CANBERRA, AUSTRALIA**

**Reference No. 6.22**

THE LABOUR FORCE, 1964 TO 1968

PREFACE

This bulletin contains statistics of the Australian civilian labour force for the period 1964 to 1968, based on the results of a quarterly sample survey (the population survey). It is issued as a supplement to the quarterly bulletin "The Labour Force" (Reference No.6.20), which contains current estimates for the main series. A similar supplement for 1969 will be issued shortly.

2. The population survey commenced in November 1960, and until November 1963 it was confined to the six State capital cities. The first survey for the whole of Australia was carried out in February 1964. Quarterly estimates of the civilian labour force in the six capital cities were published regularly in the bulletin "Employment and Unemployment", and covered the period November 1960 to May 1968. Thereafter they were discontinued. The first estimates covering the whole of Australia appeared in "The Labour Force, August 1966 to February 1969".

3. For some of the series shown herein, figures back to August 1966 have already been published. These series are now taken back to February 1964. In addition, this bulletin contains a number of previously unpublished series covering the five years 1964 to 1968.

4. The main purpose of the population survey is to provide, at quarterly intervals, statistics of the labour force, but from time to time the survey is used for other inquiries, in order to provide additional information about particular aspects of the labour force or more general information about the population of Australia. The results of these inquiries are issued separately.

## INTRODUCTION

Estimates of the civilian labour force are based on the results of the quarterly population survey, which is carried out on a one per cent sample throughout Australia in February, May, August and November each year. About 38,000 private dwellings (houses, flats, etc.) are visited during each survey as well as a sample of other dwellings (hotels, motels, etc.). The survey information is obtained by means of personal interviews carried out by specially trained enumerators.

2. A description of the sample on which the population survey is based and some operational features of the survey are given on pages 10-12.

### Population coverage

3. The sample used in the population survey covers the six States, the Northern Territory and the Australian Capital Territory. The survey estimates relate to all persons aged fifteen years and over, except members of the permanent armed forces, national servicemen enlisted in the Regular Army Supplement and certain diplomatic personnel customarily excluded from census and estimated populations. Estimates for periods prior to August 1966 exclude full-blood Aborigines.

### Classification of the labour force

4. The classification used in the surveys conforms closely to that recommended by the Eighth International Conference of Labour Statisticians, held in Geneva in 1954. Each person in the survey is classified according to his actual activity (i.e. whether working, looking for work, etc.) during "survey week", the week immediately preceding that in which the interview takes place, and is assigned to one of the three categories, employed, unemployed or not in the labour force. The interviews are carried out during a period of four weeks, so that there are four survey weeks in each of the months to which the survey relates. These weeks generally fall within the limits of the calendar month.

### Definitions

5. Definitions of the principal items appearing in tables in this bulletin are as follows :

The labour force comprises all persons who, during survey week, were employed or unemployed, as defined below.

Employed persons comprise all those who, during survey week,

- (a) did any work for pay, profit, commission or payment in kind, in a job or business, or on a farm (including employees, employers and self-employed persons), or
- (b) worked fifteen hours or more without pay in a family business (or farm) owned or operated by a relative who was a member of the same household, or
- (c) had a job, business or farm, but were not at work because of illness, accident, leave, holiday or industrial dispute; or because of production hold-up due to bad weather, plant breakdown, etc.

A person who had a job but was temporarily laid off by his employer for the whole week without pay is excluded, and is classified in the tables as unemployed. A person who did some work during the week, however, before he either lost his job or was laid off, is classified as employed. A person who held more than one job is counted only once, in the job at which he worked most hours during survey week.

Unemployed persons comprise all those who, during survey week, did no work at all, and who either :

- (a) did not have a job or business and were actively looking for work (including those who stated that they would have looked for work if they had not been temporarily ill or believed no work was available, or had not already made definite arrangements to start work in a new job after survey week), or
- (b) were laid off from their jobs without pay for the whole week.

A person who either lost his job or was laid off during survey week, but did some work at his job during that week, is classified as employed.

Persons not in the labour force are all those who, during survey week, were not in the categories "employed" or "unemployed", as defined. This category therefore includes persons without a job, business or farm who were not actively looking for work, and who, during survey week, were either keeping house (unpaid), attending school, university, etc., retired or voluntarily idle, permanently unable to work or inmates of institutions. A person who worked less than fifteen hours without pay in a family business during survey week is also classified as not in the labour force.

Hours of work relate to actual hours worked during survey week, not hours paid for. Overtime is included but time off is excluded. Estimates of average hours worked and of persons classified according to hours of work may be affected by public holidays, leave, absenteeism, temporary absence from work due to sickness, accidents and industrial disputes, and work stoppages due to bad weather, plant breakdowns, etc. If a person worked at more than one job during survey week, the total hours worked at all jobs have been recorded.

Full-time workers are persons who usually work 35 hours or more per week and others who, although usually part-time workers, worked 35 hours or more during survey week.

Part-time workers are persons who usually work less than 35 hours per week and who did so during survey week. Estimates for part-time workers include some school teachers who have been classified according to standard hours worked, not actual hours.

#### Discontinuity of series

6. It should be noted that estimates for August 1966 and subsequent periods are not strictly comparable with those for earlier periods. The main factors causing discontinuity are as follows :

- (a) From August 1966 the estimates include full-blood Aborigines.
- (b) Age groups shown for periods prior to August 1966 are restricted because of the procedure then used in recording

the ages of persons in the survey. From August 1966 an expanded range of age groups is shown in the tables.

- (c) The grouping of hours worked was changed as from August 1966 so that it would conform more closely to that recommended by the Tenth International Conference of Labour Statisticians, 1961.
- (d) From August 1966 the coding of industry has been based on a more comprehensive place of work index.
- (e) Prior to August 1967 some wage and salary earners were recorded as "working in own business" and were therefore classified as "employers and self-employed", when in fact they were employees of incorporated companies. Since August 1967, interviewers have been instructed to ask further questions in such cases in order to reduce the possibility of incorrect classification.

#### Reliability of the estimates

7. Since the estimates in this bulletin are based on a sample, they may differ from the figures that would have been obtained from a complete census using the same questionnaires and procedures. One measure of the likely difference is given by the standard error, which indicates the extent to which an estimate might have varied by chance because only a sample, and not the whole population, was enumerated. There are about two chances in three that a sample estimate will differ by less than one standard error from the figure that would have been obtained from a comparable complete enumeration, and about nineteen chances in twenty that the difference will be less than two standard errors.

8. Space does not allow for the separate indication of the standard errors of all estimates in this bulletin. A table of standard errors which is intended to be of general application is therefore given below (Table A). Standard errors of estimates of quarter-to-quarter changes are given in Table B, and approximate standard errors of estimates of the total number of persons in Australia in each of the principal employment status categories, classified by sex only, in Table C.

9. The standard errors in these tables are averages based on calculations for a limited number of surveys and are also averages over a wide range of labour force characteristics. These figures thus give not a precise measure but an indication of the magnitude of the standard error of any particular estimate for any particular survey. An example of the use of Table A is as follows: if the estimate obtained from the sample is 100,000 and the standard error is 3 per cent of the estimate, i.e. 3,000, there are about two chances in three that the true figure is within the range 97,000 to 103,000 and about nineteen chances in twenty that this figure is between 94,000 and 106,000.

10. The quarter-to-quarter change in the level of an estimate is also subject to sampling variability. The standard error of the change will depend on the standard error of the level of the estimate, rather than on the change itself. Final estimates of standard errors of movement have not yet been calculated, but an indication of the magnitude of standard errors of quarter-to-quarter change is given in Table B, below. The estimates of standard error of quarter-to-quarter change apply only to estimates of change between two consecutive quarters. Changes between corresponding quarters of consecutive years, or between two other non-consecutive quarters, will generally be subject to somewhat greater sampling variability than is indicated in the table below.

TABLE A  
STANDARD ERRORS OF QUARTERLY ESTIMATES

Size of estimate (persons)	Approximate standard error of estimates	
	Persons	Per cent of estimate
4,000	750	19
5,000	850	17
10,000	1,100	11
20,000	1,400	7
50,000	2,000	4
100,000	3,000	3
200,000	4,000	2
500,000	5,000	1
1,000,000	5,500	0.5
2,000,000	8,000	0.4

TABLE B  
STANDARD ERRORS OF ESTIMATES OF  
QUARTER-TO-QUARTER CHANGE  
(Persons)

Standard error of quarterly level	Standard error of quarter-to-quarter change
1,000	1,300
2,000	2,500
3,000	3,600
4,000	4,300
5,000	4,700
6,000	5,000
7,000	5,200
8,000	5,300

TABLE C  
STANDARD ERRORS OF PRINCIPAL EMPLOYMENT STATUS CATEGORIES

Category	Approximate standard error of estimates					
	Males		Females		Persons	
	'000	Per cent	'000	Per cent	'000	Per cent
Employed -						
Agriculture	12	3.2	3	6.3	14	3.2
Other industries	8	0.3	10	0.7	12	0.3
Total	8	0.2	10	0.7	12	0.3
Unemployed	2	6.1	2	5.7	3	4.4
Labour force	7	0.2	10	0.7	12	0.3
Not in the labour force	7	1.1	10	0.4	12	0.4

11. It should be noted that the standard errors of estimates relating to agricultural employment are generally somewhat higher than the standard errors of other estimates of the same magnitude. Estimates for females also tend to have higher standard errors relative to estimates of equivalent size for males in similar employment categories.

12. The reliability of an estimated percentage, computed by using sample data for both numerator and denominator, depends upon both the size of the percentage and the size of the denominator. Percentages quoted in this bulletin, and any other percentages calculated from figures presented herein, have generally somewhat lower proportional standard errors than have the estimates which form the numerators of the percentages, particularly where the percentages are large.

13. As the standard errors in Tables A and B show, the smaller the estimate the higher is the relative standard error. Very small estimates

would thus be subject to such high standard errors (relative to the size of the estimate) as to detract seriously from their value for most reasonable uses. In the tables in this bulletin, estimates less than 4,000 have not been shown. Although figures for these small components can be derived by subtraction, they should not be regarded as reliable.

14. The imprecision due to sampling variability, which is measured by the standard error, should not be confused with inaccuracies that may occur because of imperfections in reporting by interviewers and respondents. Inaccuracies of this kind are referred to as the non-sampling error, and they may occur in any enumeration, whether it be a full count or only a sample. Every effort is made to reduce the non-sampling error to a minimum by careful design of questionnaires, intensive training and supervision of interviewers and efficient operating procedures.

#### Seasonally adjusted series

15. Original and seasonally adjusted estimates are shown for persons in the labour force, labour force participation rates and unemployed persons in Table 1. The methods used in seasonally adjusting these statistics are explained in "Seasonally Adjusted Indicators 1970" (Reference No. 1.10), issued on 29 June 1970.

THE SAMPLE DESIGN

The sample used for the labour force survey is based on the population survey master sample, which is designed to permit the selection of samples for any purpose for which a sample of dwellings or persons is appropriate. The labour force survey sample covers private dwellings (houses, flats, etc.) and non-private dwellings (hotels, hospitals, etc.) and is a one per cent probability sample of persons; that is, every person has one chance in a hundred of selection in the sample.

2. Because of the difficulty of obtaining and keeping up to date a complete list of dwellings from which to select a sample, the population survey master sample is for the most part a sample of areas, the exception being the sample of "special dwellings" (certain types of non-private dwellings for which lists can be maintained and which have different characteristics in respect of size and geographical location). Since dwellings can readily be associated with the areas in which they are located, the area sample is equivalent to a sample of dwellings. To obtain a sample of persons, rules are adopted which associate each person with one and only one dwelling, either private or non-private. Briefly, these rules are designed so that a person is included at his usual place of residence if (a) it is occupied by one or more of its usual residents at any time during the week in which the survey is conducted, and (b) at the time of the survey the person is not absent from it for a continuous period of more than four weeks. Where a person is not included at his usual place of residence, he is included at the dwelling at which he spends most of the survey week. Modifications to these rules are necessary for dwellings such as hotels and hospitals, which contain a high proportion of transient residents; nevertheless, the rules ensure that each person is given an equal one in a hundred chance of inclusion in the sample.

3. All dwellings in Australia are allocated to a number of mutually exclusive groups called strata, each of which is sampled separately. Private dwellings are separated from special dwellings and are divided between metropolitan areas and urban and rural extra-metropolitan areas, dwellings within each of these divisions being grouped into strata according to location and socio-economic considerations. Special dwellings are also divided between metropolitan and extra-metropolitan areas, strata within these divisions being formed according to type of special dwelling (e.g. gaols, hospitals, etc.).

4. The sample from the private dwelling strata in metropolitan and other densely populated areas is a self-weighting one per cent three-stage area sample, the areas and finally the dwellings with which they are associated being selected in three stages. The first stage is the selection of Census Collectors' Districts (CDs), a CD being the area covered by one population census collector; the second the selection of blocks (areas which can be physically defined by streets or other recognisable features) from within selected CDs; and the third the selection of dwellings from within selected blocks. Although the CDs and blocks have different probabilities of inclusion (probabilities in fact approximately proportional to the number of dwellings they contain), the sample is self-weighting because each of the dwellings (and persons) selected has the same probability of inclusion, and thus may be given the same weight in forming the sample estimates. The probability of including any dwelling (or person) is one in a hundred, but this does not imply that exactly one-hundredth of all dwellings or persons are included. The number of dwellings or persons actually included may, by chance, be somewhat more or less than one-hundredth of the total number; certain steps taken to limit the size of this difference and to allow for its possible effect on survey estimates are described below. Outside the densely populated areas, a self-weighting one per cent four-stage area sample is generally used, with areas such as towns or

rural local government areas being the primary sample units at the first stage of selection and CDs, blocks and dwellings, the units at the subsequent stages. In some small towns the first stage of selection is omitted, the town itself being treated as though it were a single CD. Other modifications to the selection procedure are also made for certain other types of areas, but these affect only a small proportion of sample dwellings.

5. The sample of special dwellings in metropolitan and other densely populated areas is a self-weighting one per cent two-stage cluster sample, the sample units at each stage being special dwellings and either persons or accommodation units (e.g. rooms of hotels) according to the type of dwelling. Outside the densely populated areas, a self-weighting one per cent three-stage cluster sample is used, sample units being local government areas or towns of the private dwellings sample, dwellings and either persons or accommodation units according to the type of dwelling. Where accommodation units are selected, rules are adopted to ensure that each person associated with the dwelling is associated with one accommodation unit.

6. The effect of new dwellings, conversions, demolitions, etc. is taken into account in the sample selection procedure. For the private dwelling sample a check is made during each survey on all dwellings within each selected block. New dwellings detected are given the same chance of selection as other dwellings in the same block, so that, taking the sample as a whole, new dwellings also have one chance in a hundred of being selected. Similar procedures exist for buildings converted for use as dwellings. Dwellings demolished or converted to non-dwelling use are removed from the sample. In areas where there has been an unusually rapid rate of growth of private dwellings since the sample was first selected, either very many or very few of the new dwellings will be in sample blocks or in sample CDs. Even though there will be no general tendency for the sample to include too many or too few new dwellings, the effect in particular areas of chance departures from a sample of exactly one per cent will be that a disproportionately high or low number of new dwellings will be included, and as a consequence characteristics associated with new dwellings will be over-estimated or under-estimated accordingly. To limit such effects, special procedures are adopted to ensure that the sample remains representative, a reselection of CDs being made from the appropriate stratum, if necessary. The lists of special dwellings used in the selection of the special dwelling sample are brought up to date before each survey by using all information available from sources external to the sample. The combined effect of these measures is that during any survey the sample of dwellings represents dwellings currently in existence in Australia.

7. Enumeration at sample dwellings included in the population survey is carried out during a four-week period in metropolitan areas and a two-week period in extra-metropolitan areas. Thus, data are obtained each quarter from four interpenetrating quarter per cent samples in metropolitan areas and two interpenetrating half per cent samples in extra-metropolitan areas.

8. A selected dwelling generally remains in the sample for no more than two years. In order to minimise respondent fatigue and to maintain continuity within the sample, one eighth of the private dwellings in the sample are replaced after each survey. Adoption of this "rotation" procedure, whereby seven-eighths of the sample remains unchanged from one quarter to the next, enables more reliable measurements of changes in the population and labour force characteristics to be made than would be possible if a new sample were introduced each quarter. Selected non-private dwellings (except the large ones) are retained in the sample for no longer than one year, one quarter of those selected being replaced after each survey.

9. Labour force and other estimates derived from population survey data are obtained by using a ratio estimation procedure, in the application of which the following components are used :

- (i) population estimates ("benchmarks") classified by State, area, age and sex;
- (ii) the number of persons with the characteristics being measured in the sample in each "cell" formed by the benchmarks; and
- (iii) the total number of persons in the sample in each cell.

The latter two components are expressed as a ratio, which is multiplied by the population benchmark for the appropriate cell to give an estimate of the total number of persons with the given characteristics in that population cell. This procedure ensures that survey estimates conform to the known distribution of the population by age and sex, even though (as can be expected in a sample) the sample itself may not exactly represent that distribution, and at the same time it automatically compensates for any inherent under-enumeration or over-enumeration in the sample.

10. It will be appreciated that the theoretical soundness of the sample design could be greatly affected in practice by any substantial degree of failure to obtain information in respect of all persons selected, whether from failure on the part of the interviewer to make contact or from lack of co-operation by respondents. For this reason, a high level of response is sought and, in fact, achieved.

---

#### NOTES

1. The estimates contained in this bulletin relate to civilians aged fifteen years and over. Definitions of the principal components of the labour force are given on pages 5-6.

2. Any discrepancies between totals and sums of components in tables are due to rounding.
