NOTES ON ESTIMATES Each year the ABS revises the estimated effect of seasonal patterns on key labour force estimates. The next revision will be undertaken prior to the release of the February 2002 results. Analysis of past data suggests that some of the movement apparent in the January 2002 seasonally adjusted figures may be associated with changing seasonal patterns, particularly for female full-time employment.

Also, the seasonal adjustment process makes no specific adjustment for variation in the start date of Labour Force Survey interviewing. The two-week interview period for the monthly Labour Force Survey follows a predetermined pattern (see paragraph 7 of the Explanatory Notes). As a result, January interviewing may commence as early as the 8th or as late as the 14th, depending on the year. Interviews for January 2002 commenced on 14 January. Analysis has shown that the variation in interview start date may have an effect on labour force estimates for January, reflecting the impact of the new year holiday period on people's movements and labour market involvement.

While these effects may be present in the January 2002 figures, it is not possible to confirm or quantify them from the information currently available to the ABS. The trend figures effectively remove these irregular factors and provide the best guide to monthly movements in labour force aggregates.

SEASONAL REANALYSIS Revised seasonally adjusted and trend estimates to January 2002 and seasonal factors to January 2003 will be available on Thursday, 7 March 2002 through AusStats, or on request as a special data service. The February 2002 issues of *Labour Force Preliminary, Australia* (Cat. no. 6202.0), and of this publication, will contain revised seasonally adjusted and trend estimates.

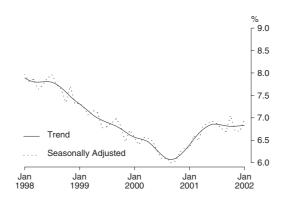

NOTES continued

| MEASURES OF LABOUR UNDERUTILISATION | On 27 Febraury 2002 the ABS released <i>Information paper: Measures of</i> <i>Labour Underutilisation</i> (Cat. no. 6296.0). The paper outlines four measures of labour underutilisation - the official unemployment rate and three supplementary measures. The supplementary measures of labour underutilisation include a wider group of people than the unemployed, such as part-time workers who are willing and available to work more hours, and people who are available to start work but who have stopped looking because they have become discouraged. |
|--|---|
| | The paper also describes the wide range of data provided by the ABS on available labour resources and the extent of labour utilisation, including data on persons unemployed, persons who are underemployed and those with marginal attachment to the labour force. |
| | The measures of labour underutilisation will be disseminated quarterly, using the latest available data, from mid-2002. |
| | For further information please contact Harry Kroon on 02 6252 6753, or email harry.kroon@abs.gov.au. |
| STATE INQUIRIES | For further inquiries about labour force data, contact Labour Force Inquiries in ABS State offices: Sydney 02 9268 4633, Melbourne 03 9615 7073, Brisbane 07 3222 6068, Adelaide 08 8237 7365, Perth 08 9360 5940, Hobart 03 6220 5884, Darwin 08 8943 2120, Canberra 02 6207 0283. |

Dennis Trewin Australian Statistician

LABOUR MARKET IN BRIEF

| TREND ESTIMATES | The trend estimate of employed persons has been increasing since |
|-------------------|--|
| | December 2000, reaching 9,225,300 in January 2002. Full-time |
| | employment rose to 6,663,900, and part-time employment rose to |
| | 2,561,400. The trend estimate of unemployment increased to stand at |
| | 677,000 in January 2002. The trend unemployment rate in January 2002 |
| | remained steady at 6.8%. The male unemployment rate remained steady |
| | at 7.0% while the female unemployment rate rose to 6.7%. The trend |
| | participation rate in January 2002 increased to 63.8%. The male |
| | participation rate decreased slightly to stand at 72.3% while the female |
| | estimate increased to 55.4%. |
| EMPLOYMENT | The seasonally adjusted estimate of employment increased by 101,800 to |
| | 9,280,000 in January 2002. Full-time employment rose by 70,500 to |
| | 6,693,800, with female full-time employment increasing by 47,600 to |
| | 2,245,900 and male full-time employment increasing by 22,900 to |
| | 4,447,900. Part-time employment rose by 31,300 to 2,586,200. Female |
| | part-time employment rose by 38,200 to 1,870,900 and male part-time |
| | employment fell by 6,900 to 715,300. |
| UNEMPLOYMENT | The seasonally adjusted estimate of unemployment increased by 34,500 |
| | to 694,100 in January 2002. The number of unemployed persons seeking |
| | full-time work increased by 26,000 to 520,900, with the number of |
| | females increasing by 14,200 and the number of males increasing by |
| | 11,800. The number of unemployed persons seeking part-time work rose |
| | by 8,500 to 173,300, with the number of males seeking part-time work |
| | increasing by 11,200 and the number of females decreasing by 2,700. |
| UNEMPLOYMENT RATE | The seasonally adjusted unemployment rate increased to 7.0% in January |
| | 2002. The male rate rose by 0.4 percentage points to 7.1 while the |
| | female rate rose by 0.1 percentage point to 6.8%. |

PARTICIPATION RATE

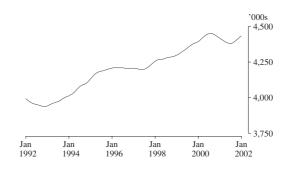

The seasonally adjusted labour force participation rate rose by 0.8 percentage points to 64.2% in January 2002. The male participation rate increased by 0.4 percentage points to 72.5% and the female participation rate increased by 1.2 percentage points to 56.1%.

PRINCIPAL LABOUR FORCE SERIES

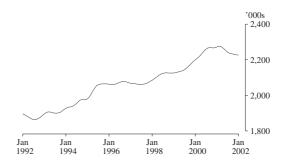

PERSONS EMPLOYED FULL TIME: TREND SERIES

Males

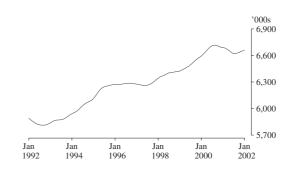

Apart from a flat period between June 1995 and June 1997, the trend estimate of males employed full time rose strongly, from 3,938,900 in December 1992 to a peak of 4,452,300 in August 2000. The trend then fell until July 2001, before rising to 4,436,000 in January 2002.

Females The trend estimate of females employed full time rose strongly from 1,865,100 in August 1992 to 2,065,500 in September 1995. The trend then remained relatively flat until July 1997, before rising to 2,276,800 in February 2001. Since then it has fallen to stand at 2,228,000 in January 2002.

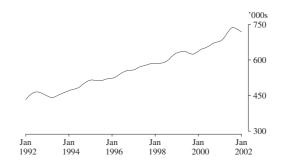

Persons From a low of 5,812,600 in September 1992, the trend estimate of persons employed full time rose strongly until June 1995. The trend then remained relatively flat until June 1997, before increasing steadily to reach a high of 6,719,300 in August 2000. The trend estimate fell to 6,621,700 in August 2001 and has recently risen to 6,663,900 in January 2002.

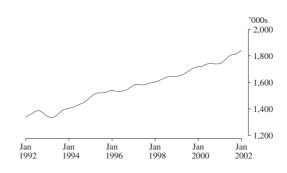

PERSONS EMPLOYED PART TIME: TREND SERIES

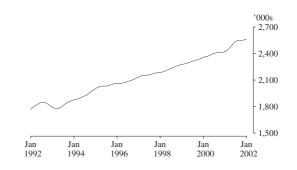

Males The trend estimate of males employed part time has risen 66% over the last 10 years, rising from 433,500 in January 1992 to 718,900 in January 2002. The trend estimate showed strong growth during 2001, reaching 737,700 in August 2001, before falling in recent months.

Females Apart from a small decrease between August 1992 and March 1993, the trend estimate of females employed part time has risen steadily over the last 10 years. In January 2002 the trend estimate was 1,842,500, 38% higher than the January 1992 estimate of 1,339,000.

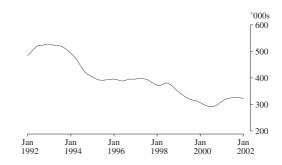

Persons The trend estimate of persons employed part time has risen steadily over the last 10 years from 1,772,600 in January 1992 to 2,561,400 in January 2002, an increase of 44% over the period. The trend estimate of persons employed part time showed strong growth between January 2001 and August 2001. Since then the trend has increased at a slower rate.

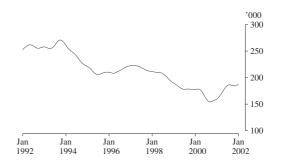

UNEMPLOYED PERSONS LOOKING FOR FULL-TIME WORK: TREND SERIES

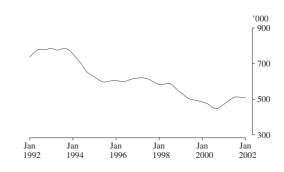

Males The trend estimate of males looking for full-time work fell rapidly from a high of 527,300 in January 1993 to 391,700 in June 1995. The trend then remained relatively flat until April 1997. Apart from a small increase in 1998, the trend estimate fell to 292,300 in August 2000, and has since risen to stand at 323,000 in January 2002.

Females The trend estimate of females looking for full-time work fell from a peak of 271,300 in October 1993 to 206,000 in July 1995. The trend then rose to 223,600 in March 1997, before falling to 154,500 in September 2000. The trend estimate then rose to 186,500 in August 2001, and has since flattened to stand at 187,500 in January 2002.

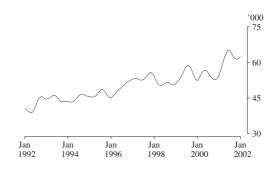

Persons The trend estimate of unemployed persons looking for full-time work fell rapidly from a high of 786,100 in August 1993 to 597,800 in July 1995. The trend estimate then remained relatively stable until June 1998, before falling to 448,400 in September 2000. The trend then rose to 513,600 in August 2001, before flattening to stand at 510,500 in January 2002.

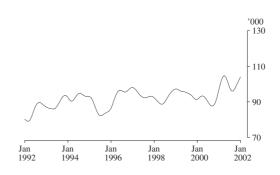

UNEMPLOYED PERSONS LOOKING FOR PART-TIME WORK: TREND SERIES

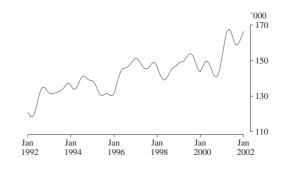

Males The trend estimate of unemployed males looking for part-time work has risen 53% over the last 10 years. Recently, the trend has risen strongly from 52,800 in November 2000 to 65,200 in July 2001. The trend estimate has since fallen to 62,500 in January 2002.

Females The trend estimate of unemployed females looking for part-time work, although fluctuating, has generally risen over the last 10 years, increasing from 80,500 in January 1992 to 104,100 in January 2002.

Persons Although fluctuating, the trend estimate of unemployed persons looking for part-time work has generally increased over the last 10 years to a high of 167,800 in May 2001. Recently the trend estimate has risen to stand at 166,600 in January 2002.

(a) See Explanatory Notes paragraphs 52 and 53 for details of exclusions to family tables. (b) Includes a small number of families with husband not in the labour force and wife unemployed. (c) Includes same sex couples.

EXPLANATORY NOTES

| INTRODUCTION | 1 This publication contains estimates of the civilian labour force derived from the Labour Force Survey component of the Monthly Population Survey. Estimates of the labour force characteristics of family members and of family composition are also included. | | | | | |
|----------------------------------|--|--|--|--|--|--|
| | 2 Estimates of the civilian labour force are available for over 77 regions across Australia and are shown in various publications produced by State offices of the ABS. These data are also available as a special data service. For details, contact any ABS office. | | | | | |
| | 3 Preliminary survey results are published in advance of this more detailed publication in <i>Labour Force, Australia, Preliminary</i> (6202.0). | | | | | |
| | 4 Although emphasis in the population survey is placed on the regular collection of specific data on demographic and labour force characteristics of the population, supplementary and special surveys of particular aspects of the labour force or of other subjects are carried out from time to time. Statistics from these surveys are available on request. A list of survey publications on labour force and related topics appears at the end of this publication. | | | | | |
| CONCEPTS, SOURCES AND METHODS | 5 The conceptual framework used in Australia's Labour Force Survey aligns closely with the standards and guidelines set out in Resolutions of the International Conference of Labour Statisticians. Descriptions of the underlying concepts and structure of Australia's labour force statistics, and the sources and methods used in compiling the estimates, are presented in <i>Labour Statistics: Concepts, Sources and Methods</i> (Cat. no. 6102.0) which is also available on the ABS website www.abs.gov.au (Statistics—Statistical Concepts Library). | | | | | |
| MONTHLY POPULATION SURVEY | 6 The population survey is based on a multi-stage area sample of private dwellings (currently about 30,000 houses, flats, etc.) and a list sample of non-private dwellings (hotels, motels, etc.), and covers about 0.5% of the population of Australia. The information is obtained from the occupants of selected dwellings by specially trained interviewers. The information obtained relates to the week before the interview (i.e the reference week). | | | | | |
| | 7 The interviews are generally conducted during the two weeks beginning on the Monday between the 6th and 12th of each month. Each year, to deal with operational difficulties involved with collecting and processing the Labour Force Survey around the Christmas and New Year holiday period, interviews for December start four weeks after November interviews start, and January interviews start five weeks after December interviews start. In addition, circumstances that present significant operational difficulties for survey collection can result in a change to the normal pattern for the start of interviewing. | | | | | |

| MONTHLY POPULATION | 8 Estimates from the Labour Force Survey are published first in |
|--------------------|--|
| SURVEY continued | Labour Force, Australia, Preliminary (Cat. no. 6202.0) 31 days after the |
| | commencement of interviews for that month, with the exception of |
| | estimates for each December which are published 38 days after the |
| | commencement of interviews. |

TELEPHONE INTERVIEWING **9** The ABS introduced the use of telephone interviewing into the Labour Force Survey over the period August 1996 to February 1997. Households selected for the Labour Force Survey are interviewed each month for eight months, with one-eighth of the sample being replaced each month. The first interview is conducted face-to-face. Subsequent interviews are then conducted by telephone (if acceptable to the respondent). The method was phased in by switching each incoming sample group over to telephone interviewing in its second month in the survey.

10 During the period of implementation, the new method produced different estimates than would have been obtained under the old methodology. The effect peaked in November 1996, when it is estimated that the published estimate of total employment was about 36,000 to 48,000 lower than would have been measured under the old methodology. The effect dissipated over the final months of implementation and was no longer discernible from February 1997. Therefore, the estimates for February 1997 and onwards are directly comparable to estimates for periods prior to August 1996.

11 The Labour Force Survey includes all persons aged 15 years and over except:

- members of the permanent defence forces;
- certain diplomatic personnel of overseas governments customarily excluded from census and estimated population counts;
- overseas residents in Australia; and
- members of non-Australian defence forces (and their dependants) stationed in Australia.

From July 1993 Jervis Bay Territory has been excluded from the scope of the survey. Before July 1993 it was included in estimates for the Australian Capital Territory.

COVERAGE **12** In the Labour Force Survey, coverage rules are applied which aim to ensure that each person is associated with only one dwelling, and hence has only one chance of selection. The chance of a person being enumerated at two separate dwellings in the one survey is considered to be negligible. See paragraph 52 for information about the effect of the coverage rules on family statistics.

SCOPE

COVERAGE continued **13** Persons who are away from their usual residence for six weeks or less at the time of interview are enumerated at their usual residence (relevant information may be obtained from other usual residents present at the time of the survey).

POPULATION BENCHMARKS **14** Labour Force Survey estimates of persons employed, unemployed and not in the labour force are calculated in such a way as to add up to the independently estimated distribution of the usually resident population aged 15 and over by age and sex. This procedure compensates for under-enumeration in the survey, and leads to more reliable estimates. Persons who, at the time of interview, are overseas for more than six weeks but for less than 12 months are included in the independent population statistics (benchmarks) and are thus provided for in the calculation of the estimates. The benchmarks are the latest available estimates at the time the Labour Force Survey is conducted, but they usually differ from the official population estimates subsequently published in *Australian Demographic Statistics* (3101.0) because they are derived from incomplete information about population changes.

REVISION OF POPULATION **15** Survey estimates are not revised for the usually small amendments of population benchmarks arising from new data on deaths and overseas and internal migration. Revisions are made, however, after each Census of Population and Housing, and when population estimation bases are reviewed. These revisions affect original, seasonally adjusted and trend estimates. The last such revision was made in February 1999 to take account of the results of the 1996 Census of Population and Housing. This revision affected all the monthly estimates from January 1995 to January 1999.

16 Population benchmarks used in the estimation of Labour Force Survey data are compiled according to place of usual residence. An explanation of the place of usual residence conceptual basis for population estimates is given in *Demographic Estimates and Projections: Concepts, Sources and Methods* (3228.0) which is available on the ABS web site www.abs.gov.au under Statistical Concepts Library.

HISTORY OF THE SURVEY**17** National surveys were conducted in February, May, August and
November each year from 1964 to February 1978. The survey has been
conducted on a monthly basis since February 1978.

QUESTIONNAIRE CHANGES **18** The questionnaire used in the survey for the collection of labour force data has been revised from time to time. Details of these changes have been published in *Information Paper: Questionnaires Used in the Labour Force Survey* (6232.0) in March 1978, December 1981, August 1984, June 1986, June 1991, March 1993 and May 2001.

QUESTIONNAIRE CHANGES**19** From April 2001, the Labour Force Survey has been conducted using
a redesigned questionnaire containing additional data items and some
minor definitional changes. Core labour force series have been revised
for the period April 1986 to March 2001 to ensure continuity. For further
details, see Information Paper: Implementing the Redesigned Labour
Force Survey Questionnaire (Cat. no. 6295.0).

TREATMENT OF FUTURE**20** Future starters are those persons who were not employed during the
reference week, and were waiting to start a new job within four weeks
from the end of the reference week, and could have started in the
reference week if the job had been available then.

21 The current Labour Force Survey definition of unemployed only includes the subset of future starters who had actively looked for work in the four weeks to the end of the reference week (see Glossary). However, International Labour Organisation guidelines do not require future starters to be actively looking for work in order to be classified as unemployed. Hence, the current Labour Force Survey treatment of future starters is not fully consistent with the International Labour Organisation standards because the precondition of active job search is not waived, with the result that some future starters are defined as not in the labour force.

22 ABS considers that the Labour Force Survey definition of unemployed should be aligned with International Labour Organisation recommendations for the treatment of future starters (that is, all future starters should be classified as unemployed). The redesigned questionnaire introduced in April 2001 provides for the more complete identification of future starters to support this definitional change. However, due to concerns that such a change could possibly result in a break in the core labour force series, ABS decided to postpone implementation of this change until early 2004, when historical series will be revised to align with new benchmarks from the 2001 Population Census. This delay provides the time necessary to monitor the likely impact on core series of the changed treatment of future starters, using data from the redesigned questionnaire from April 2001 onwards. Analysis of data from the January 2002 Labour Force Survey shows that an estimated 28,100 future starters were not actively looking for work, and hence were classified as not in the labour force.

INCLUSION OF CONTRIBUTING FAMILY WORKERS **23** In April 1986, the questionnaire was revised following the extension of the definition of employed persons to include persons who worked without pay between 1–14 hours per week in a family business or on a farm (i.e. contributing family workers). This definition aligned the Australian labour force concepts with the set of definitions adopted by the 13th International Conference of Labour Statisticians in October 1982.

INCLUSION OF24 Previously, contributing family workers who worked 1–14 hours, orCONTRIBUTINGwho had such a job but were not at work, were defined as eitherFAMILY WORKERS continuedunemployed or not in the labour force, depending on whether they were
actively looking for work. In order to assist users to assess the impact of
the change, estimates for March 1986 based on the new definition were
shown in footnotes to tables 1 and 2 of the February, March and April
1987 issues of this publication.

COMPARABILITY OF SERIES **25** As a result of changes in coding methods, estimates classified by industry, occupation and status in employment data from February 2000 onwards are not strictly comparable with earlier periods. For details on the changes to industry and occupation refer to the article in the November 1999 issue of this publication. For details of the change to status in employment see the article in the May 2000 issue of this publication.

26 From December 1989 onwards, the category *Other families* was split into *One-parent families* and *Other families*. In March 1994, *Relationship in bousehold* and *Family type* classifications were introduced to align with ABS standards. From April 2001, same sex couples are included in couple families; previously these persons were included in *One-parent families* or as a *Non-family member*.

27 Estimates of the number of families in this publication are not strictly comparable with those in publications prior to the April 1986 issue. This is due to the adoption of a weighting procedure where the weight for a family is determined using an average of the weights for all family members responding to the Labour Force Survey. Previously, the weight used to derive estimates of the number of families was determined by nomination of a proxy 'head of household' as representative of the family. Additional tables were included in the April 1986 issue of this publication to show the impact of this new procedure.

SURVEY SAMPLE REDESIGN **28** Following each Population Census, the ABS reselects the Labour Force Survey sample to take into account the new information which is obtained from the Census. The sample that was used in the Labour Force Survey from September 1992 to August 1997 has been replaced by a new sample selected using information collected in the 1996 Census. The new sample was phased in over the period September 1997 to April 1998. For additional information, see *Information Paper: Labour Force Survey Sample Design* (6269.0).

SURVEY SAMPLE REDESIGN continued

29 The sampling fractions for each State/Territory differ in order to yield reliable estimates of the main labour force aggregates for each State and Territory. The sampling fractions for the current sample together with the sampling fractions determined from the 1991 Census are:

| | 1991 Census redesign | 1996 Census redesign |
|------------------------------|-------------------------|-------------------------|
| New South Wales | 1 in 277 | 1 in 300 |
| Victoria | 1 in 242 | 1 in 257 |
| Queensland | 1 in 195 | 1 in 222 |
| South Australia | 1 in 139 | 1 in 147 |
| Western Australia | 1 in 146 | 1 in 160 |
| Tasmania | 1 in 75 | 1 in 83 |
| Northern Territory | 1 in 75 | 1 in 85 |
| Australian Capital Territory | 1 in 75 | 1 in 85 |

RELIABILITY OF THE ESTIMATES

30 Estimates in this publication are subject to two sources of error:

- sampling error: since the estimates are based on information obtained from occupants of a sample of dwellings they, and the movements derived from them, may differ from the figures that would have been produced if all dwellings had been included in the survey. More information on this topic is given in the Technical Notes; and
- non-sampling error: inaccuracies may occur because of imperfections in reporting by respondents and interviewers and errors made in coding and processing data. These inaccuracies may occur in any enumeration, whether it be a full count or a sample. Every effort is made to reduce the non-sampling error to a minimum by careful design of questionnaires, intensive training and supervision of interviewers and efficient operating procedures.

DIFFERENCES BETWEEN LABOUR FORCE SURVEY ESTIMATES AND OTHER ESTIMATES **31** The results of the 1996 Census of Population and Housing show that labour force estimates derived from the Census differ from those derived from the Labour Force Survey.

32 The broad concepts underlying the measures of the labour force and its components, employment and unemployment, are similar in the Census and the survey.

33 There are considerable differences in both the collection methodology adopted (including the detailed questions asked) and estimation procedures. Factors contributing to differences in estimates include under-enumeration in the Population Census for which census labour force estimates have not been adjusted, the use in the Labour Force Survey of population benchmarks derived from incomplete information about population change (see paragraph 14), the inclusion of permanent defence forces in census estimates, the personal interview approach adopted in the survey as opposed to self-enumeration of census schedules, differing questions used to determine labour force characteristics, and differing methods of adjustment for non-response to the survey or Census.

DIFFERENCES BETWEEN LABOUR FORCE SURVEY ESTIMATES AND OTHER ESTIMATES continued **34** The Labour Force Survey provides detailed and up-to-date estimates of employment and unemployment for Australia, States and regions, whereas the Census of Population and Housing provides counts for small areas but in less detail than is available from the survey.

35 These considerations should be borne in mind when comparisons are made between Population Census and Labour Force Survey estimates.

36 Comparability with estimates produced from the quarterly Survey of Employment and Earnings is affected by the use of a different survey methodology and definitions. The Labour Force Survey provides estimates of people in jobs whereas the Survey of Employment and Earnings provides an estimate of the number of jobs held by employees. A more detailed description of the differences between these two series is available on request.

SEASONAL ADJUSTMENT
 37 Seasonally adjusted series are published in tables 2, 8 and 24.
 Seasonal adjustment is a means of removing the estimated effects of normal seasonal variation from the series so that the effects of other influences on the series can be recognised more clearly. Seasonal adjustment does not remove the irregular or non-seasonal influences which may be present in any particular month. This means that month-to-month movements of the seasonally adjusted estimates may not be reliable indicators of trend behaviour. For example, irregular factors unrelated to the trend account for more than half the seasonally adjusted movement in series at the Australia level, with the following frequency:

| Series | Monthly movements |
|--------------------|-------------------|
| Employment | 6 in 10 |
| Unemployment | 8 in 10 |
| Unemployment rate | 7 in 10 |
| Participation rate | 9 in 10 |

38 Seasonal factors are reviewed annually to take account of each additional year's original data. Information about the most recent annual review of seasonal factors was published in a feature article in the February 2001 issue of this publication. An additional review was conducted following the revision of series associated with the introduction of the redesigned questionnaire in April 2001 (see paragraph 19). The results of this additional review were used to compile the seasonally adjusted and trend estimates in this publication.

TREND ESTIMATION **39** Smoothing seasonally adjusted series produces a measure of trend by reducing the impact of the irregular component of the series. The monthly trend estimates are derived by applying a 13-term Henderson-weighted moving average to all months except the last six. The last six monthly trend estimates are obtained by applying surrogates of the Henderson average to the seasonally adjusted series. Quarterly trend estimates (e.g. employment by industry) are derived by applying a 7-term Henderson moving average to the seasonally adjusted series. The 7-term Henderson average also uses surrogate forms of the average as the end of a time series is approached. Unlike the surrogate weights of the 13-term Henderson used on monthly data, the weights employed here are tailored to suit the particular characteristics of individual series. These trend series are used to analyse the underlying behaviour of the series over time. Trend series graphs are shown on pages 4 to 7 with the trend series published in tables 3, 9 and 24. Long term data are available

40 While this smoothing technique enables estimates to be produced which include the latest month, it does result in revisions to the most recent months as additional observations become available. Generally, subsequent revisions become smaller, and after three months or two quarters have a negligible impact on the series. There will also be revisions as a result of the annual review of seasonal factors mentioned above in paragraph 38.

on the ABS on-line data dissemination service, AusStats.

41 Trend estimates for the Australian Capital Territory and the Northern Territory are published in table 9. Original estimates for the two Territories have shown, historically, a high degree of variability, which can lead to considerable revisions to the seasonally adjusted estimates after each annual seasonal factor re-analysis. Seasonally adjusted estimates are not currently published for the two Territories. The most recent six months trend estimates are subject to revision. For the three most recent months, the revision may be relatively large. Inferences about trends drawn from smoothed seasonally adjusted (trend) estimates for months earlier than the latest three months are unlikely to be affected by month-to-month revisions. They may, however, be revised as a result of the annual re-analysis of seasonal factors.

42 Users may wish to refer to the ABS publication *A Guide to Interpreting Time Series* — *Monitoring 'Trends' an Overview (1348.0)* for further information about trend estimates. Details of the trend weighting patterns are available on request from the Assistant Director, Time Series Analysis on Canberra 02 6252 6345.

MONTH-TO-MONTH**43** Care should be taken in the interpretation of month-to-monthMOVEMENTSmovements in these estimates. Survey estimates are subject to sampling
and non-sampling variability as explained in paragraph 30.

In order to minimise respondent load and at the same time maintain continuity within the population survey sample, one-eighth of the dwellings are replaced after each survey. Adoption of this rotation procedure, whereby about seven-eighths of the sample remains unchanged from one month to the next, enables more reliable measurements of changes in the labour force characteristics of the population to be made than would be possible if a new sample were introduced each month.

45 Because a high proportion of private dwellings selected in one survey remains in the sample for the following survey, it is possible to match the characteristics of most of the persons in those dwellings from one month to the next, to record any changes that occur, and hence to produce estimates of flows between the different categories of the population and labour force.

The procedures used to select persons in non-private dwellings preclude the possibility of matching any of them who may be included in successive surveys. The mobility of the population and non-response in either or both surveys means that about 10% of persons in private dwellings which are included in the sample in successive months cannot be matched. The introduction of the new sample means less persons will be common between August, September and October 1997. Normally those who can be matched represent about 80% of all persons in the survey.

Changes in the characteristics of this latter group are shown in the gross flows table (table 28). About two-thirds of the remaining (unmatched) 20% of persons in the survey are likely to have characteristics similar to those in the matched group, but the characteristics of the other third are likely to be somewhat different.

Gross flow estimates relate only to those persons in private dwellings for whom information was obtained in successive surveys. The expansion factors used in calculating the estimates were those applying to the second of each pair of months. Note that the estimates have not been adjusted to account for the unmatched sample component.

Although it is not possible to provide gross flow estimates for all persons in the survey it is considered that the estimates derived from matched records will be a useful guide to the proportions of the movements between categories which underlie the changes in monthly levels. When comparing flows for different periods it is important to take into account the population represented by the matched sample, as shown in the last line of the table.

GROSS FLOWS continued
 50 While every effort is made to reduce non-sampling errors to a minimum, any such errors affecting labour force status will tend to accumulate in the gross flow statistics rather than to cancel out. The estimates are also subject to sampling variability, as explained in the Technical Notes. For these reasons the estimates of flows should be used with caution. The standard errors may be obtained from table A of the Technical Notes.

LABOUR FORCE STATUS**51** As a part of survey procedures, family relationships are determined
each month, enabling both the estimation of persons cross-classified by
their relationship in the household and the estimation of families. This
publication contains tables showing the labour force status and family
status of individuals and families classified by family type, number of
family members, the labour force status of persons within families, the
number of children under 15 present, and the number of dependants
present.

52 Because of the survey coverage rules, persons who usually live with other members of their family may, at the time of the survey, be enumerated as not living with all the usual members of their family. This situation is more likely for persons who are enumerated as visitors to other private dwellings or as persons staying in non-private dwellings (hotels, hospitals, etc.). The determination of family structure and family characteristics in such cases is difficult. Thus, survey questions used to determine family relationships are restricted to persons enumerated as usual residents of private dwellings. That is, the following persons are excluded:

- all persons enumerated in non-private dwellings (including hotels, motels, hospitals and other institutions); and
- persons enumerated as visitors to (rather than usual residents of) private dwellings.

53 In addition, in those households where it is not possible to obtain information relating to all the usual residents, no family information is recorded. Thus persons living in households which include a member of the permanent defence forces, who is outside the scope of the population survey, are excluded from survey questions used to determine family relationships because family information could not be obtained from each usual resident. Similarly, households which, at the time of the survey, have one or more of their usual residents away for more than six weeks, are excluded from the family relationship questions. This also applies to households from which an incomplete or inadequate questionnaire was obtained for any usual resident in on scope and coverage. A summary of those persons for whom family information is obtained as well as those usual residents of private dwellings for whom complete family information cannot be obtained, and those persons specifically excluded from the family determination procedures is contained in the family tables. Generally, relationship in household is determined for more than 90% of all civilians aged 15 and over.

BIRTHPLACE 54 From April 1991, labour force birthplace data are aggregated according to major groups of the Standard Australian Classification of Countries (SACC) (1269.0) and its predecessor. The SACC was developed by the ABS for use whenever demographic, labour and social statistics are classified by countries. 55 The SACC major groups are based on the concept of geographic proximity. They differ from the country groups presented in this publication prior to April 1991. For example, African countries are now covered by 'The Middle East and North Africa' and 'Africa (excluding North Africa)', while Asia has been split into 'Southeast Asia', 'Northeast Asia' and 'Southern Asia'. Data for selected individual countries will continue to be available in this publication. INDUSTRY 56 From August 1994, Labour Force Survey industry data are classified according to the Australian and New Zealand Standard Industrial Classification (ANZSIC), a detailed description of which appears in ANZSIC 1993 (1292.0). Like the previous Australian Standard Industrial Classification (ASIC), ANZSIC classifies businesses according to their economic activities, in a structure consisting of 4 levels (Division, Subdivision, Group and Class). Labour Force Survey data are coded at the Group level, as was the practice under ASIC. 57 To enable the conversion of historical data from ASIC to ANZSIC for the period November 1984 to May 1994, a concordance was published in the August 1994 issue of this publication and in the Information Paper - Labour Force Survey: Introduction of ANZSIC for Industry Data (Replacement Publication) (6259.0). It has been found that the concordance, which was based on preliminary investigations, did not provide the most appropriate conversion for certain Group level industries. An improved concordance has now been applied to historical Labour Force Survey estimates. This concordance was published in an appendix to the May 1996 issue of this publication, and in a further issue of the above Information Paper. For further information about the new concordance or the availability of data, contact Mark Webb on Canberra 02 6252 6525. **OCCUPATION** 58 From August 1996, Labour Force Survey occupation data are classified according to the Australian Standard Classification of Occupations (ASCO) Second Edition, a detailed description of which appears in ASCO — Australian Standard Classification of Occupations, Second Edition (1220.0). The new version of the classification replaces ASCO First Edition, which was adopted in the survey in August 1986. Like ASCO First Edition, ASCO Second Edition is a skill-based classification of occupation. However, the structure of ASCO Second Edition comprises five hierarchical levels (Major Group, Sub-Major Group, Minor Group, Unit Group and Occupation) compared with four levels in ASCO First Edition (Major Group, Minor Group, Unit Group and Occupation). Under ASCO Second Edition, Labour Force Survey data are coded to the Unit Group level, as was the practice under ASCO First Edition.

| ADDITIONAL DATA | 59 Some information is collected in the Labour Force Survey only four months each year in February, May, August, November. For these months, additional tables are included in this publication which present data for: |
|----------------------|--|
| | employed persons classified by industry, occupation and status in employment; |
| | part-time workers' preference to work more hours; and |
| | the last job details of unemployed persons. |

TECHNICAL NOTES 1 A new sample for the Labour Force Survey has been phased in over the period September 1997 to April 1998. For information about the sample design see *Information Paper: Labour Force Survey Sample Design* (6269.0).

ESTIMATION PROCEDURE 2 The labour force estimates are derived from the population survey by use of a complex ratio estimation procedure, which ensures that the survey estimates conform to an independently estimated distribution of the population by age and sex, rather than to the age and sex distribution within the sample itself.

RELIABILITY OF THE 3 Two types of error are possible in an estimate based on a sample **ESTIMATES** survey: sampling error and non-sampling error. The sampling error is a measure of the variability that occurs by chance because a sample, rather than the entire population, is surveyed. Since the estimates in this publication are based on information obtained from occupants of a sample of dwellings they, and the movements derived from them, are subject to sampling variability; that is, they may differ from the estimates that would have been produced if all dwellings had been included in the surveys. One measure of the likely difference is given by the standard error, which indicates the extent to which an estimate might have varied by chance because only a sample of dwellings was included. There are about two chances in three that the estimate that would have been obtained if all dwellings had been included will differ by less than one standard error from a sample estimate, and about nineteen chances in twenty that the difference will be less than two standard errors. Another measure of sampling variability is the *relative standard error* which is obtained by expressing the standard error as a percentage of the estimate to which it refers. The relative standard error is a useful measure in that it provides an immediate indication of the percentage errors likely to have occurred due to sampling, and thus avoids the need to refer also to the size of the estimate.

4 The imprecision due to sampling variability, which is measured by the standard error, should not be confused with inaccuracies that may occur because of imperfections in reporting by respondents, errors made in collection such as in recording and coding data, and errors made in processing the data. Inaccuracies of this kind are referred to as the *non-sampling error* and they may occur in any enumeration, whether it be a full count or a sample. It is not possible to quantify non-sampling error, but every effort is made to reduce it to a minimum by careful design of questionnaires, intensive training and supervision of interviewers and efficient operating procedures. For the examples in paragraph 9 it is assumed to be zero. In practice, the potential for non-sampling error adds to the uncertainty of the estimates caused by sampling variability.

RELIABILITY OF THE ESTIMATES continued

5 Space does not allow for the separate indication of the standard errors of all estimates in this publication. Standard errors of estimates for the latest month and of estimates of movements since the previous month are shown in table 1. Standard errors of other estimates and other monthly movements should be determined by using tables A and B.

6 The size of the standard error increases with the level of the estimate, so that the larger the estimate the larger is the standard error. However, it should be noted that the larger the sample estimate the smaller will be the standard error in percentage terms. Thus, larger sample estimates will be relatively more reliable than smaller estimates.

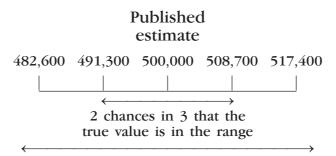

7 As the standard errors in table A show, *the smaller the estimate the bigber is the relative standard error*. Very small estimates are subject to such high standard errors (relative to the size of the estimate) as to detract seriously from their value for most reasonable uses. In the tables in this publication, only estimates with relative standard errors of 25% or less, and percentages based on such estimates, are considered sufficiently reliable for most purposes. However, estimates and percentages with larger relative standard errors have been included and are preceded by an asterisk (e.g. *3.4) to indicate they are subject to high standard errors and should be used with caution.

8 The movement in the level of an estimate is also subject to sampling variability. The standard error of the movement depends on the levels of the estimates from which the movement is obtained rather than the size of the movement. An indication of the magnitude of standard errors of monthly movements is given in table B. The estimates of standard error of monthly movements apply only to estimates of movements between two consecutive months. Movements between corresponding months of consecutive quarters (quarterly movements), corresponding months of consecutive years (annual movements) and other non-consecutive months, will generally be subject to somewhat greater sampling variability than is indicated in table B. Standard errors of quarterly movements can be obtained by multiplying the figures in table A by 1.04. Standard errors of all six monthly movements can be obtained by multiplying the figures in table A by 1.28. When using table A or table B to calculate standard errors of movements, refer to the larger of the two estimates from which the movement is derived.

RELIABILITY OF THE ESTIMATES continued

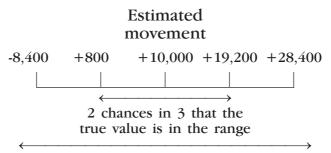

9 Examples of the calculation and use of standard errors are given below:

Consider an estimate for Australia of 500,000 employed persons aged 15–19 years. By referring to table A, in the row for an estimate of 500,000 and the column for Australia, a standard error of 8,700 is obtained. There are about two chances in three that the true value (the number that would have been obtained if the whole population had been included in the survey) is within the range 491,300 to 508,700. There are about nineteen chances in twenty that the true value is in the range 482,600 to 517,400.

19 chances in 20 that the true value is in this range

Consider estimates for females employed part time in Australia of 1,390,000 in one month and 1,400,000 in the next month. This represents an upward movement of 10,000. By referring to table B for the larger estimate of 1,400,000, a movement standard error of 9,200 is obtained (after applying linear interpolation and rounding). Therefore, there are about two chances in three that the true movement is in the range +800 to +19,200 and about nineteen chances in twenty that the true movement is in the range -8,400 to +28,400.

19 chances in 20 that the true value is in this range

RELIABILITY OF THE ESTIMATES continued

10 The relative standard errors of estimates of *aggregate hours worked*, *average hours worked*, *average duration of unemployment*, and *median duration of unemployment* are obtained by first finding the relative standard error of the estimate of the total number of persons contributing to the estimate (see table A) and then multiplying the figure so obtained by the following relevant factors:

- aggregate hours worked: 1.4;
- average hours worked: 0.9;
- average duration of unemployment: 1.5; and
- median duration of unemployment: 1.7.

The levels at which these and other labour force estimates have a relative standard error of 25% are shown in table C.

11 The following is an example of the calculation of standard errors where the use of a factor is required:

Consider a median duration of unemployment for Australia of 30 weeks, with an estimate of 1,000,000 persons unemployed. Table A gives the standard error as 11,350 which is 1.1% as a *relative standard error*. The factor of 1.7 (see paragraph 10) is applied to the relative standard error of 1.1% to obtain 1.9%. Therefore the *standard error* for the median duration of unemployment is 1.9% of 30 weeks, i.e. about half of one week. So there are two chances in three that the median duration of unemployment is between 29.5 and 30.5 weeks, and about nineteen chances in twenty that it is between 29 and 31 weeks.

12 Proportions and percentages (for example, unemployment rates) formed from the ratio of two estimates are also subject to sampling error. The size of the error depends on the accuracy of both the numerator and denominator. The formula for the relative standard error (RSE) of a proportion or percentage is given below:

RSE
$$(x / y) = \sqrt{[RSE (x)]^2 - [RSE (y)]^2}$$

13 Standard errors contained in tables A and B are designed to provide an average standard error applicable for all monthly Labour Force Survey estimates. Analysis of the standard errors applicable to particular survey estimates has shown that the standard errors of estimates of employment are generally 5% lower than those shown in tables A and B, while standard errors for estimates of unemployment and persons not in the labour force are both approximately 4% higher than those shown in the tables.

(a) See Technical Notes, paragraph 10-11. (b) For standard errors for earlier periods, see previous issues of this publication. (c) The entries in this table refer to the number of persons contributing to the estimate.

GLOSSARY

| Actively looking for work | Includes writing, telephoning or applying in person to an employer for work; answering an advertisement for a job; checking factory noticeboards or the touchscreens at Centrelink offices; being registered with Centrelink as a jobseeker; checking or registering with any other employment agency; advertising or tendering for work; and contacting friends or relatives. |
|--|---|
| Aggregate hours worked | The total number of hours a group of employed persons has actually worked during the reference week, not necessarily hours paid for. |
| Attending school | Persons aged 15–19 years enrolled at secondary or high school in the reference week. |
| Attending tertiary educational institution full time | Persons aged 15–24 years who, were enrolled full time at a TAFE college, university, or other educational institution in the reference week, except those persons aged 15-19 years who were still attending school. |
| Average duration of unemployment | For a group of unemployed persons, the aggregate duration of unemployment divided by the number of persons in the group. |
| Average family size | For any group of families, the total number of family members divided by the number of families in the group. |
| Average hours worked | Aggregate hours worked by a group divided by the number of persons in that group. |
| Birthplace | From April 1991, classified according to the <i>Standard Australian Classification of Countries (SACC)</i> (1269.0). |
| Civilian population aged 15 years and over | All usual residents of Australia aged 15 years and over except members of the permanent defence forces, certain diplomatic personnel of overseas governments customarily excluded from census and estimated population counts, overseas residents in Australia, and members of non-Australian defence forces (and their dependants) stationed in Australia. |
| Contributing family worker | A person who works without pay, in an economic enterprise operated by a relative. (This category was formerly entitled unpaid family helper). |
| Couple families | A family based on two persons who are in a registered or de-facto marriage and who are usually resident in the same household. |
| Dependent child | Any child in a family under 15 years of age or aged 15-24 years who is a full-time student (except those who have a partner or child of their own usually resident in the household). |
| Dependent student | A child who is 15-24 years of age and who attends a secondary school, or tertiary educational institution as a full-time student, and who has no partner or child of his or her own usually resident in the same household. |

- **Duration of unemployment** The elapsed period to the end of the reference week since a person began looking for work, or since a person last worked for two weeks or more, whichever is the shorter. Brief periods of work (of less than two weeks) since the person began looking for work are disregarded.
 - **Employed** Persons aged 15 years and over who, during the reference week:
 - worked for one hour or more for pay, profit, commission or payment in kind, in a job or business or on a farm (comprising employees, employers and own account workers); or
 - worked for one hour or more without pay in a family business or on a farm (i.e. contributing family workers); or
 - were employees who had a job but were not at work and were:
 - away from work for less than four weeks up to the end of the reference week; or
 - away from work for more than four weeks up to the end of the reference week and received pay for some or all of the four week period to the end of the reference week; or
 - away from work as a standard work or shift arrangement; or
 - on strike or locked out; or
 - on workers' compensation and expected to return to their job; or
 - were employers or own account workers who had a job, business or farm, but were not at work.
 - **Employee** A person who works for a public or private employer and receives remuneration in wages, salary, a retainer fee by their employer while working on a commission basis, tips, piece-rates or payment in kind, or a person who operates his or her own incorporated enterprise with or without hiring employees.
 - **Employer** A person who operates his or her own unincorporated economic enterprise or engages independently in a profession or trade, and hires one or more employees.

Employment/populationFor any group, the number of employed persons expressed as a
percentage of the civilian population aged 15 years and over in the same
group.

Family Two or more persons, one of whom is at least 15 years of age, who are related by blood, marriage (registered or de facto), adoption, step or fostering; and who are usually resident in the same household. The basis of a family is formed by identifying the presence of a couple relationship, lone parent-child relationship or other blood relationship. Some households will, therefore, contain more than one family.

- **Family reference person** In families which are not couple families or one parent families, as defined, the family reference person is the eldest person in the household (this was formerly entitled family head).
 - **Former workers** Unemployed persons who have previously worked for two weeks or more but not in the past two years.
 - **Full-time workers** Employed persons who usually worked 35 hours or more a week (in all jobs) and those who, although usually working less than 35 hours a week, worked 35 hours or more during the reference week.
 - **Household** A group of one or more persons in a private dwelling who consider themselves to be separate from other persons (if any) in the dwelling, and who make regular provision to take meals separately from other persons, i.e. at different times or in different rooms. Lodgers who receive accommodation but not meals are treated as separate households. Boarders who receive both accommodation and meals are not treated as separate households. A household may consist of any number of families and non-family members.
 - IndustryFrom August 1994, classified according to the Australian and NewZealand Standard Industrial Classification (ANZSIC) 1993 (1292.0).
 - Job leavers Unemployed persons who have worked for two weeks or more in the past two years and *left that job voluntarily*, for example, because of unsatisfactory work arrangements/pay/hours; the job was a holiday job or they left the job to return to studies; or their last job was running their own business and they closed down or sold that business for reasons other than financial difficulties.
 - **Job losers** Unemployed persons who have worked for two weeks or more in the past two years and *left that job involuntarily*, that is, were laid off or retrenched from that job, left that job because of their own ill-health or injury, the job was seasonal or temporary; or their last job was running their own business and the business closed down because of financial difficulties.
 - **Labour force** For any group, persons who were employed or unemployed, as defined.
 - Labour force statusA classification of the civilian population aged 15 years and over into
employed, unemployed or not in the labour force, as defined. The
definitions conform closely to the international standard definitions
adopted by the International Conferences of Labour Statisticians.
 - **Lone parent** A person who has no spouse or partner present in the household but who forms a parent-child relationship with at least one dependent or non-dependent child usually resident in the household.
 - **Lone person** A person who makes provision for their food and other essentials for living, without combining with any other person to form part of a multi-person household. They may live in a dwelling on their own or share a dwelling with another individual or family.

Long-term unemployed Persons unemployed for a period of 52 weeks or more.

Main English speaking
countriesThe United Kingdom, Ireland, South Africa, Canada, the United States of
America and New Zealand.

- Marital status A person is classified as married (husband, wife or partner) if they are living with another person of the same or opposite sex in either a registered or de facto marriage. The not married category comprises persons who live alone or with other family members, those in shared accommodation, and persons who, although reported as married, did not have a spouse or partner who usually lived in the household.
- Median duration of
unemploymentThe duration which divides unemployed persons into two equal groups,
one comprising persons whose duration of unemployment is above the
median, and the other, persons whose duration is below it.
- **Non-dependent child** A child of a couple or lone parent usually resident in the household, aged over 15 years and who is not a dependent student aged 15-24 years, and who has no partner or child of their own usually resident in the household.
- **Non-family member** A person who is not related to any other member of the household in which they are living.
- **Not in the labour force** Persons who were not in the categories employed or unemployed as defined.

OccupationFrom August 1996, classified according to the Australian Standard
Classification of Occupations, Second Edition 1996 (Cat. no. 1220.0).
See Information Paper: ASCO – Australian Standard Classification of
Occupations (1221.0).

- **One-parent family** A family consisting of a lone parent with at least one dependent or non-dependent child (regardless of age) who is also usually resident in the household.
 - **Other family** Related individuals residing in the same household who do not form a couple or parent-child relationship with any other person in the household and are not attached to a couple or one parent family in the household. If two brothers, for example, are living together and neither is a spouse, a lone parent or a child, then they are classified as other family.
- **Own-account worker** A person who operates his or her own unincorporated economic enterprise or engages independently in a profession or trade, and hires no employees (this category was formerly entitled self employed).
 - **Participation rate** For any group, the labour force expressed as a percentage of the civilian population aged 15 years and over in the same group.

| Part-time workers | Employed persons who usually worked less than 35 hours a week (in all jobs) and either did so during the reference week, or were not at work in the reference week. |
|---|--|
| Seasonally adjusted series | A time series of estimates with the estimated effects of normal seasonal variation removed. See paragraphs 37 and 38 of the Explanatory Notes for more detail. |
| State capital cities | The areas determining the six State capital cities are the Statistical Divisions for those capital cities defined in the <i>Statistical Geography: Volume 1 - Australian Standard Geographical Classification (ASGC)</i> (1216.0). |
| Status in employment | Employed persons classified by whether they were employers, own account workers, employees, or contributing family workers. |
| Trend series | A smoothed seasonally adjusted series of estimates. See paragraphs 39 to 42 of the Explanatory Notes for more detail. |
| Unemployed | Persons aged 15 years and over who were not employed during the reference week, and: |
| | had actively looked for full-time or part-time work at any time in the four weeks up to the end of the reference week and: |
| | were available for work in the reference week; or |
| | were waiting to start a new job within four weeks from the end of the reference week, and could have started in the reference week if the job had been available then. |
| Unemployed looking for first full-time job | Unemployed persons looking for full-time work who had never worked full time for two weeks or more. |
| Unemployed looking for first job | Unemployed persons who had never worked for two weeks or more. |
| Unemployed looking for full-time work | Unemployed persons who: |
| | actively looked for full-time work and were available for work in the reference week; or |
| | actively looked for work and were not available for work in the reference week because they were waiting to start a new full-time job. |
| Unemployed looking for part-time work | Unemployed persons who: |
| | actively looked for part-time work only and were available for work in the reference week; or |
| | actively looked for work and were not available for work in the reference week because they were waiting to start a new part-time job. |

| Unemployed persons | Unemployed persons who had worked for two weeks or more in the last |
|----------------------------|--|
| classified by industry and | two years are classified according to the industry and occupation of their |
| occupation | most recent job. |
| Unemployment rate | For any group, the number of unemployed persons expressed as a percentage of the labour force in the same group. |

SUPPLEMENTARY SURVEYS

The Monthly Population Survey program collects data on particular aspects of the labour force. The following is an historical list of supplementary surveys to the monthly labour force surveys. The data are available in publication form, by subscription or on request. It may be possible to order unpublished data from these surveys by contacting the ABS.
