#### (a) In volume terms

## KEY POINTS

#### ACTUAL EXPENDITURE (VOLUME TERMS)

- The trend estimate for total new capital expenditure (in volume terms) rose 4.2% in the December quarter 2008 while the seasonally adjusted estimate rose 6.0%.
- The trend estimate for buildings and structures rose 6.6% this quarter while the seasonally adjusted estimate rose 11.5%.
- The equipment, plant and machinery trend volume estimate rose 1.8% in the December quarter 2008. In seasonally adjusted terms the estimate rose 1.0%.

#### EXPECTED EXPENDITURE (CURRENT PRICE TERMS)

- This issue includes the fifth estimate for 2008-09 and the first estimate for 2009-10.
- Estimate 5 for 2008-09 is \$98,145m. This is 14.3% higher than Estimate 5 for 2007-08.
   Estimate 5 is 4.4% lower than Estimate 4 for 2008-09.
- Estimate 1 for 2009-10 is \$79,866m. This is 0.6% higher than the first estimate for 2008-09.
- See pages 6 to 9 for further commentary on expectations data.

## INQUIRIES

For further information about these and related statistics, contact the National Information and Referral Service on 1300 135 070 or Paul Doran on Sydney (02) 9268 4357.

### page

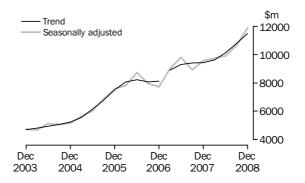

## TOTAL CAPITAL EXPENDITURE

The trend estimate for total new capital expenditure rose 4.2% in the December quarter 2008. By asset type, buildings and structures has shown relative strength in the quarter, growing 6.6%. Continued strength in Mining has been a key driver of the increase. The seasonally adjusted series for total new capital expenditure rose 6.0% in the December quarter 2008.

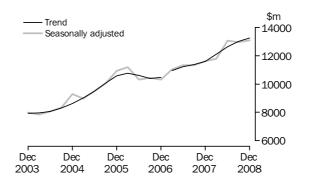

#### BUILDINGS AND STRUCTURES

Buildings and structures trend estimate rose 6.6% in the December quarter 2008. Mining (8.2%), Manufacturing (6.5%) and Other selected industries (5.3%) all rose strongly in the quarter, in trend terms. The seasonally adjusted estimate for buildings and structures rose 11.5% in the December quarter 2008.

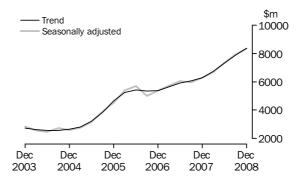

## EQUIPMENT, PLANT AND MACHINERY

The trend estimate for equipment, plant and machinery rose 1.8% in the December quarter 2008. Other selected industries rose 3.1% in the quarter, against falls for Manufacturing (-1.1%) and Mining (-0.1%). The seasonally adjusted series rose 1.0% led by an increase in Other selected industries of 2.7%.

 $\mathsf{MINING}$ 

The trend estimate for Mining rose 6.3% in the December quarter 2008. The buildings and structures asset class rose 8.2%, driving the increase. The seasonally adjusted December quarter estimate for Mining rose 4.9%. By asset class, buildings and structures continued to exhibit strength with a gain of 5.7% in the quarter compared to a rise of 2.5% in equipment, plant and machinery, in seasonally adjusted terms.

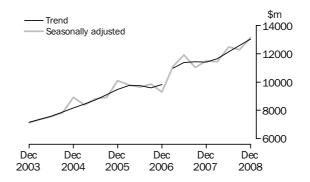

#### MANUFACTURING

The Manufacturing trend estimate rose 1.2% in the December quarter 2008. Buildings and structures rose 6.5% while equipment, plant and machinery fell 1.1%. In seasonally adjusted terms the Manufacturing estimate rose 4.8%. Buildings and structures rose 29.6% while equipment, plant and machinery fell 5.0%.

## OTHER SELECTED INDUSTRIES

The trend estimate for Other selected industries rose 3.7% in the December quarter 2008. Buildings and structures rose 5.3% while equipment, plant and machinery rose 3.1%. The seasonally adjusted estimate for Other selected industries rose 7.0%. Buildings and structures rose 15.7% and equipment, plant and machinery rose 2.7%.

## ACTUAL AND EXPECTED NEW CAPITAL EXPENDITURE

## FINANCIAL YEARS AT CURRENT PRICES

The graphs below show the seven estimates of actual and expected expenditure for each financial year. The estimates appearing below relate to data contained in tables 5 and 6. Advice about the application of realisation ratios to these estimates is in paragraphs 25 to 28 of the Explanatory Notes.

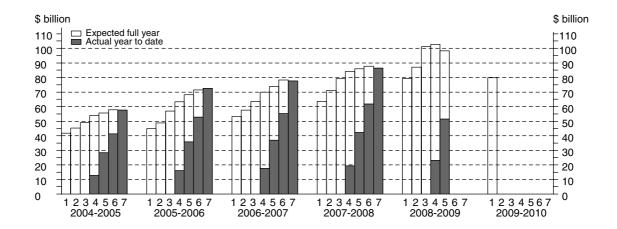

The timing and construction of these estimates are as follows:

	COM	IPOSITION OF	ESTIMATE	
Estimate	Based on data reported at:	Data on long-term expected expenditure	Data on short-term expected expenditure	Data on actual expenditure
1	Jan-Feb, 5-6 months before period begins	12 months	Nil	Nil
2	Apr-May, 2-3 months before period begins	12 months	Nil	Nil
3	Jul-Aug, at beginning of period	6 months	6 months	Nil
4	Oct-Nov, 3-4 months into period	6 months	3 months	3 months
5	Jan-Feb, 6-7 months into period	Nil	6 months	6 months
6	Apr-May, 9-10 months into period	Nil	3 months	9 months
7	Jul-Aug, at end of period	Nil	Nil	12 months

#### TOTAL CAPITAL EXPENDITURE

Estimate 5 for total capital expenditure for 2008-09 is \$98,145 million. This is 14.3% higher than Estimate 5 for 2007-08. Estimate 5 is 4.4% lower than Estimate 4 for 2008-09 after sustained growth in the estimate for 2008-09 in the three preceding quarters. Expectations for the first half of 2009 were 8.5% lower in the December quarter survey than when collected in the September quarter.

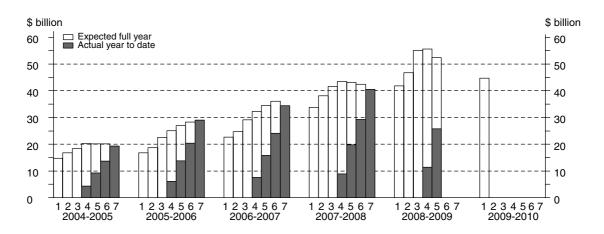

Estimate 1 for total capital expenditure for 2009-10 is \$79,866 million. This is 0.6% higher than Estimate 1 for 2008-09. By industry, Estimate 1 for Mining is 9.4% higher than the same estimate for 2008-09, while for Other selected industries, Estimate 1 is 8.0% lower than in 2008-09.

## BUILDINGS AND STRUCTURES

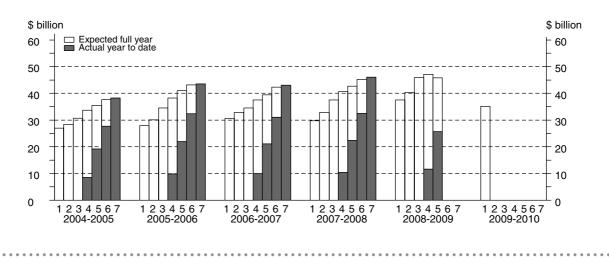

Estimate 5 for buildings and structures for 2008-09 is \$52,362 million which is 21.2% higher than Estimate 5 for buildings and structures for 2007-08. Transport (73.2%) and Mining (27.0%) showed strong growth in the year between these estimates. Estimate 5 is 5.8% lower than Estimate 4 for 2008-09. Estimate 5 for Mining buildings and structures is \$3,246m lower than Estimate 4 compared to a total change of -\$3,235m.

Estimate 1 for buildings and structures for 2009-10 is \$44,689 million. This is 6.7% higher than Estimate 1 for 2008-09. Estimates 1 for buildings and structures for Transport (79.6%), Manufacturing (61.5%) and Mining (7.1%) have all risen strongly in dollar and percentage terms in the year while Estimate 1 for Other services is 32.8% lower than it was for Estimate 1 2008-09.

EQUIPMENT, PLANT AND MACHINERY Estimate 5 for equipment, plant and machinery for 2008-09 is \$45,784 million. This is 7.3% higher than the same estimate for 2007-08. Transport (38.7%) and Mining (28.5%) were the major drivers of this increase. Estimate 5 for equipment, plant and machinery is 2.8% lower than Estimate 4 for 2008-09. Mining (-13.8%) decreased most significantly between these estimates.

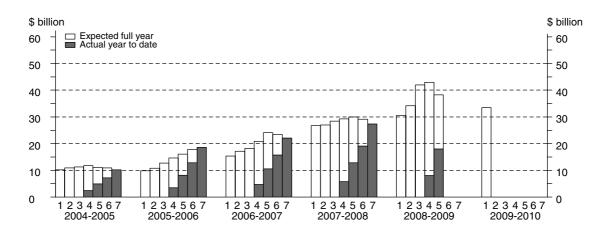

Estimate 1 for equipment, plant and machinery for 2009-10 is \$35,177 million. This is 6.2% lower than the same estimate in the previous year. Weakness in Property and Business Services (-25.5%) and Manufacturing (-16.4%) have contributed most to this decline between estimates.

MINING

Estimate 5 for Mining for 2008-09 is \$38,206 million. This is 27.3% higher than Estimate 5 for the previous year. Equipment, plant and machinery rose 28.5% and the larger buildings and structures asset class rose 27.0%. Estimate 5 fell 11.1% when compared to Estimate 4 of 2008-09. Both buildings and structures and equipment were weaker. The actual expenditure for the December quarter 2008 was 14.7% lower than indicated by expectations collected in the September quarter. Comparing expectations for the first half of 2009 collected in the September quarter to the same expectations collected in the current quarter, there has been a fall of 13.1%.

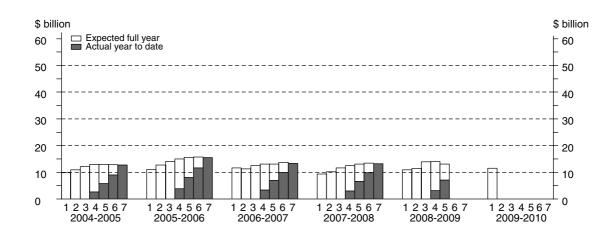

Estimate 1 for Mining for 2009-10 for is \$33,460 million. This is 9.4% higher than the corresponding estimate for 2008-09. Equipment, the smaller asset class, has risen by 17.4% while building and structures has risen by 7.1%.

#### MANUFACTURING

Estimate 5 for Manufacturing for 2008-09 is \$13,066 million. This is 0.4% lower than the corresponding estimate for 2007-08. Estimate 5 for Manufacturing 2008-09 fell 7.3% on Estimate 4 for 2008-09. Equipment, plant and machinery fell 7.0% between these estimates while buildings and structures fell 7.8%. Expectations for the first half of 2009 are down 14.6% since measured in the September quarter survey.

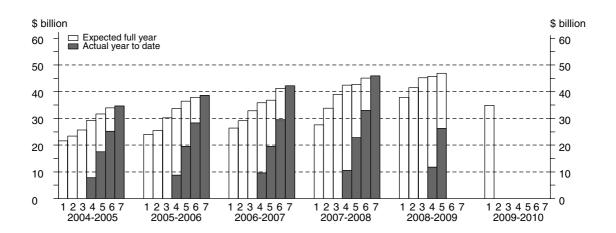

Estimate 1 for Manufacturing for 2009-10 is \$11,560 million. This is 5.7% higher than Estimate 1 for 2008-09. The building and structures asset class has risen strongly in this period (61.5%) while equipment, plant and machinery fell 16.4%.

# OTHER SELECTED

Estimate 5 for Other selected industries for 2008-09 is \$46,873 million. This is 9.7% higher than Estimate 5 for 2007-08. Estimate 5 is 2.7% higher than Estimate 4 for 2008-09. Transport (\$540.1m) and Property and Business (\$552.4m) have both recorded actual expenditure for December quarter which significantly exceeded the levels indicated by short term expectations collected in the September survey. By asset class, equipment, plant and machinery rose 3.0% while buildings and structures rose 2.2%.

Estimate 1 for 2009-10 is at \$34,846 million, which is 8.0% lower than the previous Estimate 1. Building and structures is 5.3% lower and equipment, plant and machinery 9.7% lower than Estimate 1 for 2008-09.

#### IN CURRENT PRICE TERMS

 PROJECTED CAPITAL
 The projected series below apply historical realisation ratios to contemporary

 EXPENDITURE SERIES
 expectations to convert these to quarterly figures. Trend estimates of resultant quarterly time series of actual and expected expenditure are produced.

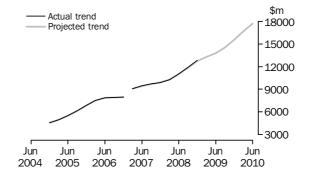

The following graphs, with accompanying commentary, show the projected capital expenditure series based on December quarter 2008 data, which includes expected expenditure up to and including the June quarter 2010. Please see paragraphs 29 to 33 of the Explanatory Notes for further details about the methodology and cautionary notes for these series.

TOTAL CAPITALReported first half of 2009 expectations for total capital expenditure weakened in theEXPENDITUREDecember quarter. There was however continued strength in the actual trend series. The<br/>projection for the total capital expenditure series suggests slowing growth to end June<br/>2009 before the series rises beyond the \$30,000m expenditure per quarter level as the<br/>2009-10 financial year progresses.

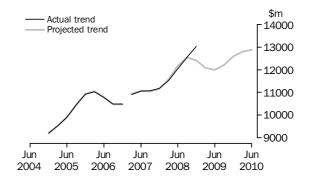

## BUILDINGS AND STRUCTURES

The projections for buildings and structures remain strong in the period to end June 2010. While expenditure expectations for the first half of 2009 decreased in the December survey data compared to September quarter, the first estimate of 2009-10 expenditure is strong relative to previous years. The buildings and structures projections are the main driver behind the strength displayed in the projection for total Capex.

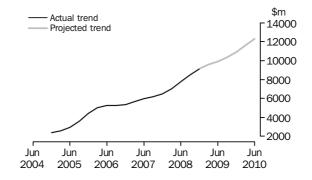

EQUIPMENT, PLANT AND MACHINERY

Projections of expenditure for equipment, plant and machinery indicate near term weakness before recovery to levels near current quarter actual expenditure levels. The actual trend noticeably outpaced the projected level in the December 2008 quarter.

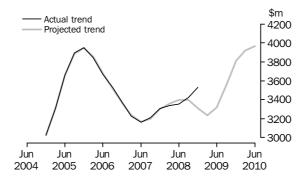

#### MINING

The Mining industry has experienced high growth since the start of 2005. The actual trend continued that pattern in the December quarter. Expectations for the first half of 2009 have weakened since the September survey. The first estimate for 2009-10 is a record high first estimate. The modelled projections suggest that this series will build towards the \$12,000m level by the end of the 2009-10 financial year.

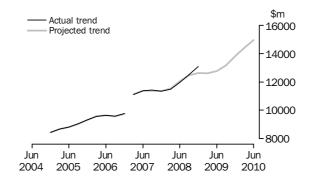

#### MANUFACTURING

The Manufacturing actual trend series was stronger in the December quarter compared to recent quarters. The actual trend has diverged above the projected trend. The model is projecting imminent weakness in the series before significant growth through 2009-10. Expectations for the first half of 2009 decreased substantially in data collected in the December quarter survey.

#### OTHER SELECTED INDUSTRIES

In the December quarter, the Other selected industries series continued the recent growth in actual trend. The projected trend suggests an easing in growth of quarterly expenditure for Other selected industries in the six month period ahead. Growth is projected to resume in the series through the 2009-10 financial year.

### EFFECT OF NEW SEASONALLY ADJUSTED ESTIMATES ON TREND ESTIMATES

TREND REVISIONS

Recent seasonally adjusted and trend estimates are likely to be revised when original estimates for subsequent quarters become available. The approximate effects of possible scenarios on trend estimates for capital expenditure in chain volume terms are presented below by illustrating the impact if next quarter's seasonally adjusted estimate rises or falls by a specified percentage (based on the historical average of movements in seasonally adjusted estimates). For further information, see paragraphs 44 and 45 in the EN.

## EXPLANATORY NOTES

INTRODUCTION	<b>1</b> This publication contains estimates of actual and expected new capital expenditure by private businesses for selected industries in Australia. The series have been compiled from data collected by the Australian Bureau of Statistics (ABS) in its quarterly Survey of New Capital Expenditure.
SCOPE OF THE SURVEY	<ul> <li>2 The Survey of New Capital Expenditure includes the following industries classified according to the Australian and New Zealand Standard Industrial Classification, ANZSIC, 1993:</li> <li>Mining (Division B)</li> <li>Manufacturing (Division C)</li> <li>Other selected industries: <ul> <li>Construction (Division E)</li> <li>Wholesale trade (Division F)</li> <li>Retail trade (Division G)</li> <li>Transport and storage (Division I)</li> <li>Finance and insurance (Division K, but excluding Superannuation funds (Class 7412))</li> <li>Property and business services (Division I)</li> <li>Other selected services: <ul> <li>Electricity, gas and water (Division D)</li> <li>Accommodation, cafes and restaurants (Division H)</li> <li>Communication services (Division J)</li> <li>Cultural and recreational services (Division P)</li> <li>Personal services (Subdivision 95)</li> </ul> </li> </ul></li></ul>
	<ul> <li>3 The survey excludes the following industries:</li> <li>Agriculture, forestry and fishing (Division A)</li> <li>Government administration and defence (Division M)</li> <li>Superannuation funds (Class 7412)</li> <li>Education (Division N)</li> <li>Health and community services (Division O)</li> <li>Other services (Subdivision 96)</li> </ul>
	<ul> <li>4 The scope excludes public sector business units (i.e. all departments, authorities and other organisations owned and controlled by Commonwealth, State and Local Government).</li> <li>5 The Survey of New Capital Expenditure, like most ABS economic collections, takes its frame from employing businesses on the ABS Business Register which is primarily based on registrations to the Australian Taxation Office's Pay As You Go Withholding (PAYGW) scheme (and prior to 1 July 2000 the Group Employer scheme). The frame is updated quarterly to take account of new businesses, businesses which have ceased employing, changes in employment levels, changes in industry and other general business changes.</li> <li>6 Businesses which have ceased employing are identified when the Australian Taxation Office (ATO) cancels their PAYGW registration (or previously their Group Employer registration). In addition, from September quarter 1999, businesses which did not remit under the Group Employer scheme for the previous five quarters were removed from the frame. A similar process has been adopted to remove businesses. Though there are a substantial number of these businesses, it is expected that they would not contribute significantly to the estimates, although the impact would vary from industry to industry.</li> </ul>

. . . . . . .

STATISTICAL UNIT	<b>8</b> In the Survey of New Capital Expenditure, the statistical unit used to represent businesses, and for which statistics are reported, is the Australian Business Number (ABN) unit, in most cases. The ABN unit is the business unit which has registered for an ABN, and thus appears on the ATO administered Australian Business Register. This unit is suitable for ABS statistical needs when the business is simple in structure. For more significant and diverse businesses where the ABN unit is not suitable for ABS statistical needs, the statistical unit used is the Type of Activity Unit (TAU). A TAU is comprised of one or more business entities, sub-entities or branches of a business entity within an Enterprise Group that can report production and employment data for similar economic activities. When a minimum set of data items is available, a TAU is created which covers all the operations within an industry subdivision (and the TAU is classified to the relevant subdivision of the Australian and New Zealand Standard Industrial Classification (ANZSIC)). Where a business cannot supply adequate data for each industry, a TAU is classified to the predominant ANZSIC subdivision. Further details about the ABS economic statistical units used in this survey, and in other ABS economic surveys (both sample surveys and censuses), can be found in Chapter 2 of the <i>Standard Economic Sector Classifications of Australia (SESCA) 2002</i> (cat. no. 1218.0).
SURVEY METHODOLOGY	<b>9</b> The survey is conducted by mail on a quarterly basis. It is based on a random sample of approximately 8,000 units which is stratified by industry, state/territory and number of employees. The figures obtained from the selected businesses are supplemented by data from units which have large capital expenditure and/or large employment and which are outside the sample framework, or not adequately covered by it.
	<b>10</b> Respondents are asked to provide data on the same basis as their own management accounts. Where a selected unit does not respond in a given survey period, a value is estimated. If data are subsequently provided, the estimated value is replaced with reported data. Aggregates are calculated from all data using the 'number raised' estimation technique. Data are edited at both individual unit level and at aggregate level.
TIMING AND CONSTRUCTION OF SURVEY CYCLE	<b>11</b> Surveys are conducted in respect of each quarter and returns are completed in the 8 or 9 week period after the end of the quarter to which the survey data relate (e.g. September quarter survey returns are completed during October and November).
	<ul> <li>12 Businesses are requested to provide 3 basic figures each survey:</li> <li>Actual expenditure incurred during the reference period (Act)</li> <li>A short term expectation (E1)</li> <li>A longer term expectation (E2).</li> </ul>

TIMING AND CONSTRUCTION OF SURVEY CYCLE continued

CLASSIFICATION BY

INDUSTRY

**13** This survey cycle facilitates the formation of estimates of expenditure for financial years (12 months ending 30 June) which are presented in tables 5 and 6 of this publication. For example, as the previous table shows for 2008-2009:

- the first estimate was available from the December 2007 survey as a longer term expectation (E2)
- the second estimate was available from the March 2008 survey (again as a longer term expectation)
- the third estimate was available from the June 2008 survey as the sum of two expectations (E1 + E2)
- in the September 2008, December 2008 and March 2009 surveys the fourth, fifth and sixth estimates, respectively, are derived from the sum of actual expenditure (for that part of the year completed) and expected expenditure (for the remainder of the year) as recorded in the current quarter's survey
- the final (or seventh) estimate from the June quarter 2009 survey is derived from the sum of the actual expenditure for each of the four quarters in the 2008–09 financial year.

**14** Businesses are requested to provide actual expenditure data by state/territory each quarter. Prior to 2002, businesses were also asked to provide expected expenditure data by state/territory each December quarter. Since 2002 state/territory expectations data have been directly collected each December quarter only from selected businesses contributing significantly to data for a particular state or territory. Expectations data for the remaining businesses which operate in more than one state or territory are pro-rated to states/territories based on actual expenditure for the December quarter in each state or territory. As has always been the case, expectations data for businesses operating within a single state/territory are allocated to that state/territory.

**15** These expectations data by state/territory are not included in this publication but are released on the ABS Website and are available on request.

 SAMPLE REVISION
 16 The survey frames and samples are revised each quarter to ensure that they remain representative of the survey population. The timing for creating each quarter's survey frame is consistent with that of other ABS business surveys. This provides for greater consistency when comparing data across surveys.

**17** Additionally, with these revisions to the sample, some of the units from the sampled sector are rotated out of the survey and are replaced by others to spread the reporting workload equitably.

**18** Adjustments are included in the estimates to allow for lags in processing new businesses to the ABS Business Register, and the omission of some businesses from the register. The majority of businesses affected and to which adjustments apply are small in size. As an indication of the size of these adjustments, in the December quarter 2008 they represented about 0.2% of the total estimate of new capital expenditure.

**19** The Australian and New Zealand Standard Industrial Classification (ANZSIC) has been developed for use in both countries for the production and analysis of industry statistics. For more information, users are referred to *Australian and New Zealand Standard Industrial Classification (ANZSIC), 1993* (cat. no. 1292.0).

**20** In order to classify new capital expenditure by industry, each statistical unit (as defined above) is classified to the (ANZSIC) industry in which it mainly operates.

CHAIN VOLUME MEASURES **21** The chain volume measures appearing in this publication are annually reweighted chain Laspeyres indexes referenced to current price values in the chosen reference year (currently 2006–07). The current price values may be thought to be the product of a price and quantity. The value in chain volume terms can be derived by linking together movements in volumes, calculated using the average prices of the previous financial year

# CHAIN VOLUME MEASURES continued

and applying compound movements to the current price estimates of the reference year. Each year's quarter-to-quarter growth rates in the chain volume series are based on the prices of the previous financial year, except for those quarters of the latest incomplete year which are based upon the second most recent financial year. Quarterly chain volume estimates for a financial year sum to the corresponding annual estimate.

**22** With each release of the September quarter issue of this publication, a new base year is introduced and the reference year is advanced one year to coincide with it. With this release of the September quarter 2008 issue of this publication, the chain volume measures for 2007–08 now have 2006–07 (the previous financial year) as their base year rather than 2005–06, and the reference year is 2006–07.

**23** A change in the reference year changes levels but not growth rates for all periods. A change in the base year can result in revisions, small in most cases, to growth rates for the last year.

**24** Chain volume measures are not generally additive. In other words, component chain volume measures do not, in general, sum to a total in the way original current price components do. For capital expenditure data, this means that the original chain volume estimates for industry groups will not add to total capital expenditure for Australia. In order to minimise the impact of this, the ABS uses the latest base year as the reference year. By adopting this approach, additivity does exist for the quarters following the reference year and non-additivity is relatively small for the quarters in the reference year and those immediately preceding it. For further information on chain volume measures refer to *Information Paper: Introduction of Chain Volume Measures in the Australian National Accounts* (cat. no. 5248.0).

**25** Once actual expenditure for a financial year is known, it is useful to investigate the relationship between each of the prior six estimates of expenditure for that financial year and the actual expenditure (see page 6 for an explanation of the derivation of the seven estimates). The resultant realisation ratios (subsequent actual expenditure divided by expected expenditure) then indicate how much expenditure was actually incurred against the amount expected to be incurred at the various times of reporting. Realisation ratios can also be formed separately for three or six month expectations as well as the 12 month E2 estimates or combinations of estimates containing at least some expectation components (e.g. six months actual and six months expected expenditure).

**26** Realisation ratios provide an important tool in understanding and interpreting expectation statistics for future periods. The application of realisation ratios enables the adjustment of expectation data for known under (or over) realisation patterns in the past and hence provides a valid basis for comparison with other expectation data and actual expenditure estimates. Once this has been done the predictions can be more validly compared with each other and with previously derived estimates of actual expenditure for earlier years. For example, if one wished to make a prediction about actual expenditure for 2008–09 based on the December 2008 survey results and compare this with 2007–08 expenditure, it is necessary to apply the relevant realisation factors to the expectation to put both estimates on the same basis.

**27** There are many ways in which realisation ratios can be applied to make predictions of actual expenditure for a future period. A range of realisation ratios for both type of asset and industry estimates is provided in tables 5 and 6.

**28** In using realisation ratios to adjust expectations data, attention should be paid to the range of values that has occurred in the past. A wide range of values is indicative of volatility in the realisation patterns and hence greater caution should be exercised regarding the predictive value of the expectation, even after adjustment by application of realisation ratios. This is particularly the case with the early 12 month expectations for the following financial year collected in the December and March surveys.

DERIVATION AND USEFULNESS OF REALISATION RATIOS EXPERIMENTAL PROJECTED CAPITAL EXPENDITURE

**29** Current short and long term expectations are of varying periods depending on the quarter in which they are collected (see paragraph 12 of the Explanatory Notes). Each expectation from the beginning of the time series is confronted with the actual expenditure that occurred in each quarter to which that expectations figure related (for example, September quarter 2008 short-term expectations related to the December quarter 2008). The output of this is to produce a quarterly realisation ratio for each expectations estimate through time.

**30** Five-year average realisation ratios are then calculated. These average realisation ratios are applied to contemporary expectations to produce estimates of projected expenditure for forthcoming quarters.

**31** These estimates of likely expenditure are then linked with the current price time series of actual expenditure to produce a quarterly time series which extends to the end point of the contemporary expectations series. For December, March and June quarters, the end point is 30 June of the following financial year. For September quarters, the end point is 30 June of the current financial year.

**32** The resultant quarterly time series are then produced in trend terms. The same aggregation structure which is used to produce seasonally adjusted and trend estimates of actual capital expenditure is used for these projected series. (See Paragraphs 41 to 45 of the Explanatory notes for more information regarding seasonally adjusted and trend estimates).

**33** While the ABS has produced these projected series to assist users in interpreting capital expenditure expectations, users should exercise caution in comparing these estimates with the estimates of actual and expected expenditure contained elsewhere in this release. In particular:

- The trend estimates which feature as key indicators in this release are based on the time series up to and including the current quarter, while the projected trend estimates are based on a time series which concludes at the end point of available expectations. Paragraph 45 of the Explanatory Notes describe the potential impact of future estimates on the end point of the trend estimate, and this is shown in more detail in the "What if ..." analysis on page 26 of this release.
- Key indicators of actual expenditure in this release are presented in volume terms, which removes the impact of price changes on the time series. Tables 1 and 2 of this release also present actual and expected expenditure in current price terms. The projected series, however, are compiled using current price estimates for the actual component of the time series (that is, prices as they related to the particular quarter) and expectations which are generally based on prices for the quarter in which they were reported.
- The projected series is based on five-year average realisation ratios. As is discussed in paragraphs 25 to 28 of the Explanatory Notes, there is some volatility in realisation ratios over time and so it is not necessarily the case that contemporary expectations will be realised in line with the average of the past five years.

**34** Estimates provided in this publication are subject to non-sampling and sampling errors. The most common way of quantifying sampling error is to calculate the standard error for the published estimate. Details of standard errors are on pages 36 and 37 of this publication.

**35** Estimates that have an estimated relative standard error between 10% and 25% are annotated with the symbol '^'. These estimates should be used with caution as they are subject to sampling variability too high for some purposes. Estimates with an RSE between 25% and 50% are annotated with the symbol '\*', indicating that the estimate should be used with caution as it is subject to sampling variability too high for most practical purposes. Estimates with an RSE greater than 50% are annotated with the

RELIABILITY OF THE ESTIMATES

RELIABILITY OF THE ESTIMATES continued

symbol '\*\*' indicating that the sampling variability causes the estimates to be considered too unreliable for general use. These annotations have only been applied to estimates from the September quarter 2003.

**36** Non-sampling errors may arise as a result of errors in the reporting, recording or processing of the data and can occur even if there is a complete enumeration of the population. These errors can be introduced through inadequacies in the questionnaire, treatment of non-response, inaccurate reporting by respondents, errors in the application of survey procedures, incorrect recording of answers, and errors in data entry and processing.

**37** Estimates for the latest quarter presented in this publication are considered preliminary and revised estimates will be released with the next issue. As discussed in Paragraphs 41 to 45 below, seasonally adjusted and trend estimates are also subject to revision as data are revised and more data become available.

**38** It is difficult to measure the size of non-sampling errors. However, every effort is made in the design of the survey and development of survey procedures to minimise their effects. In addition, respondents may have difficulties in allocating to the appropriate state(s) expenditure on some equipment items such as mobile assets (e.g. aircraft, bulk oil carriers, satellites, off-shore drilling platforms and large computer installations supporting a national network). Where such difficulties exist expenditure is allocated to the state of the businesses' head office or, in the case of aircraft, is allocated across states in proportion to the likely use of the asset.

**39** The new Australian equivalents to International Financial Reporting Standards (AIFRS) began to be progressively implemented in Australia from 1 January 2005. As a result, a number of items in the financial accounts of Australian businesses have been affected by changed definitions which have in turn impacted upon both Income Statements and Balance Sheets. A range of ABS economic collections source data from financial accounts of businesses and use those data to derive economic statistics. There have been no changes in the associated economic definitions.

**40** After monitoring data items since March quarter 2005 it has been concluded that most affected published data series have been impacted by data breaks, but that the magnitude of such breaks cannot be determined without imposing disproportionate load upon data providers to ABS surveys and other administratively collected data. ABS will continue to monitor developments and report any significant identified impacts or changes in methodology as a result of AIFRS.

**SEASONAL ADJUSTMENT 41** The quarterly original actual new capital expenditure series in this publication are affected in varying degrees by seasonal influences. The seasonal adjustment process estimates and removes the effects of normal seasonal variations from the original series so that the effects of other influences can be more easily recognised.

**42** In the seasonal adjustment process, account has been taken of normal seasonal factors (e.g. increase in June quarter capital expenditure due to the impending end of the financial year) to produce the seasonally adjusted estimates. Particular care should be taken in interpreting quarterly movements in the seasonally adjusted estimates because seasonal adjustment does not remove the effect of irregular or non-seasonal influences (e.g. change in interest rates) and reflects the sampling and other errors to which the original estimates are subject. The revision properties of the seasonally adjusted and trend estimates can be improved by the use of Autoregressive Integrated Moving Average (ARIMA) modelling. The Survey of Private New Capital Expenditure uses ARIMA modelling where appropriate for individual time series. ARIMA modelling relies on the characteristics of the series being analysed to project future period data. The projected values are temporary, intermediate values that are only used internally to improve the estimation of the seasonal factors. The projected data do not affect the original estimates

SEASONAL ADJUSTMENT continued	and are discarded at the end of the seasonal adjustment process. The ARIMA model is assessed as part of the annual reanalysis which is completed each September quarter. For more information on the details of ARIMA modelling see <i>Feature article: Use of ARIMA modelling to reduce revisions</i> in the October 2004 issue of <i>Australian Economic Indicators</i> (cat. no. 1350.0).
	<b>43</b> Seasonally adjusted estimates by asset type for Tasmania, Northern Territory and Australian Capital Territory are not separately available because of the high sampling variability associated with them. They are included in totals for Australia and while a combined residual can be derived, the measure should not be considered reliable.
TREND ESTIMATES	<b>44</b> The trend estimates are derived by applying a 7-term Henderson moving average to the seasonally adjusted estimates. The 7-term Henderson moving average is symmetric, but as the end of a time series is approached, asymmetric forms of the moving average are applied. The asymmetric moving average has been tailored to suit the particular characteristics of individual series and enable trend estimates for recent quarters to be produced. Estimates of the trend will be improved at the current end of the time series as additional observations become available. This improvement is due to the application of different asymmetric moving averages for the most recent three quarters. As a result of the improvement, revisions to the trend estimates will generally be observed for the most recent three quarters.
	<b>45</b> There may also be revisions because of changes in the original estimates. As a result of these revisions, the seasonally adjusted and trend estimates will also be revised. For further information, see <i>Information Paper: A Guide to Interpreting Time Series</i> — <i>Monitoring Trend, An Overview</i> (cat. no. 1349.0) or contact the Assistant Director, Time Series Analysis on Canberra (02) 6252 6345 or email <time.series.analysis@abs.gov.au>.</time.series.analysis@abs.gov.au>
DESCRIPTION OF TERMS	<b>46</b> A description of the terms used in this publication is given below:
	<b>47</b> <i>New capital expenditure</i> refers to the acquisition of new tangible assets either on own account or under a finance lease and includes major improvements, alterations and additions. In general, this is expenditure charged to fixed tangible assets accounts excluding expenditure on second hand assets unless these are imported for the first time.
	<ul> <li><b>48</b> Some estimates are dissected by type of asset:</li> <li><i>Buildings and structures.</i> Includes industrial and commercial buildings, houses, flats, home units, water and sewerage installations, lifts, heating, ventilating and similar equipment forming an integral part of buildings and structures, land development and construction site development, roads, bridges, wharves, harbours, railway lines, pipelines, power and telephone lines. Also includes mine development (e.g. construction of shafts in underground mines, preparation of mining and quarrying sites for open cut extraction and other developmental operations primarily for commencing or extending production). Excludes purchases of land, previously occupied buildings and speculatively built projects intended for sale before occupation.</li> <li><i>Equipment, plant and machinery.</i> Includes plant, machinery, vehicles, electrical apparatus, office equipment, furniture, fixtures and fittings not forming an integral part of buildings, durable containers, special tooling, etc. Also includes goods imported for the first time whether previously used outside Australia or not.</li> </ul>
COMPARISON WITH NATIONAL ACCOUNTS AND OTHER ABS STATISTICS	<b>49</b> The statistics for new capital expenditure shown in this publication differ from estimates of private gross fixed capital expenditure shown in the Australian National Accounts for the following reasons:

Abs  $\cdot$  private new capital expenditure and expected expenditure  $\cdot$  5625.0  $\cdot$  dec 2008 33

COMPARISON WITH NATIONAL ACCOUNTS AND OTHER ABS STATISTICS continued

- National Accounts estimates incorporate data from other sources as well as information from the new capital expenditure survey. For example, annual estimates for capital expenditure on 'machinery and equipment' are based on the ABS' annual Economic Activity Survey combined with data from the Australian Taxation Office. Quarterly estimates are interpolated between and extrapolated from the annual estimates using a variety of indicators including this survey. The ABS's quarterly Building Activity Survey and Engineering Construction Survey are the main sources for estimating the National Accounts dwellings and other building and structures items.
- National Accounts estimates include capital expenditure by all private businesses including units classified to agriculture, forestry and fishing, education, and health and community services industries and capital expenditure on dwellings by households. Data for these sectors are excluded from this publication.
- National Accounts estimates include the value of work done on speculative construction projects as the work is put into place. The statistics in this publication, however, include full value of the speculative projects as new capital expenditure of the purchases (if in scope), when the project is sold.
- National accounts estimates of gross fixed capital formation relate to acquisitions less disposals of new or existing fixed assets, whereas the survey figures are acquisitions of new fixed tangible assets only.

**50** For a more detailed explanation of the concepts and methods used in compiling the National Accounts estimates see *Australian National Accounts: Concepts, Sources and Methods* (cat. no. 5216.0).

**51** The estimates of capital expenditure on buildings and other structures will differ with estimates of Construction activity published in *Construction Work Done, Australia, Preliminary* (cat. no. 8755.0). The latter publication presents estimates of building and engineering construction work collected by the Building Activity Survey and the Engineering Construction Survey. Estimates of construction activity are based on the value of actual work done during the quarter of individual building or construction jobs by builders, and do not necessarily equate to capitalisation of this work by the builders' eventual clients. Estimates of capital expenditure in this publication are based on data reported by businesses (that is, the builders' clients) from their financial or management accounts for purchases of buildings and structures.

RELATED PUBLICATIONS continued	<b>53</b> Current publications and other products released by the ABS are listed in the <i>Catalogue of Publications and Products</i> (cat. no. 1101.0). The Catalogue is available from any ABS office or the ABS web site <http: www.abs.gov.au="">. The ABS also issues a daily Release Advice on the web site which details products to be released in the week ahead.</http:>
ABS DATA AVAILABLE ON REQUEST	<b>54</b> In addition to the data contained in this publication, more detailed industry and state information may be made available on request, the cost for such a service being dependent upon the amount of data requested. For example, data are generally available at the ANZSIC group (3 digit) level.
ABS WEBSITE	<b>55</b> The ABS website contains most of the data included in this publication but with a longer time series. In addition to the series in this publication, data for Manufacturing Subdivisions and State by Industry data are also available. A full list of available Time Series Spreadsheets available on the ABS Website is in Appendix 2 on page 38.
ACKNOWLEDGMENT	<b>56</b> ABS publications draw extensively on information provided freely by individuals, businesses, governments and other organisations. Their continued cooperation is very much appreciated; without it, the wide range of statistics published by the ABS would not be available. Information received by the ABS is treated in strict confidence as required by the <i>Census and Statistics Act 1905</i> .

# LEVEL ESTIMATESINTRODUCTIONThe estimates in this publication are based on a sample drawn from units in the surveyed<br/>population. Because the entire population is not surveyed, the published estimates are<br/>subject to sampling error. The most common way of quantifying such sampling error is<br/>to calculate the standard error for the published estimate or statistic.EXAMPLE OF USETo illustrate, let us say that the published level estimate for total capital expenditure is<br/>\$10,500m and the calculated standard error in this case is \$173m. The standard error is<br/>then used to interpret the level estimate of \$10,500m. For instance, the standard error of<br/>\$173m indicates that:

- There are approximately two chances in three that the real value falls within the range \$10,327m to \$10,673m (\$10,500m ± \$173m)
- There are approximately 19 chances in 20 that the real value falls within the ranges \$10,154m and \$10,846m (\$10,500m ± \$346m)

The real value in this case is the result we would obtain if we could enumerate the total population.

The following table shows the standard errors for quarterly level estimates. These standard errors are based on a smoothed average of capital expenditure estimates.

#### MOVEMENT ESTIMATES

EXAMPLE OF USE

The following example illustrates how to use the standard error to interpret a movement estimate. Let us say that one quarter the published level estimate for total capital expenditure is \$10,500m, and the next quarter the published level estimate is \$11,100m. In this example the calculated standard error for the movement estimate is \$221m. The standard error is then used to interpret the published movement estimate of +\$600m.

For instance, the standard error of \$221m indicates that:

- There are approximately two chances in three that the real movement over the two quarter period falls within the range \$379m to \$821m (\$600m ±\$221m)
- There are approximately nineteen chances in twenty that the real movement falls within the range \$158m to \$1,042m (\$600m ± \$442m)

The following table shows the standard errors for national quarterly movement estimates. These standard errors are based on a smoothed average of capital expenditure estimates.
