KEY POINTS

TREND ESTIMATES

- Trend estimates for short-term visitor arrivals to Australia during March 2007 (485,900 movements) increased by 0.8% compared with February 2007 (482,100 movements).
 This followed monthly increases of 0.9% each for January and February 2007.
- Currently, short-term visitor arrivals are 7.4% higher than when the series last troughed in June 2006 (452,400 movements) and 5.4% higher than in March 2006.
- During March 2007, short-term resident departures (427,400 movements) increased by 0.3% compared with February 2007 (426,000 movements). This followed monthly increases of 0.2% for January 2007 and 0.3% for February 2007.
- Short-term resident departures have continued to increase since the trend break in December 2006.

SEASONALLY ADJUSTED ESTIMATES

- Seasonally adjusted estimates for short-term visitor arrivals during March 2007 (502,900 movements) increased by 7.6% compared with February 2007. This followed monthly decreases of 0.9% for January 2007 and 2.4% for February 2007.
- Short-term resident departures for March 2007 (440,700 movements) increased by 7.0% compared with February 2007. This followed monthly decreases of 1.5% for January 2007 and 2.7% for February 2007.

ORIGINAL ESTIMATES

 In original movement terms, there were 524,200 short-term visitor arrivals to Australia and 422,500 short-term resident departures from Australia during March 2007.

MAIN FEATURES

SHORT-TERM VISITOR ARRIVALS

In trend terms, short-term visitor arrivals to Australia in March 2007 (485,900 movements) were 0.8% higher than in February 2007 (482,100 movements). Short-term visitor arrivals are currently 7.4% higher than when the series last troughed in June 2006 (452,400 movements) and 5.4% higher than in March 2006 (460,900 movements).

SHORT-TERM VISITOR ARRIVALS

The following table presents the top ten source countries (based on original estimates) for short-term visitor arrivals during March 2007. Seasonally adjusted and trend estimates are also presented for these countries, along with the percentage change in trend compared with February 2007 and March 2006.

	Trend	Seasonally Adjusted	Original	Feb 07 to Mar 07	Mar 06 to Mar 07
				Trend %	Trend %
	'000	'000'	'000'	change	change
United Kingdom	62.9	64.7	84.3	0.6	4.2
New Zealand	93.9	91.1	83.2	-0.2	3.7
Japan	51.1	51.7	60.5	-0.9	-6.4
United States of America	38.2	39.1	44.3	-0.2	-2.2
China	32.6	38.4	31.9	5.5	26.3

Canada	9.3	9.8	12.7	1.3	-1.6

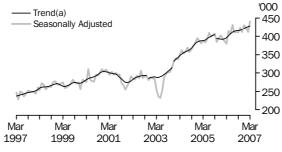

SHORT-TERM VISITOR ARRIVALS, Major Source Countries—March 2007

SHORT-TERM RESIDENT DEPARTURES

In trend terms, short-term resident departures from Australia in March 2007 (427,400 movements) were 0.3% higher than in February 2007 (426,000 movements). Short-term resident departures are currently 0.9% higher than December 2006, when a trend break was introduced.

SHORT-TERM RESIDENT DEPARTURES continued

SHORT-TERM RESIDENT DEPARTURES

(a) Breaks in trend series - see Explanatory Notes, paragraph 22.

The following table presents the top ten destinations (based on original estimates) for short-term resident departures during March 2007. Seasonally adjusted and trend estimates are also presented for these countries, along with the percentage change in trend compared with February 2007 and March 2006.

SHORT-TERM RESIDENT DEPARTURES, Major Destinations—March 2007

		Seasonally		Feb 07 to	Mar 06 to
	Trend	Adjusted	Original	Mar 07	Mar 07
				Trend %	Trend %
	'000	'000'	'000'	change	change

Singapore	16.7	17.1	17.9	-0.1	-3.3
Malaysia	15.7	16.0	16.2	1.5	10.1
Fiji	13.6	14.6	13.9	-3.4	-18.2

(a) Break in trend series from December 2006.

PERMANENT AND LONG-TERM MOVEMENTS

There were 12,940 permanent (settler) arrivals to Australia during March 2007, an increase of 17.5% compared with March 2006 (11,010 movements). People born in New Zealand accounted for the largest proportion of settlers (18%), followed by people born in the United Kingdom (13%), India (10%) and China (9%).

There were 6,250 Australian residents departing permanently from Australia during March 2007, an increase of 12.4% compared with March 2006 (5,560 movements).

Statistics on overseas arrivals and departures relate to the number of movements of travellers rather than the number of travellers. Care should be taken when using long-term movements data as it is known that some individuals who travel multiple times in a year are counted each time they cross Australia's borders (see paragraph 5 of the Explanatory Notes). Long-term movements in this publication are not an appropriate source of migration statistics. For further information refer to *Australian Demographic Statistics* (cat. no. 3101.0).

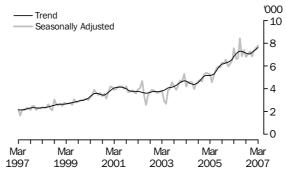

MAIN FEATURES continued

SHORT-TERM TRAVEL — INDIA

Short-term visitor arrivals

Trend estimates provide the best method to analyse the underlying direction of the short-term visitor arrivals series for India. Over the ten year period ending March 2007, trend estimates for visitor arrivals from India more than trebled. The high point during this ten year period was the current month (March 2007, with 7,600 movements) and the low point was in March 1997 (2,100 movements).

INDIA, Short-term Visitor Arrivals

In original terms, in the year ended March 2007 short-term visitor arrivals from India represented 1.5% (86,300 movements) of all short-term visitor arrivals to Australia. This was higher than the percentage in the previous twelve months (1.3%, or 72,000 movements).

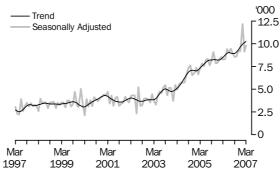

In the year ended March 2007, short-term visitor arrivals from India stated holiday (27%) as their main reason for journey, followed by visiting friends and relatives (22%) and business (19%). In comparison, the main reasons for journey for all short-term visitors to Australia were holiday (52%), visiting friends and relatives (20%) and business (11%). The median age of short-term visitor arrivals from India was 37 years (39 years for all short-term visitors arrivals), and the median duration of intended stay was 12 days (10 days for all short-term visitor arrivals).

New South Wales (44%), Victoria (30%) and Queensland (17%) were the main states/territories of intended stay for short-term visitor arrivals from India in the year ended March 2007. The main destinations for all short-term visitor arrivals to Australia were New South Wales (39%), Queensland (28%) and Victoria (18%).

Short-term residentTrend estimates provide the best method to analyse the underlying direction of the
short-term resident departures series for India. Between March 1997 and March 2003,
trend estimates, while showing fluctuations, remained reasonably stable. From this point
the series has shown strong long-term growth. The high point during the past ten years
was the current month (March 2007, with 10,200 movements) and the low point was in
May 1997 (2,500 movements). Short-term resident departures to India increased nearly
four-fold during the 10 year period.

Short-term resident departures continued

INDIA, Short-term Resident Departures

In original terms, in the year ended March 2007 short-term resident departures to India represented 2.2% (111,100 movements) of all short-term resident departures from Australia. This was higher than the percentage in the previous twelve months (2.0%, or 97,300 movements).

In the year ended March 2007, short-term resident departures to India stated visiting friends and relatives (40%) as their main reason for journey, followed by holiday (34%) and business (17%). In comparison, the main reasons for journey for all short-term residents departing Australia were holiday (48%), visiting friends and relatives (25%) and business (15%). The median age of short-term resident departures to India was 37 years (41 years for all short-term resident departures) and the median duration of intended stay was 28 days (15 days for all short-term resident departures).

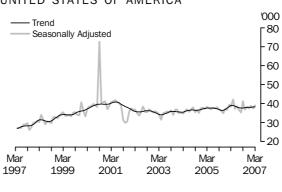

STATISTICALThe above presentation of movements in estimates does not take into account whetherSIGNIFICANCEthe change in movement is statistically significant. Care should be taken when
interpreting the impact of numeric and/or percentage change. Please see the Standard
Errors section of this issue for more detail.

SEASONALLY ADJUSTED AND TREND ESTIMATES

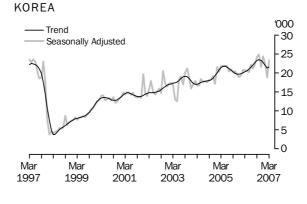

INTRODUCTION

Seasonally adjusted and trend estimates add to the understanding of overseas arrivals and departures (OAD) statistics. Seasonally adjusted estimates allow users to analyse short-term movements including irregular impacts on the series, while trend estimates provide a better method to analyse and monitor the underlying direction of the short-term movement series. In most cases the trend series is the best source of information on the long-term direction of these statistics.

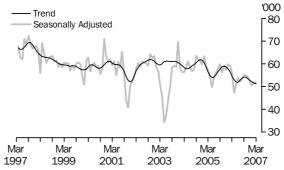

SHORT-TERM VISITOR ARRIVALS Selected source countries The graph for the United States of America shows the large increase in the seasonally adjusted series for short-term visitor arrivals in September 2000, during the Olympic Games in Sydney. For Korea the graph shows the severe fall in arrivals in 1997–98, associated with the Asian financial crisis, and subsequent strong and continuous overall growth. The graph for Japan shows the significant impact of Severe Acute Respiratory Syndrome (SARS) on the seasonally adjusted arrivals series in mid-2003.

UNITED STATES OF AMERICA

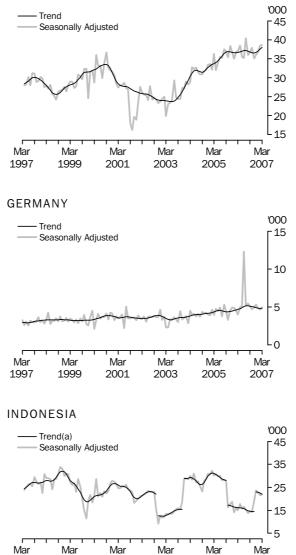

SHORT-TERM RESIDENT DEPARTURES Selected destinations

For residents departing to the United States of America the graph illustrates the effect of the 11 September 2001 terrorist attacks in that country on short-term departures of Australian residents to the United States of America. The graph for Germany shows, in the seasonally adjusted series, the effect of Germany hosting the 2006 FIFA World Cup (9 June to 9 July). For Indonesia the graph shows the impact of the 12 October 2002 Bali bombing and the reduced level of travel experienced in the next twelve months. The effect of the 1 October 2005 Bali bombing is also evident and another break in the trend series was introduced. Strong growth in recent months has resulted in the insertion of a further break in the trend series from December 2006.

EXPLANATORY NOTES

INTRODUCTION	1 This publication contains statistics of persons arriving in, and departing from, Australia, together with the major characteristics of travellers. More detailed statistics can be made available on request (see paragraph 28).
SOURCE OF THE STATISTICS	2 Persons arriving in, or departing from, Australia provide information in the form of incoming and outgoing passenger cards (see Appendix 1). Incoming persons also provide information in visa applications (apart from people travelling as Australian or New Zealand (NZ) citizens). These and other information available to the Department of Immigration and Citizenship (DIAC) serve as a source for statistics of overseas arrivals and departures (OAD).
	3 In July 1998, DIAC revised the incoming and outgoing passenger cards and associated procedures as well as computer systems. Following these changes, some questions on the passenger cards were not compulsory and answers to these questions were not checked by Customs officers. The question on marital status was deleted. Data on marital status is now derived from visa applications (only for certain visa classes) and is therefore not available for Australian or NZ citizens. The changes also affect the data for 'previous country of residence' which is imputed for Australian and NZ citizens. For more information see the May 1998 issue of this publication. Since July 1998, there have been additional minor changes to both incoming and outgoing passenger cards.
	4 From July 2001, DIAC adopted a new passenger card processing system which involved electronic imaging of passenger cards and intelligent character recognition of the data stored in the images. This process has yielded several improvements to the processing of passenger card data, most notably the detailed information about missing values. There have also been several changes to data quality. Information on these changes appears in Appendix 2.
SCOPE	5 The statistics in this publication relate to the number of movements of travellers rather than the number of travellers (i.e. multiple movements of individual persons during a given reference period are each counted separately). The statistics exclude the movements of operational air and ships' crew, transit passengers who pass through Australia but are not cleared for entry, passengers on pleasure cruises commencing and finishing in Australia, and unauthorised arrivals.
STATE AND TERRITORY CLASSIFICATION	6 Following the 1992 amendment to the <i>Acts Interpretation Act</i> to include the Indian Ocean Territories of Christmas Island and the Cocos (Keeling) Islands as part of geographic Australia, population estimates commencing with September quarter 1993 include estimates for these two territories. To reflect this change, another category of the state/territory classification has been created, known as Other Territories. Other Territories includes Jervis Bay Territory, Christmas Island and the Cocos (Keeling) Islands. OAD data for Other Territories are not available prior to February 1995.
COUNTRY CLASSIFICATION	7 The classification of countries in this publication is the Standard Australian Classification of Countries. For more detailed information refer to the ABS publication <i>Standard Australian Classification of Countries</i> (SACC) (cat. no. 1269.0).
	8 The statistics on country of birth, citizenship, residence or main destination have certain limitations because of reporting on passenger cards. For instance, United Kingdom includes England, Scotland and Wales. Similarly Korea includes both the Republic of Korea and the Democratic People's Republic of Korea.
	9 A large number of short-term residents departing state Europe as their main destination on the passenger card. These responses are grouped into inadequately described, unless otherwise indicated.

EXPLANATORY NOTES *continued*

ESTIMATION METHOD	10 OAD statistics are derived from a combination of full enumeration and sampling. All permanent movements and all movements with a duration of stay of one year or more are fully enumerated. All movements with a duration of stay of less than one year are sampled. Statistics relating to these movements are therefore estimates which may differ from statistics which would have been obtained if details of all these movements had been processed. Sample standard errors can be found in the Standard Errors section of this publication.
	11 Since January 1997 variable sample skips were used in the selection of records to be sampled. Separate skips were applied for each country of citizenship. Over a year about 3.5% of all short-term movements were selected for sampling. However, for operational reasons variable skips across months were ceased from August 2000. From January 2005, 4.9% of all short-term movements have been selected for sample. The skip values correspond to the lowest skip value (i.e. the highest sample selected) for each country from a sample design including individual month and direction of travel as sub-categories.
	12 The statistics in this publication have been rounded to the nearest 100 for short-term movements and to the nearest 10 for permanent and long-term movements. As a result, sums of the components may not add exactly to totals. Analysis featured in the Key Points and Main Features of this publication is based on unrounded data. Calculations made on rounded data may differ to those published.
CORRECTIONS AND IMPUTATIONS	13 The imprecision due to sampling errors should not be confused with errors arising from imperfections in reporting, which may occur in any data collection, whether sampled or not. Every effort is made to minimise such errors, both through careful design of the passenger cards and through checks on the information once it is received. During the edit process some items are corrected where they conflict with other known information. Missing replies to certain items such as age, state and country of stay/residence are also imputed by reference to other related items. Information on non-response rates and data imputation appears in Appendix 2.
	14 Errors of this kind differ from discrepancies arising from the fact that certain information reflects the travellers' intentions at the time the passenger cards were completed. These intentions are, of course, subject to change. Particularly affected is the distinction between permanent and temporary movement and in the latter case, length of intended stay, country in which most time will be spent and main reason for journey.
SEASONAL ADJUSTMENT AND TREND ESTIMATES	15 Seasonally adjusted and trend estimates of short-term overseas movements are shown in tables 1, 2, 3, 4, 7 and 8.
	16 Seasonally adjusted estimates are derived by estimating and removing systematic calendar related effects from the original series. In the short-term visitor arrival and short-term resident departure series, these calendar related effects are known as seasonal (e.g. increased travel in December due to the Christmas holiday period) and trading day influences (arising from the varying length of each month and the varying number of Sundays, Mondays, Tuesdays, etc. in each month). Each influence is estimated by separate seasonal and trading day factors which, when combined, are referred to as the combined adjustment factors.
	17 From November 2004 ABS has introduced an improved method for removing trading day effects from seasonally adjusted estimates. Corrections for trading day effects are now applied as prior corrections to the original estimates, rather than being applied within the seasonal adjustment process. This is now consistent with the treatment of any corrections for large extremes, changes in level, changes in seasonal pattern, Easter, and other effects. This change in methodology will result in revisions to seasonally adjusted and trend estimates. From July 2003 concurrent seasonal adjustment methodology has

SEASONAL ADJUSTMENT AND TREND ESTIMATES continued

been used to derive the combined adjustment factors. This means that data from the current month are used in estimating seasonal and trading day factors for the current and previous months. Concurrent seasonal adjustment replaces the forward factor methodology used since seasonal adjustment of short-term visitor arrivals began in 1969 and short-term resident departures in 1976.

18 Concurrent adjustment can result in revisions each month to the seasonally adjusted estimates for earlier periods. However, in most instances, the only noticeable revisions will be to the combined adjustment factors for the current month, the previous month and the same month a year ago. Although there is no specific Information Paper on concurrent adjustment to short-term visitor arrivals or resident departures, more detail on the method in general can be found in the *Information Paper: Introduction of Concurrent Seasonal Adjustment into the Retail Trade Series* (cat. no. 8514.0).

19 Seasonal adjustment procedures do not aim to remove the irregular or non-seasonal influences which may be present in any particular month, such as the effect of major sporting and cultural events, changes in airfares and the fluctuation of the Australian dollar relative to other currencies. Irregular influences that are highly volatile can make it difficult to interpret the movement of the series even after adjustment for seasonal variation. Trend estimates take these irregular influences into account.

20 The trend estimates of short-term overseas visitor arrivals and short-term Australian resident departures are derived by applying a 13-term Henderson-weighted moving average to all months of the respective seasonally adjusted series except the first and last six months. Trend series are created for the last six months by applying surrogates of the Henderson weighted moving average to the seasonally adjusted series.

21 While this technique enables smoothed data for the latest period to be produced, it does result in revisions to the smoothed series, principally of recent months, as additional observations become available. There may also be revisions as a result of the re-estimation of the seasonal factors. For further information, see *A Guide to Interpreting Time Series—Monitoring Trends* (cat. no. 1349.0).

22 Occasionally situations occur that necessitate breaks being applied to the trend series. These breaks are necessary because of a change in the underlying level of the original series. While the breaks apply to an individual country (e.g. Indonesia) a consequence is that breaks are also applied to the regional total series (e.g. Total South-East Asia) and the total series. Breaks currently included in the trend series are as follows:

- October 2002: Short-term resident departures Indonesia, Total South-East Asia and Total—Trend series breaks due to the decrease in movements resulting from the Bali bombing of 12 October 2002.
- December 2003: Short-term resident departures Indonesia, Total South-East Asia and Total—Trend series breaks due to a return to the trend levels experienced prior to the Bali bombing of 12 October 2002.
- October 2005: Short-term resident departures Indonesia, Total South-East Asia and Total—Trend series breaks due to the decrease in movements resulting from the Bali bombing of 1 October 2005.
- December 2006: Short-term resident departures Indonesia, Total South-East Asia and Total—Trend series breaks due to the increase in movements to Indonesia to levels closer to, but still lower than, the movements experienced prior to the Bali bombing of 1 October 2005.

23 An improved correction method has been implemented in the seasonal adjustment process, to remove the effects of Chinese New Year and Ramadan from the seasonally adjusted estimates.

EXPLANATORY NOTES continued

SEASONAL ADJUSTMENT AND TREND ESTIMATES continued

RELATED PRODUCTS

- Chinese New Year Chinese New Year often falls in February but on some occasions falls in January. The movement of Chinese New Year between the boundary of January and February can cause biased seasonally adjusted and trend estimates. The Chinese New Year proximity adjustment method takes into account the graduated increase in activity in the days leading up to the holiday period followed by a graduated return to the normal activity levels in the days following. The proximity correction is only applied to the series from January 1998, as it was not significant before this date. Further details on this adjustment method can be found in 'Estimating and removing the effects of Chinese New Year and Ramadan to improve the seasonal adjustment process' (ABS, *Australian Economic Indicators*, cat. no. 1350.0, November 2005 issue).
- *Ramadan* Ramadan is the ninth month of the Islamic calendar and starts eleven days earlier each year in the Western calendar, so adjustments for this effect apply to different months over the years. The adjustment was made after the detection of a significant influence on travel for Malaysia and Indonesia associated with the end of the Islamic month of Ramadan. The estimates for Total South-East Asia were also corrected as a consequence of the Malaysia and Indonesia series corrections. Other time series did not have a significant Ramadan effect and were not corrected.

24 For a detailed discussion and analysis of OAD time series estimates, see the *ABS Demography Working Paper 2004/2 – Interpretation and Use of Overseas Arrivals and Departures Estimates* (cat. no. 3106.0.55.002), available on the ABS web site.

25 Users of these statistics may also wish to refer to the following ABS products:

- Short-term Visitor Arrival Estimates, Australia (cat. no. 3401.0.55.001) issued monthly
- Australian Demographic Statistics (cat. no. 3101.0) issued quarterly
- Migration, Australia (cat. no. 3412.0) issued annually
- Overseas Arrivals and Departures, Australia, Time Series Spreadsheets. These spreadsheets can be accessed on this site from the Details tab.

26 Related statistics are also published by DIAC, the Department of Industry, Tourism and Resources and Tourism Research Australia.

27 Current publications and other products produced by the ABS are listed in the *Catalogue of Publications and Products* (cat. no. 1101.0). The Catalogue is available from any ABS office or this site. The ABS also issues a daily Release Advice on the web site which details the products to be released in the week ahead.

ADDITIONAL STATISTICS	28 As well as the statistics included in this and related publications, other relevant
AVAILABLE	unpublished data are available for the following variables:
	Citizenship (nationality)
	Country of birth
	Age (date of birth)
	Sex
	Marital status (not available for Australian or New Zealand citizens)
	Category of travel
	Permanent migrant
	Previous/future country of residence
	State of intended address/lived
	Overseas visitor
	Intended/actual length of stay
	Main reason for journey
	Country of residence
	State or territory of intended address on arrival
	State or territory in which most time spent on departure
	Australian residents
	Intended/actual length of stay overseas
	Country spent/intend to spend most time abroad
	State or territory of intended address/state or territory lived
	Occupation (not available for short-term movements)
	Country of embarkation/disembarkation
	Airport/Port of arrival/departure
	Arrival/departure date
	Intention to live in Australia for next 12 months (not available for short-term movements)
ACKNOWLEDGMENTS	29 This publication draws extensively on information provided by DIAC. This continued cooperation is very much appreciated; without it, the statistics published would not be available. Information received by the ABS is treated in strict confidence as

required by the Census and Statistics Act 1905.

APPENDIX 1 PASSENGER CARDS

APPENDIX 2 DATA QUALITY ISSUES

.

.

SCANNING AND IMAGING	The introduction of a new passenger card processing system from July 2001 has meant that information is now available on the frequency and impact of data item imputation. Much of this information has not been available previously. Additionally, the move to a new processing system has also given rise to new data quality issues directly associated with scanning and imaging.
DEFECTIVE CARDS	There are a small number of unreadable or damaged passenger cards for each month. The Australian Bureau of Statistics (ABS) receives a count of these cards from the Department of Immigration and Citizenship (DIAC) by movement direction, box type (category of traveller) and port of clearance. The information on these cards is then physically processed by the ABS and included in the estimates presented here.
DURATION OF STAY	From July 1998 DIAC has been able to determine the actual length of stay for departing overseas visitors and arriving Australian residents which was previously collected from information on intended length of stay supplied on the arrival and departure card by the passenger. This new method has resulted in a change in data distribution with the number of passengers staying for one year exactly declining significantly when compared with movements prior to July 1998.
	The introduction of the new passenger card processing system from July 2001 has shown further evidence of rounding to exactly one year in intended duration of stay/travel as reported by visitors arriving in Australia and Australian residents departing the country. To reflect the historical movement patterns, the records with a reported duration of exactly one year are allocated to short-term and long-term. For visitors, 75% of such records are allocated to short-term and 25% to long-term. The ratio is 67:33 for residents departing Australia.
TRIPS AND MATCHING OF MOVEMENTS ON THE SECOND LEG OF TRAVEL	Each month there are records for long-term residents returning to Australia and long-term visitors departing Australia which could not be matched with DIAC's Travel and Immigration Processing System (TRIPS) records. Records which did not match with a passenger card have been created directly from TRIPS and added to the ABS processing system.
NEW ZEALAND CITIZENS	Under the Trans-Tasman Agreement, New Zealand (NZ) citizens are not required to have a visa to travel to Australia. As a result, on arrival in Australia their visa documentation cannot be used to determine whether they are either a permanent migrant or a temporary visitor, or an Australian resident returning from NZ. DIAC believes that a substantial proportion of holders of NZ passports tick Box A (migrating to Australia) each time they arrive in the country, causing an overcount of NZ migrants entering Australia.
	The following edits were applied to correct the overcounting of NZ migrants:
July 2001 to June 2002	With the introduction of the new processing system from July 2001, DIAC coded all NZ citizen arrivals who had ticked Box A and had been to Australia previously (based on immigration records) to resident returning (Box C). If these people were visitors previously, this recoding had the effect of incorrectly reducing the number of NZ migrants whilst at the same time incorrectly increasing the number of NZ citizen returning residents. This problem was overcome by moving the NZ citizens that have been changed by DIAC from Box A to Box C back to Box A.

APPENDIX 2 DATA QUALITY ISSUES continued

.

July 2002 onwards	From July 2002, DIAC has introduced a new ed Arrivals of NZ citizens statistics. Where the pers (first arrival as a migrant) the record is verified passenger card records and if the person is pre then they will be counted as returning resident recording of NZ citizens who are migrating to A residents returning.	on ticks Box by checking viously reco s. 	visitor arrivals, on average, were recorded as ha	iving a reaso	n for journey c	of 'Other' or
	'Not Stated'. This percentage rose to 14% for Ju	ly, 16% in Au	ugust and 29%	in September
	1998 as a result of processing problems. These	problems ha	ave now been a	addressed by
	DIAC, with the percentage of 'Other' and 'Not S	tated' dropp	oing in October	1998 to 8%
	and 7% in November 1998.			
	From the January 1999 issue of this publication	, published (figures (table 6	in this issue)
	referencing these three months were revised. T			
	estimating the number of persons responding			•
	each country of citizenship and proportionally			
	estimated 'Other/Not Stated' total amongst the			
	are now separately available from February 199		0	

For the months of August 1998, September 1998 and October 1998, data entry problems TIME experienced by DIAC caused an overstatement of the Northern Territory as the main state of stay with a corresponding understatement for the remaining states and territories. In November 1998 these numbers returned to levels more comparable with previous years, with DIAC indicating that they had instigated data quality procedures to address this issue. From the January 1999 issue of this publication, published figures (table 11 in this issue) referencing these months were revised. The revised data were calculated by estimating the number of persons indicating the Northern Territory as their main state of stay using past trends and proportionally allocating any persons in excess of these estimates amongst the remaining states and territories. With the introduction of the new processing system from July 2001, DIAC has provided the ABS with data on all missing values of state of stay and state of usual residence. These missing values are now imputed. DATA IMPUTATIONS Data was imputed for non-response for state of stay/residence. For state of stay, non-responses were imputed at the category of traveller and state of clearance level. Non-response rates for state of stay are presented in the table below: NON-RESPONSE RATES FOR STATE OF STAY BY CATEGORY OF A2 TRAVELLER(a) March

	March
	2007
Category of traveller	%
category of travener	70
Permanent arrivals – settlers	7.0
Long-term residents returning	1.3
Long-term visitors arriving	4.6
Short-term residents returning	0.5
Short-term visitors arriving	6.9
Residents departing permanently	2.6
Long-term residents departing	2.9
Long-term visitors departing	4.4
Short-term residents departing	1.9
Short-term visitors departing	8.3

(a) Non-response rates are weighted.

Non-responses for country of stay and country of usual residence were imputed in two stages. In the first stage, records with country of stay/residence missing were set to country of disembarkation/embarkation if a response was available. In the second stage, for remaining records where country of stay/residence was missing, values were imputed at the category of traveller, reason for journey and country of citizenship level based on responses to other cards within each subgroup. Accordingly, the level of records with data for country of stay/residence not stated has been minimised.

Change in approach to non-response state of stay for long-term visitor departures

STATE WHERE SPENT MOST

Country of stay

A procedure has been applied before prorating of a non-response to state of stay for long-term visitor departures. If a correction to the box marked by a passenger is made (e.g. a visitor marks a resident box), the state of stay recorded in the incorrect box is applied.

Table A3 below presents the percentage of records with country of stay/residence missing as supplied by DIAC and prior to imputation.

	disembarkation/embarkation.		
	(b) Non-response rates are weighted.		
	(c) See DATA IMPUTATIONS, Country of		
	previous residence, in this Appendix.		
Country of previous residence	The proportion of permanent arrivals where country of previous residence was not		
	stated increased markedly over the two years to August 2006. Prior to August 2006 ABS		
	imputed this data item for these movements using country of embarkation information		
	as well as stated responses of other permanent arrivals. As a result of this increase and		
	the continuing high level of not stated responses (see table A4), records of permanent		
	arrivals whose country of previous residence is not stated have not been imputed for		
	August 2006 data onwards. For all other arrivals, imputation based on country of		
	embarkation has continued.		
SEPTEMBER 1998	A problem was experienced in the processing of OAD data for movement dates between		
PROCESSING	6 September 1998 and 16 September 1998, following the introduction of changes to		
	DIAC's input processing system. This problem may affect in the order of 10% of all		
	September 1998 records used in estimation and result in incorrect details for citizenship,		

date of birth, sex and country of birth.

.

PERMANENT ARRIVALS DURING 1999	The number of permanent arrivals during July to December 1999 was revised in October 2000, as advised by DIAC.
SEPTEMBER 1999 PROCESSING	September 1999 overseas arrivals and departures data are revised for movements from, and to, China (excl. SARs and Taiwan) and Hong Kong (SAR of China) in respect of three variables: country of birth, country of citizenship and country of residence/stay. Changes to 'country of birth' and 'country of citizenship' have been made from data supplied by DIAC. Changes to 'country of residence/stay' have been made by assuming the average proportion of country of birth to country of residence/stay for migrants from China (excl. SARs and Taiwan) and Hong Kong (SAR of China) in September 1995 to September 1998.
SEPTEMBER QUARTER 2000 PROCESSING	A processing error was identified which affected the distribution of short-term resident departures by reason for journey for the months of August and September 2000. Affected data was re-processed, and a revised copy of table 3 for the September quarter 2000 was reissued in the supplement October to December 2000 issue of this publication.
OCTOBER 2005 PROCESSING	In June 2006 DIAC advised that some passenger cards predominantly from Adelaide airport were not processed in time for the October 2005 Overseas Arrivals and Departures data cut off date. The October 2005 data was reprocessed to include the missing records (approximately 7,800) and the revised data was published in the June 2006 issue of this publication. All associated time series spreadsheets and data files were revised.
	Differences between the revised October 2005 data and the figures published in the October 2005 issue of this publication were spread across all categories of movement and all variables. A breakdown of the numeric differences by category of movement is provided in the June 2006 issue of this publication.
CHANGE TO PROCESSING OF INTENDED LENGTH OF STAY	There is evidence to suggest that when completing the intended length of stay question on the incoming passenger card (Box B), some passengers are entering their arrival/departure date or their birth date rather than their intended length of stay.
	From September 2003 a rule has been implemented to the data processing system stating that if all three elements are complete (years, months and days), then the intended length of stay is to be coded to a non-response. The ABS currently assigns 'not stated' duration as a short-term movement, however a review of this procedure will be undertaken in the future.
	This procedure changes the prior data processing system which read only the years from the field on the passenger cards. The previous data processing system could have added

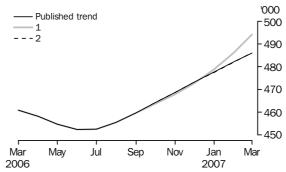

to overestimation of the number of long-term visitor arrivals.

TECHNICAL NOTE TREND REVISIONS

EFFECT OF NEW SEASONALLY ADJUSTED ESTIMATES ON TREND ESTIMATES

1 The most recent trend estimates for short-term visitor arrivals and short-term resident departures are likely to be revised when the next month's seasonally adjusted estimates become available. To assist readers of this publication in analysing short-term movement trends, the approximate effects of two possible scenarios on the previous trend estimate of short-term visitor arrivals and resident departures are presented below. *Visitor arrivals*

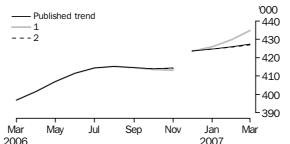

- 1 The April seasonally adjusted estimate of visitor arrivals is 2.9% higher than March.
- 2 The April seasonally adjusted estimate of visitor arrivals is 2.9% lower than March.

WHAT IF ...? REVISIONS TO TREND ESTIMATES

Resident departures

- 1 The April seasonally adjusted estimate of resident departures is 3.2% higher than March.
- 2 The April seasonally adjusted estimate of resident departures is 3.2% lower than March.

2 The figures of 2.9% for visitor arrivals and 3.2% for resident departures were chosen because they represent the average absolute monthly percentage change for visitor arrivals and resident departures over the last ten years, respectively.

3 Under concurrent seasonal adjustment, the most recent seasonally adjusted and trend estimates are likely to be revised when original estimates for subsequent months become available. The trend revision is a combined result of the revision of the seasonally adjusted estimates and the revision derived from the use of asymmetric moving averages as future data become available. ABS research shows that about 75% of the total revision to the trend estimate at the current end of the time series is due to the use of different asymmetric moving averages when the original estimate for the next time period becomes available. To assess the reliability of the trend estimate at the current end, the 'what-if' charts present trend estimates under two different scenarios for the next time period. The charts show only the impact due to the changes of the asymmetric

⁽a) Break in trend series from December 2006.

EFFECT OF NEW SEASONALLY ADJUSTED ESTIMATES ON TREND ESTIMATES continued moving averages and do not include the unknown impact of revision to seasonal factor estimates that would arise when the original estimate for the next time period becomes available.

.

STANDARD ERRORS

RELIABILITY OF ESTIMATES

Estimates based on a sample are subject to sampling variability, that is, they may differ from those that would be obtained from full enumeration.

The sampling error associated with any estimate can be estimated from the sample results and one measure so derived is the standard error. Given an estimate and the standard error on that estimate, there are about two chances in three that the sample estimate will differ by less than one standard error from the figure that would have been obtained from full enumeration, and about nineteen chances in twenty that the difference will be less than two standard errors. The relative standard error is the standard error on the estimate expressed as a percentage of the estimate.

It would be impractical to publish estimates of standard errors for all figures in individual tables. However, the following table of standard errors and relative standard errors gives an indication of the magnitude of the sampling error associated with any estimate of a particular size for short-term and total movement.

APPROXIMATE STANDARD ERROR ON ESTIMATES FOR STRATIFIED SAMPLE

			SHORT-TER	RM		
	SHORT-TERM	ARRIVAL	ARRIVAL O	R		
	OR DEPARTUR	RE OF	DEPARTUR	E OF	TOTAL ARF	RIVAL
	AUSTRALIAN RESIDENT		OVERSEAS	VISITOR	OR DEPAR	TURE
		Relative		Relative		Relative
	Standard	standard	Standard	standard	Standard	standard
Estimated number of	error	error	error	error	error	error
movements	no.	%	no.	%	no.	%
5000000	11 302	0.2	7 934	0.2	9 705	0.2
4000000	10 244	0.3	7 170	0.2	8 796	0.2
3000000	9 021	0.3	6 292	0.2	7 746	0.3
2000000	7 536	0.4	5 233	0.3	6 470	0.3
1000000	5 530	0.6	3 815	0.4	4 745	0.5
500000	4 047	0.8	2 778	0.6	3 469	0.7
100000	1 941	1.9	1 325	1.3	1 658	1.7
50000	1 408	2.8	962	1.9	1 201	2.4
10000	662	6.6	455	4.6	561	5.6
5000	476	9.5	329	6.6	402	8.0
2000	307	15.3	214	10.7	258	12.9
1000	219	21.9	154	15.4	184	18.4
750	191	25.4	135	18.0	159	21.3
500	156	31.3	111	22.3	130	26.1
400	140	35.0	100	25.0	117	29.2
300	122	40.5	87	29.1	101	33.7
200	100	49.8	72	36.0	83	41.3
100	71	70.6	52	51.8	58	58.3

An example of the use of this table is as follows. If the estimate of the number of Australian resident departures for short-term visits abroad is 1,000, then the standard error on this estimate is 219; i.e. there are two chances in three that the actual number of Australian resident departures for short-term visits abroad will lie between 781 and 1,219 and nineteen chances in twenty that it will lie between 562 and 1,438.

The larger the size of an estimate the smaller the relative standard error. For any estimate of greater than 5,000,000 the relative standard error will be less than 0.2%.

The estimate of the difference between an estimate in two different periods, or between different estimates from the same period, is also subject to sampling error. The standard error on the difference between any two estimates which are subject to sampling error can be approximated by using the larger standard error of the estimates inflated by a factor of 1.4.

STANDARD ERRORS continued

RELIABILITY OF ESTIMATES continued

An example of the use of this procedure is as follows. Assume the estimates of the number of arrivals to Australia from Germany during January 2004 and January 2005 are 7,500 and 10,000 respectively. The difference between the 2004 and 2005 figure is 2,500 and the standard errors on these estimates are approximately 392 and 455. The standard error on the difference is approximately 637 (1.4×455), and there are nineteen chances in twenty that the estimate of the difference between the two years will lie between 1,226 and 3,774.

.

GLOSSARY

Australian resident	An Australian resident is self-defined as reported by travellers when completing an incoming or outgoing passenger card.
Category of movement	 Overseas Arrivals and Departures are classified according to length of stay (in Australia or overseas), recorded in months and days by travellers on passenger cards. There are three main categories of movement: permanent movements; long-term movements (one year or more); and short-term movements (less than one year).
	A significant number of travellers (i.e. overseas visitors to Australia on arrival and Australian residents going abroad) state exactly 12 months or one year as their intended period of stay. Many of them stay for less than that period and on their departure from, or return to, Australia are therefore classified as short-term. Accordingly in an attempt to maintain consistency between arrivals and departures, movements of travellers who report their actual or intended period of stay as being one year exactly are randomly allocated to long-term or short-term, in proportion to the number of movements of travellers who report their actual length of stay as up to one month more, or one month less, than one year.
Country of residence	Country of residence refers to the country in which travellers regard themselves as living or as last having lived.
Intended length of stay	On arrival in Australia, all overseas visitors are asked to state their 'intended length of stay in Australia'. On departure from Australia, all Australian residents are asked to state their 'intended length of stay abroad'.
Long-term arrivals	 Long-term arrivals comprise: overseas visitors who intend to stay in Australia for 12 months or more (but not permanently); and Australian residents returning after an absence of 12 months or more overseas.
Long-term departures	 Long-term departures comprise: Australian residents who intend to stay abroad for 12 months or more (but not permanently); and overseas visitors departing who stayed 12 months or more in Australia.
Main destination	Australian residents travelling overseas are asked on departure for the name of the country in which they intend to spend most time.
Main reason for journey	 On arrival in, or departure from, Australia all overseas visitors and Australian residents are asked to state their purpose of journey. From September 1994, all statistics relating to main reason for journey have been published using the following categories: convention/conference business visiting friends/relatives holiday employment education other.
	In tabulations of data collected before September 1994, the 'other' category included 'in transit' and the 'holiday' category included both 'student vacation' and 'accompanying business visitor'.
Overseas Arrivals and Departures	Overseas Arrivals and Departures refer to the arrival or departure of Australian residents or overseas visitors, through Australian airports (or sea ports), which have been recorded on incoming or outgoing passenger cards. Statistics on Overseas Arrivals and Departures relate to the number of movements of travellers rather than the number of travellers (i.e. the multiple movements of individual persons during a given reference period are all counted).

GLOSSARY continued

Permanent arrivals	 Permanent arrivals (settlers) comprise: travellers who hold migrant visas (regardless of stated intended period of stay); New Zealand citizens who indicate an intention to settle; and those who are otherwise eligible to settle (e.g. overseas born children of Australia citizens). 	
	This definition of settlers is used by the Department of Immigration and Citizenship (DIAC). Prior to 1985 the definition of settlers used by the ABS was the stated intention of the traveller only. Numerically the effect of the change in definition is insignificant. The change was made to avoid the confusion caused by minor differences between data on settlers published separately by the ABS and DIAC.	
Permanent departures	Permanent departures are Australian residents (including former settlers) who on departure state that they intend to settle permanently in another country.	
Short-term arrivals	 Short-term arrivals comprise: overseas visitors whose intended stay in Australia is less than 12 months; and Australian residents returning after a stay of less than 12 months overseas. 	
Short-term departures	Short-term departures comprise:Australian residents who intend to stay abroad for less than 12 months; andoverseas visitors departing after a stay of less than 12 months in Australia.	
State where spent most time	Overseas visitors are asked on departure for the name of the state or territory in which they spent the most time. This differs from 'state of clearance' which is available on request.
