EXPLANATORY NOTES

Introduction

In May 1973 a survey, based on the quarterly population survey, was conducted throughout Australia in order to obtain, for persons who were responsible for the care of children under twelve years of age, information about the arrangements they made, if they were at work, to have their children cared for (including arrangements for after-school and school holiday care). The inquiry was directed mainly to working mothers, but males with the sole responsibility for children were also included. A preliminary statement containing a summary of the survey results was published on 25 March 1974 (Reference No. 17.11). This bulletin provides estimates in greater detail. The results of a similar survey conducted in May 1969 were published in Child Care, May 1969 (Reference No. 17.2)

The population survey

2. The survey is based on a multi-stage area sample of private dwellings (houses, flats, etc.) and non-private dwellings (hotels, motels, etc.) and covers about two-thirds of one per cent of the population of Australia. In May 1973 about 27,000 private dwellings were included in the sample. The information is obtained from the occupants of selected dwellings by carefully chosen and specially trained interviewers, the interviews being carried out during a four-week period.

Scope

3. Questions for the child care survey were not asked of persons under 15 years of age, persons aged 60 years and over, males who had never married or who were married but not permanently separated (i.e. those who were widowed, divorced or permanently separated were included), persons attending school, university, etc., full-time, persons permanently unable to work and patients in institutions such as hospitals, sanatoria, gaols, etc., for whom, for the purposes of the survey, the institution was regarded as their dwelling. Members of the permanent armed forces, national servicemen enlisted in the Regular Army Supplement and certain diplomatic personnel customarily excluded from census and estimated populations were also excluded from the survey.

Definitions

4. For the purposes of the survey, a child care

centre was defined as a registered or unregistered establishment, other than a private dwelling, where care was provided for five or more children below compulsory school age. Included in this category were pre-schools, kindergartens, child minding centres, creches, cot rooms, day nurseries and nursery schools. A home care centre was defined as one operated on a commercial basis in a private dwelling, in which the proprietor generally lived.

- 5. The person responsible for the care of a child under twelve years of age was defined as the person who, being a member of the household to which the child belonged, ranked highest in the following three categories.
 - (a) Child's mother, step-mother, foster mother, female guardian
 - (b) Child's father, step-father, foster father, male guardian
 - (c) Any other person considered by the respondent as being responsible for the child.
- 6. The labour force comprises all persons who during the survey week were employed or unemployed, according to the definitions customarily used in the population survey. Employed persons are those who, during the survey week, did any work for pay, profit, etc. in a job or business, or on a farm, worked fifteen hours or more without pay in a family business (or farm), or had a job, business or farm from which they were temporarily absent. Unemployed persons are those who, during the survey week, did not have a job or business and were actively looking for work or were laid off from their jobs without pay for the whole week. For more detailed definitions see the quarterly Labour Force bulletin (Reference No. 6.20).
- NOTE. 1. Any discrepancies between totals and sums of components in the tables are due to rounding.
 - 2. * Estimates not published because subject to sampling variability too high for most practical purposes. See page 15.

^{*} See page 15, paragraph 3.

TECHNICAL NOTE

Estimation procedure

The estimates are derived from the quarterly population survey by use of a complex ratio estimation procedure, which ensures that the survey estimates conform to an independently estimated distribution of the population by age and sex, rather than to the age and sex distribution within the sample itself.

Reliability of the estimates

- 2. Since the estimates in this statement are based on a sample, they may differ from the figures that would have been obtained from a complete census using the same questionnaires and procedures. One measure of the likely difference is given by the *standard error*, which indicates the extent to which an estimate might have varied by chance because only a sample, and not the whole population, was enumerated. There are about two chances in three that a sample estimate will differ by less than one standard error from the figure that would have been obtained from a comparable complete enumeration, and about nineteen chances in twenty that the difference will be less than two standard errors.
- 3. Space does not allow for the separate indication of the standard errors of all estimates in this statement. A table of standard errors for general application to estimates from the revised sample is given below. These figures will not give a precise measure of standard error of a particular estimate since they are averages based on calculations for a limited number of past surveys over a wide range of labour force characteristics. However, they will provide an indication of the magnitude of the standard error of any particular estimate for any particular survey. An example of the use of the table is as follows: if the estimate obtained from the sample is 100,000 and the standard error is 3 per cent of the estimate, i.e. 3,000, there are about two chances in three

that the true figure is within the range 97,000 to 103,000 and about nineteen chances in twenty that this figure is between 94,000 and 106,000.

- 4. The reliability of an estimated percentage, computed by using sample data for both numerator and denominator, depends upon both the size of the numerator and the size of the denominator. However, the percent standard error of the estimated percentage will generally be lower than the per cent standard error of the estimate of the numerator. The per cent standard errors of the numerators can be obtained from the table below.
- 5. As the standard errors in the table below show, the smaller the estimate the higher is the relative standard error. Very small estimates are thus subject to such high standard errors (relative to the size of the estimate) as to detract seriously from their value for most reasonable uses. In the tables in this statement, estimates not considered sufficiently reliable have not been shown. Although figures for these small components can in some cases be derived by subtraction, they should not be regarded as reliable.
- 6. The imprecision due to sampling variability, which is measured by the standard error, should not be confused with inaccuracies that may occur because of imperfections in reporting by interviewers and respondents. Inaccuracies of this kind are referred to as the *non-sampling error*, and they may occur in any enumeration, whether it be a full count or only a sample. Every effort is made to reduce the non-sampling error to a minimum by careful design of questionnaires, intensive training and supervision of interviewers and efficient operating procedures.
