## LIST OF TABLES

	Page
SECTION 1	
New motor vehicle registrations	5
<b>1.1</b> Ten highest years and highest month for each calendar month of new vehicle registrations	14
<b>1.2</b> New vehicle registrations as a percentage of total vehicles on register, selected years	14
<b>1.3</b> New vehicle registrations by type: State/Territory of registration, selected years	15
<b>1.4</b> New motor cycle, plant and equipment, caravan and trailer registrations, selected years	17
<b>1.5</b> New passenger vehicle registrations by make, selected years	18
<b>1.6</b> New light commercial vehicle registrations by make, selected years	19
<b>1.7</b> New rigid truck registrations by make, selected years	20
<b>1.8</b> New articulated truck registrations by make, selected years	21
<b>1.9</b> New non-freight carrying truck registrations by make, selected years	22
<b>1.10</b> New bus registrations by make, selected years	23
<b>1.11</b> New motor cycle registrations by make, selected years	24
SECTION 2	
Motor vehicle census	25
<b>2.1</b> Motor vehicles on register by type of vehicle, State/Territory of registration	34
<b>2.2</b> Motor cycles, plant and equipment, caravans and trailers on register, State/Territory of registration	36
<b>2.3</b> Passenger vehicles on register by make of vehicle, census years	37
<b>2.4</b> Light commercial vehicles on register by make of vehicle, census years	39
<b>2.5</b> Rigid trucks on register by make of vehicle, census years	40
<b>2.6</b> Articulated trucks on register by make of vehicle, census years	41
<b>2.7</b> Non-freight carrying trucks on register by make of vehicle, census years	42
<b>2.8</b> Buses on register by make of vehicle, census years	43
<b>2.9</b> Motor cycles on register by make of vehicle, census years	44
SECTION 3	
Motor vehicle characteristics	45
<b>3.1</b> Estimated average age of the vehicle fleet, census years	51
<b>3.2</b> Number of registered motor vehicles by age of vehicles, census years	51
<b>3.3</b> Estimated motor vehicle attrition rate, selected years	51

	Page
SECTION 3	
Motor vehicle characteristics <i>continued</i>	45
3.4 Motor vehicles on register by type of vehicle and type of fuel, selected years	52
3.5 New motor vehicle registrations by type of vehicle and type of fuel, selected years	53
3.6 Average fuel consumption by type of vehicle and type of fuel, selected years	54
3.7 Total volume of fuel consumed by type of vehicle and type of fuel, selected years	55
3.8 Total kilometres travelled by type of vehicle and type of fuel consumed, selected years	56
3.9 Average kilometres travelled by type of vehicle and type of fuel consumed, selected years	57
3.10 Predominant colour of motor vehicles, as at 30 June 1993	57
SECTION 4	
Motor vehicle ownership and usage	58
4.1 Motor vehicles on register per 1,000 population, State/Territory of registration, motor vehicle census years	70
4.2 Registrations of new motor vehicles per 1,000 mean resident population, selected years	71
4.3 Motor vehicles garaged per household, census of population and housing years	71
4.4 Driver and rider licences, by State/Territory of issue, selected years	72
4.5 Road fatalities by year and State/Territory of registration, selected years	72
4.6 Number of casualties/persons hospitalised due to vehicle accidents, selected years	73
4.7 Percentage of driver and rider fatalities with a BAC over the legal limit, selected years	73
4.8 Road fatalities by age group, 1991, 1993, 1994 and 1995	74
4.9 Driver fatalities relative to total distance travelled by drivers, by age and gender, 1995,	75
4.10 Fatality rates per 100 million kilometres travelled, by State/Territory	75
4.11 Total distance travelled by age and gender of drivers/riders, year ended 30 September 1991	76
4.12 Total distance travelled by age and gender of drivers/riders, year ended 30 September 1995	77
4.13 Total distance travelled by type of vehicle, selected years	78
4.14 Average distance travelled by type of vehicle, selected years	78
4.15 Number of drivers by age and gender, year ended 30 September 1991 and 1995	79

	Page
SECTION 4	Motor vehicle ownership and usage <i>continued</i> 58
	<b>4.16</b> Average distance travelled by purpose: State/Territory of registration, year ended 30 September 1991 and 1995 80
	<b>4.17</b> Mode of travel to work, 1986 and 1991 80
	<b>4.18</b> Persons travelling to work/study, April 1996 81
	<b>4.19</b> Persons not taking public transport to work/study, April 1996 81
	<b>4.20</b> Frequency of oil and/or water checks, April 1996 82
	<b>4.21</b> Frequency of vehicle servicing, April 1996 82
SECTION 5	Costs of motoring 83
	<b>5.1</b> Average weekly household expenditure on transport, 1984, 1988-89 and 1993-94 88
	<b>5.2</b> Private final consumption expenditure at average 1989-90 prices, selected years 89
	<b>5.3</b> Consumer price index, transportation group, annual average index, 1973-94 89
	<b>5.4</b> Annual average retail price of petrol by capital cities, 1983-94 90
	<b>5.5</b> Value of vehicles under new finance lease commitments, all lenders, selected years 90
	<b>5.6</b> Commercial finance commitments, all lenders, selected years 91
	<b>5.7</b> Personal finance commitments, all lenders, selected years 91
SECTION 6	Motor vehicle industry 92
	<b>6.1</b> Ten highest years and highest month for each calendar month of domestic passenger vehicle production 99
	<b>6.2</b> Domestic production of passenger vehicles and caravans, selected years 99
	<b>6.3</b> Road transport industry, manufacturing establishments, selected years 100
	<b>6.4</b> Imports and exports of motor vehicles and total imports and exports, selected years 101
	<b>6.5</b> Value of motor vehicle imports by type of vehicle and country of origin, selected years 102
	<b>6.6</b> Value of motor vehicle exports by type of vehicle and country of destination, selected years 103
	<b>6.7</b> Motor vehicle industry retail and service establishments, 1991-92 104
	<b>6.8</b> Number of taxis and distance travelled by State/Territory of registration, year ended 30 September 1991 and 1995 104
	<b>6.9</b> Motor vehicle hire industry, selected years 105
	<b>6.10</b> Total passengers carried by type of bus and main type of service, selected years 105
	<b>6.11</b> Number of industrial disputes, workers involved and working days lost, selected years 106

	Page
SECTION 7	
International comparisons	107
7.1 Number of passenger and goods vehicles and resident populations, selected countries	110
7.2 Motor vehicle purchase prices and maintenance costs, selected cities	110
7.3 Price of public transport and taxi ride, selected cities	111

## PREFACE

*Motor Vehicles in Australia, 1997* is a reference publication on motor vehicles and their use. The publication is intended for both broad community use as a compendium of information concerning motor vehicles and for industry analysts and others as a source of more detailed statistics.

This publication brings together information from a number of sources within and outside the Australian Bureau of Statistics (ABS). These include the Motor Vehicle Census, New Motor Vehicle Registrations collection, the Survey of Motor Vehicle Use, International Trade, the Census of Population and Housing, Consumer Price Indexes, the Household Expenditure Survey, ABS finance statistics, the Manufacturing Census, industrial disputes, Survey of Motor Vehicle Hire, road traffic accident statistics and various international statistics.

W. McLennan  
Australian Statistician

## INTRODUCTION

This publication is a compendium of motor vehicle and related statistics and should assist readers to research topics of interest. It is divided into seven sections, each covering a major theme.

### NEW MOTOR VEHICLE REGISTRATIONS

Section 1 presents statistics on annual new motor vehicle registrations and includes analysis of trends over the past few years.

### MOTOR VEHICLE CENSUS

Section 2 examines the findings from the Motor Vehicle Censuses of 31 May, 1995 and earlier. Some analysis of the data from all of the censuses since 1971 provides readers with an insight into changes in the composition of the motor vehicle fleet over time.

### MOTOR VEHICLE CHARACTERISTICS

Section 3 looks at selected attributes of motor vehicles such as the estimated average age and rate of vehicle attrition within the fleet, fuel consumption and the primary colours of vehicles in the fleet.

### MOTOR VEHICLE OWNERSHIP AND USAGE

Section 4 focuses particularly on demographic aspects of motor vehicle ownership and licensing, road accidents and vehicle usage patterns.

### COSTS OF MOTORING

Section 5 provides statistics on the costs associated with purchasing and operating a motor vehicle. Of significant interest, is the relationship between the cost of transport and private expenditure on transport. This section also provides some information on the financing arrangements for motor vehicle use.

### MOTOR VEHICLE INDUSTRY

Section 6 looks at vehicle production, international trade and aspects of retail trade of motor vehicles and associated services.

### INTERNATIONAL COMPARISONS

Section 7 compares selected motor vehicle and transport-related statistics across a number of other countries and major cities.

Variations occur across ABS collections over time in relation to the application and meaning of terms and concepts which have been used, and thus reference to the Explanatory Notes, on page 112, is essential. An explanation of terms used in the publication are shown in the Glossary on page 124.

The ABS first began publishing estimates of the size and composition of the vehicle fleet in 1921. Of particular significance was the census of the Australian motor vehicle fleet conducted in 1947-48. This year was one of rapid expansion in the size of the vehicle fleet, the growth of which had been interrupted by World War II.

The 1947-48 census showed that there were almost one million registered vehicles in Australia at that time. Since then, rapid growth has seen the fleet expand to 10.7 million vehicles in 1995. This near 11-fold expansion in less than 50 years compares with a population growth of 2.3 times over the same period.

## VEHICLE OWNERSHIP

Between 1947-48 and 1995, ownership of a vehicle changed from being relatively unusual to being quite common. In 1947-48 there was an average of only one vehicle per eight persons, whereas in 1995 there was an average of three vehicles per five persons. This increase was a continuation of the rapid increase throughout the 20th century. In 1921, for example, it is estimated that there was an average of one vehicle per 45 persons, while in 1930 there was an estimated average of one vehicle per 11 persons.

STATE AND TERRITORY  
VEHICLE DISTRIBUTION

The State with the most registrations in 1947-48 was New South Wales, which had over a third of the entire vehicle fleet, due primarily to its higher resident population. Victoria accounted for 29%, Queensland 16%, South Australia 11%, Western Australia 7%, and Tasmania 3%.

In 1995, New South Wales was still the leading State with 30% of total vehicle registrations. Victoria's (26%) and South Australia's (9%) shares had fallen since 1947-48, while Tasmania's remained steady. Shares rose significantly in Queensland (18%), the Australian Capital Territory (2%) and particularly in Western Australia (11%) as a consequence of changing population growth.

AVERAGE AGE OF THE  
VEHICLE FLEET

In 1947-48 the average age of vehicles in the fleet was estimated at 11.3 years, slightly higher than the figure of 10.6 years in 1995. In the intervening period, the average vehicle age fell to an estimated 6.1 years in 1971 but then rose steadily to the present estimated level. The high average vehicle age in 1947-48 reflected low production rates of vehicles during the war period, and the resulting low rate of new vehicle registrations at the time. In the following years, with increasing numbers of new vehicles entering the fleet, the average age of vehicles decreased. However, the average age began to rise again in the 1970s and 1980s, with vehicles being kept on the road longer. Factors contributing to this rise were likely to include the large increase in the proportion of households with two or more vehicles, the improved reliability of vehicles and the cost of replacing vehicles.

PASSENGER VEHICLE  
FLEET COMPOSITION

In 1947-48 the top five passenger vehicle makes were:

- Chevrolet with 16% of registrations;
- Ford with 16%;
- Vauxhall with 7%;
- Dodge with 6%; and
- Morris with 6%.

SHARE OF TOTAL PASSENGER VEHICLE REGISTRATIONS, TOP FIVE MAKES, 1947-48

Source: Survey of Motor Vehicles, 1947-48. Bulletin No. 7 - Australia.

These top five makes accounted for 51% of registered passenger vehicles in 1947-48, with the top 10 makes accounting for 71%.

In 1995, the top five makes accounted for 78% of registered passenger vehicles, which was significantly higher than for the combined share of the top 10 makes in 1947-48. The top five passenger vehicle makes in 1995 were:

- Ford with 23% of registrations;
- Holden with 21%;
- Toyota with 16%;
- Nissan with 9%; and
- Mitsubishi with 9%.

The graph on page 4 shows the share of registrations of the top five makes of passenger vehicles in 1995, highlighting how the top five makes have become more dominant in the passenger vehicle market.

Many makes of vehicles which were common on Australian roads in 1947-48 are relatively rare today. Included among these are Hillman, Willys, Plymouth, Dodge, Vauxhall, Morris and, most significantly, Chevrolet. Along with Ford, Chevrolet with 16% of passenger vehicle registrations, was one of the leading makes in 1947-48. However, by 1995 Chevrolet accounted for only 0.1% of passenger vehicle registrations.

Three other once prominent makes have also suffered declines. In 1947-48, the Austin, Dodge and Morris makes which each held between 5% and 6% of total passenger vehicle registrations together accounted for less than half of 1% of registrations in 1995.

While these makes have declined over time, others have emerged and gained large shares of registrations. In particular, Mazda, Mitsubishi,

Nissan/Datsun and Toyota have all appeared since 1947-48, to hold a combined 40% share of passenger vehicle registrations in 1995.

SHARE OF TOTAL PASSENGER VEHICLE REGISTRATIONS, TOP FIVE MAKES, 1995

Source: Motor Vehicle Census, Australia (Cat. no. 9309.0).

#### CHANGES IN THE COMPOSITION OF THE FLEET

In 1947-48, light commercial vehicles and trucks together accounted for 35% of the total fleet. By 1995, this figure had fallen to about 14%. This fall reflected a relatively larger increase in the passenger fleet, which grew from 61% of the total fleet in 1947-48 to 81% in 1995.

The makeup of the truck fleet is now less concentrated than in 1947-48. At that time the top two makers, Chevrolet and Ford, accounted for just over half of all trucks in the fleet. In 1995, the top five makes, International, Ford, Toyota, Isuzu and Mitsubishi, accounted for about the same proportion. In 1947-48, the top make, Chevrolet, had 30% of the fleet. This was double the market share (15%) of the top make in 1995, which was International. Chevrolet's dominance in 1947-48, however, was in contrast to its position in 1993 when it accounted for less than 1% of the fleet.

In the light commercial vehicle fleet, the changes were not quite so dramatic. The top two makes in 1947-48 were Chevrolet and Ford, which together accounted for just under half of all such vehicles. In 1995, the top two makes were Toyota and Ford, which together accounted for slightly less than this proportion. By 1995, however, there was a greater number of other makes with significant shares of the fleet. Even more so than in the truck fleet, Chevrolet's dominant position in the light commercial vehicle fleet in 1947-48 declined to a negligible share in 1995.

## SECTION 1

## NEW MOTOR VEHICLE REGISTRATIONS

### MAIN ECONOMIC INDICATOR

The new motor vehicles which are registered each month form a significant component of private and commercial expenditure. Monthly New Motor Vehicle Registration (NMVR) statistics are therefore a major indicator of the level of activity in the economy. They are published in original, seasonally adjusted and trend series. This chapter presents information on the statistics for 1993-94, 1994-95 and 1995-96, and discusses developments in new vehicle registrations since 1969-70.

### 1984 CAR PLAN

The motor vehicle industry has undergone significant changes in recent times. One of the major influences on the industry has been the Government's 1984 car plan and its associated policy reviews in 1987 and 1991. The plan contained initiatives aimed at rationalising, and improving international competitiveness of, domestic production. Its main elements were a progressive reduction in tariff protection and measures for the facilitation of exports. A significant outcome of the plan was a reduction in the number of makes and models being produced in Australia. For example, Nissan has ceased vehicle production in Australia and Holden produces only the Commodore (including a number of variants) and the Statesman/Caprice.

### NEW REGISTRATIONS IN 1995-96

There were 636,529 new vehicles registered in 1995-96 (excluding motor cycles, plant and equipment, caravans and trailers). This was a small decline of 0.4% on the 638,909 new vehicles registered in 1994-95 and followed successive rises of 11.3% in 1994-95, 6.0% in 1993-94 and 3.9% in 1992-93 with falls occurring in the previous two years. Both the 1994-95 and 1995-96 figures exceeded the last peak recorded in 1989-90 (627,762 vehicles) but are still lower than the record number of new registrations (674,830 vehicles) in 1984-85.

### NEW REGISTRATIONS SINCE 1969-70

In 1969-70, there were 499,001 new vehicle registrations, which was 137,528 fewer than the number recorded in 1995-96. However, as the Australian population grew more quickly, the number of new vehicle registrations per 1,000 population fell from 39.9 in 1969-70 to a low of 29.9 in 1991-92 before rising to 34.8 in 1995-96.

### TOTAL NEW VEHICLE REGISTRATIONS

Source: Motor Vehicle Registrations, Australia (Cat. no. 9304.0) and unpublished ABS data.

Upward trend disrupted

From 1969–70 through to the early 1980s, new vehicle registrations generally showed an overall increase. After reaching a peak in 1984–85, this growth came to an abrupt halt. The period 1986 to 1988 experienced the lowest number of new registrations since before 1970. Recovery from this trough was underway until apparently hindered by the economic conditions of the early 1990s. The latest figures suggest that a recovery is underway.

PROPORTION OF NEW VEHICLES IN THE FLEET

Since 1969–70, the proportion of registered new vehicles in the fleet has tended to decline. From 1969–70 to 1988–89 new vehicle registrations as a percentage of the total vehicle fleet fell steadily from 10.3% to 5.1%. In 1988–89 the proportion increased slightly to 6.0%, but from 1990–91 to 1994–95 the proportion has remained essentially flat, averaging about 5.4% of the fleet. A total vehicle fleet count as at 30 June 1996 is unavailable.

TOTAL NEW VEHICLE REGISTRATIONS AS A PROPORTION OF TOTAL REGISTRATIONS

Note: A total vehicle fleet count as at 30 June 1996 is unavailable.  
 Source: Motor Vehicle Registrations, Australia (Cat. no. 9304.0), Motor Vehicle Census, Australia (Cat. no. 9309.0) and unpublished ABS data.

NEW PASSENGER VEHICLE REGISTRATIONS

Passenger vehicles, as a proportion of total new vehicle registrations, have consistently been within the range 75% to 85%. In 1969–70, passenger vehicles accounted for 82.0% of all new vehicle registrations. From a high of 82.2% in 1971–72 the proportion gradually fell to a low of 75.7% in 1981–82. The proportion rose over the following years to 81.6% in 1987–88, declined to 78.4% in 1989–90, before peaking again at 83.9% in 1992–93. Successive falls over the next three years lowered the proportion to 82.7% in 1994–95 before recovering to reach 83.5% in 1995–96.

TOP FIVE PASSENGER VEHICLE MAKES

The five leading makes of new passenger vehicle registrations, in each of the years 1993–94, 1994–95, and 1995–96 were Ford, Holden, Toyota, Mitsubishi and Hyundai; collectively accounting for around three-quarters (76.8% in 1993–94, 74.1% in 1994–95 and 75.8% in 1995–96) of all new passenger vehicle registrations. In 1969–70, the top five makes accounted for a similar proportion (77.2%). During the intervening period, the share of the top five makes generally stayed above 80%, with a peak of 87.8% in 1987–88.

NEW PASSENGER VEHICLE REGISTRATIONS, TOP FIVE MAKES, 1995-96

Source: Motor Vehicle Registrations, Australia (Cat. no. 9304.0) and unpublished ABS data.

Hyundai moves into fifth place in 1993-94

While Ford continued to maintain its leading share of registrations, the most obvious change in the top five makes list from 1992-93 to 1995-96 was the move by Holden from third to second ahead of Toyota in 1993-94. Holden increased its proportional share of new registrations to account for 19.3% in 1993-94, remained steady at 19.4% in 1994-95 and rose again to 20.6% in 1995-96. Although the number of Toyotas registered rose in both 1993-94 and 1994-95, Toyota's share fell to 18.2% in 1993-94, fell again to 16.5% in 1994-95 and further to 15.9% in 1995-96. Another major change was the move by Hyundai to fifth place ahead of Nissan. Hyundai registrations increased by 76.2% in 1992-93, by 48.4% in 1993-94, by 52.3% in 1994-95 and by 37.1% in 1995-96. In contrast, Nissan registrations declined 27.4% between 1992-93 and 1995-96. Daewoo is the most successful new entrant into the Australian passenger vehicle market in recent years with 12,315 vehicles registered in 1995-96, up from 8,815 in 1994-95 and four the previous year.

The composition of the top five makes has changed markedly since 1969-70. In 1969-70, the top five makes were Holden (with 34.4% of the total), Ford (21.6%), Chrysler (10.0%), Toyota (6.3%) and Morris (4.9%). In the period since 1970, Ford and Holden have continued to dominate new passenger vehicle registrations, with Toyota more prominent since the late 1980s, and Hyundai becoming an increasingly significant make in recent years.

Holden's share of new passenger vehicle registrations declined from 34.4% in 1969-70 to 20.6% in 1995-96. Between 1969-70 and 1993-94, Toyota's share almost trebled, from 6.3% to 18.2%, before falling to 16.5% in 1994-95 and then to 15.9% in 1995-96. Ford maintained its share at relatively the same level throughout this period, accounting for 22.2% of new passenger vehicle registrations in 1995-96.

**NEW LIGHT  
COMMERCIAL VEHICLE  
REGISTRATIONS**

In 1969-70, there were 55,123 new light commercial vehicle registrations, increasing to 80,720 in 1993-94, to 88,840 in 1994-95 with a small fall to 86,666 occurring in 1995-96. However, caution must be used when comparing pre-1991 light commercial vehicle registration data with post-1991 data because of changes to vehicle classifications. For information on these classification changes, refer to the Explanatory Notes.

Big increase in light  
commercials

The 2.4% fall in new light commercial vehicle registrations in 1995-96 followed a period of strong growth in the market with rises of 10.1% in 1994-95, 8.0% in 1993-94 and 10.2% in 1992-93.

**NEW LIGHT COMMERCIAL VEHICLE REGISTRATIONS, TOP FIVE MAKES, 1995-96**

Source: Motor Vehicle Registrations, Australia (Cat. no. 9304.0) and unpublished ABS data.

Toyota dominates in light  
commercial vehicles

Toyota continued to be the leading make in 1995-96 with more than a third (34.4%) of all new light commercial vehicle registrations, up slightly on 1994-95 but down on the 37.2% of the previous year. Toyota was followed by Holden, which moved ahead of Ford with 19.4%; Ford had the same proportion as the previous year with 19.4%; Mitsubishi had 9.7% and Nissan 6.0%. Mazda had moved ahead of Nissan in 1994-95 but dropped out of the top five in 1995-96. This list is very different from the 1969-70 ranking which showed Holden (40.3%) and Ford (22.7%) as the dominant makes. BMC (7.5%), Toyota (5.1%) and Land Rover (4.3%) all had similar numbers of new registrations, making up the rest of the top five in 1969-70. Of most significance is the consistent rise of the Japanese makes since the early 1980s, the relative decline of Holden and the almost complete disappearance of the European makes from this vehicle category.

**NEW RIGID TRUCK  
REGISTRATIONS**

There were 9,726 new rigid trucks registered in 1995-96. This represented a fall of 14.6% and followed a rise of 16.1% in 1994-95, a small rise of 0.3% in 1993-94 and a fall of 1.5% in 1992-93.

Growth in large rigid trucks

The majority (75.7%) of new rigid truck registrations in 1995-96 were under 16 tonnes Gross Vehicle Mass (GVM). Smaller trucks (3.5 to 8 tonnes GVM) accounted for 40.5% (up marginally on 1994-95), medium sized trucks (over 8 to 16 tonnes GVM) for 35.3% (up from 33.9%) and large trucks (over 16 tonnes GVM) for 23.2% of new rigid truck registrations (down from 26.6%). Almost 80% of new trucks were registered in New South Wales, Queensland or Victoria (36.3%, 22.6% and 20.3%, respectively) with Western Australia accounting for a further 11.5%, up from 9.6% the previous year.

The top five new rigid truck makes in 1995-96 were Isuzu (27.1%), Mitsubishi (21.1%), International (8.4%), Ford (8.3%) and Hino (7.6%) to account for 72.5% of total registrations. In both 1993-94 and 1994-95 Hino was ranked third, Toyota was fifth and International was not included in the top five makes. The top five makes accounted for a slightly higher share of registrations in 1993-94 and 1994-95 although this share has not changed significantly over recent years.

NEW ARTICULATED TRUCK REGISTRATIONS

Registrations of new articulated trucks fell by 39.6% to total 2,909 in 1995-96. This substantial fall followed increases of 53.1% in 1994-95, 43.1% in 1993-94 and 26.2% in 1992-93. Registrations of new articulated trucks fell substantially in 1990-91 (47.3%) and 1991-92 (18.7%), coinciding with the economic downturn of the early 1990s.

NEW ARTICULATED TRUCK REGISTRATIONS, TOP FIVE MAKES 1995-96.

Source: Motor Vehicle Registrations, Australia (Cat. no. 9304.0) and unpublished ABS data.

Significant rises in Kenworth, Freightliner and Western Star new registrations

In 1995-96, the top five makes of new articulated trucks were Kenworth (18.1%), Mack (16.3%), International (15.3%), Volvo (9.7%) and Ford (11.0%). The same makes headed the list in both 1993-94 and 1994-95, accounting for slightly more than the same combined proportion of total registrations as in 1995-96. Between 1992-93 and 1994-95, the number of new Kenworth registrations almost doubled while registrations of Freightliner and Western Star trucks trebled and quadrupled respectively.

Almost 77% of all new articulated truck registrations in 1995-96 were in Victoria, New South Wales or Queensland (29.5%, 27.0% and 20.4%, respectively). This was down slightly on the 79.2% share that these States recorded for new rigid truck registrations. South Australia accounted for 8.4% of articulated truck registrations compared with 4.9% of rigid truck registrations.

NEW NON-FREIGHT  
CARRYING TRUCK  
REGISTRATIONS

The number of new non-freight carrying trucks registered in 1995-96 rose by 24.0% following rises of 8.9% in 1994-95 and 12.3% in 1993-94 and a 10.0% fall in 1992-93.

The leading five makes in this category for 1995-96 were Isuzu with 21.1% of all new registrations, up from 13.6% in 1994-95, followed by Ford (17.5%), Toyota (15.5%), Hino (11.3%) and Holden (8.6%). Registrations of Isuzu vehicles nearly trebled in 1995-96. Mitsubishi and Mazda, which were fourth and fifth in the 1993-94 top five list, fell by 37.6% and 15.8%, respectively, in 1994-95 and increased these registrations only slightly in 1995-96. Ford was the leading manufacturer of new non-freight carrying trucks each year between 1986-87 and 1994-95.

NEW BUS  
REGISTRATIONS

A total of 4,376 new buses were registered in 1995-96, a fall of 2.7%. Registrations rose by 17.9% in 1994-95, fell by 9.8% in 1993-94 while in 1992-93 there was a 9.9% increase.

-Toyota Clear leader

A majority (77.7%) of all new bus registrations in 1995-96 had a tare weight of 1,501-5,000 kilograms, representing medium-sized buses. Toyota continued its domination of this segment from the mid-1970s with 91.0% of all new registrations.

In the large bus segment (tare weight 5,001 kilograms and over) Mercedes-Benz and Hino dominated with 31.2% and 21.4% of new bus registrations in 1995-96, respectively. Registrations of Man and Scania buses increased from almost 12% in 1994-95 to 16.5% and 13.5%, respectively, in 1995-96.

Toyota was the only make occurring in both the 1969-70 and 1995-96 top five new bus registration make lists, accounting for 9.7% in 1969-70 and 74.2% in 1995-96.

NEW MOTOR CYCLE  
REGISTRATIONS

The total of 22,345 new motor cycle registrations in 1995-96 was a 9.0% rise on the 20,505 vehicles registered in the previous year. The number registered in 1994-95 was also a rise and restored the level of registrations to that recorded in 1990-91 (20,504). However, the 1995-96 figure was still well below the 1980-81 peak of 70,799 motor cycle registrations.

Harley Davidson  
continues growth

The five leading new motor cycle makes in 1995-96 were Honda (29.2%), Yamaha (19.2%), Harley Davidson (14.6%), Kawasaki (13.0%) and Suzuki (10.4%). The Japanese makes (Honda, Yamaha, Suzuki and Kawasaki) together accounted for 71.8% of the total, down from 72.7% in 1994-95 and 75.3% in 1993-94. New Harley Davidson registrations have grown quickly in recent years, increasing from only 8.6% of new registrations in 1989-90 to 14.6% in 1995-96. In 1995-96, Cagiva registrations almost doubled while Vespa increased from two in 1994-95 to 59.

In 1969-70, 27,270 new motor cycles were registered with the top five makes list containing four of the five makes in the 1995-96 list. The 1969-70 list consisted of Honda (41.3%), Suzuki (20.7%), Yamaha (16.8%), Kawasaki (6.3%) and Triumph (3.6%). From 1969-70 to 1991-92, the four Japanese makes comprised the top four makes each year. In 1992-93, Harley Davidson moved to fourth position and then into third from 1993-94.

Honda the historical leader

Honda has led the new motor cycle registration make list since the ABS began publishing new registration statistics in 1965, with the exception of 1977-78 and 1991-92 when Yamaha was the most popular make.

NEW MOTOR CYCLE REGISTRATIONS, TOP FIVE MAKES 1995-96

Source: Motor Vehicle Registrations, Australia (Cat. no. 9304.0) and unpublished ABS data.

#### NEW PLANT AND EQUIPMENT REGISTRATIONS

New plant and equipment registrations totalled 4,962 vehicles in 1995-96, a fall of 4.3% and follows rises of 13.1% in 1994-95, 14.0% in 1993-94 and 3.8% in 1992-93. (See the Glossary for a definition of plant and equipment.)

Since 1969-70, the year when the highest number of new plant and equipment registrations occurred was 1975-76, when 10,462 new registrations were recorded, while the lowest number occurred in 1991-92 when only 3,874 new vehicles were registered. The large fall in plant and equipment registrations across all States and Territories, but particularly Victoria, in 1991-92 was a result of the implementation of a new processing system and an associated change in classifications (refer to the Explanatory Notes).

Queensland has higher share

Queensland recorded 31.8% of all new plant and equipment registrations in 1995-96, up from 31.3% in 1994-95 and 28.7% in 1993-94. In 1995-96, New South Wales' share of new registrations was 19.3%, down on the previous two years, while registrations increased in Western Australia to 26.2% of the total from 21.5% in 1994-95.

## NEW CARAVAN REGISTRATIONS

The ABS counts new registrations of caravans but recognises that some new caravans are not registered for use on public roads. The caravan statistics exclude self-propelled campervans which are classified to non-freight carrying vehicles but include camper trailers and caravans such as 'pop-ups'. The ABS began publishing new caravan registration statistics in 1971.

Following a general rise in registrations through to the mid-70s, the picture for new caravan registrations has been one of general decline. Between 1971 and 1978-79, new caravan registrations averaged 29,880 each year. Then between 1979-80 and 1985-86 the average dropped to 11,395 per year, followed by a further fall to an average of 6,120 between 1986-87 and 1995-96.

Caravans were popular in 1975-76

The highest year for new caravan registrations was 1975-76 with 38,900 registrations, while the lowest year was 1990-91, when only 4,342 new registrations were recorded.

NEW CARAVAN REGISTRATIONS, SELECTED YEARS

Source: Motor Vehicle Registrations, Australia (Cat. no. 9304.0) and unpublished ABS data.

Victoria recorded over a third (34.3%) of all new caravan registrations in 1995-96, with 1,907 caravans registered. This is consistent with the State also having the highest count (35.8%) of total caravan registrations at the 31 May 1995 Motor Vehicle Census. Victoria's lead in new caravan registrations extended the lead that began in 1991-92, before which New South Wales was consistently the leading State. In 1995-96, New South Wales accounted for 21.7% of new caravan registrations while Queensland and Western Australia recorded shares of 17.5% and 12.5%, respectively.

## NEW TRAILER REGISTRATIONS

There were 68,125 new trailer registrations in 1995-96, a fall of 2.0% on 1994-95 which was the highest number recorded since 1988-89, and an increase of 5.6% on 1993-94. New South Wales has recorded the most new trailer registrations each year since 1972-73, except for 1992-93, when Queensland led the new registrations. Since 1972-73, Victoria has been third behind New South Wales and Queensland, except for 1985-86 and 1986-87 when it overtook Queensland.

Between 1972-73 and 1988-89 new trailer registrations did not fall below 73,000 registrations annually with a peak occurring in 1976-77 with 103,210 registrations recorded. However, since 1989-90, new registrations have averaged just over 60,000 trailers per year. (See the Glossary for a definition of vehicles included in the trailer category.)

#### SEASONALITY OF NEW MOTOR VEHICLE REGISTRATIONS

New Motor Vehicle Registration statistics are quite seasonal, fluctuating during the year. The ABS therefore adjusts the original monthly series to remove known seasonal influences affecting the figures. These seasonal factors include the number of trading days in a period, the occurrence of holidays and effect of the seasons themselves. Factors are applied to the original data series for passenger vehicles and other vehicles (i.e. light commercial vehicles, trucks, buses and non-freight carrying trucks combined) for each State/Territory and aggregated to the totals for Australia and all vehicles. The seasonal factors are available from the ABS (refer to the Explanatory Notes).

#### TREND SERIES

After the original data have been seasonally adjusted, the resulting series are smoothed to produce a trend series.

#### MORE DETAILED DATA

New Motor Vehicle Registration statistics have been published on a monthly and annual basis since the 1960s. Information additional to that provided in this Section, including details on type of fuel, State/Territory of registration, the weight characteristics of heavy vehicles and data covering the periods not included in the tables provided, are available on request. From 1991, when a new processing system was introduced, this additional information has included details of vehicle location at the postcode level and model descriptions.

## 1.1 TEN HIGHEST YEARS AND HIGHEST MONTH FOR EACH CALENDAR MONTH OF NEW VEHICLE REGISTRATIONS<sup>1</sup>

<sup>1</sup> Due to the implementation of the Third Australian Design Rules in 1991 the definition of some vehicle types changed.

<sup>2</sup> New rigid truck registrations were included with new articulated truck registrations in 1970.

<sup>3</sup> In New South Wales the body type classification applied by the registration authority for small bus type vehicles changed from panel vans to buses.

## SECTION 2

## MOTOR VEHICLE CENSUS

The Motor Vehicle Census (MVC) is a count of all vehicles registered for road use in Australia at a specific time. It provides details of the size and composition of Australia's motor vehicle fleet. The MVC is based on data provided by the respective Commonwealth, State and Territory motor vehicle registration authorities. The MVC was conducted as at 31 December 1952 and 1962 with subsequent MVCs occurring at 30 September 1971, 1976, 1979, 1982, 1985, 1988, 1991, 30 June 1993 and at 31 May 1995.

### 1993 AND 1995 MOTOR VEHICLE CENSUSES

This section contains results from the 1993 and 1995 MVCs together with a summary of the changes since the 1991 MVC. Long-term changes in the motor vehicle fleet composition since 1971 are also discussed.

At 31 May 1995, there were 10,650,902 registered motor vehicles (excluding motor cycles) in Australia, representing a 4.3% increase over the 10,215,337 vehicles registered at 30 June 1993. The 1993 count was up 4.1% on the 30 September 1991 MVC figure.

NUMBER OF VEHICLES<sup>1</sup> ON REGISTER BY TYPE OF VEHICLE, CENSUS YEARS<sup>2</sup>

<sup>1</sup> Excluding motor cycles.

<sup>2</sup> Inter-censal periods are pro-rated.

Source: Motor Vehicle Census, Australia (Cat. no. 9309.0).

All vehicle types recorded an increase in registrations from 1993 to 1995 while between 1991 and 1993, only registrations of light commercial vehicles (down 1.7%) and non-freight carrying trucks (down 0.9%) fell. Registrations of buses rose 10.3% in 1993 and a further 11.9% in 1995, while passenger vehicles rose 5.3% and 4.2%, respectively. A rise of 11.1% in 1995 for articulated trucks followed a rise of 1.5% in the previous census. These movements are discussed in more detail later in this section.

Successive decreases in new vehicle registrations of 13.6% and 3.9% in 1990-91 and 1991-92 slowed the growth in the total number of vehicles registered in the fleet and contributed to the ageing of the vehicle fleet. New vehicle registrations recorded successive rises of 3.9%, 6.0% and 11.3% in 1992-93, 1993-94 and 1994-95, respectively. A discussion on

the estimated average age and attrition rates of the vehicle fleet is presented in Section 3.

NUMBER OF MOTOR VEHICLES REGISTERED IN STATES/TERRITORIES

Strong growth in Australian Capital Territory and Queensland

The two most populous States, New South Wales and Victoria, together accounted for 56.9% of registered motor vehicles in 1995, down slightly on their combined 57.7% share in 1993. This is consistent with these two States' share of Australia's estimated resident population of 58.8% in 1995 and 59.3% in 1993.

From 30 June 1993 to 31 May 1995, total registrations rose in all States and Territories. The strongest overall growth occurred in Queensland where consecutive rises of 9.1% occurred between the 1991 and 1993 censuses and 9.0% between 1993 and 1995. The Australian Capital Territory experienced rises of 9.6% and 4.1% for the 1993 and 1995 censuses, respectively. Overall increases in the other States and Territories ranged from 4.2% in Victoria to 10.2% in Western Australia.

Between 1971 and 1995, total vehicle registrations more than doubled. The greatest relative increases occurred in the Northern Territory, where registrations more than tripled while the Australian Capital Territory nearly tripled the number of registrations recorded. Queensland and Western Australia also experienced above average rates of increase. Victoria and Tasmania recorded increases close to the average, while New South Wales and South Australia had the lowest rates of increase.

NUMBER OF VEHICLES ON REGISTER BY STATE, CENSUS YEARS

<sup>1</sup> Excluding motor cycles.

<sup>2</sup> Inter-censal periods are pro-rated.

Source: Motor Vehicle Census, Australia (Cat. no. 9309.0).

PASSENGER VEHICLES

Passenger vehicles accounted for 81.0% of total motor vehicle registrations (excluding motor cycles) in both 1993 and 1995. Registrations increased by 5.3% (418,747 vehicles) in 1993, and by 4.2% (349,398 vehicles) in 1995. There was a total of 8,628,806 passenger vehicles registered in 1995.

Over 78% of all passenger vehicle registrations at 31 May 1995, were accounted for by the top five makes. This was a marginal fall on 1993, and is comparable with 1971 when passenger vehicles constituted over

74% of total registrations. Throughout the 24-year period since 1971, the percentage share of the leading five makes has remained relatively unchanged, at around three-quarters of all passenger vehicles.

Ford leads passenger vehicles

Leading the passenger vehicle make list in 1995 was Ford, with 22.6% of all registrations, followed by Holden (21.2%), Toyota (16.3%), Nissan (9.2%) and Mitsubishi (9.1%).

PASSENGER VEHICLE FLEET SHARE, AS AT 30 JUNE 1993 AND 31 MAY 1995

Source: Motor Vehicle Census, Australia (Cat. no. 9309.0).

PASSENGER VEHICLES ON REGISTER, TOP FIVE MAKES AS AT 31 MAY 1995

Note: There are different intervals between some census years.  
Source: Motor Vehicle Census, Australia (Cat. no. 9309.0).

In contrast, the 1971 MVC showed that Holden dominated passenger vehicle registrations with 36.9% of the total, followed by Ford (17.8%),

Morris (7.9%), Chrysler (6.1%) and Volkswagen (5.7%). The most significant change over the 1971 to 1995 period has been the steady growth in the number of Japanese makes (imported and domestically produced). These makes accounted for 45.6% of total passenger vehicle registrations in 1995, up from 44.6% in 1993. Over the same period there has been a decline in registrations of previously large selling makes such as Morris, Chrysler, Volkswagen and Austin.

The 1995 MVC showed that Ford, the leading make overall, was the leading make in all States and Territories, other than in South Australia, Tasmania and the Northern Territory. In South Australia and Tasmania, Holden was the leading make, while in the Northern Territory, Toyota was the leader.

LIGHT COMMERCIAL VEHICLES

Light commercial vehicle registrations in 1995 accounted for 14.3% of total vehicle registrations. The total of 1,527,212 registrations represented a rise of 5.1% on the number recorded in 1993 and followed a fall of 1.7% in 1991.

Although care should be exercised when interpreting light commercial vehicle statistics prior to 1991 because of classification changes (see the Explanatory Notes), it is apparent that there has been strong growth in the light commercial vehicle market over the period 1971 to 1995. In this period, the number of light commercial vehicles nearly trebled, compared with a doubling in the number of passenger vehicles.

NUMBER OF LIGHT COMMERCIAL VEHICLES ON REGISTER, CENSUS YEARS

Source: Motor Vehicle Census, Australia (Cat. no. 9309.0).

Toyota with most registrations

As in 1993, four makes accounted for three-quarters of all registrations of light commercial vehicles in 1995. The leading make was Toyota, which accounted for 27.3%, up from 25.8% in 1993. Ford was next with 18.9% (down from 19.1%), followed by Holden with 18.6% (down from 18.8%) and Nissan with 10.9% (down from 11.3%). Toyota led in all States and Territories, including Victoria, where Ford was the leading make in 1993.

In contrast, the 1971 MVC showed that two makes, Holden and Ford, dominated the market, accounting for two-thirds of all light commercial

vehicle registrations. Holden particularly dominated, with almost half (47.2%) of all such vehicles, while Ford accounted for nearly one in five (19.8%) light commercial vehicles. Holden's domination has slowly declined since then. Ford's share in 1971 was similar to its share in 1995, although the percentage has fluctuated over time. The other major makes in 1971 were Morris (6.3%), Land Rover (4.6%) and Chrysler (3.9%), which together accounted for 2.1% of total registrations in 1995, down from 2.5% in 1993. In contrast, Toyota's share of the light commercial vehicle fleet in 1971 was only 1.5%, rising to 15.4% in 1982 and then continuing to grow to be the dominant make in 1995 with 27.3%.

NUMBER OF LIGHT COMMERCIAL VEHICLES ON REGISTER, TOP FIVE MAKES AS AT 31 MAY 1995

Note: There are different intervals between some census years.  
Source: Motor Vehicle Census, Australia (Cat. no. 9309.0).

## RIGID TRUCKS

Rigid truck registrations in Australia increased by 1.0% to 336,490 vehicles between 1991 and 1993, with a further rise of 0.3% from 1993 to 1995 (see the Explanatory Notes for details of the classification change affecting heavy vehicles from 1991).

The total rigid truck fleet in 1995 was shared by a number of makes, with no one make dominating. Over 86% of the fleet was accounted for by 10 makes, while more than half (52.2%) was supplied by four makes. The leading rigid truck make overall was International with 14.7% of all registrations. Isuzu (13.8%), Ford (13.3%) and Toyota (10.3%) followed closely behind.

In the small (3.5 to 8 tonnes GVM) rigid truck fleet, Toyota and Ford dominated with 19.9% and 16.5%, respectively, of this category.

International and Isuzu led the medium (over 8 to 16 tonnes GVM) rigid truck makes with 20.9% and 18.4%, respectively.

In the large (over 16 tonnes GVM) rigid truck segment, International was dominant with 32.1%, while Ford and Volvo accounted for 12.4% and 11.7%, respectively.

In 1971, International had the second highest number of rigid truck registrations, behind Bedford. While International has remained at the top, Bedford has declined from 21.2% of the fleet in 1971 to hold only 5.7% in 1995. The decline in Bedford registrations contrasted with major increases achieved by Mitsubishi (from only three registrations in 1971 to 9.0% of the total in 1995), and Isuzu (from 0.3% in 1971 to 13.8% in 1995).

#### ARTICULATED TRUCKS

The articulated truck fleet increased by 11.1% between 1993 and 1995, to a total of 58,322 registered trucks. This followed an increase of 1.5% between 1991 and 1993. In 1995, articulated trucks accounted for 0.5% of total motor vehicle registrations (up slightly from 1993) and 14.7% of total truck registrations.

As with rigid trucks, the articulated truck fleet is quite fragmented. Kenworth and International, with 17.3% and 15.6%, respectively, were the leading makes, with a further five makes accounting for between 6.6% and 12.6% each. These seven makes accounted for 82.3% of total articulated truck registrations in 1995, up from 81.0% in 1993.

The Kenworth make had only a 1.7% share of articulated truck registrations in 1971, but by 1995 it was the leading make with 17.3%. International led in 1971 with 29.0% of the fleet, dropping to second place in 1995 with 15.6%. Over the 1971 to 1995 period, Volvo and Mack increased their share of registrations, with Volvo up from a 1.7% share in 1971 to 12.3% in 1995, and Mack growing from 5.8% in 1971 to 12.6% in 1995.

Nissan UD and Western Star recorded no registrations in 1971 but accounted for 3.1% and 2.6% of registrations in 1995. A number of makes, including AEC, Allison, Commer and Leyland have disappeared from the fleet while others, such as Bedford, have declined significantly.

#### NON-FREIGHT CARRYING TRUCKS

At 31 May 1995, non-freight carrying trucks (see the Glossary for a definition) accounted for 0.4% of the total motor vehicle fleet. The number of registrations of this type of vehicle was 46,971, almost identical with the number registered at 30 September 1991.

Over time, there has been a marginal change in the leading makes of non-freight carrying trucks. In 1971, the leading make was Ford with 16.9%, while other major makes included International, Bedford and Volkswagen with 15.8%, 15.1% and 14.5% shares, respectively. The leading make in 1995 was Toyota with 25.0%, having increased from 1.1% in 1971. By 1995, Volkswagen had the second highest share with 18.7%, while Ford had fallen to third with 14.6% of total registrations. Nissan (including Datsun) registrations increased from 27 vehicles in 1971 to 3,982 (8.5% of the total) and fourth place overall in 1993. International and Bedford registrations fell to 5.9% and 5.6%, respectively.

#### BUSES

The number of buses registered in 1995 jumped by 11.5% since 1993, to 52,170 vehicles. This followed a similar rise (10.3%) between 1991 and 1993.

#### Jump in bus registrations

The comparison of bus registration figures since 1971 is hindered by changes in classifications (refer to the Explanatory Notes). Nevertheless, the statistics indicate that bus registrations have more than doubled since 1971.

Toyota the leading bus make

In 1995, Toyota was the dominant bus make in Australia, with a total share of 45.8%, up from 39.7% in 1993. The next largest make was Mercedes-Benz (8.5%), followed by Nissan (5.5%), Hino (5.3%) and Bedford (6.9%). In 1993, Bedford had the third highest number of registrations followed by Nissan (including Datsun) and Leyland.

There are three distinct size categories of buses: small-buses with a GVM of 5 tonnes or less, medium-sized buses of 5-12 tonnes GVM, and large-buses with a GVM of greater than 12 tonnes (see the Explanatory Notes for a full specification bus size definition). Toyota's dominance of bus registrations resulted from its 81.1% share of small-bus registrations and a 22.0% share of medium-sized bus registrations. Mazda had an 8.6% share of the small-bus segment with Nissan (incl. Datsun) accounting for 7.3%. Bedford (25.7%) and Hino (15.2%) together with Toyota were the major makes in the medium-sized market. The large-bus category was dominated by Mercedes-Benz with 24.3% of registrations, followed by Volvo (14.2%) and Denning, Hino, Leyland and MAN, each with a market share of between 6.2% and 10.2%.

MOTOR CYCLES

The number of motor cycles on register in 1995 was 296,628, representing rises of 2.7% since 1993 and 94.3% since 1971. Registrations for 1993 were 1.6% higher than in 1991.

NUMBER OF MOTOR CYCLES ON REGISTER, CENSUS YEARS

Source: Motor Vehicle Census, Australia (Cat. no. 9309.0).

Motor cycles decline over time

Motor cycle registrations rose steadily from 1971, peaking in 1982 with 366,878 vehicles registered. They then declined steadily until 1991 with small rises occurring in 1993 and 1995. During the 1980s, tighter motor cycle safety standards were introduced and improvements in small fuel-efficient motor cars were achieved, both factors likely to have affected demand for motor cycles.

Between 1982 and 1995, registrations of the three largest makes, Honda, Yamaha and Suzuki, have declined by approximately a third. However, during this time some makes experienced strong increases, most notably Harley Davidson and BMW.

The large increases in registrations of Harley Davidsons and BMWs resulted in those makes increasing their share of the fleet from 1.2% each in 1982 to 6.8% and 3.6%, respectively, in 1993 and further to 8.4% and 4.0% in 1995. However, Honda (29.1%), Yamaha (21.8%), Suzuki (15.8%) and Kawasaki (13.8%) were the dominant makes, accounting for over 80% of all registrations. Registrations of Honda, Yamaha and Suzuki motor cycles all fell between 1993 and 1995 while Kawasaki registrations rose slightly.

NUMBER OF MOTOR CYCLES ON REGISTER, TOP FIVE MAKES AS AT 31 MAY 1995

Note: There are different intervals between some census years.

## PLANT AND EQUIPMENT

On 31 May 1995, there were 101,195 plant and equipment vehicles on the register, down marginally on the 102,169 vehicles registered in 1993 (see the Glossary for a definition). This represented a fall of 1.0% from 1993 and followed a fall of 43.0% from 1991. Due to definitional changes over time, care must be used in interpreting plant and equipment data. However, since 1971 the number of plant and equipment vehicles registered generally increased, leading to a peak in 1988 and has then declined.

In 1995, Queensland had the most plant and equipment registrations with 30.3% of the total. This was slightly down on 1993, when it accounted for 31.3% of total registrations. New South Wales and Victoria had 23.8% and 19.4%, respectively while the remaining five States and Territories had a combined share of 26.5%.

## CARAVANS

There were 265,374 registered caravans in Australia at 31 May 1995, a decline of 0.6% since 1993, but an increase of 72.6% on 1971. During this period, registrations generally grew until 1979, before slowly but steadily declining.

### Highest registrations in Victoria

More than one in three (35.7%) caravans were registered in Victoria in 1995, which has recorded the most caravan registrations in each Motor Vehicle Census since 1971. There are nearly twice as many caravans registered in Victoria as in New South Wales, and almost two and a half times as many as in Queensland and Western Australia.

NUMBER OF CARAVANS ON REGISTER AS AT 30 JUNE 1993 AND 31 MAY 1995

Source: Motor Vehicle Census, Australia (Cat. no. 9309.0).

TRAILERS

The number of trailers (see Glossary for definition) on register rose by 6.3% between 1993 and 1995 to over 1.7 million. Since 1971 there has been substantial growth in trailer registrations, with two and a half times as many trailers on register in 1995 as in 1971. The majority of trailer registrations were box and boat trailers, which also accounted for most of the increase.

MORE DETAILED DATA

Motor Vehicle Census data have been published in *Motor Vehicle Census, Australia* (Cat. no. 9309.0) since 1971. These publications contain more detailed data, particularly for State dissections and for size breakdowns of heavy vehicles. Small area data are available for the 1991, 1993 and 1995 censuses. Details from the 31 May 1995 Motor Vehicle Census were released in August 1996.

<sup>1</sup> For years up to 1991, data as at 30 September. 1993 data as at 30 June. 1995 data as at 31 May.

<sup>2</sup> Up to and including 1982, excludes Commonwealth government-owned vehicles.

<sup>3</sup> 1988 data understated the number of vehicles on register.

<sup>4</sup> Some agricultural tractors classified as plant and equipment up until the 1991 census, have subsequently been excluded from the scope of the census.

## SECTION 3

## MOTOR VEHICLE CHARACTERISTICS

This section contains analysis of specific characteristics of the motor vehicle fleet: average age; vehicle attrition rate; fuel type used and consumption; and the most common colours of motor vehicles.

### AVERAGE AGE OF THE VEHICLE FLEET

Over the period 1971 to 1995, the age of the vehicle fleet (including motor cycles) has steadily increased from an estimated average of 6.1 years to 10.6 years. This represents an increase of 73.8% in the average age of vehicles. From Table 3.2 it can be seen that the proportion of vehicles with an age of 'not stated' has significantly declined since 1971. Therefore, the average age of the fleet is likely to be slightly higher if it is assumed that vehicles with a 'not stated' age tend to be older vehicles. Vehicles with an unknown age were excluded from these calculations.

ESTIMATED AVERAGE AGE OF THE MOTOR VEHICLE FLEET, CENSUS YEARS

Source: Motor Vehicle Census (unpublished data).

The ageing of the vehicle fleet is reflected in the fall in the proportion of new vehicles in the fleet. In 1971, 9.9% of the total fleet comprised vehicles registered for the first time, while in 1994-95 only 6.0% were first time registrations. Table 3.2 shows that, in 1995, over half of the fleet (51.4%) was 10 years or older, compared with 1971 when less than one-fifth of the fleet was this age. In 1971, 44.4% of the fleet was less than five years old but by 1995, this proportion had been reduced to 23.3%.

Factors which may have contributed to the ageing of the vehicle fleet since 1971 include: advances in vehicle manufacturing technology; a trend towards households having two or more vehicles and the increased cost of new vehicles.

### Tasmanian vehicles the oldest

From 1988 (the earliest year State/Territory fleet age data were available) to 1995, the average age of the Australian fleet has increased by 1.5 years. While Tasmania recorded the highest average vehicle age at 31 May 1995 with 12.1 years, up from 10.1 years in 1988, the average age in the Northern Territory increased from 7.5 to 9.4 years. In South

Australia, Victoria and Western Australia the average age was 11.8, 11.2 and 10.8 years, respectively. The remaining State/Territory vehicle fleets recorded average ages that were below the Australian average of 10.6 years.

ESTIMATED RATE OF  
MOTOR VEHICLE  
ATTRITION

The annual rate of motor vehicle attrition (see the Glossary for an explanation) for the total Australian fleet has been estimated back to 1969-70. Between 1969-70 and the late 1980s the estimated annual attrition rate generally declined, to a low of 3.6% in 1989-90. Following a sharp rise in 1990-91, it fell over the next three years to 3.0% in 1993-94 with a slight rise to 3.9% occurring in 1994-95.

Fewer vehicles being  
scrapped

The attrition rate for passenger vehicles fell from 5.9% in 1969-70 to a low of 2.9% in 1981-82, rose to 5.2% in 1990-91 and ranged between 3.0% and 4.0% in the succeeding years.

ESTIMATED ATTRITION RATE OF THE MOTOR VEHICLE FLEET, SELECTED YEARS

Source: Motor Vehicle Census, Australia (Cat. no. 9309.0), Motor Vehicle Registrations, Australia (Cat. no.

TYPE OF FUEL USED

The introduction of Australian Design Rule 37 made it mandatory for vehicles manufactured from February 1986 to use unleaded petrol. While the Design Rule has helped to reduce the total number of vehicles powered by leaded petrol, the retention of older vehicles in the fleet has meant that the attrition rate of leaded petrol powered vehicles has been lower than anticipated. Of all the vehicles powered by petrol recorded in the 1995 MVC, 53.5% used leaded petrol. The proportion of petrol powered vehicles using unleaded petrol was 62.2% in 1993 and 70.4% in 1991.

PASSENGER VEHICLES BY TYPE OF PETROL USED, AS AT 30 SEPTEMBER 1991, 30 JUNE 1993 AND 31 MAY 1995

Source: Motor Vehicle Census, Australia (Cat. no. 9309.0).

Decline in the number of leaded petrol vehicles

Compared with 1993, in 1995 there were 984,793 more vehicles using unleaded petrol and 667,849 fewer vehicles using leaded petrol. Over the same period, the number of passenger vehicles using unleaded petrol as a proportion of total passenger vehicles increased from 37.9% to 46.3%. The proportion of light commercial vehicles using unleaded petrol to total light commercial vehicles also rose, from 25.3% in 1993 to 30.6% in 1995. In 1991, 30.7% of petrol powered passenger vehicles and 25.5% of petrol powered light commercial vehicles used unleaded petrol.

LIGHT COMMERCIAL VEHICLES BY PETROL TYPE, AS AT 30 SEPTEMBER 1991, 30 JUNE 1993 AND 31 MAY 1995

Source: Motor Vehicle Census, Australia (Cat. no. 9309.0).

Results from the 1995 MVC indicate that petrol usage varied according to the type of vehicle. Nearly all (96.3%) passenger vehicles were reported as petrol powered. Petrol usage in other vehicle types was as follows: 76.8% of all light commercial vehicles; 67.4% of non-freight carrying trucks; 27.1% of rigid trucks; 24.5% of buses; and 4.6% of articulated trucks. The comparable figures for 1993 were: 96.8% of passenger vehicles; 79.0% of light commercial vehicles; 70.6% of non-freight carrying trucks; 30.0% of rigid trucks; 26.2% of buses; and 5.5% of articulated trucks.

Large increase in diesel passenger vehicles

Diesel fuel was used in 7.2% of all motor vehicles in 1995, an increase on the 6.6% and 6.1% recorded in 1993 and 1991, respectively. The growth in the number of diesel powered vehicles can be attributed mainly to a 72.8% increase in the number of passenger vehicles using diesel fuel between 1991 and 1995, from 101,580 to 175,641 vehicles. In the same period, the number of diesel powered light commercial vehicles increased by 20.6%, with the majority of this increase occurring between 1993 and 1995 (20.0%).

Diesel fuel was used in 91.3% of all articulated trucks and in 68.0% of all rigid trucks in 1995, up from 90.3% and 63.7% in 1993, respectively. For smaller rigid trucks (3.5 to 8 tonnes GVM), 59.4% used diesel, while 71.6% of medium-sized rigid trucks (over 8 to 16 tonnes GVM) and 89.3% of large rigid trucks (over 16 tonnes GVM) used diesel. By comparison, 26.1% of all non-freight carrying trucks and 18.0% of all light commercial vehicles were powered by diesel fuel. However, a much larger proportion of new non-freight carrying trucks and light commercial vehicles were diesel powered in 1993-94 (51.9% and 30.2%, respectively) and 1994-95 (53.3% and 28.6%, respectively).

Type of fuel used in new vehicles

During 1995-96, 91.3% of new vehicles registered used unleaded petrol, while 8.2% used diesel. This is comparable with 1983-84 (the first time fuel type data were published for new vehicle registrations) when 91.9% of registered new vehicles used petrol and 8.2% used diesel fuel.

Since 1983-84, the proportion of diesel powered vehicles has fluctuated between a low of 8.0% in 1991-92 and a high of 10.0% in 1984-85. In 1983-84, nearly a third (30.9%) of the new light commercial and truck registrations were diesel powered. By 1994-95, this proportion had risen to 39.2%, with a slight fall, to 37.6%, recorded in 1995-96.

## FUEL CONSUMPTION

Results from the Survey of Motor Vehicle Use show that between 1985 and 1991, the average consumption of fuel for all petrol powered vehicles varied between 12.1 and 12.4 litres per 100 kilometres. Average consumption for petrol powered passenger vehicles was in the range of 11.8 to 12.0 litres per 100 kilometres. The 1995 survey revealed that the average fuel consumption of all petrol powered vehicles had fallen to 11.4 litres per 100 kilometres with passenger vehicles averaging 11.2 litres per 100 kilometres.

In 1991, the efficiency of the unleaded petrol powered passenger vehicle fleet (11.4 litres per 100 kilometres on average) was significantly better than the ageing, leaded petrol vehicle fleet (averaging 12.5 litres per 100 kilometres). In 1995, the average consumption of both leaded and unleaded petrol powered passenger vehicles fell, by 6.4% to 11.7 litres per 100 kilometres and by 4.4% to 10.9 litres per 100 kilometres, respectively.

Between 1985 and 1995, the average consumption of fuel by diesel powered vehicles fell by 14.1%, from 29.0 to 24.9 litres per 100 kilometres. Over this period, the proportion of diesel powered passenger vehicles more than doubled while that of heavy commercial vehicles fell significantly. The average consumption of diesel by articulated trucks and non-freight carrying trucks fell by 5.6% and 30.4%, respectively. Average consumption by passenger vehicles and rigid trucks fell marginally and remained unchanged for light commercial vehicles.

#### AVERAGE FUEL CONSUMED BY PASSENGER VEHICLES

Note: In the 1985 SMVU, unleaded petrol was included with leaded.

Source: Survey of Motor Vehicle Use, Australia (Cat. no. 9208.0) and Survey of Motor Vehicle Use, Australia, Preliminary (Cat. no. 9202.0).

#### TOTAL FUEL CONSUMED

The total volume of fuel consumed declined by 1.1%, between 1988 and 1991, despite an increase in the total number of vehicles registered of 7.7% (700,068 vehicles) and a rise in the average fuel consumption from 14.0 to 14.2 litres per 100 kilometres. This was consistent with a fall in the total number of kilometres travelled of 2.3% (3,525 million kilometres) and in total average kilometres by 6.7%, from 16.4 to 15.3 thousand kilometres, for all vehicles. In contrast, from 1991 to 1995 the total volume of fuel consumed rose by 6.9% to 22,815 million litres. Consumption of petrol fell by 0.7% while diesel consumption rose by 23.5%. Results from the 1995 Survey showed that the total number of kilometres travelled, for all vehicles, rose by 10.7% (16,125 million kilometres) while average kilometres travelled increased by 2.0%, to 15.6 thousand kilometres.

With the introduction of unleaded petrol powered vehicles, the total volume of leaded petrol consumed has declined steadily. Between 1988 and 1991, total leaded petrol consumption fell by 25.5%, and by a further 31.3% between 1991 and 1995 for a total fall in the volume consumed of 6,297 million litres. Over the same period, unleaded petrol consumption grew by 160.0%, or 5,337 million litres.

On the other hand, while total diesel fuel consumption increased by 26.8%, from 1988 to 1995 (2.7% from 1988 to 1991), the number of diesel powered vehicles registered increased by 60.7% over the same period. The average distance travelled by diesel powered vehicles fell from 29.0 to 27.0 thousand kilometres between 1988 and 1991 and

declined further between 1991 and 1995 to 26.7 thousand kilometres. In 1991, diesel powered light commercial vehicles, rigid trucks and articulated trucks on average travelled 8.3%, 5.4% and 2.5% fewer kilometres, respectively, than in 1988. In contrast, the average kilometres travelled by passenger vehicles rose by 1.5%. In 1995, the average kilometres travelled by these vehicles rose by 0.5%, 2.8% and 15.6% respectively, compared with 1991, while the passenger vehicle average fell by 3.9%.

#### COLOUR OF MOTOR VEHICLES

The 1993 MVC contained data on the predominant colours of the motor vehicles in the fleet. Almost a third (31.8%) of all vehicles on the register were white. The next most popular colour was blue with 14.3%, followed by red with 13.3%, green with 7.0%, silver with just under 6.6% and yellow with 5.8% of total registrations. The distribution of vehicle colour was consistent across all of the States and Territories.

#### MORE DETAILED DATA

Motor Vehicle Census data have been published periodically in *Motor Vehicle Census, Australia* (Cat. no. 9309.0) since 1971. Survey of Motor Vehicle Use data have been published periodically in *Survey of Motor Vehicle Use, Australia* (Cat. no. 9208.0) since 1963. Data from the 1995 SMVU have been published in *Survey of Motor Vehicle Use, Australia, Preliminary* (Cat. no. 9202.0) with final data expected to be released in September 1997. New Motor Vehicle Registrations data have been published on a monthly and annual basis since the 1960s.

These publications contain more detailed data than are presented in this Section.

## SECTION 4

## MOTOR VEHICLE OWNERSHIP AND USAGE

Motor vehicles are an integral part of the Australian way of life. Since 1971 the number of vehicles per 1,000 of population has been increasing steadily, particularly in the Northern Territory and the Australian Capital Territory. This section examines a number of aspects of road use including the relationship between the number of motor vehicles and the population of Australia.

### RATE OF VEHICLES TO POPULATION

At 31 May 1995, there were over 10.6 million vehicles registered in Australia. This represents a vehicle registration rate of 606 vehicles per 1,000 population, a rise on the rates of 595 at 30 June 1993 and 582 at 30 September 1991.

MOTOR VEHICLES ON REGISTER<sup>1</sup> PER 1,000 POPULATION, CENSUS YEARS

<sup>1</sup> Includes motor cycles.

Source: Motor Vehicle Census, Australia (Cat. no. 9309.0). Estimated Resident Population by Sex and Age: States and Territories of Australia (Cat. no. 3201.0) and unpublished ABS data.

### Vehicles outpace population growth

In 1971, the rate for Australia was only 398 registrations per 1,000 population. The rate in all States and Territories rose steadily over the 24 years to 1995. In 1995, Western Australia had the highest rate of vehicles per 1,000 population with 679 followed closely by Tasmania with 676, while the lowest rate was in the Northern Territory with 520.

Looked at another way, there were 1.65 persons for every vehicle in Australia at 30 June 1995, down from 1.7 persons per vehicle in 1993. In 1993, the rate for the United Kingdom and Japan was 2.1 people per vehicle, while in France and Canada it was 2.0 and 2.6, respectively. However, the United States of America had a rate of only 1.3 persons per vehicle.

### RATE OF NEW VEHICLES TO POPULATION

The change in the rate of new motor vehicle registrations per 1,000 population indicates the relationship between the number of new vehicles being registered and the growth in the population. During the early 1970s, the rate of new vehicle registrations per 1,000 population increased from 39.9 in 1969-70 to a peak of 45.6 in 1974-75. Since then, it has generally shown a declining trend, with a notable trough in the late 1980s when the rate fell to 28.8 in 1987-88. Successive rises

have occurred in each of the last four years, with 1995-96 recording a rate of 34.8 new vehicle registrations per 1,000 population.

NEW MOTOR VEHICLES ON REGISTER<sup>1</sup> PER 1,000 POPULATION 1970-71 TO 1995-96

Source: *New Motor Vehicle Registrations, Australia* (Cat. no. 9304.0) and *Estimated Resident Population by Sex and Age: States and Territories of Australia* (Cat. no. 3201.0).

The Northern Territory led the States and Territories with a rate of 43.7 new vehicle registrations per 1,000 population in 1994-95, up from 36.1 the previous year. The rate for the Australian Capital Territory fell from 40.6 in 1993-94, the highest for any of the States and Territories, to 39.5 in 1994-95, the second highest. Victoria, South Australia and Tasmania with rates of 33.4, 29.6 and 28.9, respectively, were well below the rate for Australia of 34.5 new vehicles per 1,000 population. The remaining States recorded rates in the range of 36.6 to 37.7 new vehicle registrations per 1,000 population.

#### MOTOR VEHICLES PER HOUSEHOLD

Since 1971, each of the Australian Censuses of Population and Housing has asked a question on the number of vehicles garaged per household. The results support the MVC findings of a gradual shift towards a higher rate of vehicle registrations per 1,000 population. In the 1971 Population Census it was found that 28.8% of all households had two or more vehicles (excluding motor cycles) garaged. In 1976, the proportion was 33.9%, increasing to 39.2% in 1981, peaking at 42.1% in 1986 and then fell slightly to 39.4 in 1991. Note that the proportion of households not stating the number of motor vehicles garaged rose substantially in 1991, to 12.0% (up from 3.3% in 1986), resulting in all other categories recording decreases in their proportions (see Table 4.3)

The increase in the number of vehicles per household is the likely result of a number of factors. These include the trend towards households with more than one person employed; overall demographic changes in the population; the spread of urban boundaries requiring longer travelling distances and the cost of public transport. Results from the 1991 Survey of Motor Vehicle Use indicate that there were 92 million fewer passengers carried on bus route services compared with 1988. For the 1995 survey, the number of bus route service passengers carried rose by 67 million, still 25 million lower than the total in 1988.

NUMBER OF VEHICLES GARAGED BY HOUSEHOLDS, POPULATION CENSUS YEARS

Source: 1991 Census - Australia In Profile (Cat. no. 2821.0).

DRIVER AND RIDER LICENCES

The total number of driver/rider licences in force (on issue) each year almost tripled between 1970 and 1995, reflecting the increases in population (particularly the driver/rider population), car ownership and the marked increase in the size of the vehicle fleet. The number of licences on issue nearly quadrupled in the Northern Territory between 1970 and 1995, while issues in Western Australia almost tripled. Tasmania was the only State where the number of licences in force did not more than double, although it still recorded an increase of 75.5%. By comparison, the total population increased by nearly a third over the same period and the number of motor vehicles on register more than doubled.

DRIVER AND RIDER LICENCES IN FORCE, SELECTED YEARS, AS AT 30 JUNE

<sup>1</sup> Data for Queensland are not available before 1990.

Source: Year Book Australia (Cat. no. 1301.0) from data provided by the State/Territory licensing authorities.

## ROAD SAFETY

The number of road fatalities fell by nearly half between 1970 and 1995, despite the number of driver and rider licences on issue approximately tripling over the same period, the number of registered vehicles more than doubling and the total distance travelled almost doubling. In 1971, there was one fatality per 1,280 registered vehicles, but by 1995 this had fallen to one fatality per 5,419 vehicles.

In New South Wales, there were 1,309 road fatalities in 1970. This number had declined by over a half, to 620 fatalities in 1995. The fall has been even more significant in Victoria with the 1995 figure being 39.4% of the number of fatalities in 1970. In the same period, South Australia and Tasmania experienced reductions of about a half, while Queensland and Western Australia experienced less significant reductions in their number of road fatalities. In the Northern Territory, fatalities rose sharply during the 1960s and early 1970s, continued to rise at a more moderate rate over the 1980s to peak at 68 in 1990 before falling rapidly over subsequent years to about the level of 1970 in 1994. In 1995, fatalities again rose in Victoria, Queensland, South Australia and particularly the Northern Territory.

Similarly, the number of motor vehicle accident casualties (where people were hospitalised) declined sharply, particularly over the second half of the 1970s, from 91,554 persons in 1970 to 27,413 persons in 1980. The rate has continued to fall since then, reaching 21,602 persons in 1993.

TOTAL ROAD FATALITIES, 1970 TO 1995

Source: Federal Office of Road Safety, Road Fatality Statistics, Australia.

Likely factors contributing to the decline in fatalities and casualties since the late 1970s are: increased social awareness; government road safety initiatives including the introduction of seat belts; stronger application of drink driving laws; and better manufacturing design standards for vehicles.

### Effect of blood alcohol content limits

One of the main measures which States and Territories have taken to reduce the number of road fatalities is tighter regulation and implementation of blood alcohol content laws. The proportion of drivers and motor cycle riders killed having a blood alcohol content over the legal limit has fallen from 44% in 1981 to 28% of all road fatalities in

1994. The pattern is similar across most States and Territories except for increases in South Australia, the Northern Territory and particularly the Australian Capital Territory in 1993 and minor rises in Queensland in 1994 and Tasmania in both 1993 and 1994.

Road fatalities by age and gender

There was a total of 2,113 road fatalities in 1991. This number fell to 1,952 in 1993, then to 1,934 in 1994 with a sharp rise to 2,017 occurring in 1995. The pattern of road fatalities varies significantly according to age and gender.

In 1991, the 17-25 years age group recorded the highest number of road fatalities with 646, 30.6% of total fatalities. In 1993 and 1994, the number of fatalities for this age group fell to 591 and 541 (30.3% and 27.9% of total fatalities), respectively. In 1995, fatalities rose to 596, accounting for 29.5% of the total. In each of these years male fatalities were more than three times higher than female fatalities.

The next largest group was the 26-39 years age group with 489 fatalities in 1991, 479 in 1993, 432 in 1994 and 486 in 1995 (23.1%, 24.5%, 22.3% and 24.1%, respectively). Again, in this age group, male fatalities exceeded female fatalities, by over three times in 1991, 1993 and 1995 but by almost exactly three times in 1994. The 40-59 age group accounted for 16.3%, 17.4%, 17.5% and 17.3% of total fatalities, respectively, while the 60 years and over age group accounted for 20.4%, 18.5%, 22.6% and 20.1% of total fatalities.

Female fatalities accounted for 29.8% of total fatalities in 1991, 28.7% in 1993, 30.4% in 1994 and 29.9% in 1995. Male fatalities exceeded female fatalities across all age groups with the largest difference occurring in the 17-25 years age group.

FATALITIES BY AGE AND GENDER, 1995

Note: Age group 60 and over includes fatalities of unstated age.  
Source: Federal Office of Road Safety, Road Fatality Statistics, Australia.

Fatalities per 100,000 by age and gender

The rate of road fatalities per 100,000 population for the total population was 12.2 in 1991, with the male rate at 17.2 and the female at 7.3. The rate for the total population fell to 11.1 in 1993, then to 10.9 in 1994 before rising to 11.2 in 1995. The male rate fell to 15.8 in

1993, fell again to 15.2 in 1994 and rose to 15.7 in 1995. The female rate fell to 6.3 in 1993 before rising to 6.6 in 1994 and rising again to 6.7 in 1995.

The 17-25 year age group, comprising 14.5% of the total population in 1991, recorded the highest rate of fatalities per 100,000 population at 25.7. The rate for this age group fell to 23.5 in 1993 and then to 21.6 in 1994. In 1995, the rate for this group rose to 23.8, although it comprised only 13.9% of the total population. In 1991, the male rate for the 17-25 age group was 39.3, more than eight times the female rate (4.7). In 1993, the male rate fell to 36.4 while the female rate more than doubled, to 10.1. In 1994, the male rate fell again, to 32.6 while the female rate remained steady at 10.1. In 1995, both the male and female rates rose, to 36.3 for males and to 10.8 for females.

The rate for the 60 years and over age group, which comprised 15.5% of the population in 1991, was the next highest at 16.0 fatalities per 100,000 population. The rate fell to 13.0 for this age group in 1993, rose to 15.6 in 1994 then fell to 14.2 in 1995. This age group, together with the 0-16 years age group (with the exception of 1991) were the only groups where the female rate was more than half the male rate.

Driver fatalities per distance travelled by age and gender

It is of interest to compare the fatality rates of distinct groups of drivers with the total distance travelled by those groups. For this purpose, Federal Office of Road Safety information on driver fatalities can be compared with ABS Survey of Motor Vehicle Use data on total distance travelled by drivers. The analysis, for age and gender, gives a different picture to that obtained when looking at unadjusted fatality rates.

DRIVER FATALITIES PER 100 MILLION VEHICLE KILOMETRES TRAVELLED, 1995

Source: Survey of Motor Vehicle Use, Australia, Preliminary (Cat. no. 9202.0) and Federal Office of Road Safety, Road Fatalities, Australia, 1995 Statistical Summary.

Statistics on fatalities indicate that male drivers aged less than 25 are at a much greater risk than other groups in the population. For instance, in 1995, there were 201 fatalities in this category, compared with 59 fatalities of female drivers in this group and 871 of all drivers aged 15 or over. The gender differences also apply to older age groups. For drivers in the age group 25-54, male driver fatalities were nearly two and a half

times the number of female fatalities. In the 55 and over category, male fatalities were nearly 2.8 times the number of female fatalities.

Fatalities per 100 million  
vehicle kilometres  
travelled

However, when fatality rates are adjusted for distance driven a different picture emerges. The gender imbalance almost disappears whilst age differences remain. For instance, there are 1.68 driver fatalities per 100 million kilometres travelled for males under 25 and 1.43 for females in this age category. In the 55 and over group, the adjusted fatality rate is actually lower for male drivers, at 0.70 fatalities per 100 million kilometres travelled compared with 0.75 for females.

Since 1976, the rate of fatalities per 100 million kilometres travelled has been consistently declining. The rate in 1995 for Australia was 1.21, only a little over a third of the rate recorded in 1976 (3.55).

Between 1976 and 1995, the rate fell in each State and Territory with the largest percentage fall occurring in the Australian Capital Territory, from 2.26 to 0.50, and the lowest in the Northern Territory, from 9.22 to 4.23.

TOTAL DISTANCE  
TRAVELLED

For the 12 months to 30 September 1995, a total of 166,514 million kilometres was travelled by all vehicles, an increase of 10.7% on the total distance travelled in the same period in 1991. Passenger vehicles accounted for 74.2% of the total distance travelled in 1995, down from 76.0% in 1991. This proportion was consistent over the previous four surveys, 1976 to 1988, with the proportion being 77.8% in 1976.

By age and gender

For the 1995 survey, the total distance travelled, excluding buses was 164,823 million kilometres, of which 68.9% was by male drivers/riders and 31.1% by females. These proportions for the 1991 survey were 71.9% by male drivers/riders and 28.1% by females. Passenger vehicles travelled 123,560 million kilometres in 1995, or 75.0% of the total (excluding buses) with female drivers accounting for 39.6% of this distance. In contrast, female drivers/riders accounted for 5.7% of kilometres travelled by non-passenger vehicles, an increase on the 4.8% recorded for the 1991 survey.

#### TOTAL DISTANCE TRAVELLED<sup>1</sup>, 30 SEPTEMBER

<sup>1</sup> Excludes distance travelled by buses but includes distance travelled by motor cycles.  
Source: Survey of Motor Vehicle Use, unpublished ABS data.

In 1995, drivers/riders in the 35-44 age group accounted for 24.6% of total distance travelled, 23.8% of passenger vehicle distance travelled and 27.1% of distance travelled by non-passenger vehicles. In this age group, males travelled 64.3% of the total for the group, 53.2% of the passenger vehicle kilometres and 93.6% of the non-passenger vehicle kilometres. In comparison, 1991 drivers/riders in this age group accounted for 27.5% of total distance travelled, 26.7% of passenger vehicle distance travelled and 30.2% of distance travelled by non-passenger vehicles. Males accounted for 71.1% of the total for the group, 62.6% of the passenger vehicle kilometres and 95.9% of the non-passenger vehicle kilometres.

The next highest group was the 25-34 group which accounted for 22.2% of total kilometres travelled in 1995 and 25.5% in 1991.

NUMBER OF DRIVERS/RIDERS BY AGE AND GENDER

The 1991 Population Census showed that 31.3% of the total resident population were aged between 25 and 44 while the 45-54 and 55-64 age groups constituted 10.8% and 8.4% of the population.

Results from the 1991 Survey of Motor Vehicle Use revealed that nearly half (46.9%) of the passenger vehicle drivers in Australia were aged between 25 and 44 years in 1991, but accounted for 53.0% of total distance travelled (excluding buses). The 45-54 and 55-64 age groups were also over represented as drivers of passenger vehicles, accounting for 18.5% and 11.9% of drivers, and 18.4% and 10.4%, respectively, of the total passenger vehicle distance travelled.

For the 1995 survey, the proportion of passenger vehicle drivers in the 25-44 years age group had fallen to 42.4% with the 45-54 and 55-64 years age groups growing to account for 21.5% and 12.2% of drivers respectively. These groups accounted for 51.1%, 20.3% and 10.1% of total passenger vehicle distance travelled in 1995.

NUMBER OF DRIVERS/RIDERS<sup>1</sup> 30 SEPTEMBER

<sup>1</sup> Excludes drivers of buses but includes motor cycle riders.  
Source: Survey of Motor Vehicle Use, unpublished ABS data.

Males accounted for 62.4% of total drivers/riders in 1991 and for 60.9% in 1995. In 1991, female drivers comprised 43.3% of the number of drivers of passenger vehicles and 13.3% of the number of drivers/riders

of non-passenger vehicles for a total of 37.6% of total drivers/riders. By 1995, female drivers comprised 45.0% of the number of drivers of passenger vehicles and 15.1% of the number of drivers/riders of non-passenger vehicles for a total of 39.1% of total drivers/riders.

**AVERAGE DISTANCE TRAVELLED BY MOTOR VEHICLES**

The 1971 Survey of Motor Vehicle Use found that passenger vehicles travelled an average of 15,800 kilometres in the year. This average fell in both the 1976 and 1979 surveys, to 15,400 and 15,300 kilometres, respectively, before rising in each of the 1982 and 1985 surveys and peaking again at 15,800 kilometres in 1988. There was a decline in the average distance travelled, to 14,300 kilometres in 1991 with a small rise to 14,400 kilometres occurring in 1995.

While the average kilometres travelled by all vehicle types has not changed significantly since the 1970s, the total number of kilometres travelled has doubled between 1971 and 1995. Over the same period the size of the vehicle fleet increased by almost the same percentage.

**AVERAGE DISTANCE TRAVELLED BY TYPE OF VEHICLE<sup>1</sup>**

<sup>1</sup> Rigid trucks were not separately recorded in the 1971 SMVU.

Note: There are different intervals between Survey of Motor Vehicle Use periods.

Source: Survey of Motor Vehicle Use, Australia (Cat. no. 9208.0) and Survey of Motor Vehicle Use, Australia, Preliminary (Cat.no. 9202.0).

**Average distance travelled by articulated trucks**

The average annual distance travelled by articulated trucks has increased steadily from 50,500 kilometres in 1976 to 87,900 kilometres in 1995. Over the same period, the average tonne-kilometres for articulated trucks more than doubled, from 583,200 to 1,592,000. In addition to these increases there has been an increase in the number of articulated trucks registered of 82.4%.

**Average distance travelled for private purposes**

The average annual distance travelled for private purposes in 1971 was approximately 7,400 kilometres. From 1971, this distance rose progressively to peak at 8,800 kilometres in 1988 before falling to 7,900 kilometres in 1991. A slight recovery, to 8,000 kilometres, occurred in 1995.

In the 1995 survey, vehicles registered in Queensland travelled the farthest for ail purposes, averaging an annual 17,200 kilometres. This was 3.4% less than the highest average, recorded by the Northern

TRAVEL TO AND FROM WORK

Territory, in 1991. However, in both 1991 and 1995, Australian Capital Territory registered vehicles travelled the farthest for private purposes, averaging 9,100 kilometres in 1991 and falling to 8,900 kilometres in 1995.

The 1991 Survey of Motor Vehicle Use found that motor vehicles were driven a total of 34,494 million kilometres to and from work at an average of 6,500 kilometres per year. By 1995 the total distance travelled had increased to 39,188 million kilometres with the average rising to 6,600 kilometres per vehicle. In 1995, Queensland vehicles travelled the farthest, averaging 8,200 kilometres annually, considerably higher than the 6,800 kilometres travelled by Victorian vehicles which recorded the highest average in 1991. Tasmanian vehicles travelled the least with an average of 5,300 kilometres in 1995, down from 5,700 in 1991. In 1971, the equivalent figure for Australia was only 3,400 kilometres.

MODE OF TRAVEL TO WORK, 1991

Note: Other includes: worked at home; did not go to work; where the method of travel could not be determined; and any other method not specified.

Source: 1991 Census — Community Profiles, Australia (Cat. no. 2722.0).

In the 1986 and 1991 Censuses of Population and Housing, Australians were asked to nominate the modes used for travelling to work. The findings showed that nearly two-thirds of the population who travelled to work on both census days went by car for at least part of the journey. The use of public transport (train, bus, tram or ferry) was the next most common choice for travelling to work with one in 10 people using this mode of transport, significantly lower than for car usage. The proportion fell slightly from 1986 to 1991. Travelling to work by bicycle or walking accounted for 6.4% and 6.1% of the employed population, in 1986 and 1991 respectively.

Transport to work/study

Results from the ABS Environmental Issues: People's Views and Practices survey, conducted in 1996, revealed that in April 1996 the majority of people travelled to work or study as a car/truck/van driver (78%) for at least part of the trip. New South Wales had the highest proportion (22%) of any State/Territory of people using public transport (primarily buses and trains) for at least part of the trip to work or study, while the Northern Territory had the lowest proportion (5%).

The major reason that people gave for using public transport to get to work or study was that they did not own a car (34%). This was followed by cost (29%) and parking problems (23%). Environmental concern was only reported by 5% of people as a reason for using public transport.

The most frequent reasons people gave for not taking public transport to work or study were that there was no service available (36%), the travel time was too long (26%), and that their vehicle needed to be available to them during work or study hours (15%). Slightly more females than males reported that no service was available, with more reporting on the infrequency or reliability of the service, that it took too long or on comfort/privacy. Twice as many females as males reported the need for a vehicle before or after work or study and seven times as many were concerned about their own safety. Substantially more males than females reported the need for use of a vehicle during work hours, to carry tools/equipment and had the use of a company/employer's car.

Approximately one in five people in Australia reported that they had no public transport options. Around 28% of Queenslanders (the highest proportion) stated that they had no public transport available to them. The availability of rail services was more prominent in Victoria and New South Wales whereas bus services were more prominent in the Australian Capital Territory.

People aged between 18-24 years were most likely to use public transport to travel to work or study. Around 14% of people in this age group used the train with a similar proportion also using the bus. In comparison, 7% of the 65 years and over age group used the train and only 2% used the bus.

More than 50% of people who travel to work or study travelled less than 13 kilometres and 77% took 38 minutes or less to reach their destination.

#### MOTOR VEHICLE MAINTENANCE

Results from the survey also showed that in April 1996 38% of households reported that the oil and/or water levels in their vehicles were checked at least once a week while 54% were checked at least once every two weeks. An estimated 7% of households reported checking these levels infrequently and in 3% they were never checked. Of those households indicating that they checked the oil and/or water levels of their vehicles, 51% checked them at regular intervals.

Three-quarters (75%) of households with motor vehicles serviced their major vehicle at least once every six months. In contrast, 6% reported only servicing their vehicle when a problem arose.

Around 53% of households serviced their vehicles as frequently as advised by the owner's manual provided with their vehicle. Households in the Northern Territory and the Australian Capital Territory were most likely to have their vehicle serviced as recommended by the owner's manual with Tasmania recording the lowest proportion. Of those households which did not follow the servicing advice given by the owner's manual, 44% had them serviced less frequently than advised. Households in Tasmania were most likely to service their major vehicle less frequently than advised in the manual.

For those households which serviced their major vehicle, just over three-quarters (77%) always had the service performed by a motor mechanic. This service was used most frequently in the Australian

Capital Territory. A third (33%) of households reported that the mechanic worked at a franchised dealer for the make of vehicle. Households in the Northern Territory were the greatest users of such franchised mechanics with Tasmanian households the lowest users.

FREQUENCY OF VEHICLE SERVICING, APRIL 1996

Source: *Environmental Issues, People's Views and Practices* (Cat. no. 4602.0).

Of those households which did not always have their major vehicle serviced by a motor mechanic, 60% did at some time have servicing work done to the vehicle by a mechanic. The use of mechanics for this work was most likely to occur in the Australian Capital Territory and least likely to occur in Western Australia.

Of those households which had their major vehicle serviced but never used a mechanic, 85% had the vehicle serviced by a member of the household. A further 14% had the vehicle serviced by a friend or relative. In this category, the Northern Territory reported the highest number of households where a household member serviced the vehicle and Tasmania the lowest number of such households.

Households in the higher income brackets were more likely to service their vehicles as advised by the owner's manual. Around 71% of households where the weekly income was greater than \$1,500 reported servicing their major vehicle as advised in the manual, compared with 50% of those with weekly incomes of less than \$159. Households with higher incomes used mechanics at franchised dealers for the make of the vehicle in greater proportion than those on lower incomes. Around 56% of households with weekly incomes of greater than \$1,500 used a franchised dealer mechanic, compared with 26% for households where the weekly income was less than \$159.

ADDITIONAL DATA  
AVAILABLE

More detailed data concerning aspects of motor vehicle ownership and usage are available from both published and unpublished sources. Information on the environmental aspects of vehicle ownership and usage are available in *Environmental Issues: people's Views and Practices* (Cat. no. 4602.0).

1996	4 216.2	3 114.4	2 057.0	978.5	1 154.2	296.3	97.2	207.1

<sup>1</sup> Queensland data before 1990 are not available.

<sup>2</sup> The number of licences issued is overstated in 1990, except for Tasmania and the Australian Capital Territory, as combined drivers' and riders' licences were not separately identified. This resulted in double counting of licences issued for both drivers and riders combined.

<sup>3</sup> The number of licences issued are overstated in the Northern Territory for 1993, 1994 and 1995 as combined drivers' and riders' licences were not separately identified.

**SECTION 5**

**COSTS OF MOTORING**

The ABS collects and publishes a range of financial statistics pertaining either directly or indirectly to motor vehicles and transport in Australia. Information on average expenditure on transport comes from the Household Expenditure Survey (HES) which provides data on household spending patterns. The Consumer Price Index (CPI) measures changes in the prices of motor vehicles and related products and services over time. The third source used in this section is data on personal and commercial finance commitments on motor vehicles, which gives additional insights into the population's total expenditure on motor vehicles. Finally, transport expenditure, vehicle financing and pricing data are combined with private expenditure (see the Glossary) data to present an assessment of motoring costs over time.

**HOUSEHOLD EXPENDITURE ON TRANSPORT**

The HES measures expenditure by households on a range of commodities and services, including transport. In 1984 Australia's average weekly household expenditure on transport (excluding interest on loans for purchases) amounted to \$59.00. This expenditure increased by 29.0%, to \$76.13, in 1988-89 and by a further 22.9% to \$93.58, in 1993-94. Households in 1993-94 spent, on average, over \$4,860 annually on total transport, clearly underlining the significance of transport for most Australian households. Average weekly household expenditure for all expenditure groups rose by 38.9% between 1984 and 1988-89 and by 19.8% from 1988-89 to 1993-94. The CPI for transportation rose by 44.5% between 1984 and 1989 and by 20.7% between 1989 and 1994.

**Change in the proportion of household expenditure on transport**

Transport expenditure, as a proportion of total household expenditure, declined in real terms between 1984 and 1988-89, from 16.3% to 15.1%. Between 1988-89 and 1993-94, this proportion rose marginally, to 15.5%. The three main groups of transport costs (motor vehicle purchases; expenditure on fuel, lubricants and additives; and, other vehicle running expenses, excluding registration and insurance) accounted for 82.5% of average household expenditure on transport in 1984. This proportion fell to 76.7% in 1988-89 before rising slightly to account for 77.5% in 1993-94.

**WEEKLY HOUSEHOLD EXPENDITURE ON KEY TRANSPORT ITEMS**

Source: Household Expenditure Survey, Australia: Detailed Expenditure Items (Cat. no. 6535.0).

Expenditure on motor vehicle purchases

Average household expenditure on the purchase of motor vehicles (including second-hand vehicles and motor cycles) rose by 7.5% between 1984 and 1988-89 and by 37.2% between 1988-89 and 1993-94. In comparison, the price of vehicles, as measured by the CPI, increased by 70.1% from 1984 to 1989 and by 18.0% between 1989 and 1994. During the period 1984-85 to 1993-94, private expenditure on vehicle purchases rose by a total of 5.5% while at the same time registrations of new motor vehicles declined by 5.3% overall. Over the period 1988-95, the average age of the vehicle fleet increased from 9.1 years to 10.6 years while the attrition rate for the fleet initially increased from 3.6% in 1989-90 to 5.2% in 1990-91, declined over subsequent years to be 3.0% in 1993-94 before again increasing to 3.9% in 1994-95.

Although households spent relatively less in real terms on purchasing motor vehicles in 1988-89 compared with 1984, expenditure on petrol (the largest component of total fuel expenditure) rose 19.8%, vehicle registration and insurance was up by 49.8% and other running expenses of vehicles by 49.6%. At the same time, petrol prices rose by only 16.8%, suggesting a small increase in petrol consumption. This is consistent with the 9.6% increase in total kilometres travelled over this period (see Section 4). Between 1989 and 1994, the price of petrol rose by 21.5%, according to the CPI. Average household expenditure on petrol, over the same period, increased by 18.0%, suggesting a fall in consumption over the period. This is consistent with figures from the Survey of Motor Vehicle Usage which show that between 1988 and 1995 there was a slight decrease in average fuel consumption by passenger and light commercial vehicles and in total distance travelled.

Expenditure on fuel, lubricants and additives

Expenditure on fuel, lubricants and additives was the second-largest component of transport expenditure in 1984 at \$17.59 per week, behind the motor vehicle purchase component. Expenditure on this component increased by 21.5% to be the largest component in 1988-89 at \$21.38 per week. Between 1988-89 and 1993-94, average expenditure on fuel, lubricants and additives rose by 19.6% to \$25.57 per week. However, this increase was overshadowed by the 37.2% rise in the motor vehicle purchase component.

Expenditure on other vehicle running expenses

Average expenditure on vehicle running expenses (excluding insurance and registration) grew by 49.6% between 1984 and 1988-89 and by a further 15.2% through to 1993-94. During the same period there was an increase of 25.2% in private expenditure on the operation of motor vehicles. This includes expenditure on fuel, servicing/repairs, parts, registration and licensing fees, etc. Expenditure on vehicle registration and insurance increased by 49.8% from 1984 to 1988-89 and by 21.9% between 1988-89 and 1993-94.

CPI —  
TRANSPORTATION GROUP

The cost of purchasing and maintaining a motor vehicle forms a significant component of household expenditure. The CPI comprises eight groups, with Transportation accounting for 16% of the overall index, reflecting the high proportion of total expenditure allocated to this item.

Within the CPI Transportation group, Purchase of motor vehicles and Petrol each account for a large proportion of the total.

Analysis of the annual price index of petrol highlights the fluctuating nature of petrol prices over time. During the period 1973 to 1994, the petrol price index has risen at varying rates. Following a period of slow growth during the mid and late 1970s, the index experienced a relatively

high rate of growth from 1979 to 1981 before slowing again over the late 1980s. In 1986 and 1988 the index actually fell slightly. The index jumped sharply in 1990 with the rate of growth being essentially flat over the subsequent years to 1994 before a strong increase occurred in 1995.

Similar to the petrol price index, the motor vehicle purchase price index also appears to have had distinct periods of change in the price level. From 1974 to 1977, the rate of growth in the index increased strongly followed by a period of more moderate growth through to 1984. There was another period of strong growth from 1985 to 1987 before the rate of increase slowed markedly through to 1991. The rate has been growing more moderately over recent years.

ANNUAL AVERAGE PRICE INDEX OF VEHICLES AND PETROL, BASE YEAR = 1989-90

Source: Consumer Price Index (Cat. no. 6401.0).

There are many factors influencing prices, and changes in demand cannot be directly related to changes in prices. However, comparison of the motor vehicle price index and new motor vehicle registrations over the period suggests that periods of strongly growing demand occur at the same time as periods of slowly rising prices, while conversely periods of falling or slowly growing demand occur at the same time as faster rising prices.

While there are many determinants on the vehicle price index level, it is notable that the imposition of government policy aimed at a gradual reduction in vehicle industry protection from the mid-1980s saw a change in the slow and steady rate of increase in previous years. As mentioned earlier, the index grew at a noticeably faster rate in the late 1980s then levelled off.

#### AVERAGE ANNUAL RETAIL PRICE OF PETROL

The ABS collects the average retail price of petrol from surveys carried out in all capital cities during each quarter of the year. The data compiled are useful for comparing retail petrol prices and movements across capital cities. The following analysis focuses on the price of leaded petrol, as the price of unleaded petrol has only been collected since the March quarter of 1994.

Darwin most expensive  
and Brisbane cheapest  
for petrol in 1995

Between 1983 and 1995 the average retail price of leaded petrol increased by between 49.9% (in Brisbane) and 70.7% (in Perth) across all capital cities. From 1983 to 1990 and again in 1993 and 1994, Hobart was the most expensive capital city for petrol with Darwin becoming the most expensive in 1995. In contrast, between 1985 and 1995 Brisbane was the cheapest capital city for petrol, apart from 1987 when Adelaide was the cheapest city.

Generally, all of the capital cities experienced annual movements in the average retail price of petrol of between 0.1 (Melbourne 1986) to 6.3 (Perth 1995) cents per litre over the 1983 to 1995 period. However, between 1989 and 1990, the average retail price of petrol rose in all capital cities, from a minimum of 6.4 cents per litre in Hobart to a maximum of 18.1 cents per litre in Darwin. The high retail price increases that occurred between 1989 and 1990 perhaps reflect any uncertainty that existed in the petroleum industry around the time of the Persian Gulf crisis.

#### VALUE OF VEHICLES UNDER NEW FINANCE LEASE COMMITMENTS

Statistics on new finance lease commitments for motor vehicles were first published by the ABS in 1985-86. The total value of passenger vehicles under new finance lease commitments has risen steadily since 1985-86 when \$1,985 million was committed. After an initial fall in 1986-87, commitments rose quickly to peak at \$3,285 million in 1988-89 before declining substantially to a low of \$1,640 million in 1991-92. Commitments increased in each subsequent year to reach \$2,687 million in 1995-96.

#### COMMERCIAL VEHICLE FINANCE COMMITMENTS

Statistics on commercial motor vehicle finance commitments were first published by the ABS in 1985-86, when the level of commitments was \$893 million. Since then commercial motor vehicle finance commitments have grown to reach a high of \$4,096 million in 1995-96. This accounted for 3.0% of total commercial finance commitments, compared with 1.5% in 1985-86 and 3.7% the previous year. The 1995-96 commitments represent an increase of 5.5% on 1994-95 and followed increases of 22.6% in 1994-95, 33.6% in 1993-94 and 37.4% in 1992-93. This growth over the 1992 to 1996 period reflects a strong rise in demand for new motor vehicles by the commercial sector despite an increase in the price of motor vehicles of 13.7% and significant increases in the cost of running motor vehicles (as shown by the CPI).

Since 1985-86, the value of motor vehicle commercial finance commitments has grown more than four fold, while total commercial commitments has more than doubled. Motor vehicle finance commitments have increased each year since 1985-86, apart from falls of \$244.3 million (14.3%) in 1990-91 and \$0.2 million in 1986-87. In contrast, total commercial finance commitments increased each year from 1985-86 to 1988-89, then steadily declined for three consecutive years before rising again in 1992-93, 1993-94, 1994-95 and particularly strongly in 1995-96.

### VALUE OF VEHICLES UNDER FINANCE COMMITMENTS, ALL LENDERS

Source: Personal Finance, Australia (Cat. no. 5642.0) and Commercial Finance, Australia (Cat. no. 5643.0).

#### PERSONAL VEHICLE FINANCE COMMITMENTS

Personal finance commitments for motor vehicles declined steadily from a peak in 1989-90 of \$6,264 million to a low in 1991-92 of \$5,101 million before the sharp rise to \$6,949 million in 1993-94. A further strong rise, to \$8,288 million, occurred in 1994-95 followed by a 4.4% rise in 1995-96. The fall in personal motor vehicle finance commitments in 1990-91 and 1991-92 together with the fall in commercial finance commitments in 1990-91 are consistent with relatively low new vehicle registration statistics over the same period and indicates a significant slow down in the economy in the early 1990s.

In 1987-88, passenger vehicles (new and used combined) accounted for 20.7% of total personal finance commitments. Between 1987-88 and 1994-95, personal finance commitments for new passenger vehicles more than doubled to \$2,624 million before falling to \$2,505 million in 1995-96. Over the same period, used vehicle commitments rose by 78.9% to \$5,136 million with a further rise to \$5,559 million in 1995-96. In 1995-96 passenger vehicle commitments comprised 24.6% of total personal finance commitments, down from 27.2% in 1994-95.

The value of personal finance commitments on vehicles has averaged between two to three and a half times that of commercial finance commitments since 1987-88.

## SECTION 6

## MOTOR VEHICLE INDUSTRY

This section focuses on aspects relating to the motor vehicle industry, in particular the manufacture and trade of motor vehicles. The key statistical items relating to the motor vehicle industry in general are discussed, with commentary on the underlying trends in the data.

### PASSENGER VEHICLE ASSEMBLY

The highest year for passenger vehicle assembly (including manufacture) in Australia was 1973-74 when nearly 400,000 vehicles were assembled, 25% more than in 1993-94, 1994-95 or 1995-96. The period 1969-70 to 1973-74 accounted for five of the ten highest years for assembly of passenger vehicles in Australia. Assembly levels in recent years have generally not reached the levels achieved in those years.

### PRODUCTION OF PASSENGER VEHICLES

Since 1974-75, the Australian passenger vehicle production industry has experienced an overall decline in the number of vehicles assembled. Between 1974-75 and 1990-91, the number of passenger vehicles assembled fluctuated around an average of 348,795, with a low of 302,057 occurring in 1986-87 and a peak of 386,043 in 1989-90. After falling sharply to only 268,834 in 1991-92, there have been successive annual increases, with the number of vehicles assembled in 1995-96 being 12.5% higher than in 1991-92.

PRODUCTION OF PASSENGER VEHICLES, SELECTED YEARS

Source: Manufacturing Production, Australia: Transport Equipment (Cat. no. 8363.0).

### PRODUCTION OF CARAVANS

In common with the decline in passenger vehicle production since 1975-76, caravan manufacture (excluding campervans) has also fallen. While a record 35,641 caravans were manufactured in 1975-76, during the late 1970s and early 1980s the number of caravans manufactured declined sharply. In 1993-94, only 4,457 caravans were manufactured, 85.0% lower than in 1974-75, but 38.9% higher than the 1991-92 figure, when only 3,209 caravans were produced. These production figures correspond with the fall in the number of new caravan registrations, from 31,900 in 1974-75 to 6,080 in 1993-94 (an 80.9% decline). No production figures are available for 1994-95 or 1995-96.

PRODUCTION OF CARAVANS, SELECTED YEARS

Note: No data available from 1994-95.

Source: Manufacturing Production, Australia: Transport Equipment (Cat. no. 8363.0).

TRANSPORT EQUIPMENT  
MANUFACTURING

Over the period 1969-70 to 1989-90, there has been steady growth in transport equipment manufacturing, encompassing both motor vehicles and parts. Total turnover for transport equipment manufacturing establishments increased from \$1,710.5 million in 1969-70 to \$12,615.8 million in 1989-90. This was followed by a fall to \$10,643.7 million in 1992-93 before rising to \$12,906.6 million in 1993-94. Turnover for establishments comprising the instruments and electrical equipment manufacturing sector has also grown considerably. From \$51.7 million in 1969-70, turnover increased to \$877.4 million in 1989-90, fell to \$681.0 million in 1991-92 rose to \$710.8 million in 1992-93 and then fell again to \$633.8 million in 1993-94. The growth in the motor vehicle assembly sector followed a similar pattern where turnover increased sharply, from \$1,289.1 million in 1969-70 to a peak of \$8,453.9 million in 1989-90, fell over subsequent years to \$7,106.8 million in 1992-93 before recovering to \$8,996.0 million in 1993-94.

Between 1969-70 and 1989-90, there were consistent increases in total turnover, while employment fluctuated along a downward path. For the years 1990-91 to 1992-93, employment continued to fall while total turnover reversed its former upward trend, falling 32.1% over the three years. This fall mirrors the 13.7% decline in new vehicle registrations over the same period. In 1993-94, total turnover, employment and the number of new vehicles registered all increased.

Establishments up,  
employment down

Since 1969-70, there has been a marked degree of restructuring within the transport equipment manufacturing industry, to the extent that estimated employment in the industry has fallen from 85,900 people in 1969-70 to 52,500 people in 1992-93. However, over the same period, the total number of manufacturing establishments has increased from 908 to 1,275, with the majority of this increase occurring in the motor vehicle parts sector (from 498 to 774). The number of manufacturing establishments rose again in 1993-94 to 1,394 with the motor vehicle body manufacturing component experiencing the largest increase.

The growth of wages and salaries followed a similar pattern to total turnover, increasing from \$310.2 million in 1969-70 to a peak of \$1,998.8 million in 1989-90, declined over the following years to

\$1,524.2 million in 1992-93 before rising to \$1,644.3 million in 1993-94. In 1969-70, wages and salaries accounted for 18.1% of total turnover. By 1974-75, this proportion had risen to 23.4% before declining steadily to 14.3% in 1992-93 and then to 12.7% in 1993-94.

#### VALUE OF MOTOR VEHICLE IMPORTS

The total value of motor vehicle imports (excluding parts) has risen consistently since 1969-70, apart from small falls in 1990-91 and 1995-96. The value of imports in 1994-95 represented more than a 30-fold increase on 1969-70. From 1991-92 to 1994-95, the value of motor vehicle imports increased by over 85.2%, to reach \$6,619.5 million. In 1995-96, the total value of vehicle imports fell by 6.4% to \$6,198.9 million.

#### Consistent rise in motor vehicle imports

Motor vehicles accounted for 5.5% of the total value of imports in 1969-70. This proportion generally has increased, reaching 8.4% in 1988-89, before falling to 6.7% in 1990-91. It rose steadily to reach 8.9% in 1994-95 and then fell to 8.0% in 1995-96.

The value of imports of all vehicle types rose between 1993-94 and 1994-95 with passenger vehicles up by 26.0%, freight carrying vehicles by 25.8% and motor cycles by 13.2% (following a rise of 67.2% the previous year). In 1995-96 the value of passenger and freight carrying vehicles fell by 13.1% and 3.6% respectively, while motor cycles rose by 18.6%.

#### Most imports from Japan

Japan was the leading country of origin for motor vehicle (passenger and freight carrying vehicles and motor cycles) imports into Australia in 1969-70, accounting for 30.3% of the value of imports. In 1993-94, Japan was still the dominant supplier and had increased its share to 74.0% of the total value of vehicle imports. In 1994-95, this share fell to 63.1% and then to 55.3% in 1995-96. The other significant country of origin for motor vehicle imports in 1969-70 was Germany, accounting for 17.2%. While the value of vehicle imports fell to 10.3% of the total in 1994-95, up from 7.7% the previous year, Germany remained the second largest supplier. In 1995-96, the value of vehicle imports fell to 9.1% with both the United States of America and South Korea moving ahead of Germany as an exporter of motor vehicles to Australia.

Notwithstanding Japan's clear dominance and Germany's continuing significance, South Korea has been emerging as a major source of passenger vehicle imports since 1988-89. In 1988-89, South Korea accounted for 2.3% of the value of passenger vehicle imports, rising steadily to 6.7% in 1993-94 before falling slightly to 6.1% in 1994-95. In 1995-96 the value of vehicle imports attributed to South Korea rose to 10.2% of total vehicle imports with a total of \$632.0 million, making South Korea the third largest exporter of vehicles to Australia.

Imports of vehicles from the United States of America have risen sharply in recent years to total \$647.0 million in 1995-96 and making the United States of America the second largest source of imported vehicles in Australia. The value of passenger vehicle imports rose by \$147.6 million between 1993-94 and 1995-96 while freight carrying vehicles increased by \$212.9 million and motor cycles by \$24.0 million over the same period.

In 1995-96, the value of total motor vehicle imports from Japan fell by 17.9% while Germany was down 16.7%. Imports from South Korea and the United States of America rose by 55.8% and 42.5% respectively, while imports from all other countries was up by 2.5%.

VALUE OF MOTOR  
VEHICLE EXPORTS

From 1969-70 to 1995-96, the total value of motor vehicle exports (excluding parts) increased more than 10-fold. However, the increase in exports of motor vehicles has not kept pace with that of imports, reflecting the general fall in Australian vehicle manufacture as discussed earlier in this section.

TOTAL VALUE OF MOTOR VEHICLE EXPORTS AND IMPORTS, SELECTED YEARS

Note: Five yearly intervals until 1993-94.

Source: Foreign Trade, Australia: Merchandise Exports and Imports (Cat. no. 5410.0).

In 1969-70, Australian exports of motor vehicles accounted for 1.6% of total exports. Since then they have fallen to a low of 0.4% in 1979-80, before recovering to be about 1.0% in 1993-94 and 1994-95 with a marginal fall to 0.9% occurring in 1995-96.

New Zealand, major  
export market over time

For most of the period since 1969-70, New Zealand has been the largest export market for Australian vehicles, reaching their highest level of \$406.5 million in 1995-96 and accounting for 59.2% of total vehicle exports.

For the period 1990-91 to 1992-93, the United States of America emerged as the major market due largely to exports of the Ford Capri passenger vehicle. To illustrate, passenger vehicle exports to the United States of America grew from \$4.1 million in 1988-89 to \$247.5 million in 1992-93, accounting for 45.9% of the total value of passenger vehicle exports. In 1993-94, exports to the United States of America declined to \$150.4 million, to \$43.8 million in 1994-95 and then to \$3.4 million in 1994-95.

RETAIL AND SERVICE  
ESTABLISHMENTS

In 1991-92, there were 5,178 motor vehicle retailing establishments, employing an average of 11 persons per establishment and with an average annual turnover of \$4.5 million per establishment. In contrast, for the same period there were 32,494 motor vehicle service establishments, employing an average of five persons per establishment and with an average annual turnover of \$0.6 million per establishment.

While the car retailing component made up 77.8% of all motor vehicle retailing establishments in 1991-92, the services retailing segment was

much more fragmented. Automotive repair and services n.e.c., automotive fuel retailing, and smash repairing establishments accounted for 43.1%, 24.1% and 20.6%, respectively, of all motor vehicle services establishments.

Of the different types of motor vehicle services, automotive fuel retailing had the highest average annual turnover at \$1.5 million per establishment in 1991-92. This is substantially higher than the \$0.9 million annual turnover per tyre retailer establishment and the \$0.3 million for each of automotive electrical services, smash repairing and automotive repair and services n.e.c. establishments.

## TAXI OPERATIONS

Estimates from the 1991 Survey of Motor Vehicle Use showed that New South Wales and Victoria had the highest estimated number of registered taxis with 5,470 and 4,397 vehicles, respectively. The Northern Territory and the Australian Capital Territory had the fewest with 130 and 182 vehicles, respectively. The 1995 survey showed that the estimated number of registered taxis declined overall with New South Wales, Victoria and the Northern Territory falling to 5,250, 3,845 and 120 respectively. Numbers rose in the other States and Territory with the largest rise in South Australia where 1,092 were registered compared with 592 in 1991.

Tasmania: most taxis per  
10,000 population

Relative to the resident population size, in 1991 Tasmania had the highest number of registered taxis with 12.2 per 10,000 people, followed by Victoria with 9.9 and New South Wales with 9.2 taxis per 10,000 people. South Australia and the Australian Capital Territory had the lowest number of taxis relative to the population with 4.1 and 6.3 taxis per 10,000 resident population, respectively. In 1995, Tasmania still had the highest number of taxis per 10,000 persons at 12.9 while Victoria had fallen to third behind New South Wales with a ratio of 8.5. The Australian Capital Territory maintained the lowest ratio despite a substantial rise to 6.8 per 10,000 persons although it was only marginally lower than the Northern Territory which recorded a figure of 6.9, down from 7.8 in 1991.

AVERAGE DISTANCE TRAVELLED BY TAXIS, YEAR ENDED 30 SEPTEMBER

Source: Survey of Motor Vehicle Use, Australia (Cat. no. 9208.0) and Survey of Motor Vehicle Use, Australia, Preliminary (Cat. no. 9202.0).

ACT taxis travel further  
on average

The relatively low number of taxis per person in the Australian Capital Territory coincided with the highest average annual kilometres travelled of 194,800 kilometres per taxi in 1991 and 220,500 in 1995. In contrast, Tasmania with the highest number of taxis per person, had the lowest average annual kilometres travelled of 76,000 kilometres per taxi in 1991 declining to 61,100 in 1995. In 1991, South Australia had the second lowest number of taxis per person and the second lowest annual average kilometres travelled per taxi (80,100 kilometres per vehicle). In 1995, South Australia recorded the third lowest rate of taxis to population but the second lowest average annual kilometres travelled (101,900 kilometres per vehicle).

MOTOR VEHICLE HIRE  
INDUSTRY

In 1986-87, the ABS conducted a survey of the motor vehicle hire industry for the first time. The industry was defined as including only those enterprises mainly engaged in leasing, hiring or renting motor vehicles from their own stocks, without drivers, and for periods of less than one year. The results of the survey found that there were 281 enterprises, with an average fleet of 81 vehicles each and employing 11 persons per enterprise on average. Total revenue for the industry was recorded as \$288.7 million. In 1991-92, the survey was conducted a second time with the results showing that there had been a decline in the number of enterprises to 222. However, the average fleet of each enterprise had grown considerably, to 105 vehicles while the average number of employees had risen to 14 per enterprise. Total revenue for the industry had grown to \$470.3 million.

BUS OPERATIONS

Comparing results from the Survey of Motor Vehicle Use for the year to 30 September 1988 with similar periods in 1991 and 1995 showed that there was a 8.5% decline in the total number of passengers transported by buses, from 974 million passengers to 891 million passengers between 1988 and 1991 with a substantial increase of 13.7% to 1,013 million passengers between 1991 and 1995. Despite the overall decline between 1988 and 1991 there was increased use of charter, tour and school bus services of 28.4%, 20.0% and 3.3%, respectively. Route bus use fell by 12.5%. Between 1991 and 1995 route, school and charter bus use rose 10.4%, 36.8% and 26.7%, respectively. Tour bus services were included with other buses in 1995.

Route and school bus services carried the bulk of the passengers, accounting for 72.3% and 17.0%, respectively, of the total in 1991 and 70.2% and 20.5% respectively, in 1995. The majority (96.0% in 1991, falling to 95.6% in 1995) of all bus passengers were transported on buses with more than 20 seats, highlighting the use of large route service buses. School bus services accounted for the highest number of passengers (25.0% in 1991, increasing to 33.3% in 1995) carried on buses with less than 20 seats.

INDUSTRIAL DISPUTES

The number of industrial disputes across all industries has declined substantially since 1980. While trending downwards, the number of disputes in the Transport, Storage and Communication industries has fluctuated significantly, from highs of 320 and 207 in 1980 and 1985, respectively, to a low of 84 in 1993. However, the number of disputes have increased in each of 1994 and 1995.

Fall in industrial disputes

A key measure of the effect of industrial disputes is the estimated number of working days lost within an industry. Between 1973 and 1981, the number of working days lost in the Transport, Storage and Communication industries fluctuated considerably, ranging between 63,200 in 1975 and 627,300 in 1974. From 1981 the number of working

days lost declined consistently, from 465,500 in 1981 to a record low of 15,600 in 1993. In 1994, an estimated total of 118,300 days were lost in the Transport, Storage and Communication industries compared with 501,000 working days lost for all industries. In 1995, the estimated number of working days lost in the Transport, Storage and Communication industries fell to 76,200 compared with a rise of 547,600 across all industries.

## SECTION 7

## INTERNATIONAL COMPARISONS

This section presents a comparison of specific motor vehicle statistics from different countries and cities around the world. The sources of the data are the Union Bank of Switzerland's triennial Prices and Earnings Survey, the International Road Transport Union and the International Road Federation (see the Explanatory Notes for information concerning exchange rates, etc.).

### COMPARISON OF PASSENGER VEHICLE NUMBERS

Australia has a high rate of vehicle ownership in comparison with most other countries. Australia's passenger vehicle fleet more than doubled between 1970 and 1995. Similar growth occurred in the United States of America, Canada, France, New Zealand and the United Kingdom, while considerably higher growth was experienced in Japan.

### PURCHASE PRICES OF MOTOR VEHICLES

From the triennial Prices and Earnings Survey of the Union Bank of Switzerland, the cost of a popular medium-sized, four door, standard model vehicle in Sydney was \$US2,236, in 1970, slightly below the average price (\$US2,373) across the 31 cities surveyed. Although more expensive than Sydney, the cost of an equivalent vehicle in Mexico City or Tokyo was still below the average. While the cost in Johannesburg was very similar to Sydney, the same vehicle would have been much cheaper to purchase in New York, Paris, Montreal or London.

STANDARD MOTOR VEHICLE PURCHASE PRICE, SELECTED CITIES

Source: Union Bank of Switzerland, Prices and Earnings Around the Globe.

Vehicles cheaper in  
Sydney

By 1994, the Union Bank of Switzerland survey found that the average world price paid for a standard model vehicle was \$US17,677. In Sydney, the cost of the standard model vehicle was \$US14,700. Only three (New York, Mexico City and Montreal) of the cities listed in table 7.2 recorded lower prices. While the purchase price of the vehicle in Sydney increased more than six-fold between 1970 and 1994, this rise in vehicle price was much lower than the eight-, 10- and 12-fold increases in the standard vehicle price in Tokyo, London and Paris, respectively.

**MAINTENANCE COSTS  
OF MOTOR VEHICLES**

In 1970, Sydney was a relatively expensive city for road taxes/annual registration fees, costing \$US70 per year, while the average for all cities in the survey was only \$US42. In contrast, the cost in Tokyo, Paris and New York was only US\$17, \$US16 and \$US14, respectively. In 1994, the average cost of road taxes in the 53 surveyed cities had risen to \$US191 per year. In Sydney the cost had risen to \$US139, which was lower than the \$US274 (including third party insurance) recorded in 1991. The cost in Tokyo had risen to \$US380, while Johannesburg, New York and Paris remained as cheaper cities for road taxes with respective charges of \$US27, \$US28 and \$US67. Sao Paulo was by far the most expensive, increasing almost 10-fold from \$US51 in 1970 to \$US479 in 1994, down from \$US554 in 1991.

**Above average vehicle  
servicing costs**

The average cost of a 15,000 kilometre vehicle service in the 53 cities surveyed in 1994 was \$US84, slightly less than the \$US86 charged in Sydney. However, Sydney was still cheaper than Hong Kong, New York, London and Tokyo where the cost was \$US129, \$US135, \$US119 and \$US193, respectively.

**PRICE OF PUBLIC  
TRANSPORT**

The price of a single public transport ticket (valid for one ride of about 10 kilometres or at least 10 stops) in Sydney was \$US0.22 in 1970, more expensive than the average cost of \$US0.18. In London, New York, Montreal and Johannesburg the same ticket was even more expensive than in Sydney. However, public transport was extremely cheap in Mexico City, Sao Paulo and Tokyo at only \$US0.04, \$US0.08 and \$US0.08 per ticket, respectively.

PRICE OF A PUBLIC TRANSPORT TICKET, SELECTED CITIES

Source: Union Bank of Switzerland, *Prices and Earnings Around the Globe*.

**Expensive public transport**

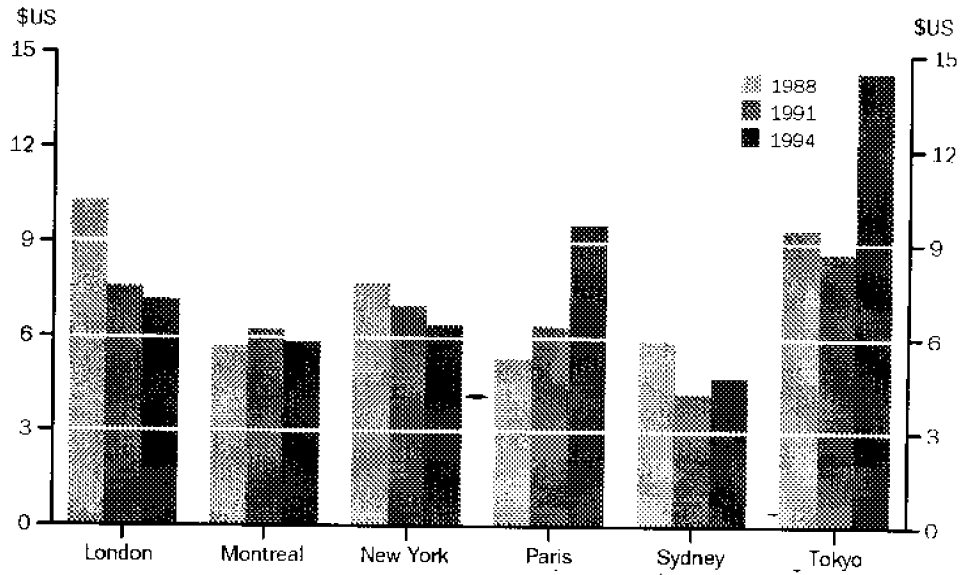

By 1994, the price of the same public transport ticket in Sydney had increased substantially to \$US1.79, almost double that of the average price of \$US0.97 for the 53 surveyed cities. Other cities where the cost of public transport was expensive included: London (\$US1.94); Tokyo (\$US1.54); Montreal (\$US1.42); and New York (\$US1.25). Public transport in Johannesburg, Sao Paulo and Mexico City remained cheap at \$US0.85, \$US0.40 and \$US0.12, respectively.

COST OF A TAXI RIDE

While public transport in Sydney was relatively expensive in 1994, the cost of a five kilometre ride in a taxi was only \$US4.71, well below the average cost of \$US5.78. The cheapest taxi fares in the surveyed cities in 1994 were in Mexico City, Hong Kong and Sao Paulo, while Tokyo, Paris and London were among the most expensive.

## EXPLANATORY NOTES

### INTRODUCTION

**1** Numerous ABS and external sources were used in the compilation of this publication. The Explanatory Notes serve to explain and clarify the scope, coverage and methodology of the surveys used, any changes in classifications and specific points of interest.

### SECTIONS 1 AND 2

New motor vehicle registrations and motor vehicle census

**2** Motor vehicle registration statistics are derived from data made available by the various State and Territory motor vehicle registration authorities and reflect the information as recorded in registration documents. The New Motor Vehicle Registration (NMVR) and Motor Vehicle Census (MVC) statistics include:

- vehicles registered for use on public roads; and
  - vehicles with diplomatic and consular plates and State and Commonwealth Government owned vehicles, other than those belonging to the defence services.
- 3** The NMVR and MVC statistics exclude:
- recreational vehicles such as trail bikes and sand dune buggies intended for use in public places in most States and Territories (except in Victoria and Queensland, where these vehicles must be registered and are thus included in MVC statistics);
  - certain vehicles which use public roads but are exempt from normal registration requirements, for example fire engines in certain States and Territories (the extent to which these vehicles are excluded varies between the States and Territories);
  - Commonwealth Government vehicles prior to 1985;
  - vehicles used solely on farms, in mines, etc. and not used on public roads; and
  - since 1993, some agricultural tractors, which were previously classified with Plant and Equipment.

**4** New motor vehicle registrations comprise registrations that are processed by the motor vehicle registration authorities in the States and Territories. In most States and Territories, the published figures for a period generally depart little from actual new registrations during the period. However, on occasion, new registrations are processed by the central motor vehicle registration authority some time after the actual date of registration. This processing lag has only a minor effect on the annual statistics included in this publication.

**5** For MVC purposes, vehicles on register at the Census date (30 September prior to 1993, 30 June in 1993 and 31 May in 1995) have been defined as those vehicles for which registration was effective for a period including the census date, or had registration expire less than one month before.

**6** From January 1991 onwards, the NMVR and MVC data in this publication are based on ABS processing procedures utilising the Vehicle Identification Number (VIN) adopted by the motor vehicle registration authorities. The VIN system and other initiatives by the registries and ABS, have considerably improved the accuracy of motor registry data. As a result, care needs to be taken when comparing data from different State/Territory registry systems, particularly when comparing data prior to 1991. In addition, duplicate records and out of scope vehicles are now more accurately identified and excluded from the statistics.

**7** Also in 1991, the ABS incorporated the third Australian Design Rule body coding classification categories for light and heavy commercial vehicles in the revised ABS vehicle classification system. Under the classification rules, goods carrying vehicles with a Gross Vehicle Mass (GVM) over 3.5 tonnes are classified as heavy commercial vehicles (rigid or articulated trucks). Goods carrying vehicles with a GVM of 3.5 tonnes and under are classified as light commercial vehicles (utilities, panel vans, forward control vehicles, etc.). Prior to 1991, any vehicle recorded by a motor registry as a truck was classified accordingly. As a result of this classification change, there was a significant increase in registrations of light commercial vehicles in some States and Territories, with corresponding falls in rigid trucks. The classification rules for buses also changed, so that only passenger vehicles with more than nine seats, including the driver's seat, are classified as buses. The result of this change was a reduction in the number of registered buses, and an increase in passenger vehicle registrations.

### SECTION 3

#### Survey of motor vehicle use

**8** The ABS Survey of Motor Vehicle Use (SMVU) collects statistics relating to motor vehicle usage from registered owners. There were nine surveys conducted between 1963 and 1995. In each survey, respondents were asked to provide information on the use of selected motor vehicles for the 12 months ended 30 September or that part for which they were registered owners of the vehicle.

**9** The population of the survey includes all powered vehicles which were registered for road use at the date of the associated MVC with a motor vehicle registration authority (for example 31 May in 1995).

**10** The scope of the survey excludes:

- caravans, trailers, tractors, plant and equipment, vehicles belonging to the defence services and vehicles with diplomatic or consular plates; and
- vintage and veteran vehicles, where they could be identified separately.

**11** The survey population was identified using MVC information obtained from the Commonwealth, State and Territory motor vehicle registration authorities. It was stratified within each State and Territory according to vehicle type and other characteristics such as the tare weight and age of the vehicle. The stratification used in the 1991 and 1995 surveys differed from previous surveys in that each vehicle type category was further stratified by vehicle-type dependent characteristics, for example buses according to age and seating capacity.

**12** Sample sizes were chosen for each category (private passenger vehicles, freight carrying vehicles, buses and motor cycles) in order to obtain a suitable level of accuracy at the State/Territory level in each category for the key variable of total distance travelled.

**13** Where the owner of the selected vehicle had not owned the vehicle for the whole survey year, the details provided for the period of ownership were adjusted to give a 12 month equivalent. The statistics therefore relate to the annual rate of use of vehicles during the 12 months ended 30 September. Part year details in respect of seasonal use vehicles were not adjusted.

**14** The vehicle type categories used for the 1991 and 1995 surveys were the same as those used in 1988, except for some renaming. Cars and station wagons were renamed Passenger vehicles. Utilities and panel vans were renamed as Light commercial vehicles, while Other truck types were renamed Non-freight carrying trucks.

**15** The survey results were classified by the type of vehicle as reported by the vehicle owner, rather than as recorded by the motor vehicle registration authorities.

#### SECTION 4

Census of population  
and housing

**16** The ABS conducts a Census of Population and Housing every five years. Its purpose is to collect information relating to every person in Australia on Census night.

**17** The Census includes:

- persons in private dwellings, occupied non-private dwellings (e.g. hospitals, gaols, etc.), camping out, on vessels in or between Australian ports and on-board overnight transport; and
- overseas visitors to Australia, regardless of how long they have been in Australia, or how long they planned to stay.

**18** The Census excludes:

- foreign diplomatic personnel and their families; and
- Australian residents overseas on Census night.

**19** People are counted where they are located on Census night, which may not necessarily be where they usually live.

Road traffic fatality and  
casualty statistics

**20** Road traffic accident statistics are based on accident report forms completed by police officers in each State and Territory of Australia. The published statistics were compiled by the ABS until 1990 and since then by the Federal Office of Road Safety.

**21** Road fatality and casualty statistics are considered to be in scope if:

- the accident resulted in the death of any person within a period of 30 days of the accident, or if the accident resulted in personal injury to the extent that the person was admitted to hospital (excluding out-patients);
- the accident occurred on any road, street, railway level crossing or any place open to the public, provided it is not outside the road reserve; and
- the accident involved one or more road vehicles which at the time of the accident were in motion, including passenger vehicles, light commercial vehicles, motor cycles, trucks, buses, trams and railway vehicles (when operating in the road reserve), pedal cycles (excluding tricycles normally used on footpaths) and ridden animals.

Environmental issues:  
people's views and  
practices

**22** This survey contains results of a supplementary survey run in association with both the March and April 1996 labour force surveys conducted throughout Australia.

**23** The population survey is based on a multi-stage area sample of private dwellings (approximately 37,000 houses, flats, etc.) and a list sample of non-private dwellings (hotels, motels, etc.). The proportion of

Australian dwellings selected this way is approximately 0.5%. For this survey, half the private dwelling sample (i.e. 18,500 dwellings) was used.

**24** The respondents to the labour force survey who fell within the scope of the supplementary survey were asked additional questions. The information collected referred to aspects of recycling, hazardous waste disposal, motor vehicle ownership and maintenance, and use of transport.

**25** The scope of the survey included all persons:

- aged 15 years and over, except where a member of the household was out of scope and coverage for questions relating to the household;
- members of the permanent defence forces;
- diplomatic personnel of overseas governments, customarily excluded from census and estimated populations;
- overseas residents in Australia; and
- members of non-Australian defence forces (and their dependents) stationed in Australia.

**26** In the labour force survey, coverage rules are applied which aim to ensure that each person is associated with only one dwelling, and hence has only one chance of selection. The coverage rules are, necessarily, a balance between theoretical and operational considerations. Nevertheless, the chance of a person being enumerated at two separate dwellings in the survey is considered to be negligible.

## SECTION 5

Consumer price index

**27** The ABS Consumer Price Index (CPI) measures quarterly changes in the price of a basket of goods and services which account for a high proportion of expenditure by the CPI population group (metropolitan wage and salary earner households). The basket covers a wide range of goods and services, arranged in the following eight groups: food, clothing, housing, household equipment and operation, transportation, tobacco and alcohol, health and personal care, and recreation and education.

Household expenditure survey

**28** The Household Expenditure Surveys (HES) are conducted every five years by the ABS, with the most recent HES conducted in 1993–94. The survey collects data on average weekly expenditure by households, for commodities and services such as food and beverages, transport, recreation, clothing and footwear.

Leasing finance  
commitments statistics

**29** The scope of the HES includes all residents of private dwellings and caravan parks aged 15 years and older.

**30** Personal finance statistics contain the value of commitments made by all lenders to individuals for their own personal (non-business) use.

**31** Commercial finance statistics contain the value of commitments made by all lenders to Government, private and public enterprises, non-profit organisations and individuals (for investment and business purposes).

**32** The following types of lenders fall within the scope of the personal and commercial finance commitment statistics: banks, permanent building societies, credit unions/co-operative credit societies, life or general insurance companies, other corporations registered under the *Financial Corporations Act 1974*, superannuation funds and providers of consumer finance registered with State credit tribunals not otherwise included above.

## SECTION 6

Manufacturing census

**33** A manufacturing establishment is one predominantly engaged in manufacturing activities, although the data collected for it cover all activities of the establishment (including non-manufacturing activities). Conversely there are some establishments predominantly engaged in non-manufacturing activities which also undertake limited manufacturing activities and which are excluded. A small number of manufacturing establishments engage, in a significant way, in a variety of activities which are normally carried out by different industries. In such cases, the original establishment is 'split' into a separate establishment for each significant activity which belongs to a separate industry.

**34** In general, Manufacturing Census data contained in this publication relate to all road transport industry manufacturing establishments which operated in Australia during the year ended 30 June, except for sole proprietorships or partnerships not employing staff at 30 June.

**35** The main unit for which statistics are reported in the 1993-94 manufacturing collection is the establishment. Prior to the 1988-89 census, this unit covered, in general, all the operations carried on under the ownership of one enterprise (business) at a single physical location.

International trade  
statistics

**36** The merchandise export and import statistics are compiled by the ABS from information submitted by exporters and importers or their agents to the Australian Customs Service.

**37** Merchandise exports and imports cover all movable goods which subtract from or add to Australia's stock of material resources. Goods moving temporarily through Australia, e.g. transit trade and repair trade, are excluded from the merchandise trade statistics.

Survey of motor vehicle  
hire

**38** The 1986–87 ABS survey of the motor vehicle hire industry included all those enterprises mainly engaged in leasing, hiring or renting motor vehicles from their own stocks, without drivers, for periods of less than one year (except licensed taxi cabs or hire cars). The industry was defined according to class 5711 of the 1983 edition of the Australian Standard Industrial Classification.

Industrial dispute statistics

**39** The ABS compiles industrial dispute statistics using information obtained primarily from the Department of Industrial Relations, trade journals, publications and newspapers.

**40** In this publication, all industrial disputes that started or were in progress during a particular year, are included in the statistics.

**41** The following types of industrial disputes are included in the statistics:

- unauthorised stop-work meetings;
- unofficial strikes;
- sympathetic strikes (e.g. strikes in support of a group of workers already on strike);
- political or protest strikes;
- general strikes;
- work stoppages initiated by employers (e.g. lockouts); and
- rotating or revolving strikes (i.e. strikes which occur when workers at different locations take turns to stop work).

**42** The industrial dispute statistics only include disputes which involved stoppages of work of 10 working days or more at the establishments where the stoppages occurred. Ten working days is equivalent to the amount of ordinary time worked by 10 persons in one day, regardless of the length of stoppage, for example 3,000 workers on strike for two hours would be counted as 750 working days lost (assuming they work an eight hour day).

Retail census

**43** The scope of the ABS Retail Census for 1991–92 included all shopfront locations operating at 30 June 1992 and classified to Division G (Retail Trade) of the Australian and New Zealand Standard Industrial Classification (ANZSIC). Motor Vehicle Retailing and Services are classified under Sub-division 53 in Division G of the ANZSIC.

**44** The scope of the Retail Census excludes:

- home-based businesses;
- door-to-door sellers;
- direct marketers; and
- retail locations operating from non-fixed premises such as occasional market stalls or vans.

**45** The business unit for which information was collected and published was the location. A location consists of a single physical site from which a business engages in productive activity on a relatively permanent basis.

**46** In the retail industry, there are a number of businesses which operate independently within other retail locations. These businesses are generally referred to as concessions and do not have a separate shopfront. However, for the purposes of the Retail Census, concessions have been treated as separate locations.

SECTION 7

Union Bank of  
Switzerland survey

**47** The Economic Research Department of the Union Bank of Switzerland conducts a triennial survey of 'Prices and Earnings Around the Globe' in selected major cities.

**48** All price data are converted to a single currency and are thus subject to the substantial fluctuations of exchange rates. In order to offset these fluctuations to some extent, the average rate of exchange over the period of the survey (e.g. the second quarter of 1994) has been used.

**49** International price comparisons are dependent on a uniform 'basket' of selected goods and services. This basket of goods and services is based on European consumer habits (with a certain amount of leeway allowed in the choice of products to account for regional differences), and is weighted in the same manner for all cities. In the maintenance of a constant weighting there is a tendency to overestimate cost differences.

**50** Care must be taken when comparing prices between surveys as no allowance has been made for currency movements, inflation, etc. over time.

**51** In the 1970 survey, 31 cities were used, in the 1988 survey 52 cities were used while in the 1991 survey 48 cities were included. In 1994, 53 cities were surveyed.

SAMPLING ERROR

**52** Estimates derived from information obtained from a sample are subject to sampling error, that is, they may differ from the statistics that would have been produced if information had been obtained from all units in the population.

NON-SAMPLING ERROR

**53** In addition to sampling errors, other inaccuracies may occur in statistics because of insufficient coverage, inadequacies in the source of information, imperfections in answers provided by respondents and errors made in the coding and processing of data. Inaccuracies of this kind are referred to as non-sampling error and may occur in any statistical collection. Every effort has been made to minimise non-sampling error in ABS collections by employing careful questionnaire design, trying to obtain responses from all selected enterprises and employing efficient operating procedures. While the effects of non-sampling errors are not quantifiable, users of these statistics should be aware of their existence and exercise caution.

SYMBOLS AND OTHER USAGES

- n.a. not available
- n.p. not available for publication but included in totals where applicable
- n.s. not stated
- nil or rounded to zero
- .. not applicable

**54** Where figures have been rounded, discrepancies may occur between sums of the component items and totals.

FURTHER INFORMATION

**55** The ABS can provide more detailed, unpublished data on request. Please contact Information Services on Canberra (06) 252 6007, or facsimile (06) 252 1404 for further details.

**56** Current publications produced by the ABS are listed in the *Catalogue of Publications* (Cat. no. 1101.0). The ABS also issues on Tuesdays and Fridays, a *Release Advice* (Cat. no. 1105.0) which lists publications to be released in the next few days. The Catalogue and Release Advice are available from all ABS offices.

## APPENDIX A:

## DATA SOURCES

### ABS TRANSPORT STATISTICS

The Australian Bureau of Statistics (ABS) is a major supplier of transport statistics. ABS transport collections serve as important information sources for government and private enterprise alike in strategy formulation and implementation. The ABS has been collecting and publishing transport statistics since 1921 and has conducted regular collections since 1963. The ABS may make available, on request, certain unpublished data. A cost may be incurred in the provision of these data.

#### New motor vehicle registrations

The New Motor Vehicle Registrations (NMVR) collection, which commenced in 1965, is a major indicator of the level of activity in the economy. When new vehicles are purchased in large numbers, consumer and business confidence is generally high. Therefore, the monthly and annual changes in the number of new vehicles registered are significant indicators of the condition of the motor vehicle industry and the economy in general, given the impact of transport on most other industries. The publication *New Motor Vehicle Registrations, Australia: Preliminary* (Cat. no. 9301.0), monitors and reports the number of new vehicle registrations occurring on a monthly basis. Data are presented in original, seasonally adjusted and trend series.

The ABS receives monthly registrations data directly from the various State, Territory and Commonwealth motor vehicle registries. The data are processed, converted to standard classifications and published. The NMVR collection measures, as the name implies, the number of new vehicles registered for the first time, and not sales of vehicles. Motor vehicles may be sold but not registered if they are not intended to be used on roads open to the general public; for example, a vehicle used exclusively on a mine site, national park or farm would not be included in the NMVR collection.

#### Motor vehicle census

The Motor Vehicle Census (MVC) has been conducted since 1971, usually on a triennial basis. The MVC is a count of all vehicles that are legally registered in Australia at a specific date. Data from the MVC enable analysts to gain an understanding of the composition and distribution of the vehicle fleet in Australia and to monitor changes in the fleet.

The MVC also provides measures of other important characteristics such as vehicle fuel type, make and age. The findings from the MVC are published in *Motor Vehicle Census, Australia* (Cat. no. 9309.0).

#### Survey of motor vehicle use

The Survey of Motor Vehicle Use (SMVU) is the main source of data on patterns of vehicle use and has been conducted in 1963, 1971, on a triennial basis from 1976 to 1991 and in 1995. The SMVU collects a range of information primarily designed to provide policy makers with a knowledge and understanding of road and fuel usage.

Information is collected on the total and average annual distance travelled and fuel consumption of the different vehicle types. Specific data on bus and taxi use are also collected in the SMVU.

Other data include area of operation, which highlight the operation of vehicles within geographic areas, while purpose of travel and driver characteristics together help to explain why and by whom vehicles are used. The SMVU also provides important data on loads carried either for hire or reward or as an activity subordinate (ancillary) to other undertakings of the business. SMVU preliminary findings are published in *Survey of Motor Vehicle Use, Australia: Preliminary* (Cat. no. 9202.0)

with final data available in *Survey of Motor Vehicle Use, Australia* (Cat. no. 9208.0).

Preliminary results from the 1995 SMVU covering the 12 months to 30 September 1995 were released in October 1996. Following a review of the current methodology, a revised collection will begin with the October quarter 1997. Final results from the 1995 SMVU will include bridging factors between the old and new methodology.

Together with the NMVR collection and the MVC, the SMVU provides essential information on road transport in Australia.

#### Freight movements survey

Between the June quarter 1994 and September quarter 1995 reference periods, ABS undertook a major survey aimed at producing a range of information about freight movements within Australia by road, rail, sea and air. Results from the survey were released in *Experimental Estimates of Freight Movements, Australia*, (Cat. no. 9217.0). Data were collected on the movement of freight in tonnes by mode of transport, by commodity, by origin and destination and by method of transport. Concern over the validity of the methodology for collecting road freight data resulted in the suspension of the road survey following the release of the September quarter 1995 publication. Data for rail, sea and air are still being collected and are available on request.

A review of the conduct and the results of the road survey, is currently underway, with the intention of developing an improved methodology.

#### OTHER ABS STATISTICS

Included in this publication are motor vehicle and transport-related statistics from a number of other ABS sources. These include: the Household Expenditure Survey; the Manufacturing Census; demographic statistics; the Census of Population and Housing; Consumer Price Index statistics; Prices; Finance Statistics; Foreign Trade statistics; the Retail Census; and Industrial Dispute statistics.

#### NON-ABS STATISTICS

Also included are data from a number of sources outside the ABS.

#### Federal Office of Road Safety

Road accident related data included in Section 4 were obtained from the Federal Office of Road Safety.

#### International organisations

The international comparisons included in Section 7 were obtained from the International Road Federation, the World Health Organisation and particularly from the Union Bank of Switzerland's publication *Prices and Earnings Around the Globe*.

**APPENDIX B:**
**KEY MOTOR VEHICLE STATISTICS**

<i>Data item</i>	<i>Unit</i>	<i>Statistic</i>	<i>Period</i>	<i>Table</i>	<i>Page</i>
Total new motor vehicle registrations	'000	636.5	1995-96	1.3	15

## GLOSSARY

<b>Articulated trucks</b>	Vehicles constructed primarily for load carrying, consisting of a prime mover having no significant load carrying area, but with a turntable device which can be linked to one or more trailers. With or without a trailer the Gross Combination Mass (GCM) would be 3.5 tonnes or more.
<b>Attrition rate</b>	The estimated proportion of motor vehicles that have been taken off the register since the previous year. The attrition rate is also referred to as the motor vehicle retirement or scrappage rate. It is calculated by adding the total registrations at the earlier census to the number of new registrations between the censuses, and subtracting the total registrations as at the later census. It can then be calculated as a percentage rate by dividing this number into the total registrations at the earlier census.
<b>Australian and New Zealand Standard Industrial Classification (ANZSIC)</b>	The ANZSIC is an industry classification used to classify businesses according to their type of economic activity. It replaced the Australian Standard Industrial Classification (ASIC) in 1993. The ANZSIC is structured into four levels: Divisions (the broadest level); Subdivisions; Groups; and Classes (the finest level).
<b>Average vehicle age</b>	The estimated average age of registered motor vehicles in Australia. The age of a vehicle is defined as the number of years since it was first manufactured. Average age is based on the year of manufacture only, the month is not used.
<b>Average fuel consumption per vehicle</b>	Expressed in litres per 100 kilometres. It is calculated by dividing the estimated total amount of fuel (in litres) used by the specified group of vehicles over a 12 month period, by the total distance travelled (in kilometres) by the specified group of vehicles multiplied by 100.
<b>Average weekly household expenditure</b>	The average obtained when the total estimated expenditure for a particular expenditure group (e.g. transport) is divided by the estimated number of spending households.
<b>Blood alcohol content (BAC)</b>	The percentage of alcohol in the blood stream gives a blood alcohol content reading. The Australian legal limit for drivers is 0.05 millilitres of alcohol per 100 millilitres of blood.
<b>Buses</b>	Vehicles constructed for the carriage of passengers. Included are all passenger vehicles with more than nine seats, including the driver's seat.
<b>Caravans</b>	Non-powered vehicles that are towed behind another vehicle and which are primarily used for accommodation purposes. Includes rigid and pop-up caravans, but excludes campervans, motor-homes or tent trailers.

<b>Concepts of averages</b>	The denominator used in calculating the various averages for vehicle usage is the estimated number of vehicles that contributed to a particular cell. For example, in Table 4.13, the average kilometres travelled for business purposes by passenger vehicles was derived by dividing the number of kilometres travelled for business purposes by passenger vehicles by the number of such vehicles which reported business travel. For Table 4.11, all vehicles in the appropriate category are included in the denominator regardless of distance travelled. Vehicles which travelled zero kilometres are included in the estimation process as they are representative of unused vehicles that are likely to occur across the vehicle population. In Tables 3.6 and 3.8, the average rate of fuel consumption is calculated by dividing the total fuel consumption by total kilometres for each vehicle type. As the denominators used to calculate the cells of a table are different, the averages along a row cannot be used to derive the total column entry for that row.
<b>Consumer Price Index (CPI)</b>	The CPI is a general indicator of the rate of change in prices paid by consumers for goods and services.
<b>Employees</b>	The number of employees in a given financial year is the annual average of the number of employees who received pay for any part of a chosen pay period in August, November, February and May of that financial year. All permanent, temporary, casual, part-time, managerial and executive employees paid during the period, as well as employees on paid or pre-paid leave, on worker's compensation, and employees paid from interstate or overseas are included.
<b>Estimated Resident Population (ERP)</b>	The official ABS estimate of the Australian population. It is based on results from the Population Census and is updated annually between Censuses using demographic statistics to obtain ERP figures. The Census count is adjusted for under enumeration and for Australian residents temporarily overseas on Census night.
<b>Exports of vehicles</b>	The total value of vehicles that are completely or partially assembled in Australia and sold to individuals or companies overseas.
<b>Fatality</b>	Death of any person within 30 days of a road vehicle crash where death is attributable to injuries sustained in the crash.
<b>Fleet</b>	For the purposes of the analysis in Section 3, fleet refers to the total number of registered vehicles in Australia.
<b>Gross Combination Mass (GCM)</b>	The weight measurement used for articulated trucks. It is calculated using the tare weight of the prime mover and attached trailer(s) and the maximum carrying capacity of the attached trailer(s).
<b>Gross Vehicle Mass (GVM)</b>	The weight measurement used for goods carrying vehicles, except articulated trucks. It is calculated using the tare weight and the maximum carrying capacity of the vehicle excluding trailer(s).
<b>Gross weight</b>	Laden weight of a vehicle.

<b>Imports of vehicles</b>	Total value of vehicles that are completely or partially assembled overseas and purchased by individuals or companies in Australia.
<b>Industrial disputes</b>	An industrial dispute is a withdrawal from work by a group of employees, or a refusal by an employer or a number of employers to permit some or all of their employees to work, each withdrawal or refusal being made in order to enforce a demand, to resist a demand, or to express a grievance.
<b>Lease</b>	Finance commitments made with a bank or other financial institution.
<b>Light commercial vehicles</b>	Vehicles primarily constructed for the carriage of goods, and which are less than 3.5 tonnes Gross Vehicle Mass (GVM). Included are utilities, panel vans, cab-chassis and forward control load carrying vehicles (whether four-wheel drive or not).
<b>Make</b>	The manufacturer of the motor vehicle, e.g. Ford, Holden, Toyota, Mitsubishi. A threshold limit has been applied for tables providing details by make. For the Motor Vehicle Census this limit is 100 vehicles for passenger and light commercial vehicles and 25 vehicles for rigid trucks, articulated trucks, buses, non-freight carrying trucks and motor cycles. Makes with registrations under these limits for any period shown in the table are included in Other/Not stated. For New Motor Vehicle Registrations the limits are, 25 for passenger and light commercial vehicles and 10 for rigid trucks, articulated trucks, buses, non-freight carrying trucks and motor cycles.
<b>Model</b>	The variant of the make of a motor vehicle, e.g. Falcon, Commodore, Camry, Magna.
<b>Motor cycles</b>	Vehicles constructed primarily for the carriage of one or two persons. Included are two and three wheeled mopeds, scooters, motor tricycles and motor cycles with side cars.
<b>Motor Vehicle Census (MVC)</b>	A measure of the total number and key characteristics of motor vehicles on the register at a specified point in time.
<b>Motor vehicle hire/self drive</b>	All motor vehicles hired, leased or rented, without drivers, for periods of less than 12 months from an enterprise mainly engaged in leasing.
<b>New Motor Vehicle Registrations (NMVR) collection</b>	A measure of the number and key characteristics of new motor vehicles registered for the first time in a specified period.
<b>Non-freight carrying trucks</b>	A truck which does not have a goods carrying capacity and is constructed for a particular purpose with special equipment fitted. Included are vehicles such as ambulances, campervans, fire-trucks, mobile cranes, tow trucks and cherry pickers.
<b>Passenger vehicles</b>	Vehicles constructed primarily for the carriage of up to nine occupants (including the driver). Included are cars, station wagons, four-wheel drive passenger vehicles and forward control passenger vehicles. Excluded are campervans and mobile homes.

<b>Plant and equipment</b>	Self-propelled machinery registered for use on public roads, such as tractors, road-plant and forklifts. Included are trailed machinery and other non-self-propelled vehicles not classified under trailers.
<b>Population Census</b>	The Census of Population and Housing is a count of all people in Australia on Census night (a specified night, once every five years) except foreign diplomats and their families and foreign crew members on ships. The objective is to measure the number and key characteristics of persons in Australia at a specific date.
<b>Predominant colour</b>	The predominant colour of the motor vehicle. The predominant colour does not include shades or tones.
<b>Private expenditure</b>	Based on private final consumption expenditure which measures the expenditure on goods and services by persons and expenditure of a current nature by non-profit organisations serving households. It includes purchases of durable as well as non-durable goods. However, it excludes expenditure by persons on the purchase of dwellings and expenditure of a capital nature by unincorporated enterprises.
<b>Registrations</b>	Registrations are those processed by the vehicle registry authorities in the Commonwealth, States and Territories during a specified period.
<b>Rigid trucks</b>	Vehicles constructed primarily for load carrying with a GVM of 3.5 tonnes or more. Included are normal rigid trucks with a tow bar, draw bar or other non-articulated coupling on the rear for use with a trailer or dolly.
<b>Size of bus</b>	For the MVC, size of bus is based on GVM, registered seating capacity, or tare weight. Small buses are those with a GVM of 5 tonnes or less, medium buses are more than 5 tonnes but less than or equal to 12 tonnes GVM, and large buses are greater than 12 tonnes GVM. If GVM is not reported, then size is based on registered seating capacity. Small buses have 20 seats or less, medium buses have 21-40 seats and large buses have 41 or more seats. If neither GVM nor registered seating capacity are reported, then size is based on tare weight. Small buses have a tare weight up to and including 3.1 tonnes. Medium buses have a tare weight of more than 3.1 tonnes to 7 tonnes. Large buses have a greater than 7 tonnes tare weight. If GVM, registered seating capacity and tare weight are all not reported then the bus is put into the not stated category.
<b>Survey of Motor Vehicle Use (SMVU)</b>	A survey conducted by the ABS, typically once every three years, to collect statistics on motor vehicle usage. Key components include distance travelled, fuel consumption and driver characteristics.
<b>Tare weight</b>	The unladen weight of a vehicle.
<b>Taxi</b>	A vehicle that can carry up to nine occupants (excluding the driver) and in which the driver is licensed to charge for the carriage of passengers or goods.

<b>Trailers</b>	Equipment that does not have an engine and is towed behind a vehicle. Included are box trailers, semi (articulated) trailers not registered as part of an articulated combination, boat trailers, horse floats and similar vehicles.
<b>Turnover</b>	Defined as sales of goods, commission revenue, repair and service revenue, rent, leasing and hiring revenue (excluding unallocated rent, leasing and hiring revenue), government bounties and subsidies, and all other operating revenue except interest royalties and dividends. Also included is the value of capital work done by an enterprise for itself and the value of equipment withdrawn from stock for own use or for rental or lease outside an enterprise.
<b>Type of vehicle</b>	Classification of vehicles by the function that they have in common. For example, passenger vehicles, light commercial vehicles, rigid trucks, buses and motor cycles.
<b>Vehicle Identification Number (VIN)</b>	The VIN uniquely identifies each vehicle. Embedded in the number are details of the make and model together with other relevant information about the vehicle. The VIN is collected by motor vehicle registry authorities at the time of registration. A VIN has been mandatory for all vehicles sold in Australia since 1989 and has been collected from the registration authorities since 1991.
<b>Vehicles garaged per household</b>	The number of registered vehicles which are owned or used by members of a household and which were garaged or parked near the occupied private dwelling (including caravans etc. in caravan parks) on Population Census night. The classification also includes company owned vehicles kept at home, but excludes motor cycles, scooters and tractors.

## For more information . . .

The ABS publishes a wide range of statistics and other information on Australia's economic and social conditions. Details of what is available in various publications and other products can be found in the ABS Catalogue of Publications and Products available from all ABS Offices.

### ABS Products and Services

Many standard products are available from ABS bookshops located in each State and Territory. In addition to these products, information tailored to the needs of clients can be obtained on a wide range of media by contacting your nearest ABS Office. The ABS also provides a Subscription Service for standard products and some tailored information services.

### National Dial-a-Statistic Line

0055 86 400

*Steadycom P/L: premium rate 25c/20 secs.*

This number gives 24-hour access, 365 days a year, for a range of important economic statistics including the CPI.

### Internet

<http://www.abs.gov.au>

A wide range of ABS information is available via the Internet, with basic statistics available for each State, Territory and Australia. We also have Key National Indicators, ABS product release details and other information of general interest.
