## SUMMARY OF RESULTS:Short-term Outlook

## OPERATING INCOME

TIME SERIES

MAIN INDUSTRY COMPARISON

In original terms, Operating income is expected to decrease by $3.0 \%$. Businesses of all sizes are expecting decreases. The expected decrease by large businesses (3.6\%) is the largest expected decrease since the commencement of the series in the December quarter 1993. Small businesses are expecting their seventh consecutive decrease (2.7\%).

Businesses in all industries are expecting Operating income to decrease in the March quarter 2002. Businesses in the Retail industry are expecting the largest decrease (5.3\%), while businesses in the Electricity, gas \& water industry are expecting the smallest decrease (0.3\%).

## S U M M ARY OF RESULTS:Short-term Outlook continued

## SELLING PRICES

TIME SERIES

MAIN INDUSTRY COMPARISON

In original terms, Selling prices are expected to decrease by $0.2 \%$ in the March quarter 2002. Although still a decrease, the March quarter expectations are an improvement on the record decrease expected for the December quarter 2001 ( $0.4 \%$ ). Both small and large businesses are expecting Selling prices to decrease by $0.3 \%$, while medium sized businesses are expecting an increase in Selling prices (0.3\%).

Businesses in the Retail industry are expecting the highest increase in Selling prices (1.1\%). This is the highest expectation since the commencement of the series in the December quarter 1993. Businesses in the Electricity, gas \& water industry are expecting their first increase in Selling prices since the September quarter 2000 (0.3\%). Businesses in the Property \& business services industry are expecting the largest decrease in selling prices (2.6\%).

## S U M M A P O F RESULTS:Short-term Outlook continued

## PROFITS

time Series

MAIN INDUSTRY COMPARISON

In original terms, businesses are expecting Profit to decrease by $26.3 \%$ in the March quarter 2002. This reflects seasonal influences. All business sizes are expecting Profit to decrease. Small businesses are expecting a $22.7 \%$ decrease, medium businesses a $40.0 \%$ decrease and large businesses a $25.5 \%$ decrease.

Businesses in the Electricity, gas and water industries are the only ones expecting Profit to increase in the March quarter 2002 (1.3\%). Businesses in the Retail industry are expecting the largest decrease ( $64.4 \%$ ), while businesses in the Manufacturing industry are expecting the largest decrease in Profit (57.2\%) for that industry since the commencement of the series in the December quarter 1993.

## S U M M ARY OF RESULTS:Short-term Outlook continued

## EMPLOYMENT

TIME SERIES
In original terms, expectations of full time equivalent Employment continue to decline. However, the March quarter 2002 expected decrease ( $0.8 \%$ ) is a continued improvement on the expected decreases in the previous two quarters ( $1.5 \%$ and $1.2 \%$ ). All business sizes are expecting full time equivalent Employment to decrease. Small businesses are expecting a $1.2 \%$ decrease, medium businesses a $1.0 \%$ decrease and large businesses a $0.4 \%$ decrease.

Businesses in all industries are expecting full time equivalent Employment to decrease in the March quarter 2002. Of all businesses, those in the Accommodation, cafes and restaurants industry are expecting the smallest decrease ( $0.1 \%$ ). Businesses in the Transport, storage and communication industries are expecting the largest decrease $(1.7 \%)$ and this is the sixteenth consecutive quarter that businesses in this industry have expected a decrease.

## S UMMARY OF RESULTS: Medium-term Outlook

## OPERATING INCOME

## TIME SERIES

MAIN INDUSTRY COMPARISON

In original terms, businesses expect Operating income to increase by $1.5 \%$ in the December quarter 2002. All business sizes are expecting Operating income to increase. Small businesses are expecting a $0.9 \%$ increase, medium businesses a $1.0 \%$ increase and large businesses a $2.9 \%$ increase.

Businesses in most industries are expecting increases in Operating income in the medium term. Businesses in the Mining and Wholesale industries are expecting the largest increases ( $4.6 \%$ and $2.9 \%$ respectively). Businesses in the Construction industry are expecting Operating income to decrease by $0.8 \%$. This reverses the increase reported in the previous quarter. The previous quarter increase followed five consecutive quarters of expected decreases in Operating income for this industry.

## S U M M ARY OF RESULTS: Medium-term Outlook continued

## SELLING PRICES

TIME SERIES

MAIN INDUSTRY COMPARISON

In original terms, businesses expect Selling prices to increase by $0.9 \%$ in the December quarter 2002. All business sizes are expecting Selling prices to increase. Small businesses are expecting a $0.9 \%$ increase, medium businesses a $1.2 \%$ increase and large businesses a $0.6 \%$ increase.

Businesses in the Finance and insurance industry are expecting the largest increase in Selling prices in the December quarter 2002 (2.3\%). This is the highest December quarter increase for this industry since the December quarter 1995. Transport, storage and communication businesses are expecting the biggest decrease in Selling prices for this industry since the commencement of the series in the September quarter 1994 (1.9\%).

## S U M M ARY OF RESULTS: Medium-term Outlook continued

## PROFITS

time Series

MAIN INDUSTRY COMPARISON

In original terms businesses expect Profit to increase by $8.1 \%$ in the December quarter 2002. Small businesses are expecting Profit to increase by $2.4 \%$ after four consecutive quarters of expected Profit decreases. Large businesses are continuing to expect strong Profit increases (27.3\%), while medium businesses are expecting their first decrease in Profit (3.2\%) since the December quarter 1994.

Of all businesses, businesses in the Wholesale industry are expecting the largest increase in Profit in the medium term (31.3\%). This is followed by businesses in the Manufacturing industry (20.0\%). Businesses in the Accommodation, cafes \& restaurant industry are expecting the biggest decrease in Profit (14.8\%). This is the highest expectation for the Manufacturing industry and the lowest expectation for the Accommodation, cafes \& restaurant industry since the commencement of the series in the September quarter 1994.

## S U M M ARY OF RESULTS: Medium-term Outlook continued

## EMPLOYMENT

TIME SERIES

MAIN INDUSTRY COMPARISON

Businesses are expecting full time equivalent Employment to decrease by $0.1 \%$ in the December quarter 2002. Although still in decline, the December quarter expectations are continuing the improvement shown in the previous quarter. Small businesses are expecting their fifth decrease in full time equivalent Employment ( $0.4 \%$ ). Medium businesses are expecting no change, while large businesses are expecting full time equivalent Employment to increase by $0.2 \%$.

Businesses in the Construction industry are showing their second consecutive expected full time equivalent Employment increase (1.2\%). Of all businesses, businesses in the Electricity, gas \& water industry are expecting the biggest decrease in full time equivalent Employment (2.6\%). Businesses in the Manufacturing industry are expecting their fifth consecutive decrease ( $0.9 \%$ ).

## EXPLANATORYNOTES

1 This publication contains estimates of future economic activity based on the business expectations of senior executives, managers and proprietors of businesses operating in Australia. The estimates have been compiled from data collected by the Australian Bureau of Statistics (ABS) in its quarterly survey of business expectations.

2 This survey commenced with short term expectations for the December quarter 1993 and medium term expectations for the September quarter 1994. This quarter's publication contains estimates of the expected change between the December quarter 2001 and the March quarter 2002 and the December quarter 2001 and the December quarter 2002.

3 The original, seasonally adjusted and trend series are the published indicators for short-term business expectations, with the trend providing an indication of the underlying direction of the series. The volatility of the medium-term seasonally adjusted series is such that the original and trend series will continue to be the published indicators, with the trend providing an indication of the underlying direction of the series. Seasonally adjusted estimates are provided on page 12, with an explanation in paragraphs 28 to 32 of the Explanatory Notes. Trend estimates are provided on pages 12 and 20 , with an explanation in paragraph 33 of the Explanatory Notes.

4 The survey is conducted by mail each quarter. This quarter's survey was collected during October and November 2001.

5 It is based on a stratified random sample of approximately 4,500 businesses selected from the ABS annual Economic Activity Survey (EAS). EAS in turn derives its survey population from the ABS central register of business units.

6 The sample is stratified by industry, sector (private and government business) and size of business (measured by number of employees). Within each stratum businesses are sampled randomly, with each business in a stratum having the same probability of selection.

7 The sample is supplemented by a further sample of businesses which have been added to the ABS business register since the original EAS sample was selected. This ensures that the expectations of relatively new businesses are taken into account in the overall estimates.

8 The statistics in this publication relate to employing businesses in all industries and sectors of the Australian economy except:

- agriculture, forestry and fishing;
- general government.

9 Data related to intended sheep matings are collected annually by the ABS and published in catalogue 7111.0 and 7113.0 publications from the Agricultural Commodity Survey.

10 The Australian Bureau of Agricultural and Resource Economics (ABARE) publishes its forecasts for specific commodities and for the Agriculture industry generally, as part of the annual Outlook conference in February each year. ABARE updates these forecasts in its quarterly publication Australian Commodities-Forecasts and Issues.

11 Each statistical unit selected in the survey is classified to an industry according to the Australian and New Zealand Standard Industrial Classification (ANZSIC).

## EXPLANATORYNOTES

## BUSINESS SIZE

BUSINESS PERFORMANCE INDICATORS

12 Data presented in this publication is classified by three business sizes :

- small (less than 20 employees, except for manufacturers where it is less than 100);
- medium (20 to 99 employees, except for manufacturers where it is 100 to 599 employees); and
- large ( 100 or more employees, except for manufacturers where it is 600 or more employees).

## PROPORTION OF BUSINESSES SELECTED BY SIZE WITHIN AUSTRALIA

|  | Small | Medium | Large | All businesses |
| :--- | :--- | :--- | :--- | :--- |
|  | $\%$ | $\%$ | $\%$ | $\%$ |
|  |  |  |  |  |
|  |  |  |  |  |
| Manufacturing | 62.7 | 14.0 | 23.3 | 100.0 |
| Other industries | 51.3 | 22.3 | 26.4 | 100.0 |
| All industries | 53.7 | 20.6 | 25.7 | 100.0 |

13 The statistical unit used in the survey of business expectations is the management unit. The management unit is the highest level accounting unit within a business for which sub-annual accounts are maintained, having regard for industry homogeneity.

14 In nearly all cases the management unit coincides with the legal entity owning the business (i.e. company, partnership, trust, sole proprietor, etc.).

15 In the case of large diversified businesses, however, there may be more than one management unit, each coinciding with a 'division' or 'line of business'.

16 The survey uses a set of well recognised economic trading indicators in measuring future trading activity. These indicators are: Operating income, selling prices, operating expenses, employment, etc. See Glossary for details.
17 The survey asks for full-time equivalent paid persons working. This is not a usual definition of employment as used by the ABS. It would be incorrect to assume a direct comparison with labour force statistics or other ABS employment statistics for instance.

18 The simple net balance for a selected indicator is estimated by subtracting the percentage of respondents predicting a 'fall' from the percentage of respondents expecting a 'rise'.
19 The net balance is a qualitative statistic best suited to indicating the sentiment of businesses about future business conditions, and measures the net proportion of businesses predicting a rise or fall in future business conditions.

20 The weighted net balance is estimated by weighting the surveyed direction of change for each unit by its benchmark level response for the equivalent variable in the EAS

21 Weighting the responses enables larger businesses to have an influence upon the net balance proportional to the level of their expenditure, employment size, etc. Movements in the weighted net balance indicate the net proportion of business activity predicting a rise or fall in future business conditions.

## EXPLANATORYNOTES

EXPECTED AGGREGATE CHANGE

COMPARISON OF RESULTS

SEASONAL ADJUSTMENT

22 The expected aggregate change measures the forecast percentage change in the level of a particular indicator. It is estimated by weighting the expected percentage change reported by respondents to the survey by their proportion of aggregate sales, expenditure, employment, etc. in the economy as measured from the benchmark estimate in the EAS.

23 The weighted aggregate estimate of a particular indicator, combined with an estimated level, can be used to quantify its expected future movement.

24 The weighted net balance and expected aggregate change are complementary measures which, in combination, give a broad indication of future business conditions. It is possible to obtain estimates in opposite directions for the net balance and weighted aggregate change estimates.

25 The weighted net balance provides a qualitative measure of the proportion of businesses predicting the direction of change in future business conditions. The expected aggregate change, however, provides a quantitative measure predicting the magnitude of change in a selected variable.

26 A comparison of the various expectations measures is provided in the following table:

## COMPARISON OF THREE MEASURES OF BUSINESS EXPECTATIONS

\(\left.$$
\begin{array}{llll} & \begin{array}{l}\text { Simple net } \\
\text { balance }\end{array} & \begin{array}{l}\text { Weighted net } \\
\text { balance }\end{array} & \begin{array}{l}\text { Weighted } \\
\text { aggregate }\end{array}
$$ <br>

\% \& \% \& \%\end{array}\right]\)| \% |
| :--- |

27 For the March quarter 2002 a simple net balance of $11.0 \%$ of businesses expect a decrease in employment. The decrease in the employment weighted net balance of $11.9 \%$ indicates that the businesses expecting a decrease in employment tend to be greater than those expecting an increase.

28 The quarterly business expectations series in this publication are affected to some extent by seasonal influences and it is useful to recognise and take account of this element of variation.

29 Seasonal adjustment may be carried out by various methods and the results may vary slightly depending on the procedure adopted. Accordingly, seasonally adjusted statistics are in fact only indicative and should not be regarded as in any way definitive. In interpreting seasonally adjusted data it is important to therefore bear in mind the methods by which they have been derived and the limitations to which the methods used are subject.

## EXPLANATORYNOTES

SEASONAL ADJUSTMENT continued

TREND ESTIMATES

30 At least once each year the seasonally adjusted series are revised to take account of the latest available data. The most recent reanalysis takes into account short-term expectations collected up to and including the December quarter 2002, and medium-term expectations collected up to and including the September quarter 2003. Data for subsequent periods are seasonally adjusted on the basis of extrapolation of historical patterns. The nature of the seasonal adjustment process is such that the magnitude of some revisions resulting from reanalysis may be quite significant, especially for data for more recent quarters. Care should be exercised when interpreting quarter to quarter movements in the seasonally adjusted series in the publication, particularly for recent quarters.

31 It should be noted that the seasonally adjusted figures necessarily reflect the sampling and other errors to which the original figures are subject.

32 Details of the seasonal adjustment methods used, together with selected measures of volatility for these series, are available upon request.

33 The trend estimates are derived by applying a 7 -term Henderson moving average to the published and unpublished seasonally adjusted series. The 7-term Henderson average (like all Henderson averages) is symmetric, but as the end of a time series is approached, asymmetric forms of the average are applied. Unlike the weights of the standard 7 -term Henderson moving average, the weights employed here have been tailored to suit the particular characteristics of individual series. While the asymmetric weights enable trend estimates for recent quarters to be produced, they can result in revisions to the estimates for the most recent three quarters as additional observations become available. There may also be revisions because of changes in the original data and as a result of the re-estimation of the seasonal factors. For further Information, see Information Paper: A Guide to Interpreting Time Series — Monitoring Trends: an Overview (Cat. no. 1348.0) or contact the Assistant Director, Time Series Analysis on Canberra 0262526345.

34 All of the estimates in this publication are subject to:

- sampling error;
- non-sampling error; and
- benchmark bias.

35 Sampling error is due to the use of a sample rather than a complete enumeration; that is, the estimates differ from the values that would have been obtained if all units were surveyed. A measure of the likely difference is given by the standard error (SE), which indicates the extent to which an estimate might have varied by chance because only a sample of units was included. There are about two chances in three that the difference will be within one standard error, and about nineteen chances in twenty that the difference will be within two standard errors.

36 The table on page 32 provides standard errors for some of the main estimates of this publication. As an example of how the standard errors can be interpreted, given that the short term expectation for Operating Income for Australia is $-3.0 \%$ with a standard error of 0.6 , there would be two chances in three that the true value would be within the range $-2.4 \%$ and $-3.6 \%$.

37 The size of the SE may be a misleading indicator of the reliability of some of the estimates for profit. This situation may occur where an estimate may legitimately include positive and negative values reflecting the financial positions of different businesses. In these cases the aggregate estimate can be small relative to the contribution of individual businesses resulting in an SE which is large relative to the estimate.

## EXPLANATORYNOTES

```
STANDARD ERRORS OF KEY ESTIMATES, SHORT-TERM EXPECTATION, AUSTRALIA
```

| Business performance indicator | Survey <br> estimate | Standard <br> error |
| :--- | ---: | ---: |
| Operating income | -3.0 | 0.6 |
| Selling prices | -0.2 | 0.3 |
| Profit | -26.3 | 5.3 |
| Capital expenditure | 1.0 | 2.3 |
| Inventories | -1.5 | 0.5 |
| Employment | -0.8 | 0.2 |
| Wage costs | -0.3 | 0.2 |

NON-SAMPLING ERROR

BENCHMARKS

38 All other inaccuracies are referred to collectively as non-sampling error. The major areas of concern are: non-response; mis-reporting of data by respondents; and deficiency in the central register of economic units.

39 Every effort is made to reduce the non-sampling error to a minimum by careful design of questionnaires and efficient editing and operating procedures.

40 The expected aggregate change is designed to reflect business expectations for each business performance indicator, as accurately as possible. However, while the estimates should be appropriate measures of business climate, the expectations may not predict actual movements accurately. Businesses may be too optimistic or pessimistic in their predictions at different times.

41 In addition, actual movements would be partly comprised of activity of relatively recently formed businesses, and businesses which are formed during the expectations reference period which are not immediately represented in BES because they would not have been included on the ABS central register of economic units. Allowance is made in other ABS series for coverage deficiencies relating to newly formed businesses but no allowance for this is made in BES. This is important for some variables, where the contribution of new businesses to growth in that variable is relatively substantial (e.g. employment, capital expenditure or stocks).

42 Benchmark (or base level) information is obtained from the ABS annual Economic Activity Survey (EAS). It is used to weight individual business responses by their relative contribution to each business performance indicator. This enables percentage responses from different businesses to be aggregated.
43 In June each year a new sample is selected from units surveyed by EAS in the previous financial year. New benchmarks are introduced for the survey conducted in August each year. The benchmark data become increasingly out of date as they are used in the surveys conducted in November, February and May. In certain cases, the benchmark data may not accurately reflect the current activity of a business. It is currently not possible to measure the extent of any such inaccuracies.
44 Results from the EAS are published in Business Operations and Industry Performance (Cat. no. 8140.0).
n.p. not available for publication but included in totals where applicable, unless otherwise indicated.

## GLOSSARY

Capital expenditure The expected change in the value of capital expenditure in new tangible assets.

## Goods and Services Tax

The Goods and Services Tax (GST) is excluded from all data items. However, the cost of complying with tax reform, e.g. the purchase of computer equipment or software, is included in the relevant data items.

Inventories The expected change in the book value of inventories between the end of the collection quarter and the end of the reference periods.

## Non-wage labour expenses

Operating income The expected change in operating income derived from the sale of goods or the provision of services by a business in terms of value.

Financial institutions report on the expected change in gross interest income plus fees and commissions.

Non-profit or charitable organisations report on the expected change in fees received for services, donations from the public and government grants and subsidies.

Other operating expenses
The expected change in the total amount of all expenses which are not classified as labour expenses.

Some of these expenses are overheads, advertising, raw materials and packaging and handling.

Paid persons working The expected change in the number of paid persons working. Where part time or casual employees are involved employers are requested to convert to a full-time equivalent. It should be noted that most other ABS series which provide data on paid persons working do not use a full-time equivalent measure.

Profit Profit is a derived item based on the present trading performance of a business and the expected changes to the level of sales of goods and services and the sum of all expense items.

The difference between the new benchmarks for the sales of goods and services and the sum of all expenses items (the sum of total wage expense, non-wage labour expense and all other operating expenses) as determined by the responses received, the Economic Activity Survey benchmarks for those items and an indicator of present trading performance (cost/income ratio) are used to determine the expected change for profit for the reference periods.

Because of reporting difficulties experienced with the cost/income ratios, caution should be exercised in interpreting profit expectations.

Reference periods There are two reference periods surveyed each quarter:

- Short-term (if the current quarter is September 2000, then the quarter being surveyed is December 2000); and
- Medium-term (if the current quarter is September 2000, then the quarter being surveyed is September 2001).

## GLOSSARY

AVAILABLE DATA

SIZE OF BUSINESS

INDUSTRY

STATE INFORMATION

NET BALANCE

MORE INFORMATION

The amount of data collected from the Survey of Business Expectations is much greater than the data contained in this publication.

Subject to the ABS provisions for maintaining the confidentiality of respondents and their information, more detailed information by industry and size of business may be made available on request.

The size of business is based on employment. Additional data can be estimated for the following size ranges:

- less than 20 employees;
- 20 to 99 employees;
- 100 to 599 employees;
- 600 or more employees;
- small (less than 20 employees except for manufacturers, where it is less than 100 employees);
- medium (20 to 99 employees except for manufacturers, where it is 100 to 599 employees); and
- large ( 100 or more employees except for manufacturers, where it is 600 or more employees).

Industry is classified according to ANZSIC and is available at the 1 and 2 digit level. Additional data is available for:

- 15 industries categorised at the one digit ANZSIC level;
- 47 industries categorised at the two digit ANZSIC level; and
- user defined industry groups such as 'service industries'.

State information has been derived from the business activity conducted by business in each State. Where sufficient information is available to provide satisfactory estimates, data may be made available at the same level of detail as that for Australia. State information is subject to a greater degree of variance than the Australia data.

A weighted net balance for industries and size of business can be produced as a special data service.
