MAIN FEATURES

This publication presents projections of the population of Australia, States and Territories from 1995–2051. The projections are based on a combination of assumptions on future levels in births, deaths and migration to arrive at the size, structure and distribution of Australia's population into the next century.

POPULATION SIZE AND GROWTH

Australia's population is projected to grow from 18.1 million in 1995 to between 22.5 and 23.9 million in 2021 and to between 24.9 and 28.3 million in 2051, depending on the assumptions made regarding future levels of fertility and overseas migration.

The United Nation's medium variant projections show the world's population increasing by 72% by the year 2050, while Australia's population under Series A/B is projected to increase by 44% to 26.0 million over the same period. These medium variant projections show that the rapidly growing populations of South-East Asia present prospects of a widening gap in terms of population size between those countries and Australia. Malaysia's population, which is currently similar to Australia's, could almost double by rising to 38 million in 2050. By contrast, New Zealand's population is projected to increase by 31% by 2050 to 4.7 million, while both Japan and Germany are projected to decline to levels below their current populations of 125.1 and 81.6 million, respectively.

Australia's rate of population growth is projected to decline from current rates of between 1.0% and 1.3% annually to between 0.2% and 0.5% by 2051. The reason for this slowing in the rate of growth is mainly a projected decline in the natural increase (births minus deaths) of the population. This decline is largely a result of the increasing numbers of deaths occurring in a rapidly ageing population.

An analysis of the projection results shows that if it is assumed that there is no net gain from overseas migration, the growth would be even slower, with the population actually beginning to decline to 20.1 million in 2051, after reaching a peak of 20.7 million in the year 2033.

AGE AND SEX STRUCTURE

The projections show that regardless of which combination of assumptions is chosen, the ageing of Australia's population will continue. This is the inevitable result of fertility remaining at low levels over a long period.

As growth slows, the population ages progressively with the median age of 34 years in 1995 increasing to between 40–41 years in 2021 and to between 42–44 years in 2051.

Similar to many countries in the world, Australia's population aged 65 years and over is projected to increase substantially into the next century. This age group is projected to rise from 2.2 million in 1995 to between 4.0 and 4.1 million in 2021 and between 6.0 and 6.4 million in 2051. By the end of the projection period between 22.5% and 24.3% of Australia's population is projected to be aged 65 years or over. The highest annual rates of growth of this age group occur between 2011 and 2021 when the peak of the baby-boom generation (born from the mid-1940s to the 1960s) enter it.

The projections also show significant growth in the number of people aged 85 years or more, with this age group being projected to have an increasing share in the population aged 65 years and over, rising from 8.8% in 1995 to between 19.5% and 20.1% in 2051.

At the other end of the scale, the population aged 0–14 years of 3.9 million in 1995 grows to between 3.9 and 4.3 million in 2021 and between 3.9 and 4.8 million in 2051. As a proportion of the total population, however, these projected figures translate to declines from 21.4% in 1995 to between 17.2% and 18.2% in 2021 and between 15.7% and 17.1% in 2051.

Projection results show that the population aged 15–64 years rises from 12.0 million in 1995 to between 14.9 and 17.1 million in 2051. In proportional terms this represents a decline from 66.7% of the total population in 1995 to 60% in 2051.

The age structure of the prime working age group (15–64 years) is projected to change considerably by the end of the projection period, with the greatest growth occurring in the population aged 45–64 years. This age group rises from 3.7 million in 1995 to between 6.1 and 6.8 million in 2051, which translates to an increase in the share of the population aged 15–64 years from 31.0% in 1995 to between 39.7% and 41.1% in 2051.

Meanwhile, the number of people aged 15–24 years, many of whom are entering the labour force for the first time, only increases slightly over the projection period from 2.7 million in 1995 to between 2.8 and 3.3 million in 2051. As a proportion of the population aged 15–64 years, these projected figures represent falls from 15% in 1995 to between 11.2% and 11.8% in 2051.

Projection results show the sex ratio (the number of males per 100 females) of the population falling from 99.2 in 1995 to between 98.0 and 98.1 by 2021 and between 95.9 and 96.3 by 2051.

STATE AND TERRITORY DISTRIBUTION

With the exception of Tasmania, the population of every State and Territory increases over the projection period. The highest rates of growth are projected to occur in Queensland and Western Australia on the assumption that they will continue to attract people moving from other States. Queensland is the only State which has a population which may double in size over the projection period and is projected to exceed Victoria's from 2019 under the highest interstate migration scenario.

New South Wales, Victoria and South Australia are projected to grow slowly, with New South Wales remaining the State with the largest population. Tasmania is the only State projected to decline in population size. The Northern Territory and the Australian Capital Territory are projected to have above average rates of growth. All projections result in the population of the Australian Capital Territory overtaking the size of Tasmania's population from about 2027 onwards.

SUMMARY OF ASSUMPTIONS

The assumptions pertaining to each component of population change and the time period to which they apply during the 1995–2051 projections are detailed below.

Two alternative assumptions have been made about future births, one assumption about future deaths, two alternative assumptions about future levels of overseas migration and three alternative assumptions about interstate migration.

SUMMARY OF ASSUMPTIONS

| <i>Component</i> | <i>Assumption</i> |
|------------------------|---|
| Mortality | <p>For Australia as a whole, 1992–94 mortality rates decline to the year 2004 according to short-term rates of decline and from 2004–51 according to long-term rates of decline.</p> <p>For the States and Territories (except the Northern Territory) State-specific mortality rates converge to the rates for Australia as a whole in the year 2004 and then decline to 2051 according to long-term rates of decline (i.e. from 2004–51 mortality rates are the same as for Australia as a whole).</p> <p>Northern Territory mortality rates decline to the year 2004 according to short-term (Australian) rates of decline and then from 2004–51 according to long-term (Australian) rates of decline.</p> |
| Fertility 1 | For Australia as a whole the total fertility rate for 1994 of 1.85 children per woman remains unchanged. For the States and Territories, fertility rates are State-specific and trend from the total fertility rate for 1994 to rates that are determined as ratios of the Australian fertility rate in the year 2004. These ratios, i.e. relative differentials between States and the Australian rate, remain constant from 2004–51. |
| Fertility 2 | <p>For Australia as a whole the total fertility rate declines from 1.85 children per woman in 1994 to 1.75 in the year 2004, after which it remains unchanged.</p> <p>For the States and Territories, fertility rates are State-specific and trend from the total fertility rate for 1994 to rates that are determined as ratios of the Australian fertility rate in the year 2004. These ratios, i.e. relative differentials between States and the Australian rate, remain constant from 2004–51.</p> |
| Overseas migration 1 | Annual net migration gain declining from 120,000 in 1995–96 to 70,000 in 1998–99 and then remaining unchanged. |
| Overseas migration 2 | Annual net migration gain declining from 120,000 in 1995–96 to 100,000 in 1997–98 and then remaining unchanged. |
| Overseas migration 3 | Zero net migration gain throughout the projection period to enable an assessment of the effect of overseas migration on population growth. |
| Interstate migration 1 | 'Large' net gains and losses for most States and Territories, commensurate with annual net gains of 38,000 for Queensland and 6,000 for Western Australia. After a transitional period from 1995 to the year 2000, annual net gains and losses remain unchanged. |
| Interstate migration 2 | 'Medium' net gains and losses for most States and Territories commensurate with annual net gains of 29,000 for Queensland and 4,000 for Western Australia. After a transitional period from 1995 to the year 2000, annual net gains and losses remain unchanged. |
| Interstate migration 3 | 'Small' net gains and losses for most States and Territories commensurate with annual net gains of 21,000 for Queensland and 2,000 for Western Australia. After a transitional period from 1995 to the year 2000, annual net gains and losses remain unchanged. |

DESCRIPTION OF THE SERIES

Using various combinations of these assumptions, eight alternative projections have been made of the population. These are identified as Series A–H. Only four of these projections, Series A–D, are covered in this publication, but details of Series E–H are available on request. In addition, another projection of the population, Series I, which assumes no net

overseas migration gain, is published at the national level and is available at the State and Territory level on request.

(M): Medium level.

(H): High level.

The base population used for the projections is the latest published estimate of 18.1 million at 30 June 1995.

SECTION A: ASSUMPTIONS

FERTILITY

Previous projections In the previous (1993 based) population projections published in this series, three assumptions were put forward regarding the future course of total fertility. The first assumption was that the estimated total fertility rate for 1993 of 1,884 per 1,000 women (or about 1.9 children per woman) would remain unchanged throughout the entire projection period. The second assumption offered a higher alternative to the first assumption and assumed a gradual return to replacement levels, rising from a total fertility rate of 1,915 births per 1,000 women for 1993 to a total fertility rate of 2,100 in the year 2002. The third assumption allowed for a downward trend from a total fertility rate of 1,875 births per 1,000 women for 1993 to a total fertility rate of 1,700 in the year 2002. The second and third assumptions were based on the recent experiences of North American and European countries, respectively.

Since the last population projections were published, age-specific and total fertility rates for the years 1993 and 1994 have become available. The observed total fertility rates for 1993 and 1994 were lower than the projected rates under all three assumptions. While the observed age-specific fertility rates for the age groups 30-34 and 35-39 followed the projections, the rates for ages 40-44 were higher than projected and the declines in age groups 15-19, 20-24 and 25-29 were more rapid.

COMPARISON BETWEEN OBSERVED AND ASSUMED ¹ AGE-SPECIFIC FERTILITY RATES ²

| Year | Age group (years) | | | | | | | Total rate |
|--|-------------------|-------|-------|-------|-------|-------|-------|------------|
| | 15-19 | 20-24 | 25-29 | 30-34 | 35-39 | 40-44 | 45-49 | |
| <i>Observed rates</i> | | | | | | | | |
| 1991 | 22.9 | 75.0 | 132.0 | 100.2 | 36.0 | 5.5 | 0.2 | 1 855 |
| 1992 | 21.9 | 74.9 | 132.6 | 104.6 | 38.4 | 6.1 | 0.2 | 1 895 |
| 1993 | 20.7 | 71.1 | 130.0 | 105.5 | 39.0 | 6.3 | 0.2 | 1 865 |
| 1994 | 20.7 | 69.2 | 126.1 | 105.1 | 41.2 | 6.7 | 0.3 | 1 846 |
| <i>Assumed rates — Assumption I (Medium)</i> | | | | | | | | |
| 1993 | 21.9 | 73.9 | 130.6 | 105.4 | 38.8 | 6.0 | 0.2 | 1 884 |
| 1994 | 21.9 | 73.5 | 129.1 | 106.1 | 39.6 | 6.4 | 0.2 | 1 884 |

| 1993 | 21.7 | 73.5 | 129.9 | 105.1 | 38.6 | 6.0 | 0.2 | 1 875 |
| 1994 | 21.5 | 72.4 | 127.0 | 104.8 | 39.0 | 6.3 | 0.2 | 1 856 |

¹ Assumption for 1993-based population projections.

² Per thousand women.

Recent trends The period 1971-80 was one of rapid decline in Australia's total fertility rate, which fell from 2.9 births per woman in 1971 to 1.9 in 1980. Since then the total fertility rate has remained relatively stable with only a slight downward trend within the 1.8-1.9 range. After a small rise to 1.9 in 1992, the total fertility rate declined slightly to 1.8 in 1994. Australia's total fertility rate has been below 2.1 children per woman, the number usually acknowledged as the average replacement level, since 1976.

TOTAL FERTILITY RATE, AUSTRALIA

Australia's total fertility rate per woman is lower than that of neighbouring countries such as Indonesia (3.1), Papua New Guinea (4.9) and Malaysia (3.7). It is higher than the total fertility rates of countries such as Italy (1.2), Germany (1.3), Greece (1.4) and Japan (1.5), being more comparable to the total fertility rates of countries such as Canada (1.8) and the United Kingdom (1.9).

TOTAL FERTILITY RATE, SELECTED COUNTRIES, 1992

| Country | Total fertility rate |
|--------------------|----------------------|
| Australia | 1.9 |
| Canada | 1.8 |
| China | 2.2 |
| Germany | 1.5 |
| Greece | 1.5 |
| Indonesia | 3.1 |
| Italy | 1.3 |
| Japan | 1.7 |
| Korea, Republic of | 1.8 |
| Malaysia | 3.7 |
| Netherlands | 1.7 |
| New Zealand | 2.1 |
| Papua New Guinea | 4.9 |
| United Kingdom | 1.9 |
| U.S.A. | 2.1 |

Source: *Births, Australia, 1994* (3301.0); United Nations Children's Fund 1994, *The State of the World's Children 1994*, Oxford University Press, New York.

The proportion of total births occurring outside registered marriage has continued to rise. In 1984, 17% of all births were to unmarried women. By 1994, this proportion had risen to 26%. It is likely that an increasing proportion of these births are occurring in de facto relationships. In 1994, 82% of ex-nuptial births were acknowledged by their fathers, compared with only 67% in 1984. The increasing trend in the proportion of births that are ex-nuptial is in line with the increase in the age at first marriage and the rise

in the divorce rate, which has increased the proportion of unmarried women in the childbearing ages.

Trends in age-specific fertility rates by birth order show that women are continuing to defer commencement of child-bearing but that some 'catching up' is occurring amongst women aged 30 and over. As birth order data at the national level are only available for nuptial births, these rates have been derived by assuming that the birth order of ex-nuptial births is pro rata the experience in Western Australia, the State having the longest time series.

First birth rates in recent years have fluctuated between 844 and 921 births per 1,000 women. Since 1992 they have declined slightly from 921 to 906 births per 1,000 women in 1994. While the age-specific fertility rates for first births to women under age 30 have remained relatively stable, the rates for ages 30-44 have showed steady increases over the period.

ESTIMATED AGE-SPECIFIC FERTILITY RATES, FIRST ORDER BIRTHS ¹

| Age group (years) | 1989 | 1990 | 1991 | 1992 | 1993 | 1994 |
|-------------------|-------|-------|-------|-------|-------|-------|

| 30-34 | 28.1 | 31.7 | 32.7 | 34.4 | 35.4 | 36.6 |
| 35-39 | 8.2 | 9.1 | 10.0 | 11.0 | 10.8 | 11.6 |
| 40-44 | 1.5 | 1.4 | 1.7 | 1.7 | 1.8 | 2.0 |
| 45-49 | 0.1 | 0.1 | 0.1 | 0.0 | 0.1 | 0.1 |
| All ages | 843.5 | 905.2 | 895.7 | 920.9 | 907.8 | 905.9 |

¹ Per thousand women.

Assumed future fertility

Two alternative assumptions as to future fertility are provided in these projections — one assuming that fertility will not fall any further, and the other assuming that it will.

Assumption 1

For Assumption 1 the estimated total fertility rate for 1995, which is derived from the birth-order data for recent years described above, is assumed to remain unchanged throughout the whole projection period. Because the latest births data available are for 1994 the estimated total fertility rate for 1995 was arrived at by establishing the assumed first birth rate (the average number of first births per 1,000 women), and then applying successive birth order progression ratios to arrive at rates for second and higher order births. The assumed first birth rate for 1995, which was established as numbering 908 births per 1,000 women, was obtained by averaging the first birth rates for the four years 1991-94.

In order to calculate higher order birth rates for 1995, parity progression ratios were derived for the years 1989-94. These ratios were calculated by dividing the birth order x fertility rate for the reference year by the average of the birth order $x-1$ of fertility rates over the three years prior to the reference year. This assumes an average birth interval of between 1.5 and 2.5 years. Three ratios were calculated for each year. These were from the first to the second birth, from the second to the third birth, and from the third to the fourth or higher order births. Assumed ratios for 1995 were derived by averaging the ratios for 1989-94, except for the ratio of first to second births where the recent lower ratios around 0.57 are assumed to continue.

BIRTH-ORDER PROGRESSION RATIOS

| Parity progression | 1989 | 1990 | 1991 | 1992 | 1993 | 1994 | 1995 ¹ |
|--------------------|------|------|------|------|------|------|-------------------|
| 1-2 | 0.65 | 0.63 | 0.59 | 0.60 | 0.57 | 0.57 | 0.57 |
| 2-3 | 0.54 | 0.58 | 0.56 | 0.56 | 0.54 | 0.53 | 0.55 |
| 3-4+ | 0.56 | 0.57 | 0.52 | 0.54 | 0.53 | 0.54 | 0.54 |

¹ Assumed ratios.

These 1995 ratios were applied to the first birth rate (908 births per 1,000 women) to arrive at the total fertility rate of 1,865 births per thousand women for 1995.

BIRTH-ORDER FERTILITY RATES¹, 1995

| | |
|--------------------------------|--------------|
| First births | 908 |
| Second births | 518 |
| Third births | 285 |
| Fourth and higher order births | 154 |
| Total fertility rate | 1 865 |

¹ Births per thousand women.

For Assumption 1 the total fertility rate for 1995 of 1,865 births per 1,000 women is assumed to remain unchanged for the entire projection period 1995-2051.

Assumption 2 Assumption 2 offers a lower alternative to Assumption 1 with the total fertility rate trending downwards from 1,836 births per 1,000 women in 1995 to 1,750 in the year 2004. This is an extrapolation of the slight decline observed since the beginning of the 1980s. The total fertility rate is then assumed to remain unchanged, at 1,750, for the remainder of the projection period 2005-51.

ASSUMED TOTAL FERTILITY RATES¹

| Year | Assumption 1 (High) | Assumption 2 (Low) |
|-----------|---------------------|--------------------|
| Observed | | |
| 1991 | 1 855 | 1 855 |
| 1992 | 1 895 | 1 895 |
| 1993 | 1 865 | 1 865 |
| 1994 | 1 846 | 1 846 |
| Assumed | | |
| 1995 | 1 865 | 1 836 |
| 1996 | 1 865 | 1 827 |
| 1997 | 1 865 | 1 817 |
| 1998 | 1 865 | 1 808 |
| 1999 | 1 865 | 1 798 |
| 2000 | 1 865 | 1 788 |
| 2001 | 1 865 | 1 779 |
| 2002 | 1 865 | 1 769 |
| 2003 | 1 865 | 1 760 |
| 2004-2051 | 1 865 | 1 750 |

¹ Births per thousand women.

Assumed future age-specific fertility rates

Recent age patterns in Australian fertility have been used as the basis for assumed future age-specific fertility rates. The age-specific fertility rates for the years 1995–2004 were calculated by distributing the assumed future total fertility rates according to these recent trends. In Assumption 2 it is assumed that there will be further deferral of first births amongst women under 30 (compounded by falling proportions of women progressing to a second child), and only small increases in the level of catching up amongst older women. The age-specific fertility rates for 2004 are assumed to remain unchanged to the year 2051.

ASSUMED AGE-SPECIFIC FERTILITY RATES¹

| Year | Age group (years) | | | | | | | Total rate |
|-------------------------------------|-------------------|-------|-------|-------|-------|-------|-------|------------|
| | 15–19 | 20–24 | 25–29 | 30–34 | 35–39 | 40–44 | 45–49 | |
| Observed rates | | | | | | | | |
| 1991 | 22.9 | 75.0 | 132.0 | 100.2 | 36.0 | 5.5 | 0.2 | 1 855 |

Assumed future State and Territory fertility

Observed total fertility rates for the States and Territories for recent years reveal a characteristic pattern in their relationship to each other and to the Australian average. Since 1989 total fertility rates for Victoria and South Australia have been consistently lower than the rates for Australia as a whole. The Northern Territory has by far the highest fertility rates with total fertility consistently some 25% above the Australian average. This reflects the high proportion of Aboriginal people in the population, whose fertility is much higher than that of the non-Aboriginal population.

Total fertility rates for the States and Territories are set pro rata the total fertility rate for Australia as a whole from 1995 for Assumption 1 and from 2004 for Assumption 2. The total fertility rate for New South Wales, for

example, remains constant at 2% above the Australian level. The rate for Victoria remains constant at 3% below the Australian level. Queensland is 2% above, South Australia is 7% below, Western Australia is 1% above, Tasmania is 4% above, the Northern Territory is 25% above and the Australian Capital Territory is 6% below. Total fertility rates for Assumption 2 for the years 1995–2004 were arrived at by linear interpolation between the most recently recorded levels and the assumed levels for 2004.

Age-specific fertility rates

Recent age patterns in fertility for the States and Territories have been used as the basis for assumed future age-specific fertility rates. The assumed future rates were calculated by distributing the total fertility rates given above according to assumed percentage age distributions for each year. Age-specific fertility rates for 2004 are assumed to remain unchanged for the remainder of the projection period.

MORTALITY

Previous projections The mortality assumptions for the previous (1993 based) projections of Australia were based on trends over the period 1963–92 in the incidence of the major groups of causes of death: neoplasms, diseases of the circulatory system, accidents, violence and suicide, diseases of infancy and other diseases. Combined annual rates of change in age-specific mortality were derived from these trends, and divided into a short-term series based on the years 1983–92 and a long-term series based on the years 1963–92.

It was assumed that, commencing from the most recently observed average mortality rates, the short-term rates of change would apply from 1993–2000 and the long-term rates of change would apply from 2001–41.

For the States and Territories, annual rates of change in age-specific death rates were derived from observations between 1983 and 1992 without any disaggregation by cause of death. It was assumed that the recently observed mortality rates for all States and the Australian Capital Territory would converge to the mortality rates for Australia as a whole by the year 2000. Each State then took on the projected Australian mortality rates for the years 2001–41. The Northern Territory mortality rates on the other hand were not assumed to converge to the Australian rates. Instead they were assumed to decline at the same rates of change as for Australia as a whole for the entire projection period.

A comparison of the projected deaths with recorded deaths for the first two years of the projection period are given in the following table.

COMPARISON BETWEEN REGISTERED AND PROJECTED DEATHS

¹ Registered deaths.

² Projected deaths (Series A 1993 based projections).

Recent trends The mortality assumptions for the 1995–2051 projections have been arrived at by an analysis of trends in the underlying causes of death and applied in the form of short-term and long-term rates of change as was done in the 1993–2041 projections. This set of projections takes into account more recent data, for the years 1993 and 1994, (published in *Causes of Death, Australia*, (3303.0)) and is therefore based on trends in the incidence of the five groups of causes of death over the period 1965–94.

Neoplasms Malignant neoplasms accounted for 27% of total deaths in 1994. The most common primary sites for males were the trachea, bronchus and lungs,

which together accounted for 25% of total male cancer deaths. Among females, breasts were the most common primary site accounting for 18% of their total cancer deaths. Death rates in recent years from this group of causes have remained relatively unchanged apart from ages 65 and over which have shown small increases for both sexes.

| | |
|---|--|
| <i>Diseases of the circulatory system</i> | This group accounted for 43% of total deaths in 1994, the major categories being ischaemic heart diseases (24%) and cerebrovascular diseases (10%). Death rates from diseases of the circulatory system show a continuation of the significant declines experienced since 1971 over all age groups and for both sexes. |
| <i>Accidents, violence and suicides</i> | Accidents, violence and suicide accounted for about 6% of total deaths during 1994. The age-specific death rate in 1994 for children aged 1–14 years, who are prone to accidents, was the lowest recorded in the last decade. There was a 30% decline in deaths from accidental drowning and submersion between 1993 and 1994. The death rate for motor vehicle traffic accidents for males aged between 15–24 years continues to decline. |
| <i>Diseases of infancy</i> | This group of diseases accounted for 1% of deaths in 1994. The significant decline in the infant mortality rate observed in recent decades is continuing. In 1994 it was 5.9 per 1,000 compared to 9.2 in 1984 and 19.6 in 1964. Infant mortality rates in other low mortality countries have also been declining in recent years and a number of those countries have rates even lower than that for Australia e.g. Singapore (4.7), Hong Kong (4.8), Japan (4.3), Finland (4.4), Iceland (4.8) and Sweden (4.8). |
| <i>Other diseases</i> | This residual group, which includes endocrine, nutritional and metabolic diseases, respiratory diseases and diseases of the digestive system, accounted for 23% of total deaths in 1994. The death rates from this group have generally remained stable over the last three decades. |
| <i>Expectation of life</i> | The overall effect of recent trends in mortality has been steady increases in the expectation of life at birth for both males and females. Most recent figures for Australia and other selected countries are presented in the following table. |

EXPECTATION OF LIFE AT BIRTH, SELECTED COUNTRIES, 1994

| Country | Males | Females |
|--------------------------|-------|---------|

Assumed future mortality

The average rates of mortality for the five major cause groups were calculated for each of the 5-yearly periods 1965–69, 1970–74, 1975–79, 1980–84, 1985–89 and 1990–94 by sex and age groups (0, 1–4, 5–9,80–84 and 85+). Short-term and long-term average annual rates of change in age-specific mortality were then derived for each cause group; the short-term series from the average annual rates of change between 1985–89 and 1990–94, and the long-term series from the average annual rates of change between all six successive periods 1965–69 to 1990–94.

Commencing from the average observed age-specific mortality rates for the three years 1992–94, assumed future mortality rates for Australia as a whole were derived by application of the short-term cause-specific rates of change for years 1994–2004 and the long-term rates of change for years 2005–51. Where necessary both short-term and long-term rates of change were modified to ensure that the general shape of the mortality curves for the years 1993, 2032 and 2051 were similar.

ANNUAL RATES OF CHANGE IN AGE-SPECIFIC DEATH RATES

| Age | Short-term rates of change | | Long-term rates of change | |

| 85 | 6.2 | 6.6 | 7.3 | 8.5 |

Assumed future State and Territory mortality

The standardised death rates for the States and Territories from 1974-94 show that all States and Territories have experienced significant improvements over this period. However, State differentials still remain, particularly between the Northern Territory and other States. Northern Territory rates are more than 40% higher than the national average. Tasmania also has mortality rates consistently above the national average.

Nevertheless, the mortality differentials between the States and the Australian Capital Territory are relatively small. For this reason, commencing from the observed 1992–94 rates, the mortality rates for all States and the Australian Capital Territory are assumed to converge to the Australian rates by the year 2004 and take on the Australian rates from 2004–51. Rates for the Northern Territory, on the other hand, do not converge to the Australian rates. Instead, commencing from the observed rates for 1992–94, mortality rates for the Northern Territory are assumed to decline at the same rate of change as for Australia as a whole.

¹ The standard population is the Estimated Resident Population (persons) of Australia at 30 June 1991.

OVERSEAS MIGRATION

While the level of natural increase in Australia has remained relatively stable over the past 15 years, the other component of population growth, net overseas migration, has fluctuated considerably. From a low of 20,000 in the mid 1970s it rose to a peak of 128,000 in 1981–82 before falling back sharply to 50,000 in 1983–84. It then rose to a record high of 160,000 in 1988–89, before falling back to 30,500 in 1992–93 and rising to 83,600 in 1994–95. These fluctuations are largely the result of changes in the Commonwealth Government's migrant visa quota.

The figure below illustrates the relative contribution of net overseas migration and natural increase to Australia's population growth in recent years.

COMPONENTS OF POPULATION GROWTH, AUSTRALIA

Recent trends

The net overseas migration component of population growth is comprised of three parts — permanent movement, long-term movement (for stays of 12 months or more) and category jumping (the net effect of travellers whose duration of stay differs from that originally stated on the passenger card).

Permanent movement

Permanent overseas arrivals (settlers) can be divided into two classes. One is regulated numerically by government policy in the form of an annual migrant visa quota. The other is largely unregulated numerically, but restricted by certain eligibility criteria, in particular, New Zealand citizenship. Overseas-born children of Australian residents also fall into this category. In 1994–95, 42% of the 87,000 permanent arrivals qualified for visas under the family reunion category of the Government's migration program, 23% qualified under the skills category and 16% qualified under the humanitarian category. Most of the remaining 19% entered under the non-visaed category and comprised mainly of New Zealand citizens (Bureau of Immigration, Multicultural and Population Research, 1995).

The level of permanent departures tends to follow the pattern of arrivals after a lag of two to five years, although at significantly lower levels, reflecting the tendency for a proportion of immigrants to return to their former country. Although there are comparable numbers of Australian residents departing permanently who were not former settlers, the combined numbers of permanent departures are usually small relative to arrivals. Net permanent movement is the major component of the net

migration gain and has averaged about 70,000 over the last two decades. Between 1985-86 and 1990-91 it was above this average, peaking at a record 124,000 in 1988-89, but since 1990-91 it has fallen to as low as 42,000 (in 1993-94).

Long-term movement As the level of long-term arrivals (for stays of 12 months or more) tends to be similar to the level of long-term departures, the net result is small and usually contributes less than permanent movement to the total net migration gain. On the other hand, long-term migration is less predictable than permanent migration as it is more responsive to local and overseas conditions. Over the last 20 years, net long-term movement has fluctuated between -12,900 in 1974-75 and 32,600 in 1994-95, averaging about 14,000.

Category jumping Since June 1990 there has been a sharp reversal in annual category jumping estimates. From strong positive estimates of around 20,000 a year in 1988-89 and 1989-90, the estimates for 1993-94 and 1994-95 were -20,600 and -9,400, respectively. This turnaround has been caused by a reduction in the number of short-term overseas visitors overstaying, combined with a sharp increase in the number of Australian residents (mainly former settlers) departing Australia short-term but not returning within 12 months. Data for 1995 show a reduction in the Australian resident component, resulting in positive category jumping estimates for the June and September quarters.

Assumed future net overseas migration levels Two alternative assumptions as to future net overseas migration gains are provided in these projections.

For both assumptions it is assumed that the annual visa quota for 1995-96 will result in 106,000 permanent arrivals. It is assumed for Assumption 1 that the visa quota will decrease (resulting in 87,000 permanent arrivals in 1998-99), after which it will remain constant until 2050-51. For Assumption 2 it is assumed that the visa quota will rise (resulting in 111,000 permanent arrivals in 1997-98), after which it will remain constant until 2050-51.

For both assumptions it is assumed that by 1996-97 the negative category jumping levels currently being experienced will have reverted to the positive average long-term levels experienced since 1980.

The assumed number of long-term arrivals for 1995-96 is 166,000 for both assumptions, reflecting a slight increase over the record level for 1994-95. For Assumption 1 it is assumed that long-term arrivals will then decline to 130,000 by 1998-99 after which they will remain constant until 2050-51. For Assumption 2 it is assumed that they will decline to 136,000 in 1997-98 and remain at that level until 2050-51. There are no differences between the two assumptions as to future long-term departures.

In terms of the total annual net migration gain, both Assumptions 1 and 2 rise from the most recently recorded level (83,630 in 1994-95) to 120,000 in 1995-96, in line with the rise in the visa quota announced for 1995-96. Assumption 1 then decreases to 70,000 in 1998-99 after which it remains constant until 2050-51. Assumption 2 decreases to 100,000 in 1997-98 and remains constant at this level until 2050-51.

In addition to projections adopting Assumptions 1 and 2, a projection is available in which it is assumed that there is no international migration. This scenario is intended to facilitate analysis of population growth from natural increase and by comparison give an indication of the cumulative effect over the projection period of Assumptions 1 and 2.

Assumed future State and Territory net levels

In deriving the State and Territory distribution of the assumed Australian net overseas migration gains, it is important to recognise that there are differences between the States and Territories in the composition of their respective net gains and consequently in their age-sex profiles. For example, the smaller States and Territories tend to have a larger share of long-term movement than permanent movement.

To allow for these differences, the State and Territory distribution of annual net overseas migration gains is arrived at by applying the average proportional State and Territory distributions for the three-year period 1992-93 to 1994-95 of each of the migration flows (permanent arrivals, permanent departures, long-term arrivals, long-term departures and category jumping). This proportional distribution is assumed to remain unchanged throughout the projection period.

Assumed future age-sex profiles of overseas migrants

Over the three years 1992-93 to 1994-95 there has been a significant difference between the sex ratios of permanent and long-term movements. The number of females arriving or departing permanently has been in excess of males, while the reverse has been the case in regard to long-term arrivals and departures. All of these differences are assumed to remain

unchanged throughout the projection period, that is, the average sex ratio of each flow for each State and Territory for the three year period 1992-93 to 1994-95 is assumed to remain unchanged. The sex ratio for category jumping is assumed to be the same as for permanent and long-term arrivals.

SEX RATIOS OF OVERSEAS MIGRATION BY CATEGORY OF MOVEMENT

| Movement category | Recorded | | | Assumed ¹ |
|-------------------|----------|---------|---------|----------------------|
| | 1992-93 | 1993-94 | 1994-95 | 1995-96 to 2050-51 |
| Arrivals | | | | |
| Permanent | 91.6 | 89.7 | 87.5 | 89.6 |
| Long-term | 109.8 | 109.2 | 101.4 | 106.8 |
| Departures | | | | |
| Permanent | 96.1 | 96.6 | 90.5 | 94.4 |
| Long-term | 112.6 | 109.8 | 99.3 | 107.2 |

¹ Average of years ended 30 June 1993 to 1995.

The distribution of migrants by age also varies between movement categories, as can be seen in the following table. Although both movement categories have a concentration of migrants in the middle age groups, there are higher proportions in the younger age groups of permanent migrants and higher proportions in the older age groups of long-term migrants. There are also differences between the age distributions of male and female migrants, with more males than females between the ages of 30-54 for all movement categories.

These differences are assumed to remain unchanged from 1995-2051, that is, the average age distributions of permanent arrivals and departures and of long-term arrivals and departures for the three-year period 1992-93 to 1994-95 are assumed to apply for future migration flows. The age distribution of category jumping is assumed to be the same as for permanent and long-term arrivals.

INTERSTATE MIGRATION

For the States and Territories, interstate migration is the most volatile of the components of population change. Apart from a distinct pattern of net flows to warmer climates, the levels are sensitive to the differences between State and Territory economies and the number of permanent and long-term overseas arrivals.

Interstate migration patterns in recent years have been dominated by a northward stream on the east coast with a smaller stream to the west coast. Both streams originate in the south east. They are resulting in very large net migration gains for Queensland and small net gains for Western Australia, but net losses for all other States. Over the last decade Queensland has received an average annual net gain of 20,000 people from New South Wales and 15,000 from Victoria, with another 5,000 from South Australia and Tasmania. The average annual net gain to Western Australia over the past decade has been about 3,000.

The numbers of interstate movers over the past decade have been greater than for the previous decade. This can be assumed to be related to the large numbers of permanent and long-term overseas arrivals during the period. Counted amongst the people moving interstate are many newly arrived immigrants from overseas who, arriving in Sydney and Melbourne, nominate New South Wales and Victoria as the States in which they intend to live, but after a brief stay move on to another State. The correlation between permanent and long-term overseas arrivals and interstate movers is in part a reflection of this onward movement. Although variable in the short term, correlation is strong from a long-run perspective, and has been assumed to continue in these projections.

OVERSEAS AND INTERSTATE MOVEMENTS

An indication of the effect interstate migration has on the relative size of State populations can be gauged from the sum of the States' and Territories' absolute net gains and losses. The larger this is, the more pronounced is the effect on relative population size. The sum of the absolute net flows has been high over the last decade, reaching a peak in 1988-89 that was repeated in 1992-93 and 1994-95. In other words, interstate migration has been making a stronger impact on the relative size of State populations during the same period for which overseas arrivals have been high. This, of

course, applies to the three most populous States in particular, New South Wales, Victoria and Queensland, whose net flows have been greatest.

| | |
|---------------------------|---|
| <i>Recent Trends</i> | The following State and Territory analysis of trends in interstate movement is for the years 1971-72 to 1994-95, the full period for which data is available. |
| <i>New South Wales</i> | Apart from 1978-79, New South Wales has experienced net losses every year since 1971-72, reaching a peak of 38,000 in the late 1980s. The 1990s have seen a drop to a more stable level of net losses averaging 16,000, with Queensland receiving just over half of the total departures. Steady net gains of around 5,000 per financial year come from Victoria, while the net result of flows to and from other States and Territories fluctuate between small gains and losses. |
| <i>Victoria</i> | Interstate departures have exceeded arrivals for every year since 1971-72, the resulting net losses generally being in the range of 5,000-15,000. The 1990s have seen net losses increasing, reaching a peak of 32,000 in 1993-94. This has been due to a large increase in departures to Queensland and a drop in arrivals from most of the other States. |
| <i>Queensland</i> | Queensland has experienced net gains every year since 1971-72, climbing rapidly in the early 1980s then dropping back before rising rapidly again in the late 1980s and early 1990s, reaching a peak of 54,000 in 1992-93. Since then levels have remained high with net gains of over 44,000 per year. The more recent high levels have been due to an increase in arrivals from Victoria, increasing from 25,000 in 1991-92 to around 32,000 for the last three years. Net gains are received from all States and Territories. |
| <i>South Australia</i> | Small (relative to population size) annual net losses have dominated the last two decades, generally not exceeding 4,000 and often much smaller. The pattern has been for a succession of periods of increasing net losses followed by periods of reduced losses/net gains. At the moment the pattern is in a period of increasing net losses, which reached 6,400 in 1994-95. Most of the net loss is due to an increase in departures to Queensland, jumping from 6,000 in the early 1990s to almost 9,000 in 1994-95. |
| <i>Western Australia</i> | Arrivals have exceeded departures in most years, with net gains peaking twice at 9,000, once in the mid 1970s and again in the mid 1980s. Small losses were experienced in the early 1990s but there has been a return to net gains of 4,000 and 5,000 in the last two years. Apart from Queensland and the Australian Capital Territory, Western Australia is the only State to have gained consistently from interstate migration over the past two decades. Most interstate arrivals come from New South Wales and Victoria. |
| <i>Tasmania</i> | Small annual net losses have predominated since 1971-72, generally not exceeding 2,000. Net flows have been more volatile since the 1980s with some net gains recorded. More recently, increasing net losses have been experienced due to an increase in departures to Queensland. |
| <i>Northern Territory</i> | A downward trend is apparent in net interstate flows, commencing from annual gains of about 3,000 in the early 1970s and declining to losses of about 1,000 in recent years. In 1994-95 there was a reduction in the net loss to 300. Gains from New South Wales and Victoria are being offset by losses to Queensland and Western Australia. The planned increase in the level of the defence force personnel in the Northern Territory over the next few years is expected to reduce the level of recent net losses. |

Annual interstate arrivals have usually exceeded departures, though net gains have declined from a peak at the beginning of the 1970s flattening out to levels of about 1,500, and then declining to small net losses in the last two years. Flows to and from New South Wales predominate.

Assumed future net interstate migration

The levels of net interstate migration assumed for the 1995-2051 projections have been derived by analysing the trends outlined above. Trends in recently recorded June-December 1995 data have also been incorporated into the first two year's assumptions. Because of the volatility of net interstate migration flows, three alternative assumptions are used. They group future net gains and losses into high, medium and lower levels corresponding to Assumption 1, 2 and 3, respectively. Each assumption remains constant after a brief initial transitional period from 1996-2000.

ASSUMED NET INTERSTATE MIGRATION

Assumed future age-sex profiles of interstate migrants

The assumed age-sex profiles of future interstate flows have been arrived at by averaging the profiles of the interstate movements recorded by the 1986 and 1991 Censuses for 1985-86 and 1990-91 respectively. The profiles are for arrivals and departures separately. These age-sex profiles remain unchanged throughout the projection period. Each profile has been compiled by single year of age and sex in percentage terms (adding to 100.0 for total persons) which are applied to the assumed total number of arrivals and departures to determine the number of movers at each age.

SECTION B: PROJECTION RESULTS

These projections, which span the period from 1995–2051, reveal the size, structure and distribution of the future population if various assumptions are made about the components of change — births, deaths and migration.

Two alternative assumptions have been made about future births, one assumption about future deaths, two alternative assumptions about future levels of overseas migration and three alternative assumptions about interstate migration.

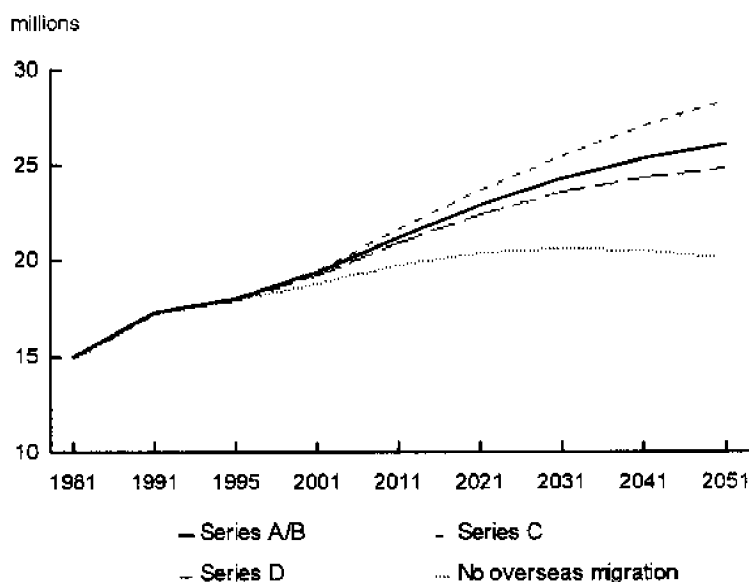

Using various combinations of these assumptions, eight alternative projections have been made of the population. These are identified as Series A–H. Only four of these projections, Series A–D, are covered in this publication, but details of Series E–H are available on request. In addition, another projection of the population, Series I, which assumes no net overseas migration gain, is published at the national level and is available at the State and Territory level on request.

The base population used for the projections is the latest published estimate of 18.1 million at 30 June 1995.

TOTAL POPULATION

Size The projections show Australia's population continuing to grow throughout the projection period, 1995–2051. The population is projected to increase from 18.1 million in 1995 to between 19.1 and 19.3 million in 2000 and to between 22.5 and 23.9 million in 2021. By the end of the projection period the population is projected to rise to between 24.9 and 28.3 million, depending on the assumptions made regarding future fertility, mortality and overseas migration.

ACTUAL (1981–95) AND PROJECTED (1996–2051) POPULATION

Growth rates While all projection series show Australia's population rising throughout the projection period, there is a clear long-term trend of a decline in the rate of population growth. Between 1995 and 2001, Australia's average annual growth rate is projected to be between 1.1% and 1.3%. This growth rate is projected to have fallen to between 0.2% and 0.5% annually by the end of the projection period. Rates as low as this have not been experienced in

Australia since regular records of population growth began around the beginning of the twentieth century.

If it is assumed that there is no net gain from overseas migration and fertility remains constant (Series D), the rate of growth would be even slower. Under these assumptions, the projected total population actually begins to decline to 20.1 million in 2051, after reaching a peak of 20.7 million in the year 2033.

¹ Exponential rate of growth.

International comparisons

United Nations projections show that the rapidly growing populations of South-East Asia present prospects of a widening gap in terms of population size between those countries and Australia. This will occur even though it is projected that these countries will experience declining population growth rates in the future. Indonesia's population, already ten times that of Australia, could increase to nearly 319 million in the year 2050, over twelve times Australia's projected population. Malaysia's population, which is currently similar to Australia's could almost double by rising to 38 million in the year 2050, exceeding the population of Australia by over 12 million or 46%. During the same period Australia's nearest neighbour, Papua New Guinea, is projected to experience growth rates of over 2% per annum, resulting in a more than doubling of its population to 9.6 million.

By contrast, the population projections of some of Australia's major trading partners show very low and even negative growth rates. The populations of both Japan and Germany are projected to decline to levels below their current populations, with their growth rates being projected to fall to -0.4% and -0.8%, respectively, by the year 2050.

AGE AND SEX STRUCTURE

The projections show that the ageing of the population, which is already evident, is set to continue. This is the inevitable result of fertility remaining at low levels over a long period and at the same time mortality rates declining. As Australia's population growth slows, the population ages progressively, with the median age of 33.7 years increasing to between 39.5 and 40.5 years in 2021 and to between 42.2 and 44.1 years in 2051. The ageing of the population is slightly more pronounced without overseas migration and if it is assumed there is no change in current fertility rates, the median age rises to 44.4 years in 2041 before declining to 43.5 years in 2051.

MEDIAN AGE OF PROJECTED POPULATION, AUSTRALIA

| Year | Series | | | |
|------|--------|------|------|-----------------------|
| | A/B | C | D | No overseas migration |
| 1995 | 33.7 | 33.7 | 33.7 | 33.7 |
| 2001 | 35.3 | 35.2 | 35.4 | 35.4 |
| 2011 | 38.0 | 37.8 | 38.4 | 39.0 |
| 2021 | 39.8 | 39.5 | 40.5 | 42.7 |
| 2031 | 41.2 | 40.7 | 42.1 | 41.8 |
| 2041 | 42.1 | 41.6 | 43.5 | 44.4 |
| 2051 | 42.6 | 42.2 | 44.1 | 43.5 |

The population aged 65 years and over rises rapidly throughout the projection period both in terms of numbers and as a proportion of the total population. From 2.2 million in 1995, this age group rises to between 4.0 and 4.1 million in 2021 and between 6.0 and 6.4 million in 2051. As a proportion of the population these numbers represent increases from 11.9% in 1995 to between 17.1% and 17.5% in 2021 and between 22.5% and 23.1% in 2051.

PROJECTED POPULATION AGED 65 YEARS AND OVER, AUSTRALIA

¹ Exponential rate of growth.

The tempo of the ageing process is also influenced by the declining proportion of the population in the age range 0-14 years, thereby gradually raising the median age for the total population. In absolute terms, the population aged 0-14 years grows to between 3.9 and 4.3 million in 2021 and between 3.9 and 4.8 million in 2051. As a proportion of the total population, however, these projected figures translate to declines from 21.4% in 1995 to between 17.2% and 18.2% in 2021 and between 15.7% and 17.1% in 2051.

| 2041–2051 | 0.3 | 0.4 | 0.1 | –0.2 |

¹ Exponential rate of growth.

The age structure of the population will change noticeably, regardless of the combinations of assumptions considered. Under Series A/B, which assumes that fertility remains constant and net gains from overseas migration are low, the age pyramid below shows a heavier concentration in the ages 50 years and over and smaller increases in the younger ages.

PROJECTED POPULATION OF AUSTRALIA (SERIES A/B), 1995 AND 2051

Ratio of males to females

The sex ratio (the number of males per 100 females) of the total Australian population in 1995 was 99.2. Depending on which combination of assumptions are chosen, the sex ratio is projected to fall to between 98.0 and 98.1 by the year 2021 and to between 95.9 and 96.3 by 2051. The decline in the sex ratio continues the long-term trend which has been evident in Australia for at least a hundred years. This trend is the outcome of persistent male/female mortality differentials combined with increasing numbers in the older age groups where women outlive men. Without any net overseas migration gains, the sex ratio also declines, reaching 97.4 in 2051.

School age population

The population of prime school age (5-16 years) is projected to increase during the projection period, from 3.1 million in 1995 to between 3.2 and 3.9 million in 2051, depending on which combination of assumptions is chosen. The numbers are greatest when fertility is assumed to remain at current levels and when net gains from overseas migration are high (Series C). If it is assumed that fertility is low and net gains from overseas migration are low (Series D), the population aged 5-16 years fluctuates throughout the projection period, eventually rising to only 3.2 million in 2051.

PROJECTED POPULATION OF SCHOOL AGE (5–16 YEARS)

The number of children reaching school age (i.e. aged 5 years) is also highest under Series C, rising from 261,000 in 1995 to 287,000 in 2021 and 321,000 in 2051. Under Series D, however, the number of 5 year olds declines to 253,000 between 2012 and 2017 and remains relatively stable around this level, reaching only 259,000 in 2051. This decline in the number of 5 year olds in the earlier part of the twenty-first century reflects the fall in the number of births caused by a smaller number of women (who were also born during a period of declining births in the 1970s) reaching the child-bearing ages.

PROJECTED POPULATION OF SCHOOL STARTING AGE (5 YEARS)

Prime tertiary age population

The size of the population aged 17–22 years, which includes a large number of people involved in tertiary education, remains relatively stable at 1.6 million during the initial part of the projection period. If it is assumed that fertility remains constant and net gains from overseas migration are high, the population rises steadily from the year 2001 to reach 2.0 million in 2051. If it is assumed that fertility and net overseas migration gains are low (Series D), the population of 17–22 year olds only increases about 70,000 to 1.7 million in 2051.

PROJECTED POPULATION OF TERTIARY AGES (17-22 YEARS)

Voting age population

The number of people of voting age (18 years and over) increases steadily from 13.4 million in 1995 to between 20.1 and 22.5 million in 2051. As the population ages, the proportion of people of voting age rises from 74.4% in 1995 to between 78.5% and 79.3% in 2021, and to between 79.5% and 81% in 2051.

PROJECTED POPULATION OF VOTING AGE (18 YEARS AND OVER)

Prime working age population

The prime working age population (15-64 years) is projected to increase throughout the projection period. With the most conservative combination of assumptions, low fertility and low overseas migration gains (Series D), the population rises from 12 million in 1995 to 14.6 million in 2021 and to 14.9 million in 2051. With constant fertility and low overseas migration gains (Series A/B), the increase is even higher, totalling 15.6 million in 2051. Numbers are greatest, however, with Series C assumptions (constant fertility and high overseas migration gains), reaching 17.1 million in 2051.

PROJECTED POPULATION OF PRIME WORKING AGES (15-64 YEARS)

While the 15-64 years age group increases numerically, as a proportion of the total population this sector never rises more than a fraction above the 1995 level of 66.7% and begins to fall steadily after 2011, when the baby-boom generation (born from the mid-1940s to the 1960s) begins to leave this age group. By 2051, the proportion of the population aged 15-64 years declines to 60%.

PROJECTED PROPORTION OF POPULATION AGED 15-64 YEARS

Regardless of which combination of assumptions is chosen, the age structure of the prime working age group will change considerably by the year 2051. The greatest growth is projected to occur in the 45-64 years age group which rises from 3.7 million in 1995 to between 5.9 and 6.1 million in 2021 and between 6.1 and 6.8 million in 2051. These figures translate to an increase in the share of the population aged 15-64 years from 31.0% in 1995 to between 39.8% and 40.5% in 2021 and between 39.7% and 41.1% in 2051. The most rapid period of growth of the population aged 45-64 years occurs during the period 1995-2011 when most of the post World War II baby-boom generation reach this age group.

PROJECTED AGE DISTRIBUTION OF PRIME WORKING AGES, SERIES A/B

PROJECTED PROPORTIONS OF PRIME WORKING AGE GROUPS, SERIES A/B

The population aged 25–44 years also increases throughout the projection period, from 5.6 million in 1995 to between 5.9 and 6.2 million in 2021 and between 6.0 and 7.0 million in 2051. As a proportion of the population aged 15–64 years, however, this age group declines from 46.4% in 1995 to between 40.2% and 40.8% in 2051. Most of this decline occurs during the period 1995–2011 as the post World War II baby-boom generation leave this age group.

The number of people who are aged 15–24 years, many of whom are entering the labour force for the first time, declines in the initial part of the projection period. This reflects the fall in births which occurred in the 1970s when these people were born. After about 2001, however, the population aged 15–24 years increases slightly, to between 2.8 and

3.3 million in 2051. As a proportion of the population aged 15–64 years, these projected numbers represent falls from 15% in 1995 to between 12.3% and 12.7% in 2021 and between 11.2% and 11.8% in 2051.

PROJECTED POPULATION AGED 15–24 YEARS

Population aged 65 years and over

The most significant population growth is projected to occur in the oldest ages. Unlike younger ages, the number of people aged 65 years and over is not affected by the choice of fertility assumptions as the people who enter this age group during the projection period have already been born. The size of this age group is greatest, therefore, when net overseas migration gains are assumed to be high (Series C), rising from 2.2 million in 1995 to 4.1 million in 2021 and to 6.4 million in 2051. If net overseas migration gains are assumed to be low (Series A/B and D), the population aged 65 years and over increases to 4.0 million in 2021 and to 6.0 million in 2051. Even without net overseas migration gains, the number in this age group rises to 5.2 million in 2051.

As a proportion of the population, the 65 years and over age group increases from 11.9% in 1995 to between 17.1% and 17.8% in 2021 and to between 22.5% and 24.3% in 2051. The highest annual rates of increase in the size of this population occur between 2011 and 2021, when the peak of the post World War II baby-boom generation enters this age group.

PROJECTED PROPORTION OF POPULATION AGED 65 YEARS AND OVER

International comparisons

United Nations projections show that ageing trends similar to Australia's are projected for many countries throughout the world. Japan, Germany, New Zealand and Canada, like Australia, are projected to experience a doubling in the proportion of their populations aged 65 years and over by the year 2050. Over the same period, Korea, China, Indonesia, Singapore, Malaysia, Viet Nam and Papua New Guinea are projected to at least triple the proportion of their populations in this age group. This means that by 2050 many countries, including Australia, are projected to have over 20% of their population aged 65 years or more, with Japan and Germany having over 30% of their population in this age group.

PROJECTED PROPORTION OF POPULATION AGED 65 YEARS AND OVER, SELECTED COUNTRIES

¹ Series A/B.

Population aged 85 years and over

The projections also show substantial increases in the number of people aged 85 years or more, rising from 190,000 in 1995 to 470,000 in 2021 and reaching 1.3 million in 2051. These numbers represent an increase as a proportion of the population from 1.1% in 1995 to between 4.4% and 5.5% in 2051. The population aged 85 years and over is also projected to have an increasing share in the population aged 65 years and over, rising from 8.8% in 1995 to between 19.5% and 20.1% in 2051.

PROJECTED POPULATION AGED 85 YEARS AND OVER

| Year/period | Series | | |
|---|-----------|---------|-----------------------|
| | A/B and D | C | No overseas migration |
| POPULATION ('000) | | | |
| 1995 | 190.0 | 190.0 | 190.0 |

¹ Exponential rate of growth.

PROJECTED POPULATION AGED 65 YEARS AND OVER AND 85 YEARS AND OVER, SERIES A/B

The annual rate of increase in the size of population aged 85 years or more is lower during the decade 2011-21 compared with other periods. This is a reflection of the decline in fertility that occurred in Australia during the Great Depression years and prior to World War II (from a total fertility rate of 2.8 children per woman in 1927 to 2.1 children per woman in 1935). Survivors of the relatively smaller generation resulting from this decline reach 85 years and over between 2011 and 2021. On the other hand, the number of people aged 85 years or more rises sharply between 2021 and

PROJECTED BIRTHS
AND DEATHS

2041, due to the effect of the baby-boom generations who reach 85 years and more during this period.

In 1994-95, there were 257,700 births and 125,800 deaths, resulting in the natural increase of the population of 132,000 persons. While the number of deaths is projected to more than double over the projection period, the number of births is projected to only increase by up to 23.4% and may even decline (Series D) by 1.4% by 2051. Regardless of which combination of assumptions is chosen, the natural increase of the population declines quite rapidly, with the number of deaths exceeding the number of births either just before or soon after the end of the projection period.

Under Series A/B, where constant fertility and low net overseas migration gains are assumed, the projected number of births, after dipping slightly in the initial years, rises to only 289,000 by the end of the projection period. Deaths, on the other hand, more than double over the same period, rising steadily to 286,000 by 2051. This results in a decline in natural increase from 136,800 in 1996 to only 2,700 in 2051, an unprecedented low level.

PROJECTED BIRTHS AND DEATHS, SERIES A/B, 1995-2051

PROJECTED NATURAL INCREASE, 1995-2051

Under Series C, which has constant fertility and high net overseas migration gains, births rise to 286,000 in 2021 and to 318,000 in 2051. Natural increase is higher than in the other series, but nevertheless still declining sharply.

Under Series D, which combines low fertility with low net overseas migration gains, births fall to 248,000 in 2011 and fluctuate at a level slightly above this to reach 254,000 in 2051. As with the other series, the number of deaths increases steadily throughout the projection period, rising to 286,000 in 2051. This again results in declining natural increase and by the year 2041 the number of deaths begins to exceed the number of births.

If it is assumed that fertility remains constant and there are no net gains from overseas migration, the natural increase of the population would also fall, with the number of deaths exceeding the number of births from 2036 onwards.

STATE AND TERRITORY SUMMARY

With the exception of Tasmania, the population of every State and Territory increases throughout the projection period.

Total population

The projections show the most rapidly growing States and Territories to be Queensland, Western Australia, the Northern Territory and the Australian Capital Territory. The population of Queensland increases from 3.3 million in 1995 to between 6.2 and 7.1 million in 2051 and Western Australia's population increases from 1.7 million in 1995 to between 3.0 and 3.3 million in 2051. Queensland's percentage growth from 1995–2051 (between 89% and 117%) exceeds that of New South Wales and Victoria combined and its total population becomes larger than Victoria's from 2019 under the highest interstate migration scenario (Series B). Queensland is the only State whose population size may double (Series B and C) over the projection period. Although not as high as Queensland's percentage growth, Western Australia's growth rate (between 71% and 93%) is well above the Australian average (between 38% and 57%).

The population of Victoria increases from 4.5 million in 1995 to between 5.0 and 5.8 million in 2051, but with percentage growth (between 10% and 28%) well below the Australian average. Percentage growth of the population of New South Wales (between 32% and 55%), though not as low as Victoria's, is also below average, with the total population rising from 6.1 million in 1995 to between 8.1 and 9.5 million in 2051.

The population of South Australia rises from 1.5 million in 1995 to between 1.5 and 1.7 million in 2051, representing the smallest total percentage increases (between 2% and 16%) of any State or Territory. The only State to experience a decline in population is Tasmania. For all series, Tasmania's population, which was 473,000 in 1995, rises initially but then begins declining to between 368,000 and 462,000 in 2051.

The populations of the Northern Territory and the Australian Capital Territory both increase at rates above the national average. The population of the Northern Territory rises from 174,000 in 1995 to between 253,000 and 309,000 in 2051, while the Australian Capital Territory's population increases from 304,000 in 1995 to between 462,000 and 564,000 in 2051.

¹ Total percentage growth.

Population distribution Comparison between the proportionate State and Territory distribution of the population in 1995 and 2051 shows losses for all Series in the share of the national population living in New South Wales, Victoria, South Australia and Tasmania and gains for Queensland, Western Australia, the Northern Territory and the Australian Capital Territory. New South Wales maintains its position as the most populous State, but all series result in the replacement of Victoria as the second most populous State by Queensland (between the years 2019 and 2029). All series result in Tasmania being replaced by the Australian Capital Territory as the sixth most populous State or Territory from about the year 2027.

PERCENTAGE DISTRIBUTION OF PROJECTED AUSTRALIAN POPULATION

Median age The median age of the population of all States and Territories rises steadily throughout the projection period, passing 40 years in most States by about 2026.

The choice of fertility assumption has an important bearing on median age, and Series D, where the rejuvenating effect of this component is at a minimum, results in the most rapid increases in the median age in all States and Territories. Higher net overseas migration gains can also lower the median age slightly.

The effect of interstate migration on age structure is more complex depending on both the size of net flows relative to population and whether they are positive or negative, as well as on the age profiles of those flows. Each of these features varies from State to State.

The overall result is high median ages in Tasmania and South Australia of approximately 49 and 46 years, respectively, by the end of the projection period. These are followed by New South Wales, Victoria, Queensland and Western Australia with median ages around 41–44 years. The Australian Capital Territory and the Northern Territory are projected to have the lowest median ages of approximately 40 and 35 years, respectively.

MEDIAN AGE OF PROJECTED POPULATION

| State/Territory | 1995 | 2011 | | | | 2051 | | | |

| <i>Aust.</i> | <i>33.7</i> | <i>38.0</i> | <i>38.0</i> | <i>37.8</i> | <i>38.4</i> | <i>42.6</i> | <i>42.6</i> | <i>42.2</i> | <i>44.1</i> |

Population aged 65 years and over Under all projection series the number and proportion of the population aged 65 years and over is projected to increase substantially in all States and Territories. Nearly all series show the projected size of the population aged 65 years and over doubling or more in all States and Territories, with the largest numerical increases being in New South Wales, Queensland, Victoria and Western Australia.

PROJECTED POPULATION AGED 65 YEARS AND OVER, SERIES A

The distribution of the population aged 65 years and over is projected to change over the projection period, with all series showing declines in the proportion of this population living in New South Wales, Victoria, South Australia and Tasmania and gains for Queensland, Western Australia, the Northern Territory and the Australian Capital Territory. By the end of the projection period in 2051, the population aged 65 years and over in Queensland is projected to exceed Victoria's and Western Australia's and is projected to be larger than South Australia's.

EXPLANATORY NOTES

INTRODUCTION

1 This publication contains projections of population by age and sex for Australia, the States and Territories for the period 1995–2051. This series of projections supersedes the 1993 series, published in May 1994, *Projections of the Populations of Australia, States and Territories 1993–2041* (3222.0). Additional unpublished details relating to this series, including population by sex and single years of age, can be obtained on disk.

2 The projections for Australia include Christmas Island, Cocos (Keeling) Islands and Jervis Bay Territory. Jervis Bay Territory is now excluded from projections for the Australian Capital Territory.

OBJECTIVES

3 The ABS currently publishes population projections every two to three years in order to regularly service the needs of users of population projections.

4 The projection results published by the ABS are not intended as predictions or forecasts, but are illustrations of growth and change in the population which would occur if the assumptions about future demographic trends prevail over the projection period.

5 While the assumptions for the projections are formulated on the basis of an assessment of past demographic trends, both in Australia and overseas, and their likely future dynamics, there is no certainty that any of the assumptions will or will not be realised. In addition, no assessment has been made of changes in non-demographic conditions.

6 Accordingly, alternative projections have been provided in recognition of this uncertainty and to provide users with a range of options.

DEVELOPMENT

7 The process of developing population projections involves research, analysis, consultation and computation. Analysis of demographic trends, research into the determinants of population growth and consultation with government at both national and State levels are necessary to formulate the various assumptions and to ensure their general relevance for the projection period.

8 Consultation occurred in November 1995, following which the assumptions for the 1995–2051 series of population projections were finalised. For fertility two alternative assumptions were selected, for overseas migration two alternative assumptions were selected and three alternative assumptions were selected for interstate migration. Only one assumption has been used for mortality. In addition, an assumption of no net overseas migration has also been used.

PROJECTION TECHNIQUES

9 There are many techniques which may be used for population projections, ranging from simple extrapolations through broad economic, social and time-series analysis to detailed component methods. The ABS uses the cohort-component method which begins with a base population for each sex by single years of age and advances it year by year by applying assumptions regarding future mortality and migration. Assumed age-specific fertility rates are applied to the female populations of child-bearing ages to provide the new cohort of births. This procedure is repeated for each year in the projection period for each State and Territory and for Australia. The resulting population projections for each year for the States and Territories, by sex and single years of age are adjusted to sum to the Australian results (minus Christmas Island, Cocos (Keeling) Islands and Jervis Bay Territory).

POPULATION PROJECTION
CONSULTANCY SERVICE

10 ABS offers a population consultancy service to undertake client specified projections. For further details, contact Matthew Montgomery on (06) 252 6487.

13 Current publications produced by the ABS are listed in the *Catalogue of Publications and Products, Australia* (1101.0). The ABS also issues, on Tuesdays and Fridays, a *Release Advice* (1105.0) which lists publications to be released in the next few days. The Catalogue and Release Advice are available from any ABS office.

SYMBOLS AND OTHER
USAGES

— nil or rounded to zero

.. not applicable

Any discrepancies between totals and sums of components of tables are due to rounding.

GLOSSARY

- Age-specific death rates** The age-specific death rate is the number of deaths at a specified age per 1,000 of the estimated resident population of that age, at 30 June.
- Age-specific fertility rates** Age-specific fertility rates are the live births registered during the calendar years, according to the age of mother, per 1,000 of the female resident population of the same age as estimated for 30 June. For calculating these rates, births to mothers under 15 are included in the 15–19 age group, and births to mothers aged 50 and over are included in the 45–49 age group. Pro rata adjustment is made for births for which age of mother is not given.
- Category jumping** Category jumping is the term used to describe changes in travel intentions from short-term to permanent/long-term or vice versa. Category jumping consists of two components — an Australian resident component and an overseas visitor component. The Australian resident component of category jumping for a reference quarter is estimated by comparing the number of residents departing with the number of these residents who return in the following 12 months to obtain the net number of Australian residents who jump category. Similarly, the number of overseas visitors arriving is compared with the number of these visitors who depart in the following 12 months to obtain the net number of overseas visitors who jump category. Estimates of category jumping are derived by subtracting the Australian resident component from the overseas visitor component.
- Dependency ratio** The dependency ratio relates the number of people aged under 15 years and 65 years and over to the number of people of prime working age (15–64 years).
- Estimated resident population** The estimated resident population (ERP) is the official ABS estimate of the Australian population. The ERP is based on the results of the latest population census and updated for subsequent births, deaths and overseas and interstate migration.
- Infant mortality rate** The number of deaths under the age of 12 months per 1,000 live births registered in the same year.
- Life expectancy** Life expectancy refers to the average number of additional years a person of a given age and sex might expect to live if the age-specific death rates of the given period continued throughout his or her lifetime.
- Long-term movement: arrivals** Long-term arrivals comprise overseas visitors who intend to stay in Australia for 12 months or more (but not permanently) and Australian residents returning after an absence of 12 months or more overseas.
- Long-term movement: departures** Long-term departures comprise Australian residents who intend to stay abroad for 12 months or more (but not permanently) and overseas visitors departing who stayed 12 months or more in Australia.
- Mean age** The average age of the population.
- Median age** The age at which half the population is older and half is younger.
- Natural increase** The excess of births over deaths.
- Net interstate migration** The difference between the number of persons who have changed their place of usual residence by moving into a given State or Territory and the number who have changed their place of usual residence by moving out of that State or Territory. This difference may be either positive or negative.

| | |
|--|---|
| Net overseas migration | The difference between the number of permanent (settler) and long-term overseas arrivals and the number of permanent and long-term departures of Australian residents (including former settlers). This difference may be either positive or negative. Short-term movements are excluded. The estimates from 1976 onwards include an adjustment of the net effect of category jumping. |
| Nuptiality | Nuptiality relates to the relative marital status of parents. Confinements and births are identified as being nuptial where the father registered was married to the mother at the time of birth, or where the husband died during pregnancy. Confinements and children of Aboriginal mothers considered to be tribally married are classified as nuptial. Other confinements, and the children resulting from them, are classified as ex-nuptial whether or not the parents were living together at the time of the birth. |
| Parity progression ratio | Parity progression ratio refers to the proportion of women with a given number of children who progress to have another child. |
| Permanent movement: arrivals | Permanent arrivals comprise travellers who hold migrant visas (regardless of stated intended period of stay), New Zealand citizens who indicate an intention to settle and those who are otherwise eligible to settler (e.g. overseas-born children of Australian citizens). |
| Permanent movement: departures | Permanent departures are Australian residents (including former settlers) who on departure state that they do not intend to return to Australia. |
| Rate of population growth | Population change over a period as a proportion (%) of the population at the beginning of the period. |
| Replacement level fertility | The average number of births per woman required to replace a population in the long term, given prevailing mortality levels. This replacement level is usually acknowledged as being 2.1 children per woman. |
| Short-term movement: arrivals | Short-term arrivals comprise overseas visitors whose intended stay in Australia is less than 12 months and Australian residents returning after an absence of less than 12 months overseas. |
| Short-term movement: departures | Short-term departures comprise Australian residents whose intended period of stay abroad is less than 12 months and overseas visitors departing who stayed less than 12 months in Australia. |
| Standardised death rates | Standardised death rates are the overall death rates that would have prevailed in a standard population if it had experienced at each age the death rates of the population being studied. The standard population used in these calculations is all persons in the 30 June 1991 Australian population. The method used to calculate standardised death rates in this publication is known as the <i>direct method</i> . The <i>direct method</i> is expressed per 1,000 persons. |
| Total fertility rate | The total fertility rate represents the number of children one woman would bear if the age-specific rates of the year shown continued during her child-bearing lifetime. It is obtained by summing the 5 year age-specific fertility rates, multiplying by 5 and (optionally) dividing by 1,000. |
