CHAPTER 2

THE LABOUR FORCE

Fundamental to the measurement of employment and unemployment is the concept of the labour force. The labour force is defined broadly as those persons who, during a particular week, are either employed or unemployed. The labour force represents the total supply of labour available to the labour market during a given week.

This chapter presents some summary statistics on the civilian labour force. The most important labour force measure is the participation rate, which represents the proportion of the working age population (defined to be those aged 15 and over) who are in the labour force. Analysis of the participation rates provides a basis for monitoring changes in the size and composition of labour supply, particularly in terms of age, sex and marital status. Other characteristics of the labour force such as birthplace, educational attainment and family characteristics are also of interest.

The principal source for statistics on the civilian labour force is the ABS population survey, which consists of the monthly labour force survey and attached supplementary surveys. The labour force survey collects information on the labour force status of individuals (i.e. whether they are employed, unemployed or not in the labour force) together with a range of demographic and other characteristics. It has provided the basis for an analysis of underemployment and labour underutilisation, a topic included in Chapter 3. The supplementary surveys cover a range of .topics including the Survey of Labour Force Experience, conducted in February in each year, which examines the movements into and out of the labour force over twelve months.

Members of the permanent Defence Forces are excluded from the labour force survey. Their numbers totalled 64,522 males and 6,239 females at the end of June 1987.

SELECTED FEATURES

Labour force

The total labour force in Australia in August 1987 comprised 7,675,100 persons - 4,609,300 males and 3,065,800 females. Over the ten year period August 1977 to August 1987, the labour force participation rate for females increased by about four percentage points to 48.3 per cent with a large increase recorded in the 25 to 35 age group (50.4 per cent to 61.9 per cent) and in the 35 to 44 age group (55.9 per cent to 65.8 per cent). For males, the overall participation rate decreased from 79.8 per cent to 74.9 per cent.

Education

An estimated 2,022,700 persons aged 15 to 64 (19.0 per cent of the civilian population in the same age group) attended an educational institution at some time in 1986. Some 1,200,900 (59.4 per cent) of these persons attended full-time while the remaining 821,800 (40.6 per cent) attended part-time.

An estimated 871,700 persons aged 15 to 64 (about 3 out of every 4 persons in this age group who attended fulltime education in 1986) were continuing full-time education in May 1987. The remaining 329,200 were classified as *Leavers* - that is, persons who were full-time students at any time in 1986 but were not full-time students in May 1987.

During the period May 1983 to May 1987 the proportion of working age teenagers who were attending an educational institution full-time has been increasing. Some 48.0 per cent of persons aged 15-19 were attending full-time in May 1983 and this proportion increased to 55.5 per cent in May 1987.
