COMMENTARY

GENERAL

The seasonally adjusted change in the wage price index (WPI) for Australia through to June quarter 2005 was 4.0% compared with 3.6% through the year to June quarter 2004. The seasonally adjusted change for the June quarter 2005 was 1.1%, the same as for the March quarter 2005.

INDUSTRY/OCCUPATION

In original terms, Education recorded an increase of 5.7% through the year to June quarter 2005, the highest change in any industry. Other industries with strong wages growth over this period were Government administration and defence (4.9%), Construction (4.9%), and Mining (4.8%). There appears to be strong demand for skilled labour in both Construction and Mining with a number of respondents to the survey reporting they are paying additional wage increases to retain quality staff. Amongst the broad occupation groups, Tradespersons and related workers recorded the highest increase (4.5%) through the year to June quarter 2005, followed closely by Professionals (4.4%).

SECTOR

The Private sector seasonally adjusted change through the year to June quarter 2005 was 3.8%, compared with 4.7% for the Public sector. The seasonally adjusted movement for the June quarter was 1.1% for the Private sector compared with the March quarter 2005 movement of 1.0% and 1.0% for the Public sector (down from the March quarter movement of 1.2%).

SAFETY NET REVIEW (SNR)

The Australian Industrial Relations Commission handed down its 2005 SNR decision on 7 June 2005. It awarded a \$17 a week increase to full-time workers employed under federal awards. The \$17 increase equates to a rise of 3.6% for those jobs paid minimum award rates (i.e. an increase to \$484.40 per 38 hour week).

The decision was handed down after the labour price index survey reference date of the pay period ending on or before 20 May. As a result the SNR has had little effect on the June quarter WPI. The flow on into the WPI is expected to occur in the September and December quarters.

ABS • LABOUR PRICE INDEX • 6345.0 • JUN 2005 17

EXPLANATORY NOTES

INTRODUCTION

- **1** This publication contains indexes measuring changes in the price of labour in the Australian labour market.
- 2 The methodology used to construct the wage, non-wage and labour price indexes is similar to that used for other price indexes such as the Consumer Price Index. In the LPI, index numbers are compiled using information collected from a representative sample of employee jobs within a sample of employing organisations. Individual indexes are compiled for various combinations of state/territory, sector (private/public), broad industry group and broad occupation group (wage price indexes only). For more detailed information on the methodology used in the construction of the LPI, refer to *Labour Price Index: Concepts, Sources and Methods* (cat. no. 6351.0.55.001).

PUBLISHED INDEXES

- **3** Four wage price indexes are constructed and published quarterly. These indexes were first compiled for the September quarter 1997:
 - ordinary time hourly rates of pay excluding bonuses index
 - ordinary time hourly rates of pay including bonuses index
 - total hourly rates of pay excluding bonuses index
 - total hourly rates of pay including bonuses index.
- **4** Four non-wage price indexes are constructed. These are financial year indexes and were first compiled for the 2001–02 financial year. The full set is updated annually in the September quarter LPI publication. In all other quarters a summary table is published as an appendix to the publication. The non-wage indexes cover:
 - annual and public holiday leave
 - superannuation
 - payroll tax
 - workers' compensation.
- **5** From the individual wage and non-wage components a labour price index can be constructed. Two versions of the labour price index are produced and, like the non-wage price indexes, they are financial year indexes (first compiled for 2001–02):
 - labour price index excluding bonuses
 - labour price index including bonuses.

DESIGN OF THE INDEXES

BROAD DESCRIPTION

- **6** The wage, non-wage and labour price indexes measure changes over time in the price of labour unaffected by changes in the quality or quantity of work performed. A range of procedures have been developed to identify and measure quality and quantity changes and ensure that only pure price changes are reflected in the indexes.
- **7** Price-determining characteristics of the jobs are detailed in fixed pricing specifications and any changes in labour payments due to changes in the pricing specifications are removed from index movements. The following are examples of changes in price-determining characteristics which are not reflected in index movements:
- changes in the nature of work performed (e.g. different tasks or responsibilities)
- changes in the quantity of work performed (e.g. the number of hours worked)
- changes in the characteristics of the job occupant (e.g. age, apprenticeship year, successful completion of training or a qualification, grade or level, experience, length of service, etc.)
- changes in location where the work is performed.
- **8** Changes in the price of labour resulting from changes in the composition of the labour market are also excluded from index movements. To achieve this, price movements for each segment of the labour market (defined by state/territory, sector, industry and occupation) are combined using expenditure weights that remain constant between successive weighting base periods.

WAGE PRICE INDEXES

- **9** The *ordinary time hourly rates of pay indexes* that *exclude bonuses* measure quarterly changes in ordinary time hourly wage and salary rates. Changes in rates of pay reflected in these indexes (i.e. pure price changes) arise from a range of sources including award variations, enterprise and workplace agreements, centralised wage fixation, individual contracts and informal arrangements.
- **10** These indexes are not affected by changes in:
 - penalty payments for overtime, shifts, weekends and public holidays (which fluctuate depending on the number of hours paid at penalty rates)
 - allowances (which fluctuate according to how much work is performed under special work conditions e.g. height, dirt, heat allowances)
 - bonus payments (which may, or may not, relate to an individual's work performance).
 - These payments are specifically excluded when calculating ordinary time hourly wage and salary rates.
- **11** The effect of rolling ordinary time penalty payments and allowances into ordinary time hourly rates is excluded from these indexes. However, when overtime penalty payments are rolled into ordinary time hourly rates, the ordinary time indexes will increase accordingly.
- **12** The *total bourly rates of pay indexes* that *exclude* bonuses are based on a weighted combination of ordinary time hourly wage and salary rates (described in paragraphs 9 and 10) and overtime hourly rates. As a result, the total hourly indexes reflect changes in both the ordinary time and overtime hourly rates. However, the effect of changes in the amount of overtime paid at each overtime rate is not shown in these indexes.
- **13** Only those indexes that *exclude* bonuses are pure price indexes because bonus payments tend to reflect, at least partly, changes in the quality of work performed.

NON-WAGE PRICE INDEXES

- **14** The *annual and public boliday leave index* is calculated using both ordinary time hourly wage and salary rates, and the amount of annual and public holiday leave offered by employers. Pure price changes in either of these variables will reflect in the index. The index specifically prices leave *entitlements* and therefore will not show changes due to fluctuations in the actual amount of leave taken by job occupants.
- **15** The *superannuation index* is calculated using ordinary time hourly wage and salary rates, and the rate of superannuation that is paid by employers. Pure price changes in either of these variables will be reflected in the index. Superannuation payments equal to and above the legislated minimum specified in the *Superannuation Guarantee Act* 1992 are included in the index. Amounts that are salary sacrificed to superannuation are included in the wage price indexes and not the superannuation index.
- 16 The *payroll tax and workers' compensation indexes* are calculated differently to the other wage and non-wage indexes. As these costs are both levied at the employer level, the indexes are calculated using total payroll information rather than rates of pay data. The separate indexes are derived by applying either payroll tax rates/thresholds or workers' compensation premium rates to the total payroll data. The indexes reflect both pure price changes in total payroll and either changes in the payroll tax rates/thresholds or workers' compensation premium rates.
- **17** Data quality concerns exist in relation to the workers' compensation premium rates for the ACT private sector. Until these concerns are resolved, this data will be imputed based on industry averages across Australia. Workers' compensation index numbers for the ACT private sector will not be published separately.

LABOUR PRICE INDEXES

18 Two labour price indexes (one including bonuses and one excluding them) are constructed from the individual wage and non-wage components. As with the wage price indexes, only the labour price index that excludes bonuses is a pure price index because bonuses tend to reflect, at least partly, changes in the quality of work performed.

SCOPE AND COVERAGE

- **19** The target population of employers for the LPI is all employing organisations in Australia (private and public sectors) except:
 - enterprises primarily engaged in agriculture, forestry or fishing
 - private households employing staff
 - foreign embassies, consulates, etc.
- **20** All employee jobs in the target population of employers are in scope of the LPI, except the following:
 - Australian permanent defence force jobs
 - non-salaried directors
 - proprietors/partners of unincorporated businesses
 - persons paid by commission only
 - working proprietors/owner managers of Pty Ltd companies
 - employees on workers' compensation who are not paid through the payroll
 - 'non-maintainable' jobs (i.e. jobs that are expected to be occupied for less than six months of a year)
 - jobs for which wages and salaries are not determined by the Australian labour market (e.g. most employees of Community Development Employment Programs, jobs where the remuneration is set in a foreign country).
- **21** As such, full-time, part-time, permanent, casual, managerial and non-managerial jobs are in scope of the LPI. Costs incurred by employers for work undertaken by self-employed persons such as consultants and subcontractors are out-of-scope of the LPI, as they do not relate to employee jobs.
- 22 Information for the wage price indexes is collected each quarter by mail questionnaires from a sample survey of approximately 4,800 private and public sector employers selected from the ABS Business Register. In the first quarter they participate in the survey, each employer selects a sample of jobs from their workplace(s) using sampling instructions provided by the ABS, and provides information for these jobs, including detailed pricing specifications. In subsequent quarters they are asked to provide details of payments made to the current occupants of these same jobs. It is essential that the same jobs are priced in successive quarters, whether the individual job occupants are the same or not. Approximately 20,000 matched jobs are priced each quarter from the selected employers.
- 23 The sampling method retains the highest possible common sample of employers over time, and retains the same sampled jobs within those employers where possible. However, it is also necessary to ensure the LPI continues to be relevant and representative over time. For these reasons, the employer sample is refreshed annually (for the December quarter) in a way that ensures a high proportion of common selections while allowing new employers to be represented in the sample. Refreshing the sample also allows the ABS to control the length of time that small businesses are included in the sample.
- **24** Between each annual refresh of the employer sample, a small number of employee jobs will be lost from the survey sample because of the closure of some businesses. In addition, some jobs in continuing businesses will be replaced in the sample because of restructuring and other job changes.

DATA COLLECTION

DATA COLLECTION continued

WEIGHTING

- 25 Annual leave and superannuation information is collected from the same job sample as that used to construct the wage price indexes. However, data are only collected annually as part of the June quarter LPI survey. Changes in the job sample due to factors such as the annual refreshing of the employer sample, together with the requirement of pricing the same jobs in successive years, reduces the number of matched jobs used to calculate the annual and public holiday leave index and the superannuation index compared with the matched jobs underlying the wage price indexes.
- **26** Information from administrative and other ABS data sources is used to construct the payroll tax and workers' compensation indexes, as well as the public holiday component of the annual and public holiday leave index.
- 27 In the LPI, as with other price indexes, expenditure weights are used to combine elementary aggregates into broader level indexes. These weights are derived from independent estimates of labour costs for each elementary aggregate. The estimates are sourced from the Major Labour Costs Survey, the Employee Earnings and Hours Survey and the Census of Population and Housing. The weights are updated for the December quarter each year to take account of changing employer expenditure patterns for labour among each segment of the labour market (elementary aggregates). They reflect changes in the distribution of the number of employee jobs among occupations, industries, states/territories and sectors, as well as changes in labour cost relativities. Appendix 1 shows the distribution of employers' expenditure on wages and salaries, for the December quarter 2004.
- 28 To facilitate comparison of index numbers over time, the published indexes are not re-referenced (i.e. reset to 100.0) each time this re-weighting occurs. Instead, the series based on the old expenditure weights and that based on the new weights are linked via an arithmetic calculation, which is referred to as chaining. This provides a continuous series from the commencement of the index, while incorporating the updated expenditure weights.

INTERPRETATION OF INDEX

29 Index numbers in this publication measure changes in the price of labour between the commencement of the series and a later period. Index number levels cannot be compared across states/territories as they do not provide comparative information on the relative levels of labour costs. Similarly, index number levels cannot be compared across sectors, industries, or occupations. The usefulness of index numbers stems from the fact that index numbers for any two periods can be used to directly calculate the change or movement in the price of labour between the two periods. These *movements* can be compared across states/territories, sectors, industries, or occupations.

PERCENTAGE CHANGE AND ROUNDING

30 The published index numbers have been rounded to one decimal place, and the percentage changes (also rounded to one decimal place) are calculated from the rounded index numbers. In some cases, this can result in the percentage change for the total level of a group of indexes being outside the range of the percentage changes for the component level indexes. Seasonally adjusted and trend estimates are calculated from unrounded original indexes and then rounded to one decimal place.

INDEX MOVEMENTS

- **31** Movements in indexes from one period to another can be expressed either as changes in index points or as percentage changes. In this publication, percentage changes are calculated to illustrate three different kinds of movements in indexes:
 - movements between consecutive quarters
 - movements between corresponding quarters of consecutive years
 - movements between consecutive financial years.
- **32** The following example illustrates the method of calculating changes in index points and percentage changes between any two periods:

Total bourly rates of pay excluding bonuses, All Sectors, Australia

Index numbers, seasonally adjusted (see table 1)

June quarter 2005 105.4

less June quarter 2004 101.3

Change in index points 4.1

Percentage change $4.1/101.3 \times 100 = 4.0\%$

FINANCIAL YEAR INDEXES

33 Index numbers for financial years are calculated as simple (arithmetic) averages of the four quarterly index numbers for the financial year. As the wage price indexes were first produced for the September quarter 1997, the first financial year index number that can be calculated is for 1997–98. Consequently, the first percentage change between financial years that can be calculated is between 1997–98 and 1998–99. The following example illustrates the method of calculating the financial year index number for 2004–05:

Total hourly rates of pay excluding bonuses, Australia

Index numbers (see table 2)

 September quarter 2004
 102.3

 plus December quarter 2004
 103.3

 plus March quarter 2005
 104.4

 plus June quarter 2005
 105.1

Financial year 2004-05 415.1/4 = 103.8

- **34** Percentage changes between the index numbers for any two financial years can be calculated using the method outlined in paragraph 32 above.
- **35** Seasonally adjusted estimates are derived by estimating and removing systematic calendar related effects from the original series. In most economic data these calendar related effects are a combination of the classical seasonal influences (e.g. the effect of the weather, social traditions or administrative practices) plus other kinds of calendar related variation, such as trading day, Easter or the proximity of significant days in the year (e.g. Christmas). In the seasonal adjustment process, both seasonal and other calendar related factors evolve over time to reflect changes in activity patterns. The seasonally adjusted estimates still reflect the sampling and non-sampling errors to which the original estimates are subject.
- The *total bourly rates of pay excluding bonuses index* is the only index of the LPI that is seasonally adjusted. Institutional effects largely drive the seasonality of this index. Important factors in determining this seasonality are the timing of effect of Australian workplace agreements and certified agreements, the length of these agreements, and the timing of significant centralised wage hearings that impact on award rates of pay such as the 'Safety Net Review' conducted by the Australian Industrial Relations Commission. A significant future change in wage setting arrangements, such as that which occurred during the mid to late 1990s, could affect the seasonality of the index. The ABS does monitor the effects of any such change and will advise users of the reliability of the seasonally adjusted series during any transition period.

SEASONALLY ADJUSTED

CONCURRENT SEASONAL ANALYSIS

37 The LPI uses a concurrent seasonal adjustment methodology to derive the adjustment factors. This method uses the original time series available at each reference period to estimate seasonal factors for the current and previous quarters. Concurrent seasonal adjustment is technically superior to the more traditional method of reanalysing seasonal patterns once each year because it uses all available data to fine tune the estimates of the seasonal component each quarter. It eliminates the need to use projected seasonal factors, and results in substantial gains in accuracy and consistency of the seasonally adjusted series. With concurrent analysis, the seasonally adjusted series are subject to revision each quarter as the estimates of the seasonal factors are improved. In most instances, the only noticeable revisions will be to the combined adjustment factors for the previous quarter and for the same quarter in the preceding year as the reference quarter (i.e. if the latest quarter is Q_t then the most significant revisions will be to Q_{t-1} and Q_{t-4}).

TREND ESTIMATES

38 Trend is a measure of the underlying direction of a series. The ABS trend estimates are derived by applying a 7-term Henderson-weighted moving average to all quarters of the respective seasonally adjusted indexes except the first three and last three quarters. Trend estimates are created for these quarters by applying surrogates of the 7-term Henderson weighted moving average to the seasonally adjusted indexes, tailored to each time series. In general, trend estimates give a better indication of underlying behaviour than the seasonally adjusted estimates. Please refer to the ABS Information Paper, A *Guide to Interpreting Time Series - Monitoring Trends* (cat. no. 1349.0).

REFERENCE BASE PERIOD

- **39** The reference base period of an index series is that period for which the value of the index is set to 100.0. It is most commonly a year but can also be a different length of time, ranging from two or three years down to a single quarter. It often coincides with the weighting base for the series, but this is not essential. The September quarter 1997 was used as the original reference base for the wage price indexes as it was the first quarter for which data was available.
- **40** With the introduction of the non-wage price indexes, all indexes are presented on a reference base of 2003–04. An explanation of the re-referencing process is included in Appendix 2 of this publication.

REVISIONS TO INDEXES

41 Original index numbers will be released as final figures at the time they are first published. Revisions will only occur in exceptional circumstances. Trend and seasonally adjusted indexes for some quarters will be revised as extra quarters are included in the series analysed for seasonal influences (see paragraph 37).

⁽d) For the public sector, these industries are combined and included in the 'All industries' total.

APPENDIX 2 RE-REFERENCING THE WAGE PRICE INDEX

REFERENCE BASE

The reference base of an index series is that period for which the value of the index is set to 100.0. For the wage price indexes, the September quarter 1997 was used as the original reference base, as it was the first quarter for which data was available. With the introduction of the non-wage and labour price indexes, all indexes are now presented on a reference base of 2003–04.

CONVERTING A SERIES TO THE NEW REFERENCE BASE

The conversion of series from the old base to the new base also involves a rescaling of the index numbers. The conversion factor that should be applied to the index numbers is calculated by obtaining the ratio of the index numbers on the old and new bases for the new reference period.

The conversion factor is calculated using the *unrounded* index number for the 2003–04 financial year. The calculation of financial year indexes is outlined in paragraph 33 of the Explanatory Notes.

For example, for the *total bourly rates of pay excluding bonuses index* for Australia, an arithmetic conversion factor is obtained as follows:

Index number for year 2003–04 (on base September quarter 1997 = 100.0) is 123.075

Index number for year 2003–04 (on base 2003–04 = 100.0) is 100.0 Conversion factor 100/123.075 = 0.8125

The factor 0.8125 may be multiplied by any *total bourly rates of pay excluding bonuses index* number for Australia on the old reference base to give the corresponding number on the new reference base. The procedure shown in the above example may be followed in respect of any specific index series for which index numbers have been published on the old reference base.

Index numbers and percentage changes are always published to one decimal place, with the percentage changes being calculated from the rounded index numbers. Index numbers for periods longer than a single quarter (e.g. for financial years) are calculated as the simple arithmetic average of the relevant rounded quarterly index numbers. The conversion factor described above is applied to the rounded index numbers.

A consequence of re-referencing price indexes can be that period to period percentage changes calculated using re-referenced index number series may differ slightly from those calculated using the original series. These differences do not constitute a revision of the index but simply reflect the effect of rounding.

The conversion of series from the new base to the old base involves a rescaling of the index numbers. The rescaling factor is obtained by taking the inverse of the previously described scaling factor.

For example, for the *total bourly rates of pay excluding bonuses index* for Australia, the rescaling factor is obtained as follows:

Index number for year 2003–04 (on base September quarter 1997 = 100.0) is 123.075

Index number for year 2003–04 (on base 2003–04 = 100.0) is 100.0 Conversion factor 123.075/100 = 1.2308

The factor 1.2308 may be multiplied by any *total bourly rates of pay excluding bonuses index* number for Australia on the new reference base to give the corresponding number on the old reference base.

Conversion factors for most of the published *total bourly rates of pay excluding bonuses indexes* are provided in table A2. Additional factors can be obtained using the formulas above or by contacting Tim Landrigan on Perth (08) 9360 5151.

GLOSSARY

Annual and public holiday Measures changes in the price of annual and public holiday leave (see Explanatory Notes

leave index paragraph 14).

Bonuses Payments made to a job occupant that are in addition to regular wages and salaries and

which generally relate to the job occupant's, or the organisation's, performance.

Elementary aggregates The finest aggregations of jobs, in terms of state/territory, sector, industry group and

occupation group, for which expenditure weights are available.

Employee job A job for which the occupant receives remuneration in wages, salary, payment in kind, or

piece rates.

Employer Organisation with one or more employees.

Expenditure weights A measure of the relative importance of each elementary aggregate, based on employers'

total expenditure on the LPI component being considered (e.g. wages and salaries, superannuation, etc.). Expenditure weights are used to combine elementary aggregate

indexes into broader level indexes.

Index number Measures the ratio of the price of labour between the commencement of the index series

and a later period.

Industry Classified according to the Australian and New Zealand Standard Industrial

Classification (ANZSIC), 1993 (cat. no. 1292.0).

Labour price index Measures changes in the price of labour. Includes wages and salaries, overtime, bonuses

(only in the labour price including bonuses index), annual and public holiday leave, superannuation, payroll tax and workers' compensation (see Explanatory Notes

paragraph 18).

Occupation Classified according to the Australian Standard Classification of Occupations (ASCO),

Second Edition (cat. no. 1220.0).

Ordinary time hourly rates of pay index Measures quarterly change in ordinary time hourly rates of pay (see Explanatory Notes paragraphs 9 and 10).

Ordinary time hours Award, standard or agreed hours of work paid for at the ordinary rate.

Overtime hours The number of hours paid for in excess of ordinary time hours, based on the data for the

first quarter a selected job is included in the survey.

Payroll tax index Measures changes in the price of payroll tax (see Explanatory Notes paragraph 16).

Reference base period The period for which an index series is given the value of 100.0. The current reference

base for the LPI is the 2003–04 financial year.

Sector Public sector comprises local government authorities and all government departments

and agencies created by, or reporting to, the Commonwealth, or state/territory

parliaments. The private sector comprises all organisations not classified as public sector.

Seasonal adjustment Process of removing systematic calendar related effects from the original series (see

Explanatory Notes paragraphs 35–37).

Superannuation index Measures changes in the price of superannuation (see Explanatory Notes paragraph 15).

Total hourly rates of pay index Measures quarterly change in combined ordinary time and overtime hourly rates of pay

(see Explanatory Notes paragraph 12).

Trend A measure of the underlying direction of a series (see Explanatory Notes paragraph 38).

Weighting base The period to which the expenditure weights relate.

Workers' compensation index Measures changes in the price of workers' compensation (see Explanatory Notes

paragraph 16).
