FOREWORD

This issue presents a historical series of data from the Labour Force for the years 1966 to 1984.

The introduction of the ABS time series data base AUSSTATS on CSIRONET, together with a more historical perspective to be adopted in *Labour Statistics, Australia* (Catalogue No 6101.0) means that much of the information presented in this publication will be available from other sources. It is therefore unlikely that there will be an update of the series produced in this publication.

Users should note that a new questionnaire for the labour force survey was introduced in April 1986 which resulted in a revision to the definition of employed persons. Estimates contained in this publication have not been adjusted to the new definition.

APPENDIX 1: SEASONAL ADJUSTMENT OF LABOUR FORCE SURVEY ESTIMATES: EXPLANATORY NOTES 323

APPENDIX 2: LABOUR FORCE SURVEY ESTIMATES FROM AUGUST 1966 TO NOVEMBER 1977: EXPLANATORY NOTES 325

EXPLANATORY NOTES

Introduction

This publication contains estimates of the civilian labour force derived from the labour force survey part of the monthly population survey for the period 1966 to 1984.

2. More detailed estimates are published each month in *The Labour Force, Australia* (6203.0). Preliminary estimates are published monthly in *The Labour Force, Australia, Preliminary* (6202.0).

3. Estimates of the labour force characteristics of family members and of family composition are published each month in *The Labour Force, Australia* (6203.0). Additional and more detailed family information can be found in the annual publication *Labour Force Status and Other Characteristics of Families* (6224.0).

4. Estimates of labour force status and gross changes (flows) derived from matched records are published each month in *The Labour Force, Australia* (6203.0).

5. Estimates of the civilian labour force are now available for about fifty regions across Australia. For details, see the Information Paper *Release of Regional Labour Force Statistics* (6262.0).

6. Although emphasis in the population survey is placed on the regular collection of specific data on demographic and labour force characteristics of the population, supplementary and special surveys of particular aspects of the labour force or of other subjects are carried out from time to time. Statistics from these surveys are published and are available on request. A list of survey publications on labour force and related topics is shown later in this publication.

The population survey

7. The population survey is based on a multi-stage area sample of private dwellings (about 33,000 houses, flats, etc.) and non-private dwellings (hotels, motels, etc.), and covers about two-thirds of one per cent of the population of Australia. The information is obtained from the occupants of selected dwellings by carefully chosen and specially trained interviewers. The interviews are generally conducted during the two weeks beginning on the Monday between the 6th and 12th of each month. Because of operational problems arising from the Cristmas and New Year holidays, interviews for the December 1978, 1979, 1983 and 1984 surveys commenced a week earlier than usual and interviews for the January 1979 and 1980 surveys commenced a week later than usual. The information obtained relates to the week before the interview (i.e. the survey week).

Scope

8. The labour force survey includes all persons aged 15 and over except:

(a) members of the permanent defence forces;

(b) certain diplomatic personnel of overseas government, customarily excluded from census and estimated populations;

(c) overseas residents in Australia; and

(d) members of non-Australian defence forces (and their dependents) stationed in Australia.

Definitions

9. The labour force category to which a person is assigned depends on the *actual activity* undertaken during the survey week (i.e. whether working, looking for work, etc.). The following definitions, which conform closely to the international standard definitions specified by the International Labour Office (ILO), relate only to those persons within the scope of the survey.

10. *Employed persons* comprise all those aged 15 and over who, during the survey week:

(a) worked for one hour or more for pay, profit, commission or payment in kind in a job or business, or on a farm (including employees, employers and self-employed persons); or

(b) worked for 15 hours or more without pay in a family business or on a farm (i.e. unpaid family helpers); or

(c) were employees who had a job but were not at work and were: on paid leave; on leave without pay for less than four weeks up to the end of the survey week; stood down without pay because of bad weather or plant breakdown at their place of employment for less than four weeks up to the end of the survey week; on strike or locked out; on workers' compensation and expected to be returning to their job; or receiving wages or salary while undertaking full-time study; or

(d) were employers or self-employed persons who had a job, business or farm, but were not at work.

11. *Full-time workers* are those who usually work 35 hours or more a week and others who, although usually part-time workers, worked 35 hours or more during the survey week. *Part-time workers* are those who usually work less than 35 hours a week and who did so during the survey week. When recording hours of work, fractions of an hour are disregarded.

12. *Hours of work.* The figures of aggregate hours and of average hours refer to actual hours worked during the survey week, not hours paid for. The figures may be affected by public holidays, leave, absenteeism; temporary absence from work due to sickness, injury, accident and industrial disputes; and stoppages of work due to bad weather, plant breakdown, etc. When hours of work are recorded, fractions of an hour are disregarded and this results in slightly lower figures than would be the case if actual time worked was recorded. Persons stood down for the whole of the survey week without pay because of bad weather or plant breakdown at their place of employment are regarded as employed and therefore are included (working no hours) in the calculation of average hours worked. Persons stood down in the survey week for reasons other than bad weather and plant breakdown and waiting to be called back to their job are regarded as unemployed and are therefore excluded from the calculation.

13. The *employment/population ratio* for any group is the number of employed persons expressed as a percentage of the civilian population aged 15 and over in the same group.

14. *Unemployed persons* are those aged 15 and over who were not employed during the survey week, and

(a) had actively looked for full-time or part-time work at any time in the four weeks up to the end of the survey week and:

(i) were available for work in the survey week, or would have been available except for temporary illness (i.e. lasting for less than four weeks to the end of the survey week); or

(ii) were waiting to start a new job within four weeks from the end of the survey week and would have started in the survey week if the job had been available then;

or (b) were waiting to be called back to a full-time or part-time job from which they had been stood down without pay for less than four weeks up to the end of the survey week (including the whole of the survey week) for reasons other than bad weather or plant breakdown.

15. *Actively looking for work* includes writing, telephoning or applying in person to an employer for work; answering a newspaper advertisement for a job; checking factory or Commonwealth Employment Service noticeboards; being registered with the Commonwealth Employment Service; checking or registering with any other employment agency; advertising or tendering for work; and contacting friends or relatives.

16. *Unemployed persons looking for first job* are those who had never worked full time for two weeks or more. Prior to November 1977 the estimates comprise unemployed persons who had never had a job.

17. The *Unemployment rate* for any group is the number unemployed expressed as a percentage of the labour force (i.e. employed plus unemployed) in the same group.

18. *Duration of unemployment* is the period from the time the person began looking for work or was stood down to the end of the survey week. Thus the survey measures current (and continuing) periods of unemployment rather than completed spells. For persons who may have begun looking for work while still employed, the duration of unemployment is defined as the period from the time the person last worked full time for two weeks or more to the end of the survey week. Periods of unemployment are recorded in complete weeks and this results in a slight understatement of duration. *Average (mean) duration* is obtained by dividing the aggregate number of weeks a group has been unemployed by the number of persons in that group. *Median duration* is the duration which divides unemployed persons into two equal groups, one comprising persons whose duration of unemployment is above the median and the other, persons whose duration is below it.

19. *Unemployed persons classified by industry and occupation.* Unemployed persons who had worked full time for two weeks or more in the last two years are classified according to the industry and occupation of their most recent full-time job. *Unemployment rates* by industry and occupation are only available for February, May, August and November.

20. The *unemployment/population ratio* for any group is the number of unemployed persons expressed as a percentage of the civilian population aged 15 and over in the same group.

21. The *labour force* comprises all persons who, during the survey week, were employed or unemployed, as defined above.

22. The *labour force participation rate* for any group is the labour force expressed as a percentage of the civilian population aged 15 and over in the same group. Because it is not practicable to ascertain information about school attendance or birthplace for persons in institutions (who are classified as not in the labour force), labour force participation rates for persons classified by school attendance or birthplace are calculated using population estimates which exclude those in institutions.

23. *Persons not in the labour force* are those who, during the survey week, were not in the categories employed or unemployed, as defined above. They include persons who were keeping house (unpaid), attending an educational institution (school, university, etc.), retired, voluntarily inactive, permanently unable to work, inmates of institutions (hospitals, gaols, sanatoria, etc.), trainee teachers, members of contemplative religious orders, and persons whose only activity during the survey week was jury service or unpaid voluntary work for a charitable organisation. Specific surveys of persons not in the labour force indicate that a number want to work but are not classified as unemployed because they were not actively looking for work and/or were not available to begin work in the survey week. Included in this group are the discouraged jobseekers and other persons marginally attached to the labour force.

24. *Persons attending school* comprise those aged 15 to 20 who, during the survey week, were enrolled full time at secondary or high schools. Excluded are persons who were enrolled at universities, colleges of advanced education, technical colleges, other tertiary educational institutions, and coaching and business schools. Persons attending school are classified as in the labour force if they were employed or unemployed as defined above. Because it is not practicable to ascertain from persons in institutions (who are classified as not in the labour force) whether or not they are enrolled at secondary or high schools, such persons are excluded from estimates classified by school attendance.

25. Persons classified by *labour force status* are classified according to whether or not they are in the labour force. Persons in the labour force classified by *employment status* are classified according to whether they are employed or unemployed. Employed persons classified by *status of worker* are classified according to whether they were employers, self-employed persons, wage and salary earners (employees), or unpaid family helpers (who worked 15 hours or more in the survey week).

26. *Classification of industry and occupation.* Industry is classified according to the *Australian Standard Industrial Classification* (ASIC) 1983 edition (1201.0 and 1202.0) for November 1984 and subsequent estimates. From October 1979 to October 1984 the 1978 edition was used. Prior to September 1979, the 1969 edition was used. Occupation is classified according to the *Classification and Classified List of Occupations Revised November 1980* for August 1981 and subsequent estimates. The "Revised June 1976" edition was used for the period November 1977 to July 1981 and the "Revised June 1971" edition was used for the period November 1971 to August 1977 while the "Revised June 1966" edition was used prior to August 1977.

27. In the labour force survey, persons are classified as *married* or *not married.* Marital status is determined from information supplied by the respondent about the individual himself or herself and, where the person was reported as being married, about the living arrangements of persons usually resident in the household. Marital status does not

therefore necessarily reflect legal status. Persons are classified as married if they are reported as being married (including de facto) and their spouse was a usual resident of the household at the time of the survey. The not-married category comprises persons who have never married, or are separated, widowed or divorced, as well as those who, although reported as being married, did not have a spouse who usually lived in the household. Persons who live in a de facto relationship but do not volunteer this information when asked whether they are married are classified as not married. For discontinuities in estimates of marital status, see paragraph 37.

28. The areas determining the six *State capital cities* are the Statistical Divisions for those capital cities defined in *Census of Population and Housing 30 June 1981, Persons and Dwellings in Local Government Areas and Urban Centres (Preliminary)* (2401.0-2408.0). Capital City Statistical Divisions are predominantly urban in character and the boundaries are delineated to contain the anticipated urban development of the capital cities (and associated urban centres) for a period of at least 20 years.

Population benchmarks

29. Labour force survey estimates of persons employed, unemployed and not in the labour force are calculated in such a way as to add up to the independently estimated distribution of the population aged 15 and over by age and sex. This procedure compensates for under-enumeration in the survey, and leads to more reliable estimates. The independent population statistics (benchmarks) are the latest available estimates at the time the labour force survey is conducted, but they usually differ from the official population estimates subsequently published in *Australian Demographic Statistics* (3101.0) because they are necessarily derived from incomplete information about population changes.

Revision of series

30. Survey estimates are not revised for the usually small amendments of population benchmarks arising from new data on deaths and overseas and internal migration. Revisions are made, however, after each census of population and housing, and when population estimation bases are reviewed. Survey estimates from February 1978 to January 1984 have been recalculated to conform to revised population estimates which take account of the results of the 1981 census.

31. Generally speaking the revisions to the estimates following the 1981 Census were small. The revised population estimates do, however, have a slightly different sex and age distribution from the previous population estimates. This results in revisions of different magnitude for males and females. Also, the revisions to the original series are much larger for estimates from early surveys (i.e near February 1978) than for more recent surveys. For February 1978, the civilian population aged 15 and over was revised upwards by 95,000 (comprising 38,000 males and 57,000 females), employment revised upwards by 53,400 (30,000 males and 23,400 females) and unemployment revised upwards by 5,800. Original estimates for December 1983 show the following revisions — an increase of 27,400 (comprising a decrease of 9,000 males and an increase of 36,400 females) in the civilian population aged 15 and over, an increase of 2,000 employed persons (minus 10,900 males and plus 12,900 females) and an increase of 1,900 persons unemployed. The revisions to the original series have had little effect on unemployment rates but have generally resulted in a small reduction to the participation rate. This revision is influenced by the new benchmarks containing a higher proportion of females, whose participation rate is lower than that for males, and by the revised age distribution for males.

32. Table A at the end of these explanatory notes compares the benchmarks for the civilian population aged 15 and over based on the 1976 and 1981 Censuses for the period August 1971 to February 1978. The differences between the two benchmarks are shown in terms of an adjustment factor which, when applied to a previously published 1976 Census-based estimate raises that estimate to the level of the 1981 Census base. The adjustment factors for males and females differ, and users wishing to estimate the effect of revisions to estimates from surveys prior to February 1978 should choose the appropriate factor from Table A. It should be noted that these adjustment factors are simply ratios of the civilian population aged 15 and over, and may differ slightly from adjustment factors calculated from ratios of actual survey estimates of employed and unemployed. No factors are available for the period prior to 1971.

33. Following the change in official population estimates to a place of usual residence basis after the 1981 Census, the population benchmarks used in the estimation of labour force survey data are compiled according to place of usual residence. For an explanation of the new conceptual basis of population estimates see *Population Estimates: An Outline of The New Conceptual Basis of ABS Population Estimates* (3216.0). To co-ordinate with the new benchmarks, the labour force survey questionnaire was changed in October 1982 to enable identification of each respondent's place of usual residence. The estimates shown in this publication for the period from October 1982 onwards are thus wholly according to place of usual residence. Prior to October 1982, the estimates are based on a combination of place of enumeration and place of usual residence. Persons who are away overseas from their usual residence for less than six weeks at the time of interview are generally enumerated at their usual residence when relevant information can be obtained from other usual residents present at the time of the survey. Persons who, at the time of interview, are overseas for six weeks or more but for less than twelve months are included in the estimates on the assumption that their labour force characteristics are similar to those of the persons responding in the survey.

34. Until February 1978, surveys were conducted in February, May, August and November each year from 1964. From February 1978 the survey has been conducted on a monthly basis. A revised questionnaire was introduced for the February 1978 survey. The questionnaire, which had undergone little change since 1964, except for the inclusion of 1975 of additional questions on jobseeking, was revised to provide more accurate and more detailed information concerning the labour force.

35. Details of the changes made to the questionnaire in February 1978 and additional minor amendments made in November 1981 are contained in the March 1978 and December 1981 issues (respectively) of *Information Paper: Questionnaires Used in the Labour Force Survey* (6232.0). As noted in paragraph 33, the questionnaire was further changed in October 1982 to enable identification of each respondent's place of usual residence. Questions enabling identification of family relationships within households were also included at that time. Details are contained in the August 1984 issue of the *Information Paper* (6232.0).

Comparability of series

36. As noted in pagragraphs 30 to 33, estimates from February 1978 have been revised to conform to revised population estimates which take account of the results of the 1981 Population census, and are thus not strictly comparable with estimates for periods prior to February 1978. For information concerning estimates from August 1966 to November 1977, see Appendix 2.

37. Paragraph 27 outlines the definition of marital status now used in the labour force survey. In conjunction with the revision of estimates back to February 1978 to conform to revised population estimates, a revision to take account of the new definition of marital status was also applied. Consequently, estimates of marital status contained in this publication for the period from February 1978 are not comparable with those for earlier periods which classify as married all respondents who reported that they were married or separated. The revision to the marital status classification was undertaken in two parts. Firstly, for all surveys from February 1978, persons who reported that they were separated, were reclassified as not married. Secondly, from June 1983 onwards, in addition to including persons reported as separated, the not-married category includes persons who although reported as married, did not, at the time of the survey, have a spouse who was a usual resident of the household.

Survey sample

38. For detailed information on sample design and selection see the Technical note.

39. The population survey sample is reselected every five years to allow data from the latest census of population and housing to be used to improve the efficiency of the population survey sample design. The latest reselection, which used data from the 1981 Census, was introduced for the October 1982 survey.

40. The sampling fraction differs for States and Territories. This enables estimates of reasonable accuracy to be produced from all States and Territories as well as for Australia. Sampling fractions for each State and Territory are given in the Technical note to this publication.

Reliability of the estimates

41. Estimates in this publication are subject to two sources of error:

(a) sampling error: since the estimates are based on information obtained from occupants of a sample of dwellings they, and the movements derived from them,may differ from the figures that would have been produced if all dwellings had been included in the survey. More information on this topic is given in the Technical note.

(b) non-sampling error: inaccuracies may occur because of imperfections in reporting by respondents and interviewers and errors made in the coding and processing of data. These inaccuracies may occur in any enumeration, whether it be a full count or only a sample. It is not possible to quantify these *non-sampling errors,* but every effort is made to minimise them by careful design of questionnaires, intensive training and supervision of interviewers and efficient operating procedures.

Differences between population census and population survey estimates

42. The results of the Censuses of Population and Housing show that labour force figures derived from the census differ from estimates derived from the labour force surveys.

43. The broad concepts underlying the measures of the labour force and its components, employment and unemployment, are similar in the census and the survey. However there are considerable differences in both the collection methodology adopted (including the detailed questions asked) and estimation procedures. Factors contributing to differences in estimates include under-enumeration in the population census for which census labour force estimates have not been adjusted, the use in the labour force survey of population benchmarks derived from incomplete information about population change (see paragraph 29), the inclusion of permanent defence forces in census estimates, the personal interview approach adopted in the survey as opposed to self-enumeration of census schedules, differing questions used to determine labour force characteristics (particularly the identification of unemployed persons) and differing methods of adjustment for non-response to the survey or census.

44. The labour force survey provides detailed and up-to-date estimates of employment and unemployment for Australia and States, whereas the census of population and housing provides counts for small areas, but in less detail than is available from the survey.

45. These considerations should be borne in mind if comparisons are made between population census and labour force survey estimates.

Seasonal adjustment

46. Seasonally adjusted series are published in Table 2. As happens with all seasonally adjusted series, the seasonal factors are reviewed annually to take account of each additional year's original data. The latest review, in February 1985, revised the monthly series back to February 1978. For additional information, see Appendix 1.

Unpublished data

47. In some cases, the ABS can also make available information which is not published. This information may be made available in one or more of the following forms: microfiche, photocopy, data tape, computer print-out, manually-extracted tabulation. In general, a charge is made for providing unpublished information. Inquiries should be made to the officer whose name appears in the *Phone Inquiries* section of the inquiries box at the front of this publication, or to Information Services in the nearest ABS Office.

Social Indicators No. 4, 1984 (4101.0); *(\$21.50, \$25.50 incl. postage)*

Information Paper: Comparison of Employment Estimates from The Labour Force Survey and the Survey of Employment and Earnings (6263.0)

49. Current publications produced by the ABS are listed in the *Catalogue of Publications, Australia* (1101.0). The ABS also issues, on Tuesdays and Fridays, a *Publications Advice* (1105.0) which lists publications to be released in the next few days. The Catalogue and Publications Advice are available from any ABS office.

Symbols and other usages

* subject to sampling variability too high for most practical uses. See paragraph 21 of the Technical note

(a) Discontinuity following introduction of revised definition. See Explanatory notes, paragraph 16. See also paragraph 36 of the Explanatory notes and paragraphs 12 to 17 of Appendix 2 to this publication. (b) For information on change in timing of the survey, see Explanatory notes, paragraph 7 and Appendix 2, paragraph 15. Estimates from February 1978 have been revised — see Explanatory notes, paragraphs 30 to 33.

(a) There is a discontinuity in the estimates for Community Services between August 1969 and August 1970 due to a change in the classification of teachers who worked the full school week, from part-time to full-time workers.

(b) For information on change in timing of survey see Explanatory Notes paragraph 7 and Appendix 2, paragraph 15. Estimates from February 1978 have been revised. See Explanatory Notes paragraphs 30 to 33. For information concerning comparability of series see Explanatory Notes paragraph 36 and Appendix 2, paragraphs 12 to 17.

(a) There is a discontinuity in the estimates for Professional, technical and related workers between August 1969 and August 1970 due to a change in the classification of teachers who worked the full school week from part-time to full-time workers. (b) For information on change in timing of survey see Explanatory notes paragraph 7 and Appendix 2, paragraph 15. Estimates from February 1978, have been revised. See Explanatory notes paragraphs 30 to 33. For information concerning comparability of series see Explanatory notes paragraph 36 and Appendix 2, paragraphs 12 to 17.

TABLE 29. EMPLOYED PERSONS: CCLO MINOR OCCUPATION GROUP, EACH AUGUST 1966 TO 1984 — *continued*
('000)

Minor occupation group(a)	*August* 1980	1981	1982	1983	1984
PERSONS — *continued*					
TRADESMEN, PRODUCTION-PROCESS WORKERS AND LABOURERS, N.E.C. — *continued*					
Bricklayers, plasterers and construction workers, n.e.c.	149.0	149.1	140.0	127.7	145.9
Compositors, printing machinists, engravers, bookbinders and related workers	48.1	48.8	44.1	45.8	44.6
Potters, kilnmen, glass and clay formers and related workers	12.4	9.8	8.9	10.8	10.6
Millers, bakers, butchers, brewers and related food and drink workers	115.7	95.2	108.2	105.7	103.6
Chemical, sugar and paper production-process workers	26.1	29.3	25.6	19.6	18.5
Paper products, rubber, plastic and production-process workers, n.e.c.	56.1	57.2	60.7	57.2	53.7
Packers, wrappers, labellers	57.1	51.8	42.8	46.0	42.8
Stationary engine, excavating and lifting equipment operators	95.0	108.3	97.3	94.4	96.7
Storemen and freight handlers	118.9	128.7	126.3	125.1	121.9
Labourers, n.e.c.	167.3	163.2	149.9	140.7	143.3
SERVICE, SPORT AND RECREATION WORKERS	607.2	599.4	603.7	606.1	650.1
Fire brigade, police and other protective service workers	66.2	61.9	67.8	69.8	79.6
Housekeepers, cooks, maids and related workers	210.7	207.5	194.9	201.7	222.8
Waiters, bartenders	77.6	70.2	72.8	70.4	77.5
Caretakers, cleaners, buildings	107.7	108.8	114.3	111.0	106.3
Barbers, hairdressers and beauticians	32.5	40.2	38.9	33.5	42.0
Launderers, dry cleaners and pressers	22.5	17.8	16.2	18.5	16.1
Athletes, sportsmen and related workers	9.1	12.0	11.6	11.6	14.6
Photographers and camera operators	5.1	4.1	7.0	7.5	8.1
Service, sport, recreation workers, n.e.c.	73.3	75.4	79.8	80.7	82.2
Total	**6,281.4**	**6,393.7**	**6,379.3**	**6,241.1**	**6,462.3**

(a) Some minor occupation groups are not listed separately.
(b) For information on change in timing of survey see Explanatory Notes paragraph 7 and Appendix 2, paragraph 15. Estimates from February 1978 have been revised. See Explanatory Notes paragraphs 30 to 33. For information concerning comparability of series see Explanatory Notes paragraph 36 and Appendix 2, paragraphs 12 to 17.

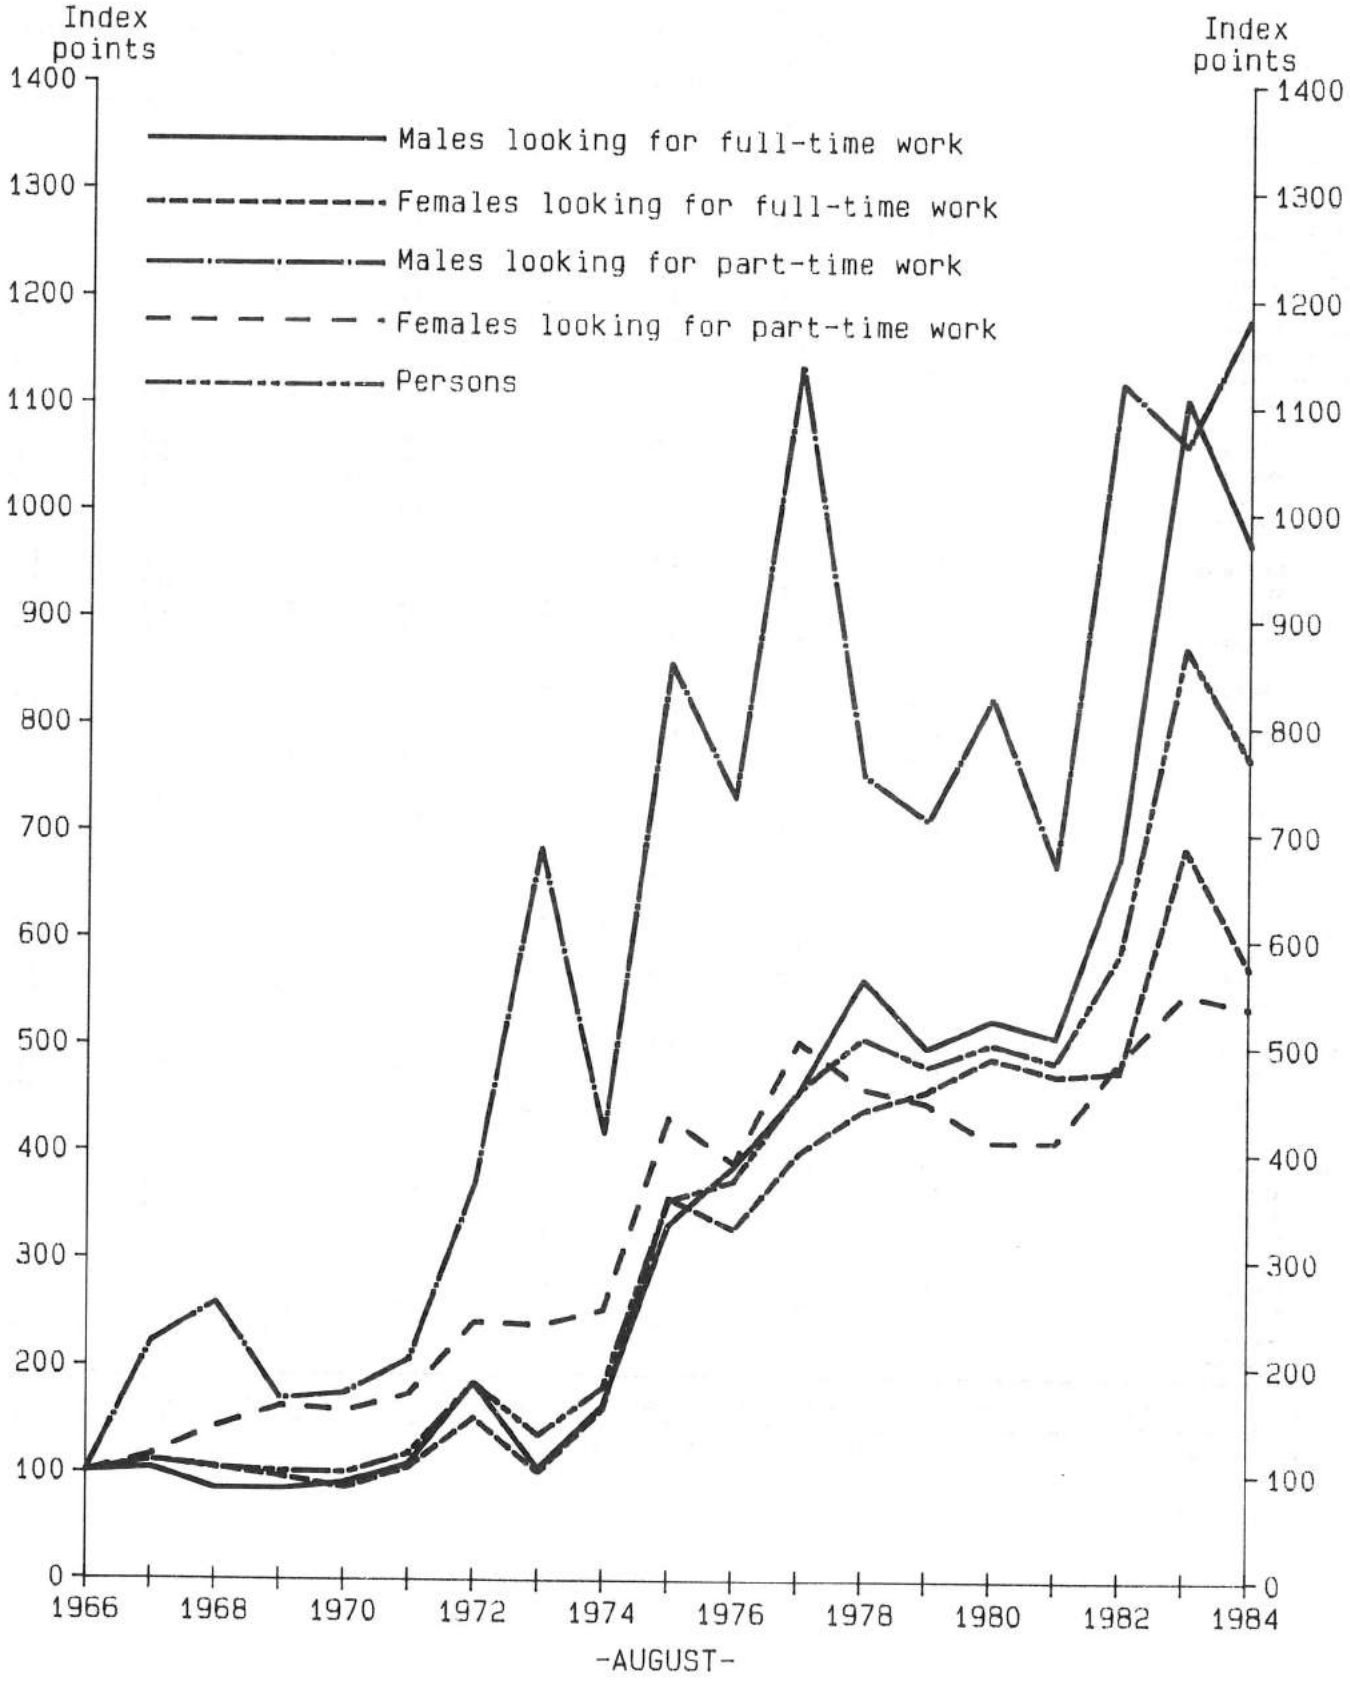
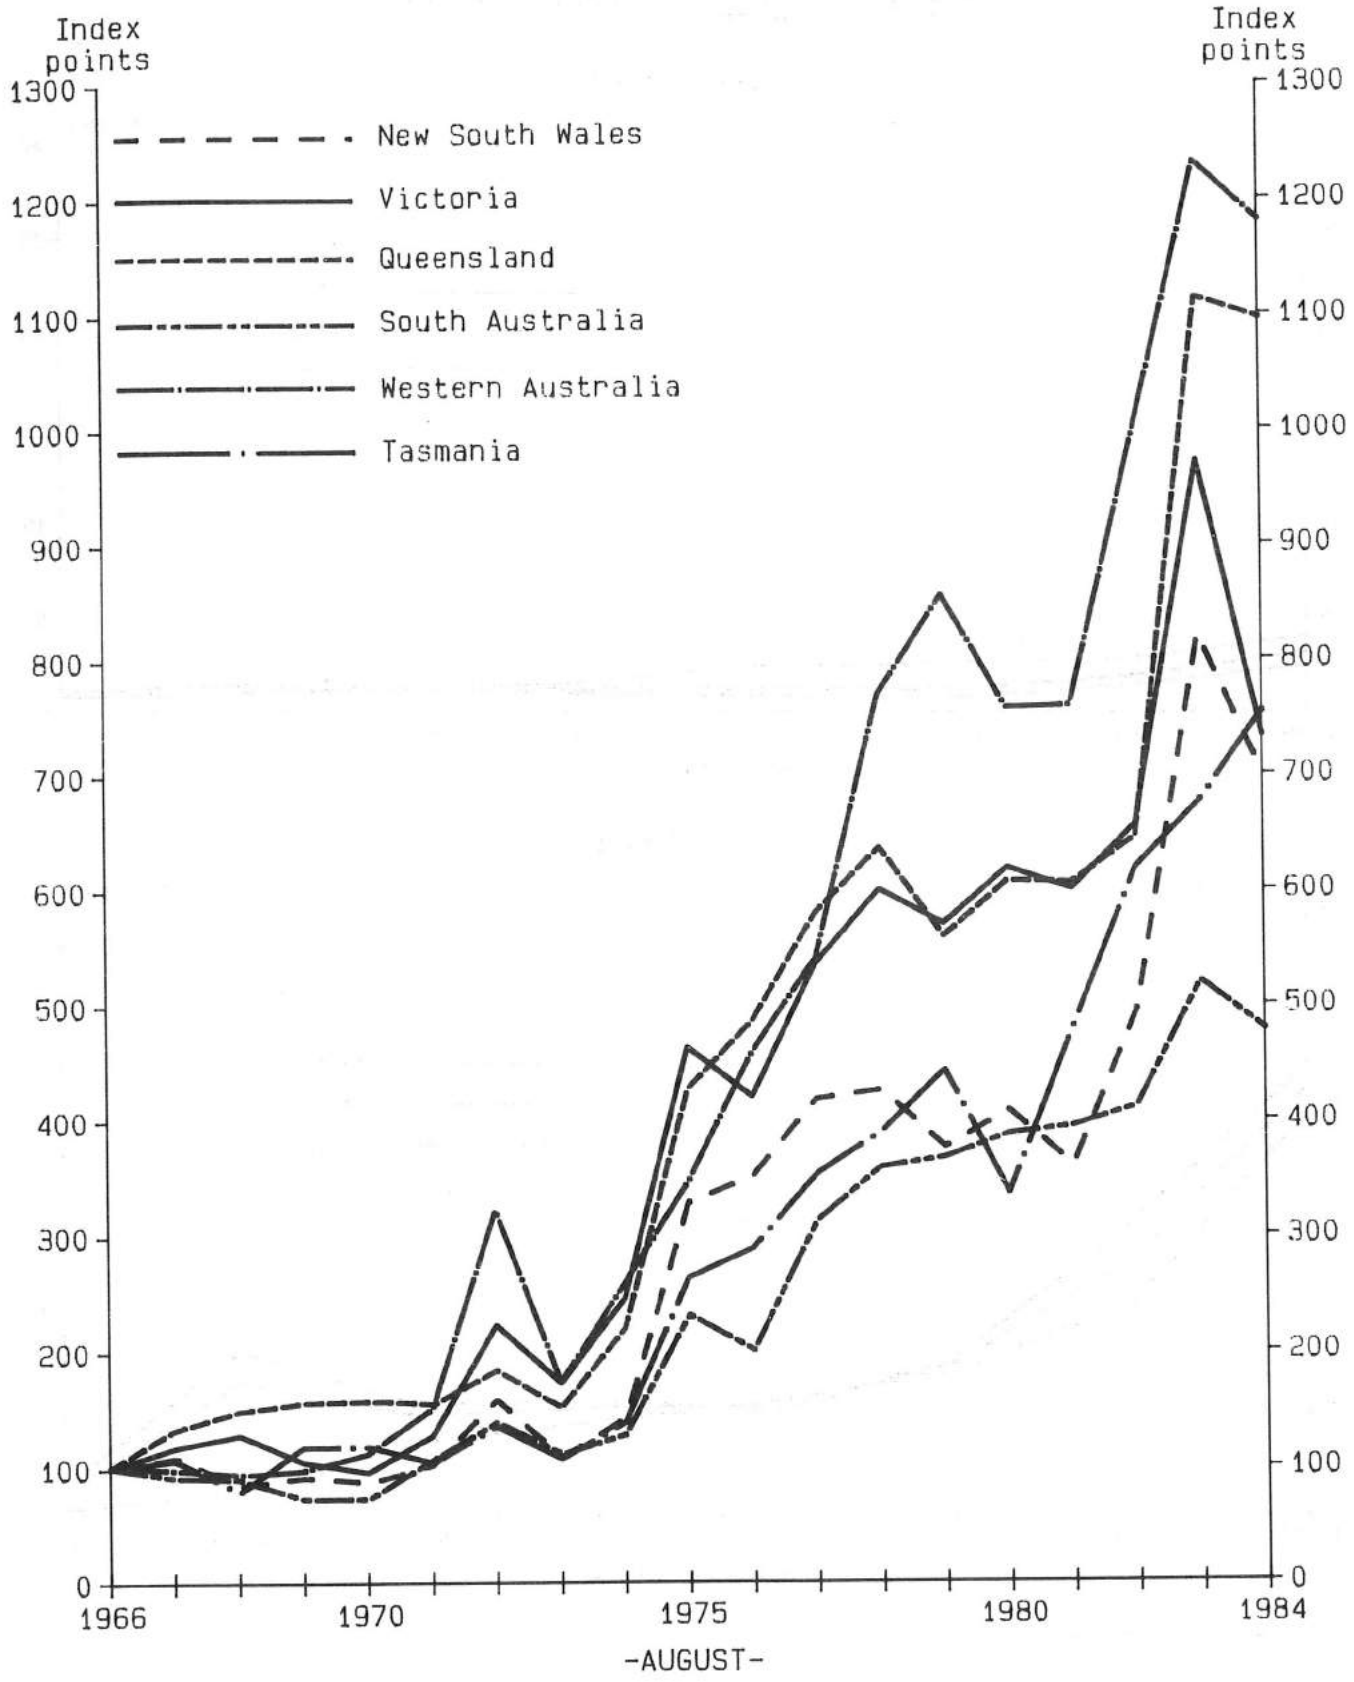
(a) Includes males aged 65 and over, females aged 60 and over, persons aged 65 and over, details for whom are not shown separately. (b) For information on change in timing of survey see Explanatory notes paragraph 7 and Appendix 2, paragraph 15. Estimates from February 1978 have been revised. See Explanatory notes paragraphs 30 to 33. For information concerning comparability of series see Explanatory notes paragraph 36 and Appendix 2, paragraphs 12 to 17.

CHART 17. INDEXES OF UNEMPLOYED PERSONS AUGUST 1966 TO AUGUST 1984 (a) (1966=100)



(a) See footnote (a) to Chart 1.

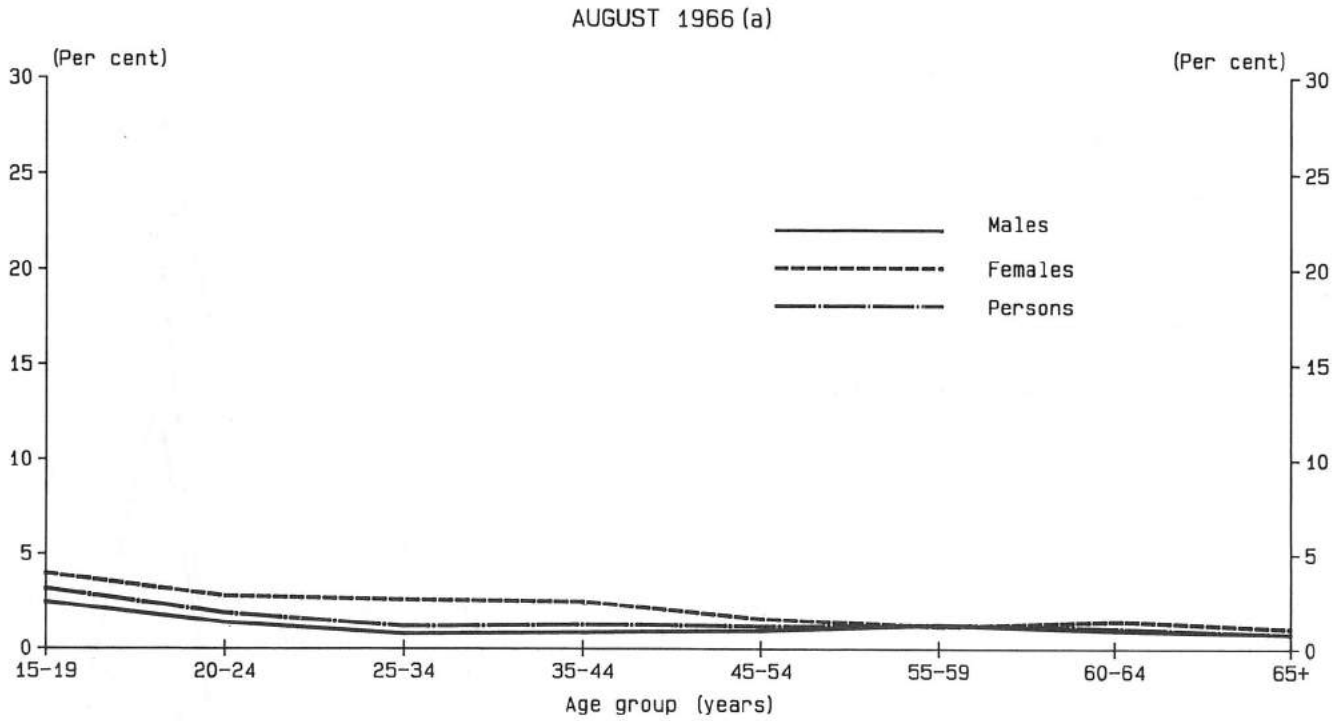
CHART 18. INDEXES OF UNEMPLOYED PERSONS: STATES AUGUST 1966 TO AUGUST 1984 (a) (1966=100)

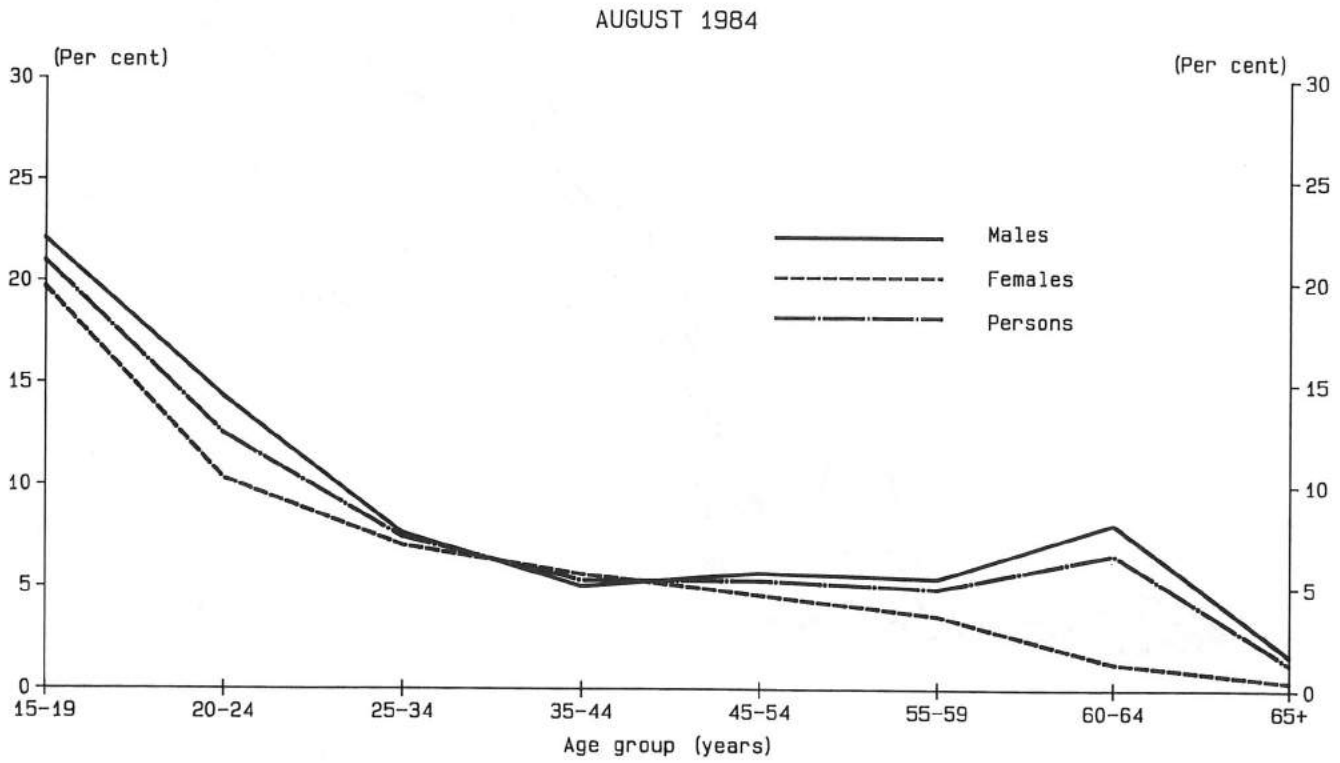


(a) See footnote (a) to Chart 1.

CHART 19. UNEMPLOYMENT RATES, BY AGE AUGUST 1966 AND AUGUST 1984

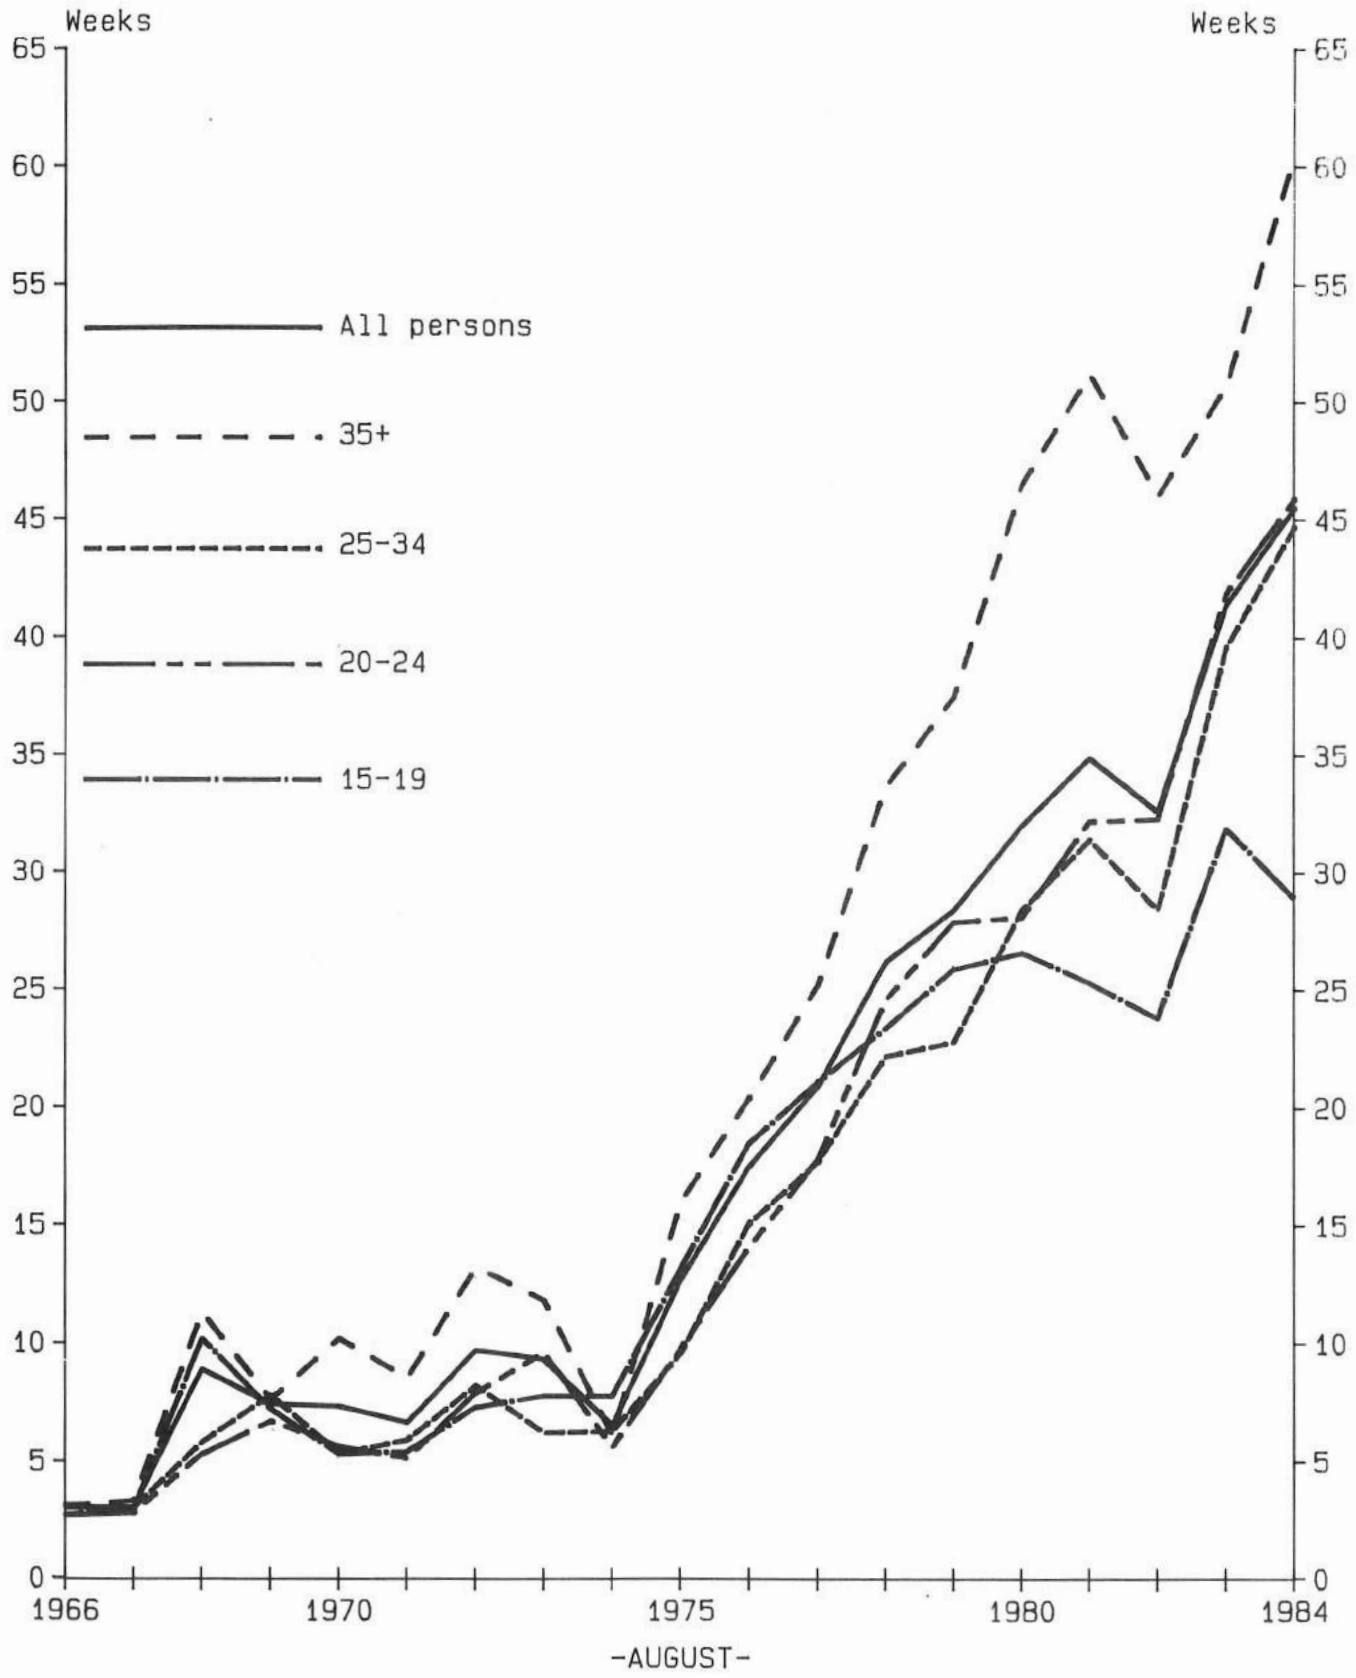
(The unemployed in each group as a percentage of the civilian labour force in the same group.)





(a) See footnote (a) to Chart 1.

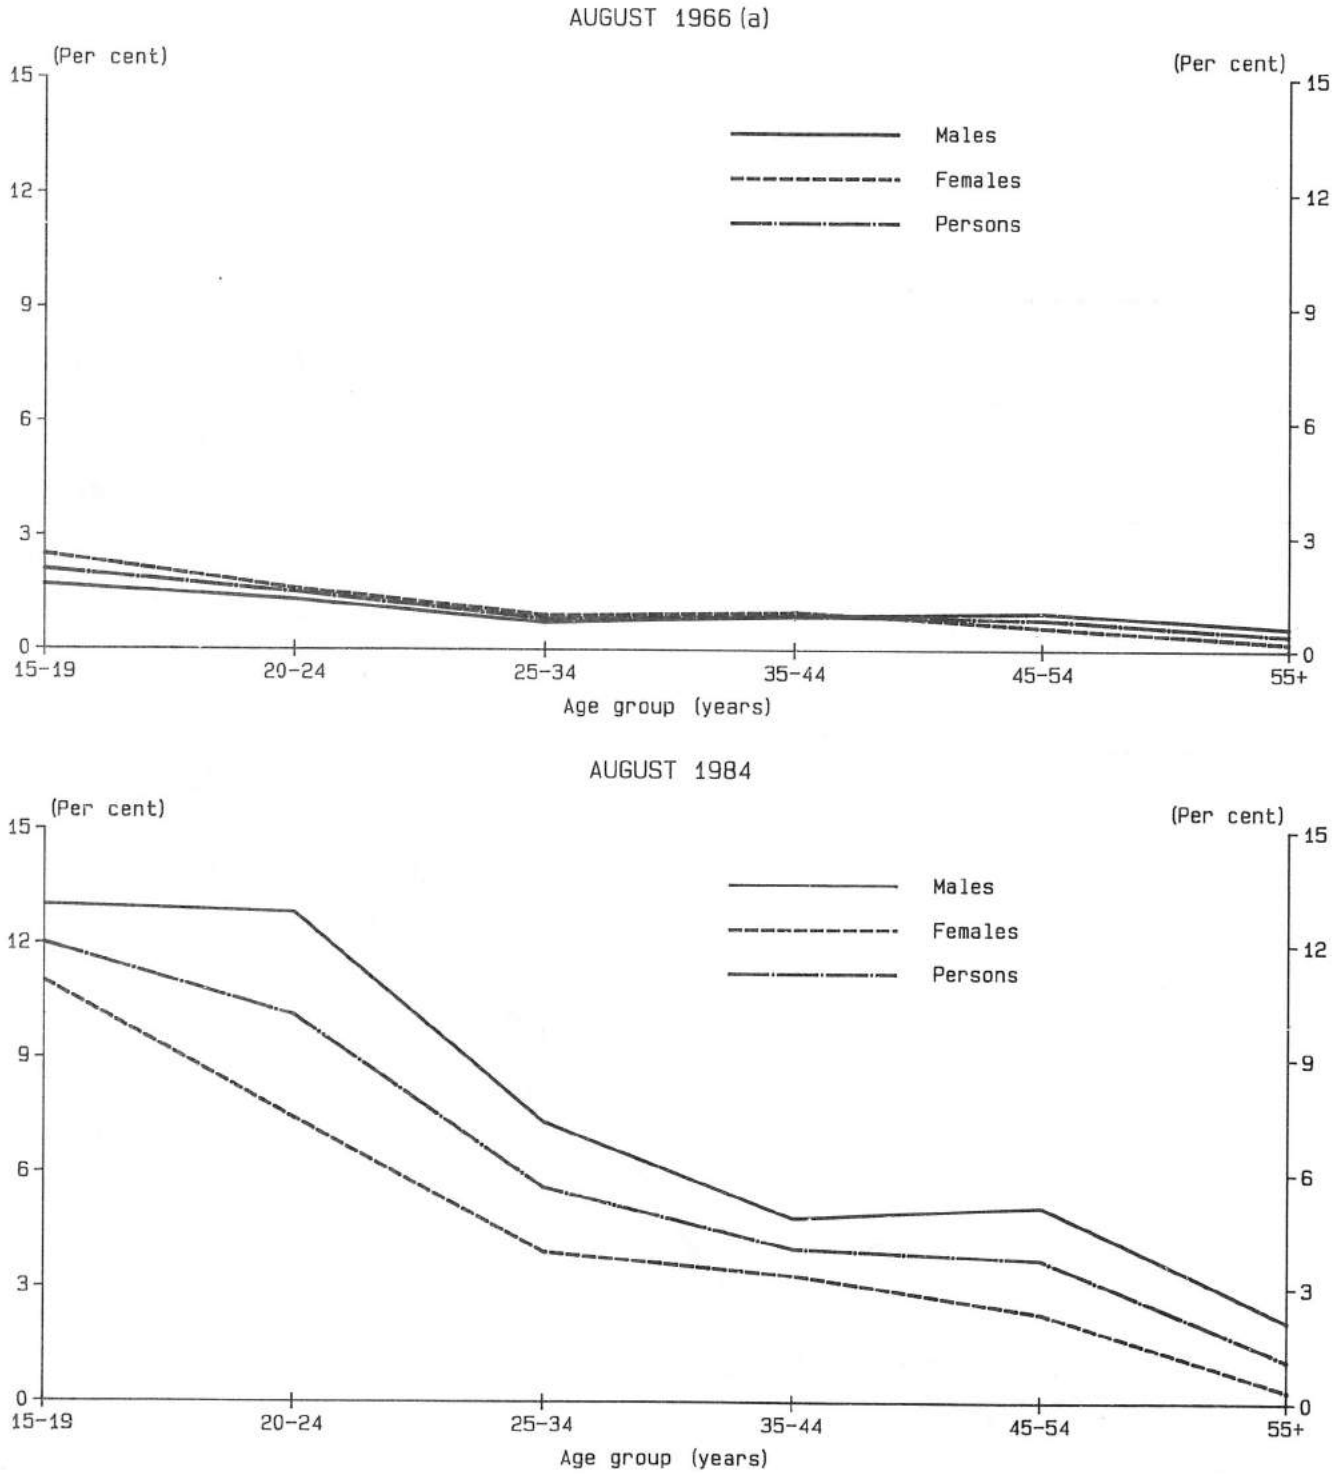
CHART 20. AVERAGE DURATION OF UNEMPLOYMENT, BY AGE AUGUST 1966 TO AUGUST 1984 (a)



(a) See footnote (a) to Chart 1.

CHART 21. UNEMPLOYMENT/POPULATION RATIOS, BY AGE

(The number of unemployed persons in each group as a percentage of the civilian population aged 15 and over in the same group.)



(a) See footnote (a) to Chart 1.

TABLE 45. PERSONS NOT IN THE LABOUR FORCE: AGE AND MARITAL STATUS ('000)

Month	Age group									Total

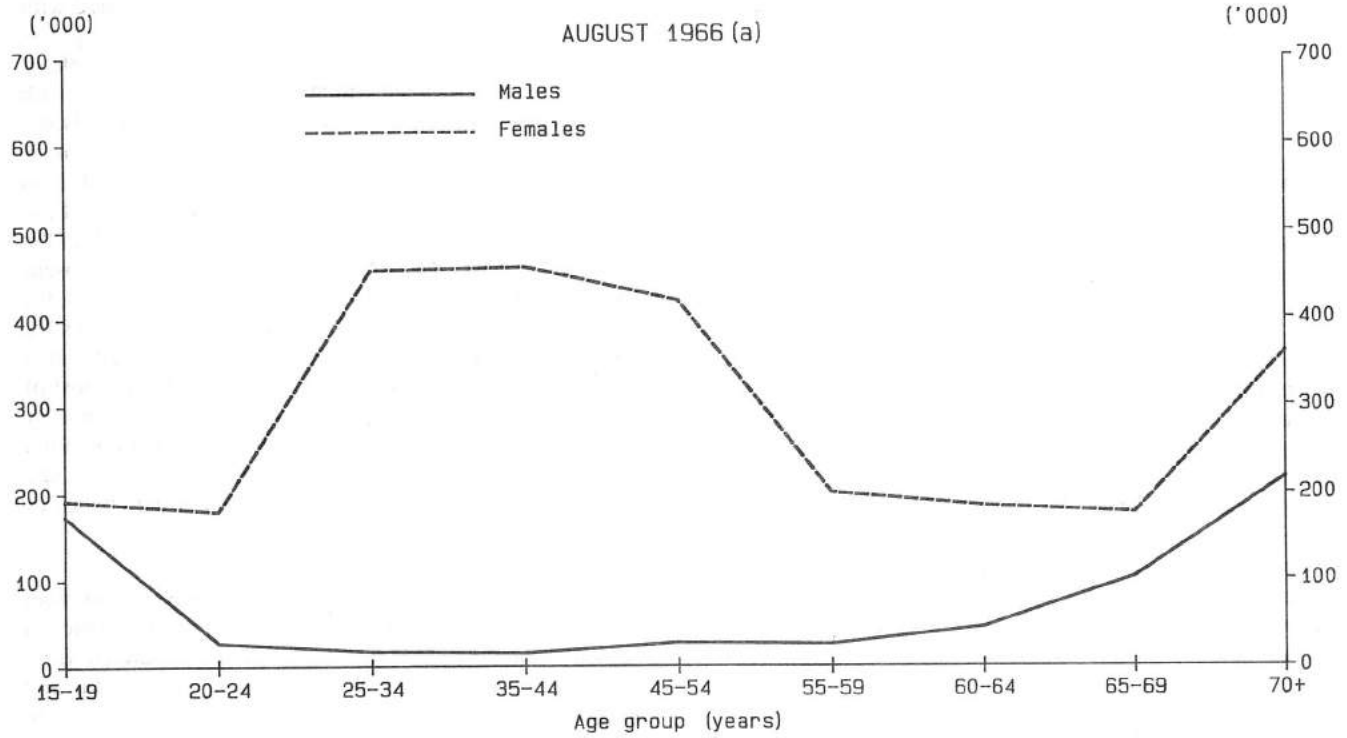
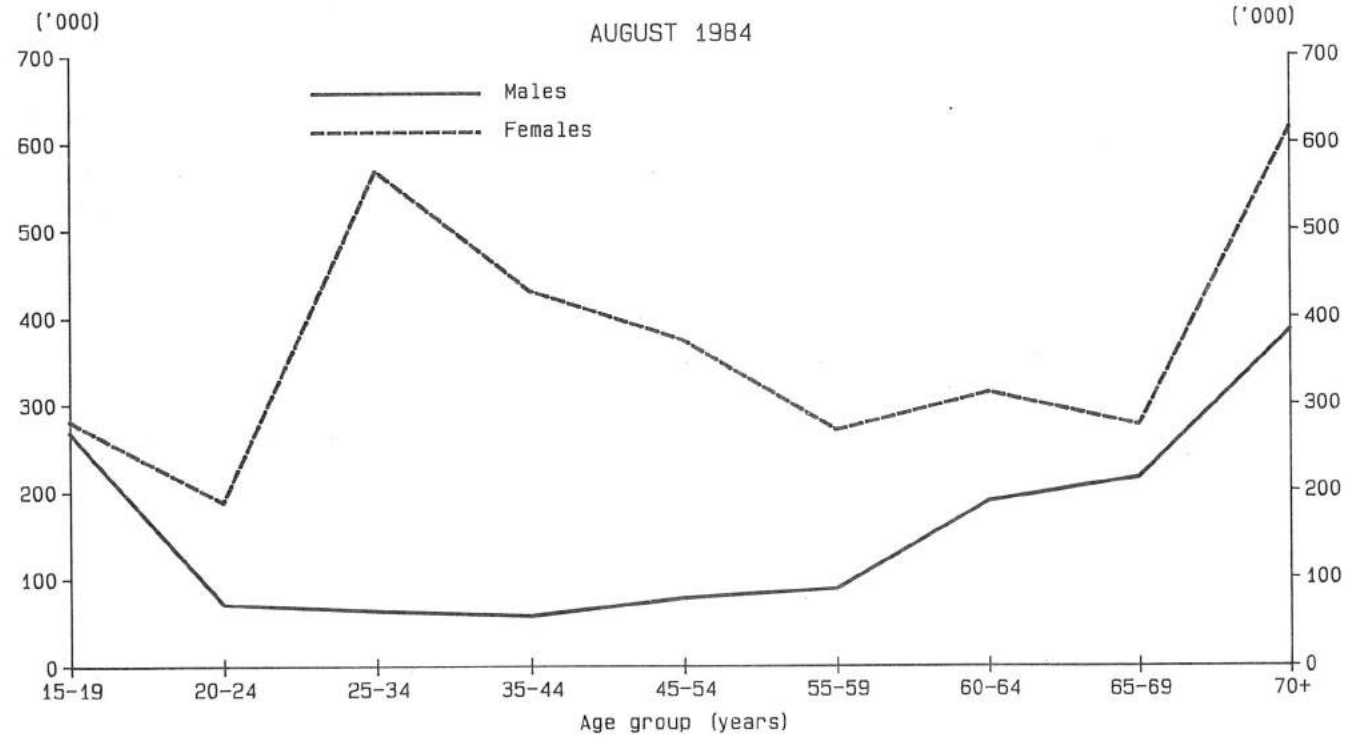
(a) Took active steps to find work but were not available to start work in the survey week for reasons other than their own temporary illness or injury. (b) Persons (except live-in staff) resident in hospitals, homes (e.g. convalescent), prisons and reformatories at the time of the survey.

CHART 22. PERSONS NOT IN THE LABOUR FORCE, BY AGE





(a) See footnote (a) to Chart 1.

TECHNICAL NOTE

The sample design

The sample used for the labour force survey is based on the population survey master sample, which is designed to permit the selection of samples for any purpose for which a sample of dwellings or persons is appropriate. Since the introduction of labour force surveys four different sample designs have been used, as outlined below.

2. The sample design for surveys carried out between August 1966 and August 1972 was based on a one per cent sample of households throughout Australia. About 40,000 private dwellings (houses, flats, etc.), as well as a sample of non-private dwellings (hotels, hospitals, etc.), were included.

3. Data obtained from the 1971 Census of Population and Housing were used to reselect the sample and a more efficient sample design was introduced during 1972. Different proportions of the population were included in the different States and Territories but, in aggregate, about two-thirds of one per cent of the population of Australia was included. The sample consisted of about 30,000 private dwellings as well as a sample of non-private dwellings. The new sample was phased in over three surveys, May to November 1972. The February 1972 estimates are based entirely on the old sample and the November 1972 estimates entirely on the new sample.

4. Following the 1976 Census of Population and Housing a further redesign was undertaken. The proportion of the population included for each State and Territory was unchanged, except for the Australian Capital Territory, where the proportion was increased from one-half to one per cent. This new sample was introduced in November 1977 when two surveys were conducted, one using the old sample and the other the new.

5. The population survey sample was again reselected following the 1981 Population Census, and a new sample in all States and Territories was introduced for the October 1982 survey. Because of the introduction of the new sample, there was not the usually high proportion of dwellings common to each of two consecutive surveys and the standard errors of movements between September and October 1982 are therefore higher than normal.

6. In reselecting the survey sample, the sampling fractions for States and Territories were not altered except for Western Australia. Because the population of the State was expected to overtake that of South Australia during the intercensal period, it was decided to make the sampling fraction for Western Australia 1 in 100, the same as for South Australia, instead of 1 in 90 as previously. This resulted in a slight increase in the standard errors of estimates for Western Australia.

7. Because of the difficulty of obtaining and keeping up to date a complete list of dwellings from which to select a sample, the population survey master sample is for the most part a sample of areas, the exception being the sample of non-private dwellings (i.e. certain types of dwellings for which lists are maintained and which have different characteristics in respect of size, geographical location and inhabitants). Since dwellings can readily be associated with the areas in which they are located, the area sample is equivalent to a sample of dwellings. To obtain a sample of persons, rules are adopted which associate each person with one and only one dwelling, either private or non-private. Briefly, these rules are designed so that a person is considered to be at his usual place of residence if it is occupied by one or more of its usual residents at any time during the week in which the survey is conducted and, at the time of the survey, the person is not expected to be absent from it for a specific continuous period (four weeks for surveys up to November 1977, and more than six weeks for February 1978 and later surveys). In other cases a person is considered to be at the dwelling at which he spends most of the survey week. Modifications to these rules are necessary for dwellings such as hotels and hospitals, which contain a high proportion of transient residents; nevertheless, the rules ensure that each person is given his correct chance of inclusion in the sample.

8. All dwellings in Australia are allocated to a number of mutually exclusive groups called strata, each of which is sampled separately. Private dwellings are separated from non-private dwellings and are divided into metropolitan and non-metropolitan areas, the latter being further divided into urban and rural areas. Dwellings within each of these divisions are grouped into strata according to location and socio-economic considerations. Non-private dwellings are divided between metropolitan and non-metropolitan areas and groups of strata.

9. The sample from the private dwelling strata in metropolitan and other densely populated areas is a self-weighting area sample, the dwellings being selected in three stages. The first stage is the selection of Census Collectors' Districts (CDs), a CD being the area covered by one population census collector; the second, the selection of blocks (areas which can be physically defined by streets or other recognisable features) from within selected CDs; and the third the selection of dwellings within selected blocks. Although the CDs and blocks have different probabilities of inclusion (probabilities approximately proportional to the number of dwellings they contain), the sample is self-weighting, that is, for surveys conducted between August 1964 and August 1972, each dwelling (and person) selected in Australia had the same probability of inclusion, and for surveys conducted since November 1972, each dwelling (and person) selected in a State or Territory has had the same probability of inclusion, the probabilities being as follows — New South Wales and Victoria, 1 in 200; Queensland, 1 in 140; South Australia, Western Australia, Northern Territory and the Australian Capital Territory, 1 in 100 (Western Australia was 1 in 90 from November 1972 to September 1982 and the Australian Capital Territory was 1 in 200 from November 1972 to November 1977); and Tasmania, 1 in 60. However, although, for example the probability of including any dwelling (or person) in South

Australia, is one in a hundred, this does *not* imply that exactly one-hundredth of all dwellings or persons are included. The number of dwellings or persons actually included may, by chance, be somewhat more or less than one-hundredth of the total number; certain steps taken to limit the size of this difference and to allow for its possible effect on survey estimates are described in paragraph 12.

10. In sparsely populated areas, a self-weighting four-stage area sample is generally used, with areas such as towns or rural Local Government Areas being the primary sample units at the first stage of selection and CDs, blocks and dwellings, the units at the subsequent stages. In some small towns the first stage of selection is omitted, the town itself being treated as though it were a single CD. Other modifications to the selection procedure are also made for certain other types or areas, but these affect only a small proportion of sample dwellings.

11. The sample of non-private dwellings in metropolitan and other densely populated areas is a self-weighting two-stage cluster sample, the sample units at each stage being (i) dwellings and (ii) either persons or accommodation units (e.g. rooms of hotels) within each dwelling. In the sparsely populated areas, a self-weighting three-stage cluster sample is used, sample units being (i) Local Government Areas or towns in the private dwelling sample (ii) dwellings and (iii) either persons or accommodation units within each dwelling. Where accommodation units are selected, rules are adopted to ensure that each person associated with the dwelling is associated with only one accommodation unit.

12. The effect of new dwellings, conversions, demolitions, etc. is taken into account in the sample selection procedure. For the private dwelling sample a check is made during each survey on all dwellings within each selected block. New dwellings detected are given the same chance of selection as other dwellings in the same block, so that, taking the sample as a whole, new dwellings also have the correct chance of being selected. Similar procedures exist for buildings converted for use as dwellings. Dwellings demolished or converted to non-dwelling use are removed from the sample. In areas where there has been an unusually rapid rate of growth of private dwellings since the sample was first selected, either very many or very few of the new dwellings will be in sample blocks or in sample CDs. Even though there will be no general tendency for the sample to include too many or too few new dwellings, the effect in particular areas of chance departures from a sample of exactly the correct distribution will be that a disproportionately high or low number of new dwellings will be included in these areas, and as a consequence characteristics of the persons associated with new dwellings will be over-estimated or under-estimated accordingly. To limit such effects, special procedures are adopted to ensure that the sample remains representative, a reselection of CDs being made from the appropriate stratum, if necessary. The lists of non-private dwellings used in the selection of the non-private dwelling sample are brought up to date every 6 months by using information available from sources external to the sample. The combined effect of these measures is that during any survey the sample of dwellings represents dwellings currently in existence in Australia.

13. When the population survey was conducted quarterly (i.e. until November 1977) the interviews at sample dwellings were carried out during a four-week period in metropolitan areas and a two-week period in non-metropolitan areas. Thus, data were obtained each quarter from four interpenetrating samples in metropolitan areas and two interpenetrating samples in non-metropolitan areas. For the monthly population survey the interview period is two weeks in metropolitan areas, and one week in non-metropolitan areas.

14. A selected private dwelling generally remains in the sample for eight surveys; hence for the quarterly surveys conducted up to November 1977, the period in the sample was generally two years, and for the monthly surveys conducted since February 1978 it has generally been eight months. In order to minimise respondent fatigue and to maintain continuity within the sample, one-eighth of the private dwellings in the sample are replaced after each survey. Adoption of this 'rotation' procedure, whereby seven-eighths of the sample remains unchanged from one survey to the next, enables more reliable measurements of survey-to-survey changes in the population and labour force characteristics to be made than would be possible if a new sample were introduced in each survey. Until November 1977, selected non-private dwellings (except the large ones) were retained in the sample for no longer than a year, with one quarter being replaced after each survey. However, since the introduction of monthly surveys in February 1978, selected non-private dwellings have been retained in the sample for eight surveys, with one-eighth of them being rotated out of the sample after each survey.

Estimation procedure

15. Labour force and other estimates derived from population survey data are obtained by using a complex ratio estimation procedure, in the application of which the following components are used:

(i) population estimates ('benchmarks') classified by State, metropolitan/non-metropolitan area, age and sex;

(ii) the number of persons with the characteristics being measured in the sample in each 'cell' formed by the benchmarks; and

(iii) the total number of persons in the sample in each cell.

The ratio of (ii) to (iii) is multiplied by the population benchmark for the appropriate cell to give an estimate of the total number of persons with the given characteristics in that population cell. This procedure ensures that survey estimates conform to the known distribution of the population by age and sex, even though (as can be expected in a sample) the sample itself may not exactly represent that distribution, and at the same time it automatically compensates for any inherent under-enumeration or over-enumeration in the sample.

16. It will be appreciated that the theoretical soundness of the sample design could be greatly affected in practice by any substantial degree of failure to obtain information in respect of all persons selected, whether from failure on the part of the interviewer to make contact or from lack of co-operation by respondents. For this reason a high level of response is sought and, in fact, generally about 96 per cent of households fully respond to the survey.

Reliability of the estimates

17. Two types of error are possible in an estimate based on a sample survey; sampling error and non-sampling error. The *sampling error* is a measure of the variability that occurs by chance because a sample, rather than the entire population, is surveyed. Since the estimates in this publication are based on information obtained from occupants of a sample of dwellings they, and the movements derived from them, are subject to sampling variability; that is, they may differ from the figures that would have been produced if all dwellings had been included in the surveys. One measure of the likely difference is given by the *standard error*, which indicates the extent to which an estimate might have varied by chance because only a sample of dwellings was included. There are about two chances in three that a sample estimate will differ by less than one standard error from the figure that would have been obtained if all dwellings had been included, and about nineteen chances in twenty that the difference will be less than two standard errors. Another measure of sampling variability is the *relative standard error* which is obtained by expressing the standard error as a percentage of the estimate to which it refers. The relative standard error is a useful measure in that it provides an immediate indication of the percentage errors likely to have occurred due to sampling, and thus avoids the need to refer also to the size of the estimate.

18. Space does not allow for the separate indication of the standard errors of all estimates in this publication. Estimates for the period August 1966 to December 1984 are based on one of four different sample designs (see paragraphs 2 to 4).

19. Standard errors of estimates for October 1982 to December 1984 are shown in Table A. Tables B and C show, respectively, for the same time period, standard errors of estimates of monthly movements and publication cut-offs for labour force estimates. Table D shows standard errors of estimates of monthly movements between September and October 1982. (See paragraph 5.)

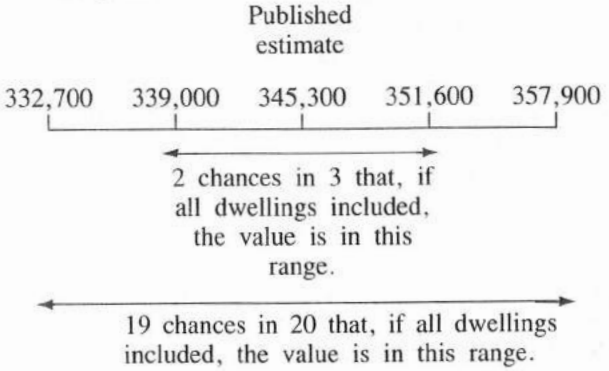
20. The size of the standard error increases with the level of the estimate, so that the larger the estimate the larger the standard error. However, it should be noted that the larger the sample estimate the smaller will be the standard error in percentage terms. Thus, larger sample estimates will be relatively more reliable than smaller estimates.

21. As the standard errors in Table A show, *the smaller the estimate the higher is the relative standard error*. Very small estimates are subject to such high standard errors (relative to the size of the estimate) as to detract seriously from their value for most reasonable uses. For the labour force survey, estimates which have a relative standard error larger than 25 per cent are not published. In the tables in this publication, estimates below the levels shown in Table C, and percentages based on such estimates, have not been included but are indicated with a '*'. Although figures for these small components can in some cases be derived by subtraction, they should not be regarded as reliable. See paragraph 24 concerning higher or lower publication cut-off points for some estimates.

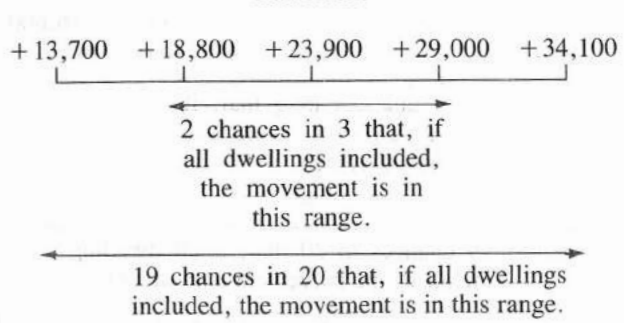
22. The movement in the level of an estimate is also subject to sampling variability. The standard error of the movement depends on the levels of the estimates from which the movement is obtained rather than the size of the movement. An indication of the magnitude of standard errors of monthly movements is given in Table B. The estimates of standard error of monthly movements apply only to estimates of movements between two consecutive months. Movements between corresponding months of consecutive quarters (quarterly movements), corresponding months of consecutive years (annual movements) and other non-consecutive months, will generally be subject to somewhat greater sampling variability than is indicated in Table B. Standard errors of *quarterly* movements can be obtained by multiplying the figures in Table A by 1.11. Standard errors of quarterly estimates calculated this way will not necessarily agree with those obtained by multiplying the figures in Table B by 1.4, which was the method shown in previous issues of this publication. This is because Tables A and B are derived independently of each other. Standard errors of all annual movements can be obtained by multiplying the figures in Table A by 1.3. When using Table A or Table B to calculate standard errors of movements, refer to the larger of the two estimates from which the movement is derived.

23. Examples of the calculation and use of standard errors are given below:

(a) From Table A it will be seen that the estimate of 345,300 unemployed males looking for full-time work in December 1984 has a standard error of about 6,300. Therefore there are about two chances in three that the number that would have been obtained if all dwellings had been included in the survey would have been within the range 339,000 to 351,600 and about nineteen chances in twenty that it would have been within the range 332,700 to 357,900.



(b) The estimate of movement in the number of unemployed males looking for full-time work from November to December 1984 is an increase of 23,900. Table B relates the standard error of the monthly movement to the larger of the two estimates from which the movement is derived. In this case the December 1984 estimate (345,300) is the larger. From Table B it will be seen that the standard error of the monthly movement is about 5,100. Therefore there are about two chances in three that if all dwellings had been included in the surveys the movement would have been within the range +18,800 to +29,000 and about nineteen chances in twenty that it would have been within the range +13,700 to +34,100



24. The relative standard errors of estimates of *aggregate hours worked, average hours worked, average duration of unemployment,* and *median duration of unemployment* are obtained by first finding the relative standard error of the estimate of the total number of persons contributing to the estimate (see Table A) and then multiplying the figure so obtained by the following relevant factors:

Aggregate hours worked: 1.2
Average hours worked: 0.7
Average duration of unemployment: 1.3
Median duration of unemployment: 2.0

Publication cut-off points for these and other labour force estimates (see paragraph 21) are shown in Table C. Because of these higher relative standard errors, estimates of aggregate hours worked, average duration of unemployment, and median duration of unemployment have higher cut-off points for publication (see paragraph 21) than other estimates as shown in Table A.

25. An example of the calculation of standard errors by the use of these factors is as follows:

In November 1984 the estimate of median duration of unemployment for unemployed males was 26 weeks (from Table 35) and the number unemployed was estimated as 341,100. From Table A it can be estimated that this figure (341,100) has a standard error of about 6,400 and therefore a relative standard error of about 1.9 per cent. The *relative standard error* of the estimate of median duration of unemployment is calculated by multiplying this figure (1.9) by the appropriate factor shown in the previous paragraph (in this case 2.0): $1.9 \times 2.0 = 3.8$ per cent. The *standard error* of this estimate of median duration of unemployment is therefore 3.8 per cent of 26, i.e. 1.0. Therefore there are about two chances in three that the median duration of unemployment for unemployed males that would have been obtained if all dwellings had been included in the survey would have been within the range 25 to 27 weeks and about nineteen chances in twenty that it would have been within the range 24 to 28 weeks.

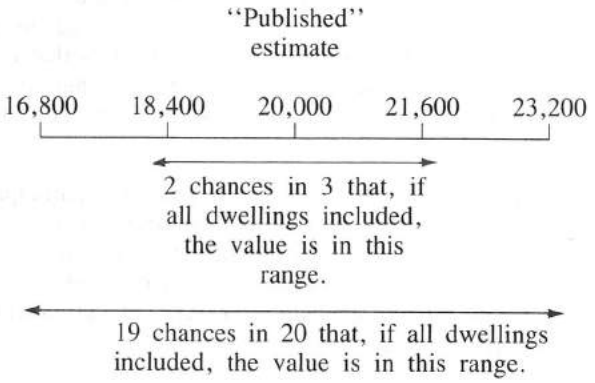
26. Proportions and percentages (for example, participation rates) formed from the ratio of two estimates are also subject to sampling error. The size of the error depends on the accuracy of both the numerator and denominator. The formula for the relative standard error (RSE) of a proportion or percentage is given below:

$$RSE(x/y) = \sqrt{[RSE(x)]^2 - [RSE(y)]^2}$$

27. Standard errors contained in Tables A and B are designed to provide an average standard error applicable for all monthly labour force survey estimates from October 1982 to December 1984. Recent analysis of the standard errors applicable to particular survey estimates has shown that the standard errors of estimates of employment are generally equivalent to those shown in Tables A and B, while standard errors for unemployment and not in the labour force are approximately 3 per cent and 11 per cent respectively higher than those shown in the tables. Standard errors for capital cities are approximately the same as those for corresponding States. Standard errors for estimates classified by country of birth are approximately the same for persons born in Australia. For aggregate estimates of persons born outside Australia the standard errors are about 15 per cent higher. The standard errors vary for individual countries of birth but are generally less than 10 per cent higher.

28. Standard errors of estimates for November 1977 to September 1982 are shown in Table E. To obtain the standard errors of estimates for August 1966 to August 1977 the standard error obtained from Table E should be multiplied by the appropriate factor from Table F. Because of the reduction in the sample size for November 1975 and November 1977 the standard errors for all estimates from these surveys, except unemployed persons looking for full-time work in November 1977, should be increased by a factor of 1.15. The figures in Table E will not give a precise measure of the standard error of a particular estimate since they are averages based on calculations for a limited number of surveys over a wide range of labour force characteristics. However, they will provide an indication of the magnitude of the standard error of any particular estimate for any particular survey. An example of the use of Tables E and F is as follows. If the estimate obtained for New South Wales from a survey carried out in 1974 is 20,000 the standard error obtained from Table E is about 2,000, and the factor from Table F is 0.8, and therefore the standard error is about 1,600 ($2,000 \times 0.8$). That is, there are two chances in three that the number that would have been obtained if all

dwellings had been included in the survey would have been within the range 18,400 to 21,600 and about nineteen chances in twenty that it would have been within the range 16,800 to 23,200.



29. An indication of the magnitude of the standard error of *quarter-to-quarter* change for the period November 1972 to February 1978 is given in Table G. To obtain the standard error of quarter-to-quarter change for the period August 1966 to November 1972 the standard errors in Table G should multiplied by the appropriate factors shown in Table H.

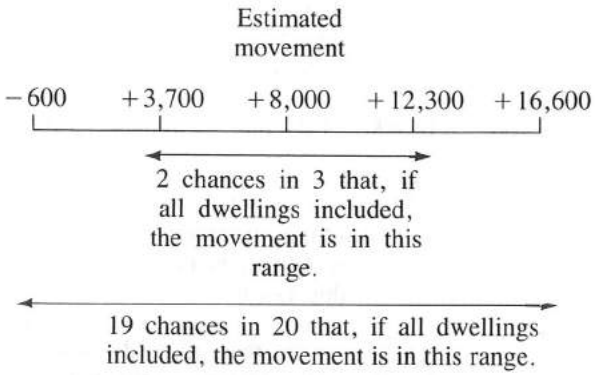
30. An indication of the magnitude of the standard error of *monthly* movements for the period from February 1978 to September 1982 is given in Table I. A guide to the standard errors of *quarterly* movements for periods from February 1978 to September 1982 can be obtained by multiplying the figures shown in Table I by 1.4.

31. A guide to standard errors of *annual* movements can be obtained for the period August 1966 to November 1972 by multiplying the figures derived from Tables G and H by 1.5; for the period November 1972 to February 1978 by multiplying the figures in Table G by 1.3; and for the period February 1978 to September 1982 by multipying the figures in Table E by 1.4. For *annual* movements between estimates which come from two different sample designs (see paragraphs 1 to 4) the standard error of movement may be obtained by multiplying the standard error of the larger *estimate* (obtained from Table E or F) by 1.4.

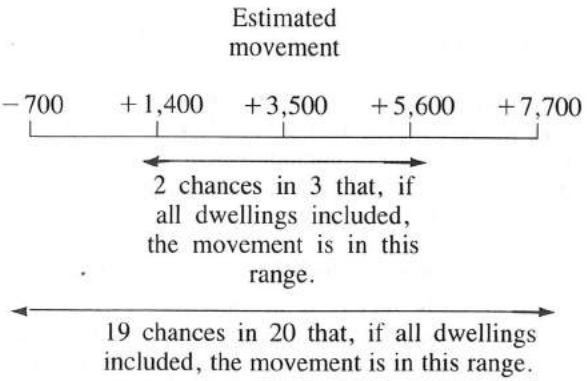
32. The estimates of standard errors of quarterly and monthly movements apply only to estimates of movements between two successive quarters or months. Movements between corresponding quarters and months of successive years (i.e. annual movements) are discussed above. Movement between two other non-consecutive quarters or months will generally be subject to somewhat greater sampling variability than is indicated in Tables G to I, but usually no greater than the standard error of the corresponding annual movements.

33. Examples of the use of Tables G and I are given below.

(a) If a survey estimate for Australia increased from 192,000 in one month in 1978 to 200,000 in the next month the standard error of the monthly increase of 8,000 can be obtained directly from Table I. The standard errors in that table relate to the size of the larger of the two estimates from which the movement is derived. In this case the larger estimate is 200,000 and it will be seen that the standard error of this monthly movement is 4,300. Therefore there are about two chances in three that if all dwellings had been included in the surveys the movement would have been within the range +3,700 to +12,300 and about nineteen chances in twenty that it would have been within the range −600 to +16,600.



(b) Assume a survey estimate for Australia increased from 6,500 in August 1974 to 10,000 in August 1975. From Table G the standard error of the larger of the two estimates for a quarterly movement is 1,600. Referring to paragraph 31 the standard error of the *annual* movement (3,500) can be obtained by multiplying this standard error by 1.3, i.e., it is about 2,100. There are two chances in three that if all dwellings had been included in the surveys the movement would have been within the range +1,400 to +5,600 and nineteen chances in twenty that the estimate would have been within the range −700 to 7,700.



34. The imprecision due to sampling variability, which is measured by the standard error, should not be confused with inaccuracies that may occur because of imperfections in reporting by interviewers and respondents. Inaccuracies of this kind are referred to as the non-sampling error, and they may occur in any statistical collection whether it be a full count or only a sample. It is not possible to quantify these *non-sampling errors*, but every effort is made to

minimise them by careful design of questionnaires, intensive training and supervision of interviewers and efficient operating procedures.

TABLE A. STANDARD ERRORS OF ESTIMATES, OCTOBER 1982 TO DECEMBER 1984

Size of estimate	*N.S.W.*	*Vic.*	*Qld*	*S.A.*	*W.A.*	*Tas.*	*N.T.*	*A.C.T.*	*Australia*

TABLE D. STANDARD ERRORS OF ESTIMATES OF MONTHLY MOVEMENTS BETWEEN SEPTEMBER AND OCTOBER 1982

The introduction of a new sample in October 1982 resulted in the standard errors of movements between September and October 1982 shown in the table below being higher than normal (see paragraph 5 of this Technical Note). Standard errors of *quarterly and annual* movements ending in October 1982 can also be obtained directly from the table below.

Size of larger estimate	*N.S.W.*	*Vic.*	*Qld.*	*S.A.*	*W.A.*	*Tas.*	*N.T.*	*A.C.T.*	*Australia*

APPENDIX 1

SEASONAL ADJUSTMENT OF LABOUR FORCE SURVEY ESTIMATES: EXPLANATORY NOTES

Introduction

1. Labour force surveys were conducted quarterly by the ABS up to and including November 1977 and have been conducted each month since February 1978. Table 2 contains seasonally adjusted labour force series for the period August 1966 to December 1984.

2. As happens with all seasonally adjusted series, the seasonal factors are reviewed annually to take account of each additional year's original data. When interpreting trends based on seasonally adjusted series, it should always be borne in mind that seasonally adjusted figures by their nature will be revised when later information is used in calculating the seasonal factors.

Unemployment series

3. Seasonally adjusted *monthly* unemployment estimates are shown for the period February 1978 to December 1984.

4. The seasonally adjusted monthly estimates of unemployed males, females and persons looking for full-time work have been obtained by aggregating the independently adjusted estimates of several components, i.e. unemployed persons aged 15 to 19 looking for their first full-time job, other unemployed aged 15 to 19 looking for full-time work, and unemployed persons aged 20 and over looking for full-time work. In the case of unemployed married females, the series has been adjusted directly. Seasonally adjusted estimates of unemployed persons looking for part-time work are then added to the above estimates to obtain seasonally adjusted estimates of total unemployment. This aggregative approach is used because of the disparate trends and seasonal patterns in the component series. Seasonally adjusted unemployment rates for unemployed persons looking for full-time work and for total unemployed are calculated by dividing the appropriate seasonally adjusted unemployment series by the corresponding seasonally adjusted estimates of the labour force.

5. In 1974 and 1975 the seasonal pattern of the unemployment series changed significantly after the rapid rise in unemployment which occurred at that time. However, the further large increase in unemployment in 1982 and 1983 does not appear to have been accompanied by a similar change in seasonal pattern.

6. Seasonal adjustments of some *quarterly* unemployment series are shown for the period August 1966 to November 1977. Because of the significant change in the seasonal pattern of the unemployment series in 1974 and 1975, the quarterly series are published in two segments. Data prior to February 1974 have been analysed to provide seasonal adjustment factors for the period up to and including November 1974. Factors for the period from February 1975 to November 1977 have been obtained by analysing estimates for this period together with the corresponding monthly observations from the monthly survey up to May 1980, the latter being included in the analysis to obtain a sufficiently long series for reliable estimation of seasonal factors for the three-year period in question.

7. Those wishing to assess trends in unemployment series over the last twenty years or so should take into accout that the seasonally adjusted figures have been estimated as three different segments; a quarterly series until November 1974; another quarterly series from February 1975 to November 1977; and a monthly series from February 1978. The quarterly survey was conducted in the months of February, May, August and November. When comparing estimates for February 1978 and subsequent months with those for earlier periods it should be noted that with the introduction of monthly surveys the interviews are now conducted during a two-week period, whereas formerly the period was four weeks. This change of timing may affect the level of the figures for any month, but especially for months during which the labour force status of the population may be changing rapidly.

8. Also the quarterly series for February, May, August and November omits the months of December and January in which unemployment is seasonally high. Therefore the average annual value of the quarterly series is less than that of the monthly series, which affects the level of the seasonal adjustment factors as between the two segments. This results in a further discontinuity in the general level of the seasonally adjusted series between the quarterly and monthly segments. The effect is small for most components of the seasonally adjusted unemployment series, but for unemployed persons 15 to 19 years looking for their first full-time job it is pronounced.

Other labour force series

9. Seasonally adjusted *quarterly* estimates of labour force series other than the unemployment series (namely, employed persons, labour force and labour force participation rate) are shown in Table 2. The series are based on estimates from the quarterly labour force survey which ceased in November 1977 and corresponding monthly data for February, May, August and November from the monthly labour force survey which commenced in February 1978.

10. As the change in level of unemployment in 1974 did not cause any series discontinuity of the seasonal pattern of these series, they are seasonally adjusted in two segments. The first segment is the quarterly series up until November 1977 and the second segment is the monthly series from February 1978. When comparing estimates for February 1978 and subsequent months with the quarterly estimates from the earlier period the differences between the quarterly and monthly surveys should be noted (see paragraphs 7 and 8 above).

11. Seasonally adjusted *monthly* estimates of employed persons, labour force and labour force participation rate for the period February 1978 to December 1984 are also shown in Table 2.

Interpretation of seasonally adjusted series

12. As with all seasonally adjusted series, the seasonally adjusted figures still reflect the sampling and non-sampling errors to which the original figures are subject. Furthermore, the seasonal adjustment process does not attempt to remove the effects of random influences (such as industrial disputes) on the estimates. Care should be taken in drawing conclusions as to the trend of the series on the basis of only a few months of seasonally adjusted figures.

13. Data for males, females and persons for each labour force series have been adjusted independently of each other. Because of this approach, the adjusted series for males and females may not add to the adjusted series for persons. Similarly, adjusted series for employment and unemployment may not add to the adjusted labour force series. The differences are generally not large in comparison with the month-to-month variability of the seasonally adjusted series.

Further information

14. The quarterly and monthly labour force survey series have also been published in *Seasonally Adjusted Indicators, Australia* (1308.0) and *Time Series Data on Magnetic Tape and Microfiche* (1311.0).

15. Further details of the methods of adjustment of, and selected measures of variability for these series are available upon request and are included in *Seasonally Adjusted Indicators, Australia 1983* (1308.0).

APPENDIX 2
LABOUR FORCE SURVEY ESTIMATES FROM AUGUST 1966 TO NOVEMBER 1977: EXPLANATORY NOTES

Revision of series

Information concerning the methods used in revising the estimates from August 1966 to November 1977 to conform to population estimates which take account of the results of the 1976 Population Census is given in the following paragraphs.

2. *Revised population estimates.* Survey estimates are not revised for the usually small amendments to population benchmarks arising from new data on deaths and migration. Revisions are made, however, after each census and when the basis of population estimation is reviewed. Therefore, when the population estimates were revised to take account of the results of the 1966, 1971 and 1976 population censuses, including estimates of underenumeration, and to incorporate a revised method of measuring overseas migration gain (i.e. by excluding movements of less than one year's duration), the labour force survey estimates were also revised. For information concerning the revised population estimates for the period June 1971 to June 1977 see *Population and Vital Statistics: June Quarter 1977* (3212.0).

3. The *new sample* and *revised questionnaire.* A new sample based on the 1976 Population Census was used for the February 1978 survey and the survey data were obtained by means of a revised questionnaire. The new sample was selected in order to reflect the changes in the distribution of the population shown by the 1976 Population Census results. The questionnaire, which had undergone little change since 1960 except for the inclusion in 1975 of additional questions on job-seeking, was revised to provide more accurate and more detailed information concerning the labour force.

4. Copies of both the revised questionnaire and the one previously used, together with a description of the main features of the revised questionnaire, are contained in the March 1978 issue of *Information Paper: Questionnaires used in the Labour Force Survey* (6232.0).

5. In order to provide an indication of the effects of the new sample and revised questionnaire, two surveys were undertaken during the same four-week period in November 1977, one using the old sample and questionnaire and the other using the new sample and revised questionnaire. Although it would have been desirable to conduct two surveys in other months in order to measure more accurately the effects of the new sample and revised questionnaire, that could not be done because of considerations of cost. Also, because of the cost of conducting two surveys concurrently, the sample size of both surveys had to be reduced to one-half of one per cent of the population (from the normal two-thirds of one per cent). The results of the two November surveys were used to calculate certain adjustment factors which were applied to the estimates from August 1966 to August 1977 to make them as comparable as possible with the results of later surveys. (See paragraphs 14 and 15). Estimates from February 1978 to January 1984 have subsequently been revised. See page 3, paragraphs 30 to 33 of the Explanatory Notes to this publication.

6. It was expected that the estimates derived from the new sample and revised questionnaire would differ to some extent from those derived from the old sample and questionnaire, for the following reasons:

(a) Whilst the revised questionnaire was designed to collect data according to basically the same definitions as previously, it was expected that the improved wording of some questions aimed at collecting more accurate data would result in some changes.

(b) A different sample could be expected to produce a different result.

(c) Dwellings in the old sample had been included in the survey for at least three occasions and up to a maximum of nine, whilst all dwellings in the new sample were included in the survey for the first time. From previous experience it was considered likely that there would be differences in the quality of the data provided by new entrants into the survey and those who had been surveyed several times.

7. In revising the estimates for the period August 1966 to November 1977 the old estimates were first recalculated incorporating revised population benchmarks, as explained in paragraph 2. These adjusted estimates were then further revised to take account of the effect of the new sample and revised questionnaire. The methods used are summarised below.

8. *Estimates for November 1977.* Estimates for the various labour force status categories of the population were obtained as follows:

(a) *Employed persons.* The estimates adopted were those obtained by using the new sample and revised questionnaire.

(b) *Unemployed persons looking for full-time work.* It was considered that the revised questionnaire had relatively little effect on the estimates for this category and the November 1977 estimates were obtained by averaging the results of the two November surveys. The amalgamation of the two results produced estimates based on a sample of one per cent of the population.

(c) *Unemployed persons looking for part-time work.* In the old questionnaire only one question was

asked in order to establish whether persons had been looking for work and this was followed by a question on whether full-time or part-time work was being sought. In the revised questionnaire two questions were asked: whether or not the persons had been looking for full-time work, and if not, whether or not they had been looking for part-time work. It was clear that a considerable increase in the estimated number of unemployed persons seeking part-time work had resulted from the inclusion of a separate question on this aspect of unemployment and the estimates obtained by using the new sample and revised questionnaire were therefore adopted.

(d) *Labour force*. Revised estimates were obtained by adding revised estimates of employed and unemployed persons.

(e) *Persons not in the labour force*. Revised estimates were obtained by subtracting revised labour force estimates from revised population benchmarks.

9. *Estimates for periods before November 1977*. The estimates for employed and unemployed persons for the period from August 1966 to August 1977 were adjusted to new population benchmarks (see paragraph 2) and were then further revised by applying to them adjustment factors derived from the results of the two surveys conducted for November 1977 (see paragraphs 12 and 13). For each group the ratio of the estimate adopted for November (see paragraph 8) and the adjusted estimate based on the new benchmarks was applied to each of the earlier adjusted estimates. A more satisfactory revision of the estimates would have been possible had sufficient resources been available to conduct dual surveys over a number of months rather than only for November 1977.

10. Estimates for the labour force and for persons not in the labour force were obtained by addition and subtraction in the same manner as outlined in paragraph 8(d) and 8(e).

Revised labour force estimates

11. For periods before August 1976 revised labour force estimates in full detail are available only for August of each year. For the months of February, May and November, only broad revised aggregates (as in Table 1) are available. Estimates for States, Territories and State capital cities are only available each August prior to August 1971. Estimates classified by birthplace are not available prior to February 1972. Estimates of the number of married females employed full time in the various industries are not available prior to August 1971.

Comparability of series

12. The adjustment factors mentioned in paragraphs 5 and 9 were applied at the level of State by sex by marital status by employment status by status of worker. Because of the resources required and the limited time available, and because with any further disaggregation the adjustment factors would in many cases have been based on very small estimates with high sampling variability, it was considered that this procedure was the most practicable in the circumstances. In the course of the revision the opportunity was taken to eliminate some other discontinuities: for example, those caused by a change in the definition of unemployment.

13. The method adopted for the revision provided comparable series for those characteristics taken into account when calculating the adjustment factors, but not necessarily for the other characteristics. Thus no account was taken of the possible effects of the new sample and revised questionnaire on the distribution of the labour force by such characteristics as age, country of birth, industry, occupation, hours worked, and duration of unemployment. As a result, revised estimates for these characteristics for periods before November 1977 may not be strictly comparable with estimates for November 1977 and later periods. See also paragraph 5.

14. Revised estimates for the period August 1976 to November 1977, which were first published in the February 1978 issues of *Unemployment (Preliminary Estimates)* (6201.0), *The Labour Force (Preliminary)* (6202.0) and *The Labour Force, Australia* (6203.0), supersede and are not comparable with estimates appearing in earlier issues of those publications and in the series of publications entitled *The Labour Force* (6204.0), covering the period 1964 to 1977.

15. When comparing estimates for February 1978 and subsequent months with those for earlier periods it should be noted that with the introduction of monthly surveys the interviews are now conducted during a two-week period, whereas formerly the period was four weeks. This change of timing may affect the level of the figures for any month, particularly for months during which the labour force status of the population may be changing rapidly.

16. The survey periods for February in the years 1971, 1972, 1974 and 1976 were later than in other years, and as a consequence the estimates of the proportion of the population 15 years and over who attended school was correspondingly higher. In addition, in February 1974 the survey period in Queensland was delayed by a further week in order to avoid as far as possible the effects of the flood in the south-east area of the State.

17. Because of the effects of cyclone Tracy the population survey was not conducted in Darwin in February 1975. The estimates for this period therefore exclude Darwin.
