Visitor arrivals				
Trend	419.2	-1.5		
Seasonally adjusted	413.7	-1.6		
Original	434.5		3 965.1	10.8

#### POINTS ΚΕΥ

- There were 434,500 short-term visitor arrivals to Australia during March 2001.
- The number of short-term visitors arrivals during the March quarter 2001 (1.3 million) increased by 8% compared to the March quarter 2000 (1.2 million).
- The total number of short-term visitor arrivals for the nine months July 2000 to March 2001 amounted to almost 4 million, an increase of 11% compared to the nine months July 1999 to March 2000 (3.6 million).
- The trend estimate for short-term visitor arrivals has been declining since November 2000.
- New Zealand (16%) was the main source country of short-term visitor arrivals to Australia during the nine months to March 2001, 10% more than in the nine months to March 2000.
- Japan (14%) remained the second largest source country of short-term visitor arrivals during the nine months to March 2001.
- Short-term visitor arrivals from China during the nine months to March 2001 showed the fastest increase (48%) over the equivalent period ending March 2000. Indonesia showed the second fastest (29%) and Korea showed the third fastest increase (23%).
- For information on the use of the passenger card data in estimating net overseas migration from August to December 2000 see the special article on page 4.

For further information about these and related statistics, contact the National Information Service on 1300 135 070, or Amanda Dobson on Canberra 02 6252 5640.

## N O T E S

FORTHCOMING ISSUES	Final overseas arrival and departure data for August 2000 onwards are not expected to be published before August 2001. Data from passenger cards completed by persons arriving in or departing from Australia, together with other information available to Department of Immigration and Multicultural Affairs (DIMA), serve as a source for statistics on overseas arrivals and departures. DIMA is currently automating the processing of passenger cards and ABS has to receive relevant data. <i>ISSUEEXPECTED RELEASE DATE</i> April 2001May 200121 June 2001June 200119 July 2001			
CHANGES IN THIS ISSUE	This issue of 3401.0 contains preliminary estimates of short-term visitor arrivals in August 2000 through to March 2001. There is no final data on short-term visitor arrivals, short-term resident departures and permanent and long-term movements for these months. Only tables 1 and 6 of the standard publication are included.			
	Also in this issue, seasonally adjusted and trend data have been revised due to the change in the occurrence of the Chinese new year in January 2001 compared to February in 2000.			
TREND REVISIONS	Each time new seasonally adjusted estimates become available, trend estimates of short-term arrivals are revised (see paragraph 14 to 17 of the Explanatory Notes).			
	The example in the graph below shows the illustrative scenario and the consequent revisions to previous trend estimates of visitor arrivals.			
	The seasonally adjusted estimate for:			
	<b>1</b> April visitor arrivals is 2.90% higher than March and			
	<b>2</b> April visitor arrivals is 2.90% lower than March.			
	VISITOR ARRIVALS			
	Published trend - 1 - 2 - 2 - 460 - 435 - 410 - 385 - 360 2000 - 2001			

The percentage change of 2.90 was chosen because it represents the average absolute monthly percentage changes between months for visitor arrivals over the last four years.

Dennis Trewin Australian Statistician

#### MAIN FEATURES

#### SHORT-TERM MOVEMENTS

VISITOR ARRIVALS There were an estimated 434,500 short-term visitor arrivals to Australia during March 2001 bringing the total number of visitor arrivals for the nine months to March 2001 to almost 4 million, 11% higher than the number of overseas visitor arrivals in the nine months to March 2000 (3.6 million). The major source countries of short-term visitor arrivals to Australia during the nine months to March 2001 were New Zealand (16%), Japan (14%), the United Kingdom (12%), the United States of America (10%), Singapore (5%) and Korea (3%). Comparing the nine months to March 2001 to the corresponding period to March 2000, there were increases in the number of visitor arrivals from eight out of the ten top source countries. The number of short-term visitor arrivals from New Zealand, the main source country, increased by 10% whilst Japan and the United Kingdom, the second and third main source countries, increased by 3% and 10% respectively. Conversely, the number of short-term visitor arrivals declined from Taiwan (-12%) whilst arrivals from Singapore remained unchanged. Off all countries, the number of short-term visitor arrivals from China showed the fastest increase (48%), followed by Indonesia (29%) and Korea (23%). Of the top ten source countries for short-term visitor arrivals during the nine months to March 2001: 618,900 short-term visitors came from New Zealand an increase of 10%, compared to the nine months to March 2000; 569,100 came from Japan, an increase of 3%; 495,200 came from the United Kingdom, an increase of 10%; 383,400 came from the United States of America, an increase of 16%; 202,600 came from Singapore, which remained unchanged; 131,100 came from Korea, an increase of 23%; 122,800 came from Germany, a marginal increase; 119,300 came from China, an increase of 48%; 115,400 came from Malaysia, an increase of 5%; and 92,100 came from Taiwan, a decrease of 12%.

# USE OF PASSENGER CARD DATA IN ESTIMATING NET OVERSEAS MIGRATION FOR AUGUST TO DECEMBER 2000

	UST TO DECEMBER 2000
INTRODUCTION	Overseas Arrivals and Departures (OAD) data have a multiplicity of usage. Tourism interests use this information for planning, forecasting, evaluation and determination of commercial and government policies. Australian Bureau of Statistics uses OAD for estimating resident population of Australia and States and Territories on a quarterly basis. December resident population estimates are used in the allocation of funds to each State and Territory government. This last use requires the Australian Statistician to determine estimates of the December population before 10 June of the following year (under the <i>State Grants (General Purposes) Act 1994</i> ).
	Arrivals and Departures data are sourced from passenger cards and other information available to the Department of Immigration and Multicultural Affairs (DIMA), a process which is described in the Explanatory Notes. Until July 2000 DIMA processed a sample of the passenger cards for movements involving an intended duration of stay of less than 12 months in Australia or overseas but fully for permanent and long-term (12 months and over) migrants. DIMA is in the process of implementing an automated passenger card processing system which is to process all movements from August 2000. This system will provide several improvements in OAD data as the processing system moves from fully processing only a sample of cards to complete processing of all movements. This new system is expected to provide data, without sampling error, several weeks faster than the current manual entry system.
	Unfortunately, OAD data from the new system is not expected to be available in time for the Australian Statistician to determine the December 2000 population by early June 2001.
	Given this situation with the final OAD data, special arrangements are in place (with the cooperation of DIMA) to estimate net overseas migration for the period July to December 2000. This information will then be used to determine the estimated resident population (ERP) at 31 December 2000 in accordance with ABS' statutory requirements.
SAMPLING OF PASSENGER CARDS	Following advice from DIMA in February 2001 that final data for August through December 2000 would not be available before July 2001, plans for the manual data entry of passenger cards for August through December 2000 have been considered. The volume of data to be processed (around 8 million cards) and the short timeframe mean that data entry from every card is expensive and impractical.
	ABS plans to use information obtained from DIMA's Travel and Immigration Processing system (TRIPS) and samples of incoming and outgoing passenger cards for each month August through December 2000. The sample design and the resulting sampling error should allow reliable estimation of the national and State/Territory population estimates.

# USE OF PASSENGER CARD DATA IN ESTIMATING NET OVERSEAS MIGRATION FOR AUGUST TO DECEMBER 2000

PLANNED METHOD	It is proposed that ABS produces estimates of net overseas migration for August to December 2000 based on a targetted random sample of passenger cards to produce Australia level estimates of net overseas migration.
	The numbers of first arrivals on migrant visas, Australian residents returning after an absence of 12 or more months overseas and visitors departing after a stay of 12 or more months in Australia will be obtained from the TRIPS system and become direct components of estimated net overseas migration.
	Visitor arrivals and resident departures that have not yet been cancelled out by a return movement on TRIPS will be sampled. Passenger cards will be examined for the sampled arrivals and departures to determine the number of movements relating to an intended period of 12 months or more.
	Because a feasible sample size will only allow national estimates, State level estimates are proposed to be based on each State's share of the national total for the August–December period over the last three years.
	ABS investigations have shown that, based on the number of cards received between August and December 1999, a sample size of around 45,000 cards would be required to measure net overseas migration during this period with accuracy. DIMA has indicated that this option is feasible.
FURTHER INFORMATION	Further information is contained in Demography Working Paper 2001/1 — <i>Estimating July to December 2000 Net Overseas Migration</i> , available on the ABS website http://www.abs.gov.au. From the navigation bar select Themes; Demography; ABS Demography Working Papers.

INTRODUCTION	<b>1</b> This publication contains statistics of persons arriving in, and departing from, Australia, together with the major characteristics of travellers. More detailed statistics can be made available on request (see paragraph 21).
SOURCE OF THE STATISTICS	<b>2</b> Persons arriving in, or departing from, Australia provide information in the form of incoming and outgoing passenger cards (see Appendix 1). Incoming persons also provide information in visa applications, apart from people travelling as Australian and New Zealand citizens. These and other information available to the Department of Immigration and Multicultural Affairs (DIMA) serve as a source for statistics of overseas arrivals and departures.
	<b>3</b> In July 1998, DIMA revised the incoming and outgoing passenger cards and associated procedures as well as computer systems. Following these changes, some questions on the passenger cards were not compulsory and answers to these questions were not checked by Customs officers. The question on marital status was deleted. Data on marital status is now derived from visa applications (only for certain visa classes) and is therefore not available for Australian or New Zealand citizens. The changes also affect the data for 'Previous country of residence' which is imputed for Australian and New Zealand citizens. For more information see the May 1998 issue of this publication. Since July 1998, there have been additional minor changes to both passenger cards.
	<b>4</b> The preliminary estimates of visitor arrivals by country of residence (see Table 6, page 7) are based on data from DIMA's Travel and Immigration Processing System (TRIPS). The TRIPS system produces a limited range of data, including country of citizenship, which is used by ABS to produce preliminary estimates by country of usual residence. These preliminary estimates will be revised in the next issue of this publication, when final data is available. For more information see pages 3 and 4 of the June 1997 and the September 1998 issues of this publication.
SCOPE	<b>5</b> The statistics in this publication relate to the number of movements of travellers rather than the number of travellers (i.e. multiple movements of individual persons during a given reference period are each counted separately). The statistics exclude the movements of operational air and ships' crew, of transit passengers who pass through Australia but are not cleared for entry, and of passengers on pleasure cruises commencing and finishing in Australia aboard ships not then engaged on regular voyages. Similarly, these statistics exclude those persons not travelling under standard visa conditions, such as 'boat people' and the 1999 intake of Kosovo refugees.
COUNTRY CLASSIFICATION	<b>6</b> The classification of countries in this publication is the <i>Australian Standard Classification of Countries for Social Statistics</i> (ASCCSS). For more detailed information refer to the ABS publication <i>Australian Standard Classification of Countries for Social Statistics</i> (Cat. no. 1269.0).
	<b>7</b> The statistics on country of birth, citizenship, residence or main destination have certain limitations because of reporting on passenger cards. For instance, United Kingdom includes England, Scotland and Wales. Similarly Korea includes both the Republic of Korea and the Democratic People's Republic of Korea.

8 ABS • OVERSEAS ARRIVALS AND DEPARTURES • 3401.0 • MARCH 2001

.....

STATE AND TERRITORY CLASSIFICATION	<b>8</b> Following the 1992 amendment to the <i>Acts Interpretation Act</i> to include the Indian Ocean Territories of Christmas Island and the Cocos (Keeling) Islands as part of geographic Australia, population estimates commencing with the September quarter 1993 include estimates for these two territories. To reflect this change, another category of the State/Territory classification has been created, known as Other Territories. Other Territories includes Jervis Bay Territory, Christmas Island and the Cocos (Keeling) Islands.
ESTIMATION METHOD	<b>9</b> Overseas arrival and departure statistics are derived from a combination of full enumeration and sampling. All permanent movements and all movements with a duration of stay of one year or more are fully enumerated. All movements with a duration of stay of less than one year are sampled. Statistics relating to these movements are therefore estimates which may differ from statistics which would have been obtained if details of all these movements had been processed.
	<b>10</b> Since January 1997 variable sample skips have been used in the selection of records to be sampled. Separate skips are applied for each country of citizenship and the skips may vary for each processing month. Over a year about 3.5% of all short term movements are selected for sampling.
	<b>11</b> The statistics in this publication have been rounded to the nearest 100 for short-term movements and to the nearest 10 for permanent and long-term movements. In tables showing both short-term and permanent and long-term movements the total movements have been rounded to the nearest 100. The sums of the components may, due to rounding, not add exactly to totals.
CORRECTIONS AND IMPUTATIONS	<b>12</b> The imprecision due to sampling errors should not be confused with errors arising from imperfections in reporting, which may occur in any data collection, whether sampled or not. Every effort is made to minimise such errors, both through careful design of the passenger cards and through checks on the information once it is received. During the edit process some items are corrected where they conflict with other known information. Missing replies to certain items such as age and country of birth are also imputed by reference to other related items.
	<b>13</b> Errors of this kind differ from discrepancies arising from the fact that certain information reflects the travellers' intentions at the time the passenger cards were completed. These intentions are, of course, subject to change. Particularly affected is the distinction between permanent and temporary movement and in the latter case, length of intended stay, country in which most time will be spent and main reason for journey.

.....

SEASONAL ADJUSTMENT AND TREND ESTIMATES **14** Original and seasonally adjusted short-term overseas visitor arrivals are shown in Table 1. In the seasonally adjusted series, account has been taken of normal seasonal factors and trading day effects (arising from the varying numbers of Sundays, Mondays, Tuesdays etc. in the month) and the effect of movement in the date of Easter which may, in successive years, affect figures for different months.

**15** Seasonal adjustment is a means of removing the estimated effects of normal seasonal variation from the series so that the effects of other influences on the series may be more clearly recognised. Seasonal adjustment procedures do not aim to remove the irregular or non-seasonal influences which may be present in any particular month, such as the effect of major sporting and cultural events, changes in airfares and the fluctuation of \$A relative to other currencies. Irregular influences that are highly volatile can make it difficult to interpret the movement of the series even after adjustment for seasonal variation.

**16** The trend estimates for short-term overseas visitor arrivals are shown in Table 1. These trend estimates are derived by applying a 13–term Henderson-weighted moving average to all months of the respective seasonally adjusted series except the first and last six months. Trend series are created for the last six months by applying surrogates of the Henderson weighted moving average to the seasonally adjusted series.

**17** While this technique enables smoothed data for the latest period to be produced, it does result in revisions to the smoothed series, principally of recent months, as additional observations become available. There may also be revisions as a result of the re-estimation of the seasonal factors. For further information, see *A Guide to Interpreting Time Series—Monitoring 'Trends', an Overview* (Cat. no. 1348.0).

## **18** Users of these statistics may also wish to refer to the following ABS publications:

- Australian Demographic Statistics (Cat. no. 3101.0)—issued quarterly
- Migration, Australia (Cat. no. 3412.0)—issued annually
- Tourism Indicators, Australia (Cat. no. 8634.0)—issued quarterly.

**19** Related statistics are also published by the Department of Immigration and Multicultural Affairs, the Department of Transport and Regional Services and the Bureau of Tourism Research.

**20** Current publications produced by the ABS are listed in the *Catalogue of Publications and Products, Australia* (Cat. no. 1101.0). The ABS also issues, on Tuesdays and Fridays, a *Release Advice* (Cat. no. 1105.0) which lists publications to be released in the next few days. Both are available from any ABS office or the ABS website.

ADDITIONAL STATISTICS AVAILABLE	<b>21</b> As well as the statistics included in this and related publications, other relevant unpublished data are available for the following variables:						
	Citizenship (Na	tionality)					
	Country of birt

### GLOSSARY

. . . . . . . . . . .

Australian resident	Australian residence is self-defined as reported by travellers when completing Incoming and Outgoing Passenger Cards.
Category of movement	Overseas Arrivals and Departures are classified according to length of stay (in Australia or overseas), recorded in months and days by travellers on passenger cards. There are three main <i>categories of movement</i> :
	<ul><li>permanent movements</li><li>long-term movements</li><li>short-term movements.</li></ul>
	A significant number of travellers (i.e. overseas visitors to Australia on arrival and Australian residents going abroad) state exactly 12 months or one year as their intended period of stay. Many of them stay for less than that period and on their departure from, or return to, Australia are therefore classified as short-term. Accordingly in an attempt to maintain consistency between arrivals and departures, movements of travellers who report their actual or intended period of stay as being one year exactly are randomly allocated to long-term or short-term, in proportion to the number of movements of travellers who report their actual length of stay as up to one month more, or one month less, than one year.
Country of residence	Country of residence refers to the country in which travellers regard themselves as living or as last having lived.
Intended length of stay	On arrival in Australia, all overseas visitors are asked to state their 'Intended length of stay in Australia'. On departure from Australia, all Australian residents are asked to state their 'Intended length of stay overseas'.
Long-term arrivals	Long-term arrivals comprise:
	<ul> <li>overseas visitors who intend to stay in Australia for 12 months or more (but not permanently); and</li> <li>Australian residents returning after an absence of 12 months or more overseas.</li> </ul>
Long-term departures	Long-term departures comprise:
	<ul> <li>Australian residents who intend to stay abroad for 12 months or more (but not permanently); and</li> <li>overseas visitors departing who stayed 12 months or more in Australia.</li> </ul>
Main destination	Australian residents travelling overseas are asked on departure for the name of the country in which they intend to spend most time.

### GLOSSARY

. . . . . . . . . . . . . . . .

Main reason for journey	<ul> <li>On arrival in, or departure from, Australia all overseas visitors and Australian residents are asked to state their main reason for journey. From September 1994, all statistics relating to <i>main reason for journey</i> have been published using the following categories:</li> <li>convention/conference</li> <li>business</li> <li>visiting friends/relatives</li> <li>holiday</li> <li>employment</li> <li>education</li> <li>other</li> </ul> In tabulations of data collected before September 1994, the 'Other' category
	includes 'In transit' and the 'Holiday' category includes both 'Student vacation' and 'Accompanying business visitor'.
State/Territory of address/lived	Overseas visitors and Australian residents are asked on arrival/departure for the name of the State or Territory of intended address/State or Territory lived.
Overseas Arrivals and Departures (OAD)	Overseas Arrivals and Departures refer to the arrival or departure of Australian residents or overseas visitors, through Australian airports (or sea ports), which have been recorded on Incoming or Outgoing Passenger Cards. Statistics on Overseas Arrivals and Departures relate to the number of movements of travellers rather than the number of travellers (i.e. the multiple movements of individual persons during a given reference period are all counted).
Permanent arrivals	<ul> <li>Permanent arrivals (settlers) comprise:</li> <li>travellers who hold migrant visas (regardless of stated intended period of stay);</li> <li>New Zealand citizens who indicate an intention to settle; and</li> <li>those who are otherwise eligible to settle (e.g. overseas born children of Australian citizens).</li> </ul>
	Multicultural Affairs. Prior to 1985 the definition of settlers used by the ABS was the stated intention of the traveller only. Numerically the effect of the change in definition is insignificant. The change was made to avoid the confusion caused by minor differences between data on settlers published separately by the ABS and the Department of Immigration and Multicultural Affairs.
Permanent departures	Permanent departures are Australian residents (including former settlers) who on departure state that they intend to settle permanently in another country.
Short-term arrivals	<ul> <li>Short-term arrivals comprise:</li> <li>overseas visitors whose intended stay in Australia is less than 12 months; and</li> <li>Australian residents returning after an absence of less than 12 months overseas.</li> </ul>
Short-term departures	<ul> <li>Short-term departures comprise:</li> <li>Australian residents who intend to stay abroad for less than 12 months; and</li> <li>overseas visitors departing who stayed less than 12 months in Australia.</li> </ul>

.....

#### STANDARD ERRORS

#### RELIABILITY OF ESTIMATES

**1** Estimates based on a sample are subject to sampling variability i.e. they may differ from those that would be obtained from full enumeration.

**2** The sampling error associated with any estimate can be estimated from the sample results and one measure so derived is the standard error. Given an estimate and the standard error on that estimate, there are about two chances in three that the sample estimate will differ by less than one standard error from the figure that would have been obtained from full enumeration, and about nineteen chances in twenty that the difference will be less than two standard errors. The relative standard error is the standard error on the estimate expressed as a percentage of the estimate.

**3** It would be impractical to publish estimates of standard errors for all figures in individual tables. However, the following tables of standard errors and relative standard errors give an indication of the magnitude of the sampling error associated with any estimate of a particular size for short-term and total movement.

#### APPROXIMATE STANDARD ERRORS ON ESTIMATES FOR STRATIFIED SAMPLE

Estimated number of persons	SHORT-TERM DEPARTURE OR ARRIVAL OF AUSTRALIAN RESIDENTS <i>Relative</i> Standard standard error error			OR DEPARTURE	TOTAL ARRIVALS OR DEPARTURES Relative Standard error error	
	no.	%	no.	%	no.	%
10 000	550	6 9	490	5 7	550 410	6 8
5 000 2 000	450 280	9 14	330 230	11	410 250	8 13
1 000	200	20	150	15	170	17
750	180	24	140	19	150	20
500	130	26	110	22	125	25
400	120	30	100	25	115	29
300	110	36	84	28	97	32
200	90	45	70	35	80	40
100	63	63	49	49	56	56

**4** An example of the use of this table is as follows. If the estimate of the number of Australian resident departures for short-term visits abroad is 500, then the standard error on this estimate is 130 i.e. there are two chances in three that the actual number of Australian resident departures for short-term visits abroad will lie between 370 and 630 and nineteen chances in twenty that it will lie between 240 and 760.

**5** The larger the size of an estimate the smaller the relative standard error. For any estimate of greater than 10,000 the relative standard error will be less than 6%.

#### STANDARD ERRORS

RELIABILITY OF ESTIMATES continued **6** The estimate of the difference between an estimate in two different periods or between different estimates from the same period is also subject to sampling error. The standard error on the difference between any two estimates which are subject to sampling error can be approximated by using the larger standard error of the estimates inflated by a factor of 1.4.

**7** An example of the use of this procedure is as follows. Assume the estimates of the number of arrivals to Australia from Taiwan during January 1994 and January 1995 are 1,500 and 750 respectively. The difference between the 1994 and 1995 figures is 750 and the standard errors on these estimates are approximately 190 and 140. The standard error on the difference is approximately 266 ( $1.4 \times 190$ ), and there are nineteen chances in twenty that the estimate of the difference between the two years will lie between 218 and 1,282.
