NOTES ON THE ESTIMATES

MAIN FEATURES

NOTE: Changes in individual quarters are necessarily subject to the uncertainties discussed in the Explanatory notes under Interpretation of quarterly estimates, and furthermore some may be substantially revised as firmer data come to hand. This applies particularly to the estimates for the two most recent years for gross operating surplus, the income of companies and non-farm unincorporated enterprises, depreciation, and therefore to the estimated magnitude of change in gross non-farm product.

ESTIMATES OF MAIN AGGREGATES AT AVERAGE 1979-80 PRICES, SEASONALLY ADJUSTED

	<i>Percentage Change</i>		<i>Percentage Points Contribution to Growth in GDP</i>	
	<i>Mar. qtr 1985 to June qtr 1985</i>	<i>June qtr 1984 to June qtr 1985</i>	<i>Mar. qtr 1985 to June qtr 1985</i>	<i>June qtr 1984 to June qtr 1985</i>

Gross non-farm product	2.7	4.8	2.5	4.5

.. not applicable

In current price seasonally adjusted terms, wages, salaries and supplements rose by 3.7 per cent in June quarter 1985, following a rise of 0.3 per cent in the previous quarter, while gross operating surplus of trading enterprise companies rose 2.8 per cent after rising by 3.0 per cent in the March quarter 1985.

The following notes are provided to aid analysis of the estimates for recent quarters.

In June quarter 1985 the income aggregates show stronger growth than that indicated by the expenditure aggregates with the result that there is a rise in the seasonally adjusted, constant price statistical discrepancy between March and June quarters. By contrast, in the March quarter 1985 the constant price estimates show strong growth in the expenditure aggregates which is not matched by the income side. Hence there is a large fall in the statistical discrepancy between the December and March quarters.

The reasons for such changes in the statistical discrepancy are not known; any or all of the many data sources could be involved. However, the most probable reasons are: inconsistencies in the timing and valuation of stocks and exports and imports of goods and services; and the recording of public sector expenditures on a predominantly cash basis.

The notes below under the heading 'statistical discrepancy' include a table in which the rates of growth indicated by both the income and expenditure aggregates over recent periods are compared.

Stock valuation adjustment

The size of the stock valuation adjustment (SVA) in the June quarter 1985 represents a substantial increase over the average value in recent years. A major deter-

minant of quarter-to-quarter changes in the SVA is the rate of change in the price indexes used in its derivation. While the SVA calculations draw on a wide range of price data, the single most influential source is the ABS collection of Price Indexes of Articles Produced by Manufacturing Industry (APMI); the All Manufacturing Industry Index from APMI has risen sharply since February 1985, due in large part to the effects of the depreciation of the \$A during the early part of 1985.

Private gross fixed capital expenditure—equipment

No direct measure is available of the price of private gross fixed capital equipment. A significant component of the current-weighted price index used to deflate this item is based on implicit price deflators (IPDs) for imports of capital equipment. Substantial price increases arising from the depreciation of the \$A earlier this year have led to a review of the assumptions underlying the use of these IPDs. To better allow for timing lags affecting the transmission of import prices into the price of final expenditure on equipment a three-quarter moving average has been applied to the imports IPD used in the current-weighted price index. This has resulted in revisions to the constant price series back to the June quarter 1980.

Gross fixed capital expenditure—Sales of public sector assets

The national accounts attribute gross fixed capital expenditure to sectors on the basis of legal ownership. The following table provides information on major sales of fixed assets from the public sector to the private sector. Because a large majority of these sales are associated with leaseback and similar arrangements this data can be used to partially adjust capital expenditure estimates from sector of legal ownership to sector of effective ownership. However, it should be noted that such an adjustment would not take into account all arrangements under which assets owned by the private sector are effectively controlled by the public sector. Also, it would result in estimates of capital expenditure inconsistent with estimates of gross operating surplus and other aggregates in the sector accounts, for which information is not available to make estimates on other than the present basis.

MAJOR SALES OF FIXED ASSETS FROM THE PUBLIC SECTOR TO THE PRIVATE SECTOR (EXCLUDING DWELLINGS)

	<i>Non-dwelling construction (\$ million)</i>	<i>Equipment (\$ million)</i>	<i>Total (\$ million)</i>
1981-82	81	1,216	1,297
1982-83	98	851	949
1983-84	90	1,120	1,210
1984-85	63	628	691
<i>1982—</i>			
September	3	113	117
December	43	165	208
<i>1983—</i>			
March	12	355	367
June	40	218	257
September	8	96	104
December	13	509	523
<i>1984—</i>			
March	24	86	110
June	45	428	473
September	n.p.	n.p.	151
December	3	136	139
<i>1985—</i>			
March	n.p.	n.p.	n.p.
June	n.p.	n.p.	n.p.

Stocks

In seasonally adjusted terms, private non-farm stocks at constant prices recorded a small increase during the June quarter 1985. This is the smallest increase since stocks began rebuilding in the June quarter 1984 and contributed -0.7 percentage points to growth in gross domestic product (GDP) during the latest quarter.

With only a small increase in stocks associated with continued growth in sales(a), the constant price private non-farm stocks to sales(a) ratio in the June quarter 1985 has dipped to its lowest level on record. The recent history of this ratio is set out below:

<i>Quarters ended</i>	<i>Ratio</i>
<i>1984—</i>	
March	0.688
June	0.677
September	0.673
December	0.676
<i>1985—</i>	
March	0.684
June	0.660

(a) Constant price sales are defined as gross non-farm product plus imports of goods and services (excluding imports of fuel, imports of certain large items of equipment by both the public and private sectors and certain other government imports) less changes in private non-farm stocks. (All these variables are at average 1979-80 prices.)

Statistical discrepancy

The statistical discrepancy represents the difference between the sum of the estimates of gross domestic product (GDP) and imports of goods and services on the one hand and the sum of the estimates of components of gross national expenditure and exports of goods and services on the other hand. Conceptually these two totals are the same. The inclusion of the statistical discrepancy on the expenditure side of the domestic production account is a convention and does not necessarily imply that the sum of the income components more accurately measures GDP than the sum of the expenditure components.

The aspect of the statistical discrepancy which is of most concern in the quarterly context is the magnitude of change from one quarter to the next. In some quarters there are quite significant movements in the seasonally adjusted constant price statistical discrepancy. A useful way of examining the significance of the statistical discrepancy is to compare the change in gross non-farm product as published with the result which would be obtained using the expenditure aggregates excluding the statistical discrepancy. The following table shows such a comparison for the last 8 quarters together with an annual comparison for the last two financial years.

PERCENTAGE CHANGES IN GROSS NON-FARM PRODUCT AT AVERAGE 1979-80 PRICES, SEASONALLY ADJUSTED

	<i>Income-based(a)</i>	<i>Expenditure-based(b)</i>
<i>1983-84</i>	3.4	3.0
<i>1984-85</i>	5.0	4.7
<i>1983—</i>		
September	1.9	2.6
December	1.0	-0.2
<i>1984—</i>		
March	2.7	3.4
June	1.8	-0.6
September	—	0.8
December	1.6	1.4
<i>1985—</i>		
March	0.5	3.2
June	2.7	1.9

(a) Gross non-farm product as published. (b) Gross non-farm product less statistical discrepancy.

Household saving ratio

Present estimates indicate that, on a seasonally adjusted basis, the proportion of household disposable income devoted to consumption in the June quarter was 88.3 per cent while household saving, which is derived as a balancing item, represented 11.7 per cent. Both of these ratios are affected by any deficiencies or inconsistencies in the estimation and seasonal adjustment of household income and expenditure. A high proportion of both the rise in the saving ratio in the March quarter and the fall in the saving ratio in the June quarter is due to the impact of the Commonwealth public service dispute in the early part of 1985 on provisional tax collections.

The household saving ratio in recent quarters is as follows:

<i>Quarters ended</i>	<i>Percentage</i>
<i>1984—</i>	
March	13.9
June	14.7
September	12.8
December	13.8
<i>1985—</i>	
March	14.9
June	11.7

Revisions

Quarterly estimates have been revised as a result of annual benchmark revisions and the inclusion of preliminary annual estimates for 1984-85. In addition corrections have been made to the seasonally adjusted series for wages, salaries and supplements and gross non-farm product at constant prices. Two components of private final consumption, viz other household durables and post and telephone services, have been seasonally reanalysed for both current and constant price series.

EXPLANATORY NOTES

Introduction

This publication provides estimates of the components of gross domestic product and national expenditure and supporting tables for the June quarter 1985, together with comparative estimates for the eight previous quarters and the four years 1981-82 to 1984-85. In addition, seasonally adjusted estimates of the major aggregates and some selected series are provided for the June quarter 1985, together with comparative estimates for the twelve previous quarters. Tables 32-42 provide time series, in both original and seasonally adjusted terms, for the period from September quarter 1969 for the aggregates contained in the domestic production account (at both current and average 1979-80 prices), some selected income aggregates and implicit price deflators.

Concepts, definitions, sources and methods

2. A basic guide to the Australian national accounts entitled *Australian National Accounts, Concepts, Sources and Methods* (5216.0) is available. It outlines major concepts and definitions, describes sources of data and methods used to derive annual and quarterly estimates for major aggregates at current and constant prices and discusses the accuracy and reliability of the national accounts. The concepts, definitions, sources and methods applicable to the estimates contained in this publication are as described in 5216.0 but with the changes outlined in Appendix A, *Australian National Accounts, National Income and Expenditure, 1983-84* (5204.0).

Interpretation of quarterly estimates

3. Estimating for a period of less than one year presents special problems in that it is often difficult to adhere strictly to definitions and concepts used in annual estimates. The measurement of income for a quarterly period is particularly difficult since it is not always possible to match the value of production for a quarter with the cost incurred in that production. This problem occurs, for example, in estimating the income of farm unincorporated enterprises in each quarter, and results in considerable variation in the estimates for this series, and for gross farm product, from quarter to quarter. Difficulties are also experienced in obtaining detailed data for short periods and in preparing consistent estimates from various sources where different accounting procedures and periods are used.

4. These problems inevitably affect the consistency and reliability of the current price estimates, and similarly affect the constant price estimates based on the current price estimates. Accordingly, these factors as well as the approximations and assumptions necessarily made in the revaluation of flows to constant prices should be borne in mind when interpreting or using the estimates, for example, in attempting to draw precise quantitative inferences relating to quarter-to-quarter changes in gross domestic product or its components, or in productivity.

5. Analysis of trends requires allowance for these uncertainties in estimation. The effects are in some measure indicated by the change in the statistical discrepancy for corresponding periods. Uncertainty in trends arises also from the likelihood of revisions as more information becomes available and from the irregularity of short-term movements. The inclusion of the statistical

discrepancy on the expenditure side of the accounts is a convention and does not necessarily imply that the sum of the income components more accurately measures GDP than the sum of the expenditure components (plus exports less imports). As household and other saving are estimated as balancing items in their respective accounts, care should be exercised in their interpretation.

6. Estimates of national income and expenditure are necessarily prepared from a wide range of statistical information, some of which is available quickly and some only with a delay of several years. For this reason most figures should be regarded as subject to revision as more complete and more accurate information becomes available. The revisions will be of two main types-those made to the most recent quarters as firmer quarterly or monthly data come to hand and those which are a consequence of revisions to annual totals and are distributed to the quarters approximately in accordance with existing quarterly patterns.

7. No simple measure is available of the accuracy of the major summary national accounting aggregates. However the following example illustrates the sensitivity of quarter to quarter growth to the timing of recording a transaction. If, in the latest year, the timing of recording a transaction were delayed by one quarter and if the transaction had an impact on constant price gross domestic product of +\$34 million then the measure of the rate of growth would be affected in three adjoining quarters (centred on the quarter in which the transaction was recorded) by -0.1, +0.2, and -0.1 percentage points respectively. Of course the percentage impact of such a timing delay on relevant sub-aggregates would be greater.

8. The quarterly implicit price deflators (IPDs) shown in Table 9 are derived by dividing seasonally adjusted current price estimates by the corresponding seasonally adjusted constant price estimates. Movements in the levels of individual implicit price deflators can be greatly affected by changes in the physical composition of the aggregates and their components. Generally, it is considered that IPDs derived from seasonally adjusted data are more reliable than those obtained by using original (i.e. unadjusted) series, because the former are less likely to be affected by compositional change than are the latter. However the seasonal adjustment process is itself a source of possible distortion, especially to the extent that it is not possible to identify, in a fully consistent way, the seasonality of the current price estimates and of the constant price estimates. A discussion of the limitations involved in using IPDs as measures of pure price change is contained in Appendix B of *Australian National Accounts, Concepts, Sources and Methods* (5216.0).

Seasonal adjustment

9. As most series are affected to some extent by seasonal factors, allowance should be made for normal seasonal variation. In Tables 6, 8, 9, 13, 17, 19, 22 and 23, *seasonally adjusted* values are presented for selected series. Series which show substantial irregularities in the original or adjusted series should be treated with some reserve. As different methods of seasonal adjustment tend to produce different results, it is necessary to bear in mind the methods by which they have been derived and the limitations to which those methods are subject. It

should also be noted that the methods of seasonal adjustment used by the ABS do not force the sum of the seasonally adjusted estimates for each quarter of a financial year to equal the original annual total.

10. The general methods used in the ABS for making seasonal adjustments are described in *Seasonally Adjusted Indicators, Australia, 1983* (1308.0). However, special methods have been used to adjust some of the components of gross farm product which were not amenable to seasonal adjustment by the usual methods. To obtain the seasonally adjusted estimates, the estimated values of production of wheat, other grain and sugar cane, for any financial year, are distributed equally over the four quarters of the year ended June. One effect of these methods is that changes in the annual production of these commodities first enter into the seasonally adjusted figures in the September quarter.

11. Where there is no apparent seasonality in their implicit price deflators, constant price estimates are seasonally adjusted using the same factors as are used for adjusting the corresponding current price estimates. As far as possible the remaining constant price estimates have been adjusted using methods similar to those for the corresponding current price estimates.

Analysis of contributions to growth table

12. Table 3 presents an analysis of the contribution provided by each major aggregate to the percentage change in seasonally adjusted gross domestic product at constant prices. The formula used to calculate the contribution of each aggregate to the growth in GDP is:

$$\frac{A(t) - A(t-1)}{GDP(t-1)} \times 100.0$$

where $A(t)$ = value of aggregate A in quarter under consideration

$A(t-1)$ = value of aggregate A in preceding quarter

$GDP(t-1)$ = value of GDP in preceding quarter

All these values are seasonally adjusted constant price estimates. It should be noted that the figures in this table are additive within each quarter, unlike the percentage change tables shown elsewhere in this publication.

Rounding of figures

13. Although percentage changes are given to one decimal place in this publication, this does not imply that they can be regarded as accurate to the last digit shown. The figures after the decimal point are given to avoid distortions which may occur in rounding off the figures to the nearest half or whole number.

14. The procedures used in preparing this publication may occasionally result in rounding differences between figures in this publication and corresponding figures in other publications.

15. Where figures have been rounded, discrepancies may occur between sums of the component items and totals.

Related publications

16. In addition to those mentioned above other ABS publications which may be of interest include:

Historical Series of Estimates of National Income and Expenditure, Australia (5207.0) (\$1.10, \$1.90 incl. postage)—issued for December Quarter only.

Australian National Accounts, Gross Product by Industry, 1982-83 and 1983-84 (5211.0)

Budget Paper: National Income and Expenditure, 1984-85 (5213.0)

17. Current publications produced by the ABS are listed in the *Catalogue of Publications, Australia* (1101.0). The ABS also issues, on Tuesdays and Fridays, a *Publications Advice* (1105.0) which lists publications to be released in the next few days. The Catalogue and Publications Advice are available from any ABS office.
