-76. Each year Australia loses a proportion of its previous migrant intakes. Additionally, partly as a result of the high international mobility of professional and skilled workers, substantial numbers of Australians take up job opportunities overseas.

These factors, together with low levels of natural increase, make it appear that the population in the year 2001 will be well below the previously projected level of 20 million. The size of Australia's population in the year 2001 will be dependent, in large part, on the size of immigration intakes over the remainder of the century, and these, in turn, will be affected by policy as well as by economic and social factors.

Because of the high level of unemployment in Australia, entry for permanent settlement is at present restricted to the spouses, dependent children and parents of Australian residents and those who possess skills in an occupation for which there is a substantial unfilled demand. However, fiancees and fiances may be considered, as well as other categories where compelling compassionate or humanitarian consideration exist, e.g. refugees.

The granting of assisted passages is restricted to the spouses and minor dependent children of Australian residents, and to those possessing occupational skills that are in short supply.

#### Accommodation of migrants

Migrants must be assured of accommodation on arrival, unless they have sufficient funds to be independent. For those migrants nominated by relatives or friends, this initial accommodation has usually been in private homes. Most of the assisted migrants nominated by the Commonwealth Government are provided with transitory accommodation in migrant hostels operated by Commonwealth Hostels Ltd, a non-profit-making Government-sponsored company. These hostels provide a range of services to help migrants to settle in Australia, including child minding centres, English language classes, youth recreation activities, welfare officers and assistance in obtaining permanent accommodation.

The total capacity of hostels is about 10,000. A further 1,800 migrants nominated by the Commonwealth Government can be accommodated in self-contained flats. Hostel accommodation is available to families for up to 12 months, while tenancies of flats are limited to six months. Childless couples and single persons are accepted in hostels for up to six months and three months respectively. Extensions of stay are granted in extenuating circumstances.

British assisted migrants nominated by State Governments are, in most cases, provided with initial accommodation in reception centres operated by the State authorities.

## Settlement services

#### Migrant welfare, settlement and integration

The Department of Social Security provides direct assistance to migrants through its migrant welfare staff and the Telephone Interpreter Service, and indirect help through support to voluntary agencies.

The migrant welfare staff consists of an establishment of 31 professional social workers and 64 trained welfare officers, most of whom have competence in languages additional to English. They are deployed throughout all capital cities and some other centres and work in co-operation with State and local government authorities and voluntary organisations. Migrant welfare staff members provide specialised information, counselling and, where appropriate, professional social work services for migrants experiencing settlement problems, and refer clients as necessary to other relevant authorities and agencies.

In addition to its normal migrant welfare services, the Department co-ordinates the provision by various authorities and agencies of special settlement and orientation assistance for groups of newly-arrived refugees and similar groups.

Under the *Immigration (Guardianship of Children) Act*, the Minister for Social Security is the legal guardian of certain classes of immigrant children entering Australia who are neither accompanied by nor joining an adult relative. Most of the Minister's functions under the Act have been delegated to the principal officers of the State and Territory child welfare authorities.

The Department of Social Security is responsible for the development, in consultation with State and Territory child welfare authorities and other relevant Commonwealth Government Departments, of policy in relation to inter-country adoptions. A Commonwealth/State Inter-Departmental Standing Committee has been established for this purpose.

The Telephone Interpreter Service was introduced in 1973 to help overcome communication problems by providing over the telephone a general interpreting, information and advisory service to migrants in a wide range of languages, and to assist the community generally in communicating with non-English speakers, especially in emergency situations. The service commenced in Sydney and Melbourne in February 1973, and now operates in all mainland State capitals. During the financial year ending 30 June 1977, a total of 99,816 calls was received, making a total of 296,000 since February 1973.

In addition to providing direct services for migrants, the Department administers a grant scheme whereby financial assistance is provided to selected community welfare agencies to enable them to employ qualified social workers or welfare workers to help migrants overcome serious settlement problems. As at the end of June 1977, 45 agencies were approved to receive grants, and 38 social workers and 8 welfare workers were employed.

The Department also directly funds the eight Good Neighbour Councils operating in the several States and Territories. The Councils are autonomous voluntary organisations with which are associated the many community groups and people throughout Australia whose common objective is to facilitate the integration of migrants. As at 30 June 1977, these grants overall enabled Councils to pay the administrative costs involved in maintaining principal offices in the capital cities, 15 regional offices and 8 sub-offices, as well as employing 76 staff. In that year, the Councils had active contact with over 1,000 organisations and controlled a network of more than 500 branches with 6,500 representatives in regional centres.

The Department recognises the importance of national group organisations in fostering resettlement. It has published a directory of such organisations in Australia and has distributed copies free of charge to interested persons and relevant institutions. Systematic updating is maintained with the aid of a computer which is being linked with a foreign language information distribution service.

The Department also undertakes research into the ethnic background of various individual national groups, and into their distribution and settlement experience in Australia. On the basis of this research, the Department publishes ethnic background papers on selected migrant source countries for distribution to welfare and other workers involved in the migrant settlement process in order to promote understanding and tolerance of cultural differences.

#### Migrant education

Notes on this aspect are included in Chapter 12.

## Refugees

Australia has opened its door to many refugees. Of almost 1 million people settled by the International Refugee Organisation between 1947 and 1952, Australia accepted 170,700, a total exceeded only by the United States of America. Since the early 1950s, crises have occurred which have increased the complexity of the world refugee problem, including the Hungarian uprising of 1956, its counterpart in Czechoslovakia in 1968, the continuing flow of refugees from Yugoslavia up to the late 1960s and early 1970s, the expulsion of Asians from Uganda in 1972, the events following the change of government in Chile in 1973, the fighting in Cyprus and the Lebanon, and the end of the war in Vietnam, Laos and Cambodia in 1975. Australia's total intake was 4,374 in 1975-76 and 8,124 in 1976-77.

#### REFUGEE ARRIVALS

Period					Assisted	Other	Total
Annual a	vera	ge—					
1951-5	5				3,515	n.a.	n.a.
1956-60	)				5,904	n.a.	n.a.
1961-6:	5				1,799	n.a.	n.a.
1966-70	)				7,446	n.a.	n.a.
1971–7:	5	٠	•	•	2,773	7,776	10,549
Annual to	tals	_					
1971					7,527	13,846	21,373
1972					2,324	7,478	9,802
1973					1,473	7,241	8,714
1974					1,686	7,013	8,699
1975					853	3,302	4,155
1976					865	3,231	4,096

## Citizenship

The grant of citizenship is controlled by the Australian Citizenship Act 1948. Citizenship may be acquired by birth in Australia, by birth abroad to Australian parents, or by grant of citizenship to persons resident in Australia under conditions prescribed in the Act.

An amendment to the legislation in 1973 meant that all persons are now eligible for the grant of Australian citizenship provided that they have lived in Australia for at least three years, are of good character, have an adequate knowledge of English and of the responsibilities and privileges of citizenship, and declare that their intention is to reside permanently in Australia.

## PERSONS GRANTED AUSTRALIAN CITIZENSHIP

Period				Number
Annual aver	ages			
1951-55	Ĭ.			6,729
1956-60				44 412
1961-65				43,823
1966-70				40,934
1971-75		•		61,182
Annual tota	ls			
1971 .				38,799
1972 .				38,402
1973				57,102
1974				87,549
1975	Ť	·		84,059
1976 .				118,189
