NOTES

- RE-ISSUED PUBLICATION** This publication is a re-issue of *Australian National Accounts: State Accounts* (cat. no. 5220.0) that was released on 12 November 2004. It contains amended data for the 2003–04 estimate of *ownership of dwellings – gross operating surplus* for the Northern Territory. As the state and territory estimates are constrained to the Australian totals, this amendment has been offset in the corresponding series for New South Wales. The effect of this amendment has been to revise growth in chain volume *gross state product* (GSP) for the Northern Territory for 2003–04 from –0.1% to 0.4%. GSP growth rates for New South Wales and all other states are unaffected.
- This publication also contains amended data for the 2002–03 and 2003–04 estimates of the household income account item *gross operating surplus – dwellings owned by persons* for New South Wales, Queensland, Western Australia, Northern Territory and the Australian Capital Territory. The effect of this amendment is to slightly change the state and territory shares of gross household disposable income. This amendment has no impact on GSP estimates.
- ABOUT THIS PUBLICATION** This publication contains state and territory estimates of gross domestic product (referred to as gross state product (GSP)) and its components, in current price and chain volume terms, for the years 1995–96 to 2003–04. Historical data starting in 1989–90 are available electronically through the subscription service, Ausstats, or as individual spreadsheets on www.abs.gov.au (see Appendix 1 for a full list of available tables).
- REVISIONS IN THIS ISSUE** See the Analysis of results section on page 7 for details of revisions.
- CHANGES IN THIS ISSUE** A new layout for components of private gross fixed capital formation has been introduced in tables 5 to 22. Tables showing revisions to components of GSP have been released in electronic form (tables 44 to 59).
- CHANGES IN NEXT ISSUE** The estimates presented in the 2004–05 issue will reflect the impact of an important upgrade to the way the ABS compiles its economic statistics. A more detailed explanation appears in the Analysis of results section on page 8.
- DATA VALUES AND ROUNDING** All values, unless otherwise indicated, are shown in Australian dollars rounded to the nearest million.
- Where figures have been rounded, discrepancies may occur between the sums of the component items and totals.
- NEXT ISSUE** The 2004–05 issue of this publication is expected to be released in November 2005.

Dennis Trewin
Australian Statistician

ANALYSIS OF RESULTS

GROWTH IN EXPERIMENTAL GSP CHAIN VOLUME MEASURES

The chain volume measure of gross state product (GSP) in 2003–04 increased in all states. Western Australia (7.5%), Queensland (5.1%) and South Australia (4.3%) were the only states to experience growth rates stronger than that for the national GDP measure (3.8%).

GSP, Chain volume measures—2003–04

	<i>Annual growth</i>	<i>Average annual compound growth rates (1993–94 to 2003–04)</i>
	%	%
New South Wales	2.0	3.6
Victoria	3.7	3.9
Queensland	5.1	4.9
South Australia	4.3	3.2
Western Australia	7.5	4.4
Tasmania	3.0	2.0
Northern Territory	0.4	3.7
Australian Capital Territory	1.5	2.9
Australia	3.8	3.9

The chain volume estimates of GSP included in this publication are derived indirectly. The method involves deriving a price deflator from the best possible current price and chain volume estimates of expenditure that encompass as much as possible of GSP. This deflator is then applied to current price income estimates of GSP. The chain volume estimates are labelled as 'experimental' for reasons set out in the Explanatory Notes (paragraphs 30 to 34). Users should therefore exercise caution when using these estimates for economic analysis.

Given these measurement issues, the ABS is currently developing estimates of GSP using the production approach. The ABS believes that better quality volume estimates of GSP can be produced using this approach. It is expected that these estimates will be available in March 2006.

GSP PER CAPITA

For some analytical purposes it is important to allow for the impact of population growth on movements in GSP. The annual growth in GSP per capita was lower than GSP growth for all states.

The following states had GSP per capita growth higher than the national outcome for GDP per capita at 2.5%: Western Australia (5.8%), South Australia (3.7%) and Queensland (2.7%).

ANALYSIS OF RESULTS *continued*

GSP PER CAPITA *continued*

GSP PER CAPITA, Chain volume measures—2002–03 to 2003–04

(a) GDP.

REAL GROSS STATE INCOME

Chain volume estimates of GSP measure the volume of goods and services produced in each state. If the terms of trade for a state change significantly (i.e. the prices for a state's exports and imports change at different rates) then GSP will not accurately reflect the change in real purchasing power of the income generated within a state. For this reason, real gross state income (RGSI) includes an adjustment for the terms of trade. (For details on the calculation method see the Explanatory Notes, paragraphs 35 to 37).

The following graph shows annual percentage changes in RGSI per capita in 2003–04. Growth in RGSI per capita has tended to be greater than GSP per capita over the past ten years, reflecting favourable movements in the terms of trade.

RGSI PER CAPITA, Chain volume measures—2002–03 to 2003–04

STATE FINAL DEMAND (SFD)

Volume growth in state final demand was positive in all states in 2003–04 with the strongest growth in Western Australia at 8.0%. Growth is being driven by both total final consumption expenditure and particularly strong growth in total gross fixed capital formation.

The weakest growth was 3.6% in Victoria, which is below the national domestic final demand growth rate of 5.3%.

ANALYSIS OF RESULTS *continued*

STATE FINAL DEMAND (SFD) *continued*

STATE FINAL DEMAND, Chain volume measures—2003–04

	LEVELS		SFD growth	Contribution to DFD
	2002–03	2003–04		
	\$m	\$m	%	% pts
New South Wales	260 727	272 231	4.4	1.5
Victoria	195 987	203 138	3.6	0.9
Queensland	139 256	150 171	7.8	1.4
South Australia	55 241	58 072	5.1	0.4
Western Australia	75 769	81 817	8.0	0.8
Tasmania	15 560	16 785	7.9	0.2
Northern Territory	10 341	10 916	5.6	0.1
Australian Capital Territory	21 974	22 811	3.8	0.1
Australia	774 853	815 934	5.3	. .

. . not applicable

All states were positive contributors towards Australia's domestic final demand growth in 2003–04. New South Wales, Victoria and Queensland contributed 1.5, 0.9 and 1.4 percentage points respectively, accounting for around 75% of the growth in total domestic final demand.

GOVERNMENT FINAL CONSUMPTION EXPENDITURE

Government final consumption expenditure rose in all states in 2003–04. Queensland showed the strongest growth in chain volume terms of 3.7%, mainly driven by strong state and local expenditure. The lowest growth was recorded in Victoria at 1.2%, followed by Tasmania and South Australia at 1.7% and 2.3% respectively. The major contributors to Australia's growth in government final consumption expenditure of 2.5% were NSW (0.8 percentage points) and Queensland (0.6 percentage points).

HOUSEHOLD FINAL CONSUMPTION EXPENDITURE

Household final consumption expenditure volume growth was strongest in Queensland (8.8%), Tasmania (8.1%), Western Australia (6.8%) and the Northern Territory (6.2%). Weaker growth was experienced in New South Wales (4.5%), Victoria (4.5%), the Australian Capital Territory (4.5%) and South Australia (4.4%). The major contributors to Australia's growth in household final consumption expenditure of 5.6% were NSW (1.6 percentage points), Queensland (1.6 percentage points) and Victoria (1.2 percentage points).

PRIVATE GROSS FIXED CAPITAL FORMATION

In 2003–04, Australia experienced strong volume growth in private gross fixed capital formation. This growth is reflected in most states, with 5 of the 8 states showing strong growth of over 9%: Tasmania (16.7%), Western Australia (11.9%), Northern Territory (10.8%), Queensland (9.6%), and South Australia (9.1%). Growth was weaker for New South Wales (5.9%), Victoria (3.4%) while the Australian Capital Territory fell (-5.0%) due to a large fall in non-dwelling construction. The major contributors to Australia's strong growth of 7.0% were Queensland (1.9 percentage points), NSW (1.8 percentage points) and Western Australia (1.4 percentage points).

PUBLIC GROSS FIXED CAPITAL FORMATION

The pattern of volume growth for public gross fixed capital formation varied considerably across the states in 2003–04. While all states except the Northern Territory (-15.1%) grew, the Australian Capital Territory (26.0%) and Western Australia (22.0%) showed particularly strong growth, while in Queensland (1.6%) and Victoria (1.1%) the growth

ANALYSIS OF RESULTS *continued*

PUBLIC GROSS FIXED CAPITAL FORMATION *continued*

was more subdued. The major contributors to Australia's growth in public gross fixed capital formation of 5.4% were Western Australia (2.2 percentage points), NSW (1.5 percentage points) and the Australian Capital Territory (0.7 percentage points), partly offset by a fall in the Northern Territory (0.2 percentage points).

INDUSTRY COMPOSITION OF TOTAL FACTOR INCOME

Factor incomes grew in all states with Tasmania showing the strongest growth (8.7%), followed by Queensland (8.5%) and the Australian Capital Territory (7.9%). The other states showed growth rates of around 7 percent, except the Northern Territory (3.0%), which was affected heavily by declines in the mining industry (8.2%). Australian factor incomes grew by 7.3%.

Compensation of employees grew by 5.6% in Australia between 2002–03 and 2003–04. Queensland (7.8%) showed the strongest growth while South Australia showed the weakest growth (3.6%).

The pattern of growth in gross operating surplus and gross mixed income varied across the states. GOS growth varied from 13.0% in Tasmania to 0.4% in the Northern Territory while GMI varied from 20.6% in Western Australia to 1.7% in Tasmania.

The table below shows industry contributions to total factor income for 2003–04. In line with long term trends, there has been a shift from goods producers to service providers over the period 1989–90 to 2003–04.

INDUSTRY CONTRIBUTION TO TOTAL FACTOR INCOME (a)—2003–04

— nil or rounded to zero (including null cells)

(a) Industries may not add to total due to rounding differences.

(b) State details for general government gross operating surplus by industry are not available.

The main industries contributing to 2003–04 total factor income growth are the manufacturing and the services industries, namely property and business services, ownership of dwellings, finance and insurance, wholesale trade, and retail trade.

ANALYSIS OF RESULTS *continued*

INDUSTRY COMPOSITION OF TOTAL FACTOR INCOME *continued*

There are differing industry impacts in each state in total factor income. The Northern Territory and Western Australia are dominated by the mining industry, in Victoria, South Australia and Tasmania the manufacturing industry is significant, while the Australian Capital Territory has strong property and business services and government administration and defence industries.

GROSS HOUSEHOLD DISPOSABLE INCOME PER CAPITA

The previous analysis of GSP per capita concentrates on the level of economic production and its growth. It does not provide a measure of incomes received by residents of a particular state, because a proportion of income generated in the production process may be transferred to other states or overseas (and conversely income may be received from other states or overseas). A measure that takes these flows into account is gross household disposable income per capita which is shown below.

GROSS HOUSEHOLD DISPOSABLE INCOME PER HEAD OF MEAN POPULATION—2003–04

	\$
New South Wales	26 838
Victoria	27 238
Queensland	22 915
South Australia	23 852
Western Australia	25 958
Tasmania	21 963
Northern Territory	28 029
Australian Capital Territory	38 173
Australia	25 946

Gross household disposable income per capita in 2003-04 was highest in the Australian Capital Territory and lowest in Tasmania. Differences between the states reflect differences in the impact of a range of factors including the average level of compensation of employees received per employee, the proportion of the population in employment, the age distribution of the population, and differences in the level of dwelling rent (including that imputed to owner occupiers). For example, a significant reason for the high level of gross household disposable income per capita in the Australian Capital Territory compared with other states is that the labour force participation rate is much higher there than in the rest of Australia.

REVISIONS IN THIS ISSUE

The estimates contained in this issue are based on annual supply and use benchmarks for Australia as published in the 2003–04 issue of *Australian System of National Accounts* (cat. no. 5204.0). They incorporate new and revised estimates from the annual supply and use tables for 2000–01, 2001–02 and 2002–03, and from other sources which normally become available by this time each year. The revised annual supply and use tables contain revisions to the contributions of each industry. The most significant revisions are to Agricultural value added following a review of compilation methods and to expenditure on dwelling rent following the introduction of new benchmark data from the 2001 Population Census. All states are affected by these revisions. Although the supply and use table revisions have not had a significant impact on the aggregate GDP movements for Australia, because the structure of economic activity varies across states,

ANALYSIS OF RESULTS *continued*

REVISIONS IN THIS ISSUE *continued*

there are revisions to GSP for each state in response to the industry changes at the Australia level.

CHANGES IN NEXT ISSUE

The annual estimates for Australia presented in the 2004–05 issue of *Australian System of National Accounts* (cat. no. 5204.0) will reflect the impact of an important upgrade to the way the ABS compiles its economic statistics.

At the same time as incorporating these new data, the ABS plans to introduce changes to other series to reflect updated data or methodological improvements. These changes may impact on the full timespan. More detailed explanations about major changes to the Australian annual estimates will be described in a feature article in the March quarter 2005 issue of *Australian National Accounts: National Income, Expenditure and Product* (cat. no. 5206.0).

The effect of these changes on Australia level GDP growth are expected to be small but the industry shares are expected to change. Since the structure of economic activity varies across states, changes in Australia level industry shares of GDP may lead to an impact on growth rates for each state but the nature of this impact is unknown at this stage.

(a) Users are cautioned that these estimates are derived indirectly by calculating a deflator from the expenditure components of the state series concerned. Therefore, in general, the sum of the state estimates may not equal the estimates for Australia. It is emphasised that, at times, there may be movements that cannot be fully explained in the chain volume estimates of GSP through the use of the proxy deflator (see paragraphs 30 to 34 of the Explanatory Notes).

Reference year for chain volume measures is 2002-03.

(a) For a definition of real gross state income and real gross domestic income see the Glossary.

(b) Users are cautioned that these estimates are derived indirectly by calculating a deflator from the expenditure components of the state series concerned. Therefore, in general, the sum of the state estimates may not equal the estimates for Australia. It is emphasised that, at times, there may be movements that cannot be fully explained in the chain volume estimates of GSP through the use of the proxy deflator (see paragraphs 30 to 34 of the Explanatory Notes).

Reference year for chain volume measures is 2002-03.

(c) Real gross domestic income.

(a) Reference year for chain volume measures is 2002-03.

(b) Calculated as the residual of GSP less state final demand less international trade in exports of goods and services, plus international trade in imports of goods and services. The balancing item implicitly comprises changes in inventories, total net interstate trade and statistical discrepancy.

(a) Reference year for chain volume measures is 2002-03.

(b) Calculated as the residual of GSP less state final demand less international trade in exports of goods and services, plus international trade in imports of goods and services. The balancing item implicitly comprises changes in inventories, total net interstate trade and statistical discrepancy.

(a) Reference year for chain volume measures is 2002-03.

(b) Calculated as the residual of GSP less state final demand less international trade in exports of goods and services, plus international trade in imports of goods and services. The balancing item implicitly comprises changes in inventories, total net interstate trade and statistical discrepancy.

(a) Reference year for chain volume measures is 2002-03.

(b) Calculated as the residual of GSP less state final demand less international trade in exports of goods and services, plus international trade in imports of goods and services. The balancing item implicitly comprises changes in inventories, total net interstate trade and statistical discrepancy.

— nil or rounded to zero (including null cells)

(a) Reference year for chain volume measures is 2002-03.

(b) Calculated as the residual of GSP less state final demand less international trade in exports of goods and services, plus international trade in imports of goods and services. The balancing item implicitly comprises changes in inventories, total net interstate trade and statistical discrepancy.

(a) Reference year for chain volume measures is 2002-03.

(b) Calculated as the residual of GDP less domestic final demand less international trade in exports of goods and services, plus international trade in imports of goods and services. The balancing item implicitly comprises changes in inventories and statistical discrepancy (E).

EXPLANATORY NOTES

INTRODUCTION

1 This publication contains state and territory estimates of gross domestic product (referred to as gross state product (GSP)) and its components, in current price and chain volume terms, for the years 1995–96 to 2003–04. Where ‘state’, is referred to in the text, it also encompasses the two territories. The estimates in this publication are consistent with those published for Australia in the 2003–04 issue of *Australian System of National Accounts* (cat. no. 5204.0). For further details of the concepts, sources and methods used in compiling the estimates in this publication refer to *Australian System of National Accounts: Concepts, Sources and Methods* (cat. no. 5216.0). The latest edition was released in December 2000 and is accessible on the ABS web site <<http://www.abs.gov.au>> (starting at the home page select: Statistics – About Statistics – Concepts and classifications – ABS concepts, sources, methods and statistical frameworks – 5216.0).

2 State estimates are essentially a dissection of the Australian estimates contained in cat. no. 5204.0. While it is possible in some cases to build up estimates using the same data sources as those used for the Australian estimates, it is quite often necessary to derive dissections using a variety of allocators. These may be directly related to the aggregate being allocated (for example, economic survey data) or only indirectly related (for example, population and household income distributions).

3 Quarterly state estimates of state final demand (SFD) and its components are released quarterly in the publication *Australian National Accounts: National Income, Expenditure and Product* (cat. no. 5206.0). The data are available for chain volume measures and in current prices and are presented in trend, seasonally adjusted and original forms.

CONCEPTUAL BASIS

4 Australia’s national accounts statistics are based on the latest international standard for national accounting – the *System of National Accounts, 1993* (SNA93). SNA93 was produced by five international organisations involved in the use of economic statistics and the promotion of international statistical standards – United Nations, Organisation for Economic Co-operation and Development, International Monetary Fund, World Bank and Commission of the European Communities.

5 While national estimates are based on the concepts and conventions embodied in SNA93, no such detailed standard is available for sub-national (regional/state) accounts. In the main, the national concepts are applicable to state accounts, but there remain a number of conceptual and measurement issues that either do not apply or are insignificant at the national level. Most problems arise for the Transport and storage, Communication services, and Finance and insurance industries, and in the treatment of central government. In such cases, conventions need to be established which reflect data availability and/or the needs of users.

CONCEPTS, DEFINITIONS, SOURCES AND METHODS

6 Extensive revisions to *Australian System of National Accounts: Concepts, Sources and Methods* (cat. no. 5216.0) were required to reflect the implementation of SNA93 in the Australian national accounts and other changes to sources and methods which have occurred over recent years. 5216.0 outlines major concepts and definitions, describes sources of data and methods used to derive annual and quarterly estimates for major aggregates at current prices and in chain volume terms, and discusses the accuracy and reliability of the national accounts. In addition, it includes documentation on input-output tables, financial accounts, capital stock, productivity measures, balance sheets, and state accounts. For detailed information about the nature and extent of the conceptual changes introduced with the implementation of SNA93 reference should be made to the following information papers: *Implementation of Revised International Standards in the Australian National Accounts* (cat. no. 5251.0), *Introduction of Chain Volume Measures in the Australian National Accounts* (cat. no. 5248.0), and *Upgraded Australian National Accounts, 1998* (cat. no. 5253.0).

EXPLANATORY NOTES *continued*

ESTIMATES OF GSP AND ITS COMPONENTS

7 Estimates of GSP in current prices are produced by summing factor incomes, i.e. compensation of employees, gross operating surplus (GOS) and gross mixed income (GMI), plus taxes less subsidies on production and imports. While wages and salaries can be readily collected by state, this is not always the case for other components of compensation of employees or for GOS plus GMI, which often cannot be measured satisfactorily within business accounting systems at the individual location. Most of the ABS economic collections which provide data for the estimates in this publication have used the 'management unit' as their basic collection unit. A management unit is the largest unit within an enterprise group (a group of legal entities under common ownership and control) which controls its productive activities and for which accounts are kept. The operations of some management units cut across state borders, and conventions have to be adopted in order to allocate GOS plus GMI to states.

8 For the Transport and storage and Communication services industries, estimates of GOS plus GMI by state can be substantially affected by the conceptual basis adopted for allocation. For example, in the case of the modal transport industries (i.e. all transport industries except Services to transport), possible ways of attributing production could include tonne (or person) kilometres travelled in a state; economic activity attributed to the base of operations only; or a mixture of both. As state economic activity for interstate modal transport activities cannot be uniquely defined, it may even be preferable that they should be regarded as extra-territorial and excluded entirely from state production. However, the approach adopted in this publication is to use activity indicators to allocate interstate transport services to states.

9 Numerous data sources are used to apportion Australia level GOS plus GMI to states. Where available, economic survey data are used to apportion GOS for corporations. For those industries for which economic survey data are not available, a variety of allocators is used to extrapolate or estimate state dissections of GOS. Indicators include state details of wages and salaries, employment, household final consumption expenditure, movements in unincorporated enterprises' GMI, freight shipped from Australian ports, and airport passenger embarkations/disembarkations (the latter two indicators are specific to the transport industry). Taxation statistics are used to apportion GMI for non-agricultural unincorporated enterprises in some industries, and economic survey data are used for other industries. Production-based estimates of agricultural GOS plus GMI are derived using the same data sources and methodology as are used for the Australian estimates. Although the GOS of state and local government non-financial corporations is directly available from the ABS public finance system, GOS for Commonwealth government non-financial corporations is allocated mainly using indirect indicators.

10 While state by industry estimates of wages and salaries are obtained from the same data sources as those used for the Australian estimates, the estimates of the other components of compensation of employees are essentially allocations of the Australian total. State by industry estimates of employers' superannuation contributions are derived using wages and salaries by state by industry as an allocator. State by industry estimates of workers compensation premiums are based on labour costs data collected by the ABS. It should be noted that there is a minor difference between compensation of employees as published in the total factor income tables and as published in the household income accounts for both the Australian and state estimates. The difference arises in situations where a household supplies labour to a production establishment that is in a different domestic territory (state/county) from the household.

11 Estimates of taxes less subsidies on production and imports are derived by adding values for taxes received and subsidies paid by state and local governments and the Commonwealth government. Data are available from the ABS public finance system, although Commonwealth government values are not generally available by state.

EXPLANATORY NOTES *continued*

ESTIMATES OF GSP AND ITS COMPONENTS *continued*

Indicators are used to allocate the goods and services tax, excise tax, customs duties and major subsidies to the state where the economic activity took place.

STATE EXPENDITURE ESTIMATES

12 In addition to estimates of GSP and their income components, this publication contains state estimates for a number of expenditure components and international exports and imports of goods and services in both current prices and chain volume terms. The difference between the sum of these components and GSP is known as the balancing item. The balancing item reflects: changes in inventories; interstate trade in goods and services; and the expenditure statistical discrepancy.

Current price estimates

13 State estimates of household final consumption expenditure and private gross fixed capital formation are derived largely from the same sources used for the Australia-level estimates. In the case of household final consumption expenditure, data sources for major components such as household goods, dwelling rent, purchase of motor vehicles, fares, and purchases of gas, electricity and fuel are available by state. Some components of expenditure on recreation and culture rely on the extrapolation and interpolation of less frequent Household Expenditure Survey data. Where actual data are not available, indirect indicators such as household disposable income are used to allocate the Australia-level estimate.

14 State estimates of private gross fixed capital formation in dwellings and non-dwelling construction are derived using data from the ABS Building Activity Survey and the Engineering Construction Survey, while expenditure on equipment is derived from the Survey of Private New Fixed Capital Expenditure. Ownership transfer costs are derived from stamp duty data supplied by the various states, ABS surveys of real estate agents and lawyers, and various other data such as the number of real estate property transfers by state. Essentially, these are the same data sources used to prepare the Australia-level estimates.

15 State estimates of gross fixed capital formation in livestock are based on data from the ABS Agricultural Census, the Survey of Livestock Slaughtering and Australian Bureau of Agricultural and Resource Economics surveys. State estimates of exploration expenditure are derived from the ABS Survey of Actual and Expected Private Mineral Exploration. State estimates of capital expenditure on software and artistic originals are based on a variety of allocators, including some indirect ones.

16 Final expenditures of state and local governments can be readily allocated by state, and the same public finance source that is used to derive Australian estimates is also used to derive state estimates.

17 The treatment of national government final expenditures in regional accounting is rather problematic. National government includes the Commonwealth government and the universities, with the major allocation difficulties arising from the Commonwealth government component. Alternative treatments are to attribute final expenditures to the region in which the expenditure was incurred, or to the region in which the beneficiaries reside, or even to consider the Commonwealth government as a consumer unit is extra-territorial and therefore to exclude it from all regions. For practical reasons the first approach has been adopted in this publication, although it still requires extensive use of indirect indicators. An implication is that a large proportion of the consumption of Commonwealth government services is included in SFD for the Australian Capital Territory, increasing the balancing item for that territory. If data had been available to allocate Commonwealth final consumption expenditure to end users, the balancing item for the Australian Capital Territory would be a much smaller negative (or even a positive value) because the provision of much of the services produced would be regarded as an interstate export instead. Estimates for Commonwealth government expenditures in the states on both an annual and quarterly basis therefore have to be treated with considerable caution.

EXPLANATORY NOTES *continued*

Current price estimates continued

18 The non-defence component of Commonwealth government final consumption expenditure is apportioned to states using data on gross earnings from the ABS Survey of Employment and Earnings. Defence salaries and recurrent expenditure are allocated using defence employment by state, while defence weapons and their delivery platforms are allocated according to population.

19 For Commonwealth general government gross fixed capital formation, Australia-level estimates are first subdivided into expenditure on non-dwelling construction, and expenditure on machinery and equipment. The Australia-level non-dwelling construction component is generally allocated to the states based on Commonwealth government construction expenditures by state as an indicator. Expenditure on machinery and equipment is allocated using Commonwealth general government employment by state. State estimates of capital expenditure on intangible fixed assets are based on a variety of allocators, including some indirect indicators.

20 For Commonwealth public corporation gross fixed capital formation, a variety of allocators is applied at the individual corporation level. Direct allocation is possible in a few cases where corporations operate wholly in one state. For some corporations state-level direct indicators are available from either the ABS Engineering Construction Survey or from published accounts. For other corporations, indirect allocations are used—for example, purchases of ships are allocated using general freight activity through ports in each state.

21 State estimates of international exports and imports of goods are on a recorded trade basis. No timing adjustments have been made to convert the data to a balance of payments basis and therefore the data differ slightly from the export and import estimates contained in cat. no. 5204.0. Exports of goods data are on a state of origin basis, that is the state in which the final stage of manufacture or production occurs. For most exports this should correspond to the required basis for state allocation, that is, the state of final resident ownership. The estimates differ from those published in *International Trade in Goods and Services, Australia* (cat. no. 5368.0) because re-exports, which are not published on a state basis in cat. no. 5368.0, are allocated to the states by commodity and included in the state figures in this publication. Those commodities subject to a confidentiality restriction, which are not available by state in cat. no. 5368.0 are allocated to the states by commodity in proportion to each state's total exports and re-exports and included in the state export figures in this publication.

22 State estimates of international imports of goods are on the basis of the state in which the imports were released from Australian Customs Service control. In most cases this corresponds to the state of initial resident ownership, which is the required basis of state allocation. No information is available on which to base an adjustment for goods released from Customs' control in a state other than that in which their owner resides.

23 International trade in services data are consistent with balance of payments estimates of exports and imports of services. State allocation has been made primarily on the basis of a series of indicators for transportation, travel and communication services. For other services (about 25% of all trade in services) allocation is based on the location of the business reporting the information, which serves as a proxy for state of origin/consumption of that service.

Chain volume estimates

24 Chain volume estimates of government and household final consumption expenditure for Australia are derived by aggregating the volume estimates for the states using a bottom-up approach. The state volume estimates are derived using state-specific price indexes. Much use is made of components of the capital city consumer price indexes and state wage cost indexes.

EXPLANATORY NOTES *continued*

Chain volume estimates continued

25 Chain volume estimates of private gross fixed capital formation for Australia are derived by aggregating the volume estimates for the states using a bottom-up approach. State-specific price indexes are used to derive the volume estimates for capital formation in dwelling and non-dwelling construction. National price indexes are used to derive the volume estimates for capital formation in machinery and equipment and intangibles, although account is taken of the different industry compositions within each state – industry patterns of capital formation by asset type vary.

26 Quarterly chain volume estimates of public gross fixed capital formation for Australia are derived by aggregating the volume estimates for the states using a bottom-up approach. State-specific price indexes are used for gross fixed capital formation in non-dwelling construction, but national price indexes are used to derive the volume estimates for the remainder. Annual chain volume estimates of public gross fixed capital formation by state are derived by aggregating the quarterly estimates and then constraining these estimates to be consistent with the national estimates.

27 Detailed estimates of current price exports of goods on a recorded trade basis at the two-digit level of the *Standard International Trade Classification Revision 3* (SITC Rev 3) are revalued, generally using national rather than state-specific deflators, to produce volume estimates of these components. There is an assumption that the national deflators will usually provide a reasonable measure of change in price at the state level. Revaluation at the two-digit (division) level of SITC Rev 3 is a compromise giving a reasonable level of disaggregation by commodity type without increasing the magnitude of the revaluation exercise too significantly. In a very limited number of cases more specific deflators are used to replace the national deflator at the SITC Rev 3 division level. This occurs in those cases where the composition of a particular division is known to be variable between states and the division includes commodities with price movements which deviate significantly from the division average. Mineral and agricultural commodities are the most significant in this regard. The state estimates are benchmarked to the national estimates.

28 A similar approach is adopted for imports of goods, with national deflators being used. The level of revaluation corresponds broadly to the commodity subgroup level of the balance of payments merchandise imports end-use classification of imports, i.e. two-digit Broad Economic Classification by three-digit level of the SITC Rev 3. The state estimates are benchmarked to the national estimates.

29 Chain volume estimates of exports and imports of international trade in services have been calculated using the same methodology and deflators as applied at the Australian level. About 10 categories of imports and exports of services are identified and calculation of chain volumes is carried out at this level.

CHAIN VOLUME MEASURES OF GSP

30 The chain volume measures of GSP presented in this publication are derived by revaluing current price, income-based estimates of GSP, using deflators which are compiled using the available data on the composition of expenditures on state production and movements in associated prices. For a more complete description of why this approach has been adopted, and details of the data sources and the methods used, see Chapter 28, *Australian National Accounts: Concepts, Sources and Methods* (cat. no. 5216.0).

31 A lack of data means that it is not possible to derive estimates at the state level equivalent to the aggregate Australian expenditure-based estimates of gross domestic product. While the components of SFD and estimates of international merchandise trade and international trade in services by state are available, there are no complete data on interstate trade in goods and services; or changes in inventories. Hence, an expenditure-based GSP volume measure cannot be derived by a similar methodology to that adopted at the Australian level.

EXPLANATORY NOTES *continued*

CHAIN VOLUME MEASURES OF GSP *continued*

32 In order to make maximum use of the incomplete expenditure data and limited price data available at the state level, an approach is adopted which essentially involves deriving the best possible current price and chain volume estimates of expenditure that encompass as much as possible of GSP. For each state, current price estimates of identified components of international and interstate trade and changes in inventories are combined with the current price estimates of SFD and, similarly, the chain volume measures of those components are combined with the chain volume measures of SFD. The quotient derived by dividing the aggregate chain volume measure into the aggregate current price estimates is a Paasche (current-weighted) price index. It is this price index which is used to revalue the current price estimates of GSP.

33 It is crucial to identify separately those components for which the deflators deviate significantly from the average, since the method adopted effectively attributes the weighted average deflator to the unidentified components. There is an assumption underlying the approach adopted in deriving the aggregate state deflators that, because of price competition, the available national price indicators are reasonably indicative at the state level. This is a less distorting assumption if the price indicators are weighted together at a reasonable level of commodity disaggregation, and implies deriving the current price and chain volume estimates at as fine a level as possible.

34 Despite the fact that as broad a range of information as possible is used in this estimation procedure, the aggregate current price and chain volume estimates of expenditures used in the derivation of the state deflator are not considered to be complete measures. They merely serve to produce the best deflators and therefore the most reliable chain volume measures of GSP that the available data and resources allow. For this reason, they are regarded as experimental estimates.

REAL GROSS STATE INCOME

35 The chain volume measures of GSP measure the volume of goods and services produced in each state. If the terms of trade for a state change significantly (i.e. the prices for a state's exports and imports change at different rates) then chain volume GSP will not accurately reflect the change in real purchasing power of the income generated within a state. For this reason real gross state income (RGSI), has been developed which measures chain volume GSP adjusted for changes in the terms of trade. This measure was introduced in a feature article published in the March quarter 2002 issue of *Australian National Accounts: National Income, Expenditure and Product* (cat. no. 5206.0).

36 To obtain an estimate of RGSI, the following adjustment is made to the volume measure of GSP, prior to chaining:

- exports of goods and services at current prices are deflated by the implicit price deflator for imports of goods and services;
- the actual volume estimates of exports are then deducted from this value;
- the resultant terms of trade adjustment is then added to the volume measure of GSP, and
- the measures of RGSI in the prices of the previous year are then chained to give chain estimates of RGSI.

37 The estimates of exports and imports of goods and services used in these calculations include both international and interstate trade. The methods used to derive them are described in Chapter 28 of *Australian National Accounts: Concepts, Sources and Methods* (cat. no. 5216.0). The international trade data are considered to be of reasonable quality and are presented in this publication. The interstate trade data are derived using a model, and are considered to be of poor quality. Fortunately, the major contribution to changes in the terms of trade of a state comes from its internationally traded goods, principally Australia's exports of primary goods and its importation of manufactured goods (e.g. IT equipment). The contribution of interstate trade to changes

EXPLANATORY NOTES *continued*

REAL GROSS STATE INCOME

continued

in a State's terms of trade is relatively minor because the prices of goods and services exported and imported tend to change at a similar rate.

ACCURACY OF ESTIMATES

38 The estimates in this publication represent allocations of Australian estimates published in 5204.0. Therefore, they will reflect any inaccuracies in those estimates as well as inaccuracies introduced by any particular conceptual, methodological and data problems inherent in the allocation of Australian estimates to states. The degree of accuracy and reliability will necessarily be lower than that for the Australian estimates.

39 Uniform methodologies and consistent data sources have been used for all states. Although there is no reason to expect that there would be any bias in the methods used, there is some variation in both the quality of data between states (particularly where sample surveys are used) and the sensitivity of estimates to alternative concepts.

40 Detailed industry estimates for the two territories are likely to be less accurate than those for the states. For example, for the Communication services industry, data for the Australian Capital Territory are available only in combination with New South Wales; a similar problem exists for Communication services data relating to the Northern Territory, which are combined with data for South Australia. The use of indirect allocators to separate the territories has a far more significant effect on the relative errors for the Australian Capital Territory and for the Northern Territory than for New South Wales and South Australia. Where sample surveys are used to collect data, standard errors are often higher for the territories than for the states.

41 The limitations of ABS sample surveys in producing state estimates are particularly relevant for estimates of private gross fixed capital formation – machinery and equipment. Estimates for each state are derived largely from a quarterly national survey of business. The survey design aims to achieve a high degree of statistical accuracy in the samples in the larger states. However, as the accuracy of the estimates from this survey (in percentage terms) is roughly proportional to the size of the sample, the estimates for the smaller states are generally less accurate than those for the larger states. Hence, the estimates for the Northern Territory, Australian Capital Territory, Tasmania and South Australia are particularly prone to volatile movements.

42 Estimates of GOS plus GMI for the latest year rely on a range of broad activity indicators such as retail turnover, construction work done and persons employed. Therefore, they are subject to revision as more suitable sources, such as taxation statistics and ABS economic survey data, become available.

43 Estimates of taxes less subsidies on production and imports, government final consumption expenditure, and general government and public corporation gross fixed capital formation can be substantially affected by the indicators chosen to apportion the Commonwealth government component to states. Again, care is required when interpreting these estimates.

44 The incomplete nature of the price and expenditure data available at the state level for the derivation of the GSP deflators, and the generally lower level of accuracy of state data, referred to earlier, mean that there is greater scope for inaccuracy than in comparable estimates at the Australian level. The chain volume measures of GSP are derived measures, calculated by adjusting the current price estimates using specially constructed state deflators. This means that the chain volume measures incorporate the combined effects of the inaccuracies in the current price estimates and those in the deflators. These inaccuracies reflect a number of factors, including higher relative sampling errors; the 'fuzziness' of some state data arising from difficulties that businesses and government agencies operating across the country have in allocating their activities by state; and the limited availability of source data on a state basis in a number of areas. The inaccuracies in the component value and price estimates may be compounded or offset in the process of deriving the chain volume measures.

EXPLANATORY NOTES *continued*

ACCURACY OF ESTIMATES

continued

45 In analysing the chain volume measures it is important to recognise the data limitations at the state level and to be aware that the accuracy of the estimates will not be as high as that of the corresponding national estimates.

OTHER NATIONAL ACCOUNTS STATISTICAL PUBLICATIONS

46 This publication is part of a regular sequence of national accounts publications. The key national accounts publication is the quarterly *Australian National Accounts: National Income, Expenditure and Product* (cat. no. 5206.0) released approximately two months after the end of the reference period. The first estimates of national accounts for a particular financial year are released in the June quarter issue of 5206.0, generally in early September. This quarterly publication also contains state estimates for the aggregate State Final Demand and its components.

47 In early November each year the annual publication *Australian System of National Accounts* (cat. no. 5204.0) is released. It contains the annual benchmark income and expenditure data on which the data in this publication are based. In addition it contains detailed income, capital and financial accounts and balance sheets for all institutional sectors, estimates of productivity and capital stock and a range of industry data. Overall it provides a detailed picture of the structure of the Australian economy.

48 Input-output tables for 1998–99, consistent with the 1998–99 estimates for income, expenditure and production shown in the 2003–04 issue of this publication, are available in *Australian National Accounts: Input Output Tables 1998–99* (cat. no. 5209.0.55.001). Related to this release is the detailed commodity information contained in *Australian National Accounts: Input-Output Tables (Product Details)* (cat. no. 5215.0.55.001)

49 In recent years a significant amount of progress has been made in developing estimates of the contribution of tourism to the Australian economy in the form of a tourism satellite account. The latest estimates up to 2002–03 were released in *Australian National Accounts: Tourism Satellite Account* (cat. no. 5249.0).

FEATURE ARTICLES AND TECHNICAL NOTES

50 Feature articles and technical notes are written on a regular basis to inform users of emerging issues and methodological changes and their impact on the national accounts. Most commonly feature articles and technical notes are released in the quarterly publication 5206.0 but other publication vehicles are also used. A full list of feature articles published since December 1988 is included in Appendix 2.

INFORMATION PAPERS

51 Information papers are published by the ABS to provide information on topical issues and developments. The following information papers relating to national accounting issues are available at all ABS offices:

Development of Multifactor Productivity Estimates of Australia 1974–75 to 1987–88
(cat. no. 5229.0)

Improvements to ABS Economic Statistics, 1997 (cat. no. 1357.0)

Introduction of Revised International Statistical Standards in ABS

Macro-economic Statistics (cat. no. 5245.0)

Implementation of Revised International Standards in the Australian National Accounts (cat. no. 5251.0)

Introduction of Chain Volume Measures in the Australian National Accounts
(cat. no. 5248.0)

Upgraded Australian National Accounts (cat. no. 5253.0)

Upgraded Australian National Accounts: Financial Accounts (cat. no. 5254.0)

ABS Statistics and the New Tax System (cat. no. 1358.0)

Improvements in ABS Economic Statistics (Arising from the the New Tax System)
(cat. no. 1372.0)

EXPLANATORY NOTES *continued*

OCCASIONAL PAPERS

52 Occasional papers produced by the officers of the ABS report on various aspects of research being undertaken on national accounts. They are not used for the release of official statistics and do not necessarily reflect the views of the ABS. The following occasional papers are available at all ABS offices:

Current-Cost and Constant-Cost Depreciation and Net Capital Stock—C. Bailey (1981/1)

The Accuracy and Reliability of the Quarterly National Accounts—A. Johnson (1982/2)

State Accounts, Australia: Issues and Experimental Estimates—S. Burrell, J. Daniel, A. Johnson and R. Walters (1984/4)

The Effects of Rebasings the Constant Price Estimates of the Australian National Accounts—R. Dippelsman (1985/1)

Estimates of Depreciation and Capital Stock, Australia—R. Walters, and R. Dippelsman (1985/3)

Estimates of Multifactor Productivity, Australia—C. Aspden (cat. no. 5233.0)

Productivity, Prices, Profits and Pay, 1964–65 to 1989–90—I. Castles (cat. no. 5239.0)

Balanced Australian National Accounts—C. Kim, G Salou, P Rossiter (Working Papers in Economics and Applied Statistics, 94/2 (cat. no. 1351.0)

Measuring Unpaid Household Work—Issues and Experimental Estimates (cat. no. 5236.0)

Unpaid Work and the Australian Economy, 1997 (cat. no. 5240.0)

National Balance Sheets for Australia: Issues and Experimental Estimates, 1989–1992 (cat. no. 5241.0)

53 Current publications and other products released by the ABS are listed in the *Catalogue of Publications and Products* (cat. no. 1101.0). The Catalogue is available from any ABS office or the ABS web site <<http://www.abs.gov.au>>. The ABS also issues a daily *Release Advice* on the web site which details products to be released in the week ahead.

APPENDIX 2 FEATURE ARTICLES

INTRODUCTION

This Appendix presents a list of national accounts related feature articles and technical notes published since the December quarter 1988 release of *Australian National Accounts: National Income, Expenditure and Product* (cat. no. 5206.0). The list covers articles published in 5206.0 as well as national accounts related articles published in other releases including *Australian Economic Indicators* (cat. no. 1350.0), *Australian System of National Accounts* (cat. no. 5204.0) and *Year Book Australia* (cat. no. 1301.0). Feature article and notes written since March 1998 can be access through the ABS web site <<http://www.abs.gov.au>> by accessing the relevant publication. Otherwise, the articles can be accessed by purchasing the relevant publication or by contacting the officers named on the front of this publication.

AUSTRALIAN NATIONAL ACCOUNTS, National Income, Expenditure and Product—(cat. no. 5206.0)

Title

Dec 88	Measuring the nation's capital stock (Stephen Moore & Nicolas Brown)
Mar 89	Imports of computer equipment (Paul McCarthy)
Jun 89	Gross domestic product, employment and productivity 1982—83 to 1985—86 (Neil Batty)
Dec 89	The flow of funds: Measuring the financial transactions of the Australian economy
Mar 90	Natural resource and environmental accounting in the national accounts
Jun 90	Which is the best short-term measure of gross domestic product? A Statistical analysis of short term movements of the three measures of gross domestic product and their average. (Charles Aspden)
Dec 90	Gross domestic product (GDP) adjusted for terms of trade effect
Sep 93	Real gross domestic income
Dec 94	New industry classification (ANZSIC)
Sep 96	Factors influencing short-term growth of production and labour productivity Impact of the 1995–96 farm season on Australian production. (Charles Aspden)
Jun 97	Finance and insurance—New constant price methods
Jun 99	Expenditure on the year 2000 problem Sydney hailstorm
Sep 99	The Sydney Olympic games Measures of saving in the national accounts
Mar 00	The new tax system and the Australian national accounts
Mar 01	New chain volume estimates for the services sector Treatment of 3G spectrum licences Real/volume balance sheet for Australia
Sep 01	Further developments in the analysis of productivity growth in Australia
Dec 01	Forthcoming changes in the estimation of compensation of employees Real net national disposable income—A new national accounts measure
Mar 02	A New strategy for annual benchmarking of the Australian national accounts Real gross state domestic income
Jun 02	Accounting for the environment in the national accounts
Sep 02	Impact of the drought on Australian production in 2002–03
Dec 02	An Information and communication technology satellite account
Mar 03	A Quality assessment of the national accounts information system
Jun 03	Statistical treatment of the 2003 Rugby World Cup
Sep 03	Statistical treatment of economic activity in the Timor Sea
Mar 04	Supply and use tables and the quarterly national accounts Measuring price change in the Australian economy

APPENDIX 2 FEATURE ARTICLES *continued*

AUSTRALIAN ECONOMIC INDICATORS, (cat. no. 1350.0)

Title

Nov 91	Measuring inflation (Tony Johnson)
Apr 92	International comparisons of gross domestic product at purchasing power parity
Jul 92	Introduction to financial accounts
Aug 92	The Business cycle in Australia: 1959 to 1992 (Gerard Salou and Cynthia Kim)
Sep 92	State accounts: Trends in state and territory economic activity (Tony Johnson)
Mar 93	Change in base year of constant price national accounts from 1984–85 to 1989–90
Apr 93	Input-output tables: Describing the shape of Australia's economy (Dr Annette Barbetti)
Sep 93	The Timeliness of quarterly income and expenditure accounts: An International comparison (Philip Smith, StatsCan)
May 94	'Real' estimates in the national accounts
Dec 94	Unpaid work and the Australian economy
Aug 95	Valuing Australia's natural resources—Part 1
Oct 95	Valuing Australia's natural resources—Part 2
Dec 95	A Comparison of the World Bank and ABS wealth estimates
Jan 98	An Introduction to tourism satellite accounts (Carl Obst)
July 98	Revisions to quarterly economic growth rates 1984 to 1993 Improving the quality of the national accounts
Oct 98	Improvements to trend estimation for national accounts aggregates
Aug 99	Upgrade of capital stock and multifactor productivity estimates
Oct 99	Impact of Y2K and the Sydney hailstorm on the national accounts
Aug 00	The Sydney Olympic games
Sep 00	Australian tourism satellite account
Aug 01	New chain volume estimates for the service sector Real / volume balance sheets for Australia
Dec 01	Saving, borrowing, investment and wealth
Jan 02	Further developments in the analysis of productivity growth in Australia
Mar 02	Purchasing power parities and real expenditures—1999 benchmark results for OECD countries
Apr 02	Technical Note: Introducing real net national disposable income—A new national accounts measure
Jul 02	Real gross state domestic income
Oct 02	Accounting for the environment in the national accounts
Jan 03	Impact of the drought on Australian production in 2002–03
Apr 03	An Information and communication technology satellite account
Jul 03	A Quality assessment of the national accounts information system
Oct 03	Impact of the 2003–04 farm season on Australian production The Underground economy and Australia's GDP Statistical treatment of the 2003 Rugby World Cup
Jan 04	Statistical treatment of economic activity in the Timor Sea
Jul 04	Supply and use tables and the quarterly national accounts Measuring price change in the Australian economy

2004 Impact of the farm season on Australian production in 2002–03 and 2003–04

GLOSSARY

Agricultural factor income	The total factor income arising from production in agriculture and services to agriculture. It is equal to the estimated gross value of production (after the inventory valuation adjustment) less estimated production costs other than compensation of employees and consumption of fixed capital for all enterprises engaged in agriculture and services to agriculture. It includes agricultural output produced by the household sector for its own consumption.
Agricultural income	The income accruing from agricultural production during the year. It is equal to gross agricultural product at factor cost less consumption of fixed capital, compensation of employees, and net rent and interest payments.
Agricultural production costs	Include all costs (other than compensation of employees and consumption of fixed capital) incurred in current production but exclude net rent and interest payable which are treated as appropriations out of operating surplus. In general, marketing costs are as shown in the statistical publication <i>Value of Agriculture, Australia</i> (cat. no. 7113.0) and represent the difference between the value at the farm (or other place of production) and wholesale markets. Other costs include taxes on production and imports, fertilisers, fuel, costs associated with inter-farm transfers of livestock and fodder, maintenance and other miscellaneous items.
Balancing Item	Calculated as the residual of GSP less <i>state final demand</i> less <i>international trade in exports of goods and services</i> , plus <i>international trade in imports of goods and services</i> . The balancing item implicitly comprises changes in inventories, total net interstate trade and a statistical discrepancy (E).
Chain volume measure	Chain volume measures are calculated by deflating income-based GSP using deflators compiled using expenditure data on state production. The measures are then linked together by compounding movements in volumes. Generally, chain volume measures are not additive. In other words, component chain volume measures do not sum to a total in the way original current price components do. In order to minimize the impact of this property, the ABS uses the latest base year as the reference year. By adopting this approach, additivity exists for the period following the reference year and non-additivity is relatively small for the years immediately preceding. A change in reference year changes levels but not growth rates, although some revision to recent growth rates can be expected because of the introduction of a more recent base year (and revisions to the current price estimates underlying the chain volume measures).
Compensation of employees	The total remuneration, in cash or in kind, payable by an enterprise to an employee in return for work done by the employee during the accounting period. It is further classified into two sub-components: wages and salaries; and employers' social contributions. Compensation of employees is not payable in respect of unpaid work undertaken voluntarily, including the work done by members of a household within an unincorporated enterprise owned by the same household. Compensation of employees excludes any taxes payable by the employer on the wage and salary bill (e.g. payroll tax, fringe benefits tax). See also <i>Employers' social contributions</i> ; <i>Wages and salaries</i> .
Consumption of fixed capital	The reduction in the value of fixed assets used in production during the accounting period resulting from physical deterioration, normal obsolescence or normal accidental damage. Unforeseen obsolescence, major catastrophes and the depletion of natural resources are not taken into account.
Current prices	Estimates are valued at the prices of the period to which the observation relates. For example, estimates for 2003–04 are valued using 2003–04 prices. This contrasts to chain volume measures where the prices used in valuation refer to the prices of a previous period.
Current transfers	Transactions, other than those classified as capital transfers, in which one institutional unit provides a good, service or cash to another unit without receiving from the latter anything of economic value in return.

GLOSSARY *continued*

Current transfers to non-profit institutions	Transfers for non-capital purposes to private non-profit institutions serving households such as hospitals, independent schools, and religious and charitable organisations.
Current taxes on income, wealth, etc.	Include taxes on the incomes of households or the profits of corporations and taxes on wealth that are payable regularly every tax assessment period (as distinct from capital taxes that are levied infrequently).
Employers' social contributions	Payments by employers which are intended to secure for their employees the entitlement to social benefits should certain events occur, or certain circumstances exist, that may adversely affect their employees' income or welfare – namely work-related accidents and retirement.
Exports of goods and services	The value of goods exported and amounts receivable from non-residents for the provision of services by residents.
Final consumption expenditure – general government	Net expenditure on goods and services by public authorities, other than those classified as public corporations, which does not result in the creation of fixed assets or inventories or in the acquisition of land and existing buildings or second-hand assets. It comprises expenditure on compensation of employees (other than those charged to capital works, etc.), goods and services (other than fixed assets and inventories) and consumption of fixed capital. Expenditure on repair and maintenance of roads is included. Fees, etc., charged by general government bodies for goods sold and services rendered are offset against purchases. Net expenditure overseas by general government bodies and purchases from public corporations are included. Expenditure on defence assets that are used in a fashion similar to civilian assets is classified as gross fixed capital formation; expenditure on weapons of destruction and weapon delivery systems is classified as final consumption expenditure.
Final consumption expenditure – households	Net expenditure on goods and services by persons and expenditure of a current nature by private non-profit institutions serving households. This item excludes expenditures by unincorporated businesses and expenditures on assets by non-profit institutions (included in gross fixed capital formation). Also excluded is expenditure on maintenance of dwellings (treated as intermediate expenses of private enterprises), but personal expenditure on motor vehicles and other durable goods and the imputed rent of owner-occupied dwellings are included. The value of 'backyard' production (including food produced and consumed on farms) is included in household final consumption expenditure and the payment of wages and salaries in kind (e.g. food and lodging supplied free to employees) is counted in both household income and household final consumption expenditure.
Gross disposable income – households	Gross household income less income tax payable, other current taxes in income, wealth etc., consumer debt interest, interest payable by unincorporated enterprises, net non-life insurance premiums and other current transfers payable by households.
Gross domestic product (GDP)	The total market value of goods and services produced in Australia within a given period after deducting the cost of goods and services used up in the process of production but before deducting allowances for the consumption of fixed capital. Thus gross domestic product, as defined here, is 'at market prices'. It is equivalent to gross national expenditure plus exports of goods and services less imports of goods and services.
Gross fixed capital formation – general government	Expenditure on new fixed assets plus net expenditure on second-hand fixed assets whether for additions or replacements (other than weapons of destruction and weapon delivery systems). Expenditure on new roadworks (or upgrading existing roads) is included but expenditure on road repair and maintenance is classified as government final consumption expenditure.
Gross fixed capital formation – private	Expenditure on fixed assets broken down into dwellings, other buildings and structures, machinery and equipment, livestock, intangible fixed assets and ownership transfer costs. The machinery and equipment category includes plant, machinery, equipment, vehicles, etc. Expenditure on repair and maintenance of fixed assets is excluded, being

GLOSSARY *continued*

Gross fixed capital formation – private <i>continued</i>	chargeable to the production account. Additions to fixed assets are regarded as capital formation. Also included is compensation of employees and other costs paid by private enterprise in connection with own-account capital formation. Expenditure on dwellings, other buildings and structures, and machinery and equipment is measured as expenditure on new and second-hand assets, less sales of existing assets. Ownership transfer costs comprise stamp duty, real estate agents' fees and sales commissions, conveyancing fees and miscellaneous government charges.
Gross fixed capital formation – public corporations	Expenditure on new fixed assets plus net expenditure on second-hand fixed assets and including both additions and replacements. Also included is compensation of employees paid by public corporations in connection with capital works undertaken on own account.
Gross income – households	The total income, whether in cash or kind, receivable by persons normally resident in Australia. It includes both income in return for productive activity (such as compensation of employees, the gross mixed income of unincorporated enterprises, gross operating surplus on dwellings owned by persons, and property income receivable, etc.) and transfers receivable (such as social assistance benefits and non-life insurance claims).
Gross mixed income of unincorporated enterprises	The surplus or deficit accruing from production by unincorporated enterprises. It includes elements of both compensation of employees (returns on labour inputs) and operating surplus (returns on capital inputs).
Gross operating surplus	The operating surplus accruing to all enterprises, except unincorporated enterprises, from their operations in Australia. It is the excess of gross output over the sum of intermediate consumption, compensation of employees, and taxes less subsidies on production and imports. It is calculated before deduction of consumption of fixed capital, dividends, interest, royalties and land rent, and direct taxes payable, but after deducting the inventory valuation adjustment. Gross operating surplus is also calculated for general government, and it equals general government's consumption of fixed capital.
Gross state product (GSP)	GSP is defined equivalently to gross domestic product (GDP) but refers to production within a state or territory rather than to the nation as a whole. Details regarding its calculation are contained in the Explanatory Notes in this publication. See <i>gross domestic product</i> .
Implicit price deflator	Obtained by dividing a current price value by its real counterpart (the chain volume measure). When calculated from the major national accounting aggregates, such as gross domestic product, implicit price deflators relate to a broader range of goods and services in the economy than that represented by any of the individual price indexes that are published by the ABS. Whereas the chain price indexes are chain Laspeyres indexes, the annual implicit price deflators are chain Paasche price indexes, i.e. each year-to-year movement is calculated using the current price value shares of the second of the two years to weight together the elemental price indexes.
Imports of goods and services	The value of goods imported and amounts payable to non-residents for the provision of services to residents.
Intangible fixed assets	Includes such assets as computer software, entertainment, literary or artistic originals, and mineral exploration intended to be used for more than a year.
Livestock	Livestock assets are classified as either fixed assets or inventories. Those livestock which are used in production of other products (e.g. breeding stock, animals for entertainment, sheep for wool and dairy cattle) are fixed assets. Inventories cover all other livestock types and includes those animals raised for meat or other one-off products (e.g. leather).
Machinery and equipment	Consists of transport equipment, computing equipment and other machinery and equipment other than that acquired by households for final consumption.
Market output	Output that is sold at prices that are economically significant or otherwise disposed of on the market, or intended for sale or disposal on the market.

GLOSSARY *continued*

Net saving plus consumption of fixed capital – households	Is equal to gross household disposable income less household final consumption expenditure and can also be referred to as the gross saving of households. Household saving is estimated as the balancing item in the households income account. It includes saving through life insurance and superannuation funds (including net earnings on these funds), increased equity in unfunded superannuation schemes and the increase in farm assets with marketing boards. Household net saving, i.e. gross saving less consumption of fixed capital, cannot be calculated at a state level as consumption of fixed capital is only calculated at the Australia level.
Other subsidies on production	Consist of all subsidies, except subsidies on products, which resident enterprises may receive as a consequence of engaging in production. Other subsidies on production include: subsidies related to the payroll or workforce numbers, including subsidies payable on the total wage or salary bill, on numbers employed, or on the employment of particular types of persons, e.g. persons with disabilities or persons who have been unemployed for a long period. The subsidies may also be intended to cover some or all of the costs of training schemes organised or financed by enterprises. Subsidies aimed at reducing pollution are also included. See also Subsidies on products.
Other taxes on production	Consist of all taxes that enterprises incur as a result of engaging in production, except taxes on products. Other taxes on production include: taxes related to the payroll or workforce numbers excluding compulsory social security contributions paid by employers and any taxes paid by the employees themselves out of their wages or salaries; recurrent taxes on land, buildings or other structures; some business and professional licences where no service is provided by the Government in return; taxes on the use of fixed assets or other activities; stamp duties; taxes on pollution; and taxes on international transactions. See also <i>Current taxes on income, wealth, etc.</i> , <i>Taxes on production</i> and imports and <i>Taxes on products</i> .
Output	Consists of those goods and services that are produced within an establishment that become available for use outside that establishment, plus any goods and services produced for own final use.
Primary incomes	Consist of incomes that accrue to institutional units as a consequence of their involvement in processes of production or their ownership of assets that may be needed for the purposes of production.
Property income	Is the income receivable by the owner of a financial asset or a tangible non-produced asset in return for providing funds, or putting a tangible non-produced asset at the disposal of another institutional unit.
Purchasers' price	The amount paid by the purchaser, excluding any deductible tax, in order to take delivery of a unit of a good or service at the time and place required by the purchaser. The purchaser's price of a good includes any transport charges paid separately by the purchaser to take delivery at the required time and place.
Real gross domestic income	A measure of the real purchasing power of income generated by domestic production. It is calculated by adjusting the chain volume measure of GDP for changes in the terms of trade.
Real gross state income	A measure of the real purchasing power of income generated by production within a state or territory. It is calculated by adjusting the chain volume measure of GSP for changes in the terms of trade.
Secondary income	Consists of receipt and payment of current transfers.
Social assistance benefits in cash to residents	Includes current transfers to persons from general government in return for which no services are rendered or goods supplied. Principal components include: scholarships; maternity, sickness and unemployment benefits; child endowment and family allowances; and widows', age, invalid and repatriation pensions.

GLOSSARY *continued*

State final demand	The aggregate obtained by summing government final consumption expenditure, household final consumption expenditure, private gross fixed capital formation and the gross fixed capital formation of public corporations and general government. It is conceptually equivalent to the Australia level aggregate domestic final demand.
Statistical discrepancy (E)	<p>Calculated as the differences between aggregate incomes and expenditures for each measure of GDP. For years in which a balanced supply and use table is available to benchmark the national accounts, the same measure of GDP is obtained.</p> <p>At the state level the national statistical discrepancy (I) is allocated across the states and territories to ensure consistency between the sum of the states and Australia. In addition, the balancing item for each state implicitly contains the statistical discrepancy (E) for that state – calculated as GSP using the income approach less GSP using the expenditure approach.</p>
Subsidies on products	Subsidies payable per unit of a good or service. The subsidy may be a specific amount of money per unit of quantity of a good or service, or it may be calculated ad valorem as a specified percentage of the price per unit. A subsidy may also be calculated as the difference between a specified target price and the market price actually paid by a purchaser. A subsidy on a product usually becomes payable when the product is produced, sold or imported, but it may also become payable in other circumstances, such as when a product is exported, leased, transferred, delivered or used for own consumption or own capital formation.
Taxes less subsidies on production and imports	Defined as 'taxes on products' plus 'other taxes on production' less 'subsidies on products' less 'other subsidies on production'.
Taxes on production and imports	Consist of 'taxes on products' and 'other taxes on production'. These taxes do not include any taxes on the profits or other income received by an enterprise. They are payable irrespective of the profitability of the production process. They may be payable on the land, fixed assets or labour employed in the production process, or on certain activities or transactions. See also <i>Current taxes on income and wealth</i> , <i>Other taxes on production</i> and <i>Taxes on products</i> .
Taxes on products	Taxes payable per unit of some good or service. The tax may be a specific amount of money per unit of quantity of a good or service (quantity being measured either in terms of discrete units or continuous physical variables such as volume, weight, strength, distance, time, etc.), or it may be calculated ad valorem as a specified percentage of the price per unit or value of the goods or services transacted. A tax on a product usually becomes payable when the product is produced, sold or imported, but it may also become payable in other circumstances, such as when a good is exported, leased, transferred, delivered, or used for own consumption or own capital formation.
Terms of trade	Calculated by dividing the export implicit price deflator by the import implicit price deflator and multiplying by 100.
Total factor income	That part of the cost of producing the gross domestic product which consists of gross payments to factors of production (labour and capital). It represents the value added by these factors in the process of production and is equivalent to gross domestic product less taxes plus subsidies on production and imports.
Wages and salaries	Consist of amounts payable in cash including the value of any social contributions, income taxes, etc., payable by the employee even if they are actually withheld by the employer for administrative convenience or other reasons and paid directly to social insurance schemes, tax authorities, etc., on behalf of the employee. Wages and salaries may be paid as remuneration in kind instead of, or in addition to, remuneration in cash. Separation, termination and redundancy payments are also included in wages and salaries. Wages and salaries are also measured as far as possible on an accrual rather than a strict cash basis. See also <i>Employers' social contributions</i> ; <i>Compensation of employees</i> .

FOR MORE INFORMATION . . .

- INTERNET* **www.abs.gov.au** the ABS web site is the best place to start for access to summary data from our latest publications, information about the ABS, advice about upcoming releases, our catalogue, and Australia Now—a statistical profile.
- LIBRARY* A range of ABS publications is available from public and tertiary libraries Australia-wide. Contact your nearest library to determine whether it has the ABS statistics you require, or visit our web site for a list of libraries.
- CPI INFOLINE* For current and historical Consumer Price Index data, call 1902 981 074 (call cost 77c per minute).
- DIAL-A-STATISTIC* For the latest figures for National Accounts, Balance of Payments, Labour Force, Average Weekly Earnings, Estimated Resident Population and the Consumer Price Index call 1900 986 400 (call cost 77c per minute).

INFORMATION SERVICE

Data already published that can be provided within five minutes will be free of charge. Our information consultants can also help you to access the full range of ABS information—ABS user pays services can be tailored to your needs, time frame and budget. Publications may be purchased. Specialists are on hand to help you with analytical or methodological advice.
