EXPLANATORY NOTES

Introduction

During the period February to May 1981 a survey was conducted throughout Australia in order to obtain information about the different types of working patterns of employed persons. Persons defined as 'handicapped' (see *Survey of Handicapped Persons, Australia, February to May 1981 (Preliminary)* (4342.0)) were not asked some of the questions relating to working patterns. However, a limited amount of data about the working hours arrangements of handicapped persons is included in some of the tables in this publication.

2. This is the third publication for this survey and contains tables for some groups not included in the previous two publications, such as 'day' workers and multiple jobholders. A preliminary publication *Working Hours Arrangements, Australia, February to May 1981 (Preliminary)* (6337.0) containing a summary of results of the current survey, was released on 19 February 1982. The first final publication *Working Hours Arrangements, Australia, February to May 1981* (6338.0) containing detailed results was released on 5 August 1982.

3. A survey of evening and night work, and work patterns of employees, was conducted in November 1976. Results were published in *Work Patterns of Employees, November 1976* (6328.0) and *Evening and Night Work, November 1976* (6329.0). The results contained in these publications are not directly comparable with the results in the following tables, as information obtained in the November 1976 survey was less extensive and differently defined.

4. The current survey was based on a multi-stage area sample of private dwellings (about 30,000 houses, flats, etc.) and non-private dwellings (hotels, motels, etc.) and covered about two thirds of one per cent of the population in Australia. Information was obtained from the occupants of selected dwellings by carefully chosen and specially trained interviewers. Some data obtained related only to the four weeks prior to the interviews, which commenced on 2 February 1981.

Scope

5. The survey included all persons aged fifteen years and over except:

- (a) members of the permanent defence forces;
- (b) certain diplomatic personnel of overseas governments, customarily excluded from census and estimated populations;
- (c) overseas visitors holidaying in Australia;
- (d) members of non-Australian defence forces (and their dependants) stationed in Australia;
- (e) boarding school students, some patients in hospitals and sanatoria, or inmates of gaols, reformatories, etc.

Definitions

6. A *nightworker* was defined as an employed person who in any one of the four weeks prior to the survey date worked a total of 15 hours or more between 7.00 p.m. and 7.00 a.m. in either their main or second job. Persons who worked these hours in all jobs combined but not in their main or second jobs individually were not classified as nightworkers. ('Main job' was defined as the job in which respondents usually worked the most hours.)

7. *Other workers* (i.e. 'day' workers) were, therefore, persons who did not work the hours described in paragraph 6 above.

8. *Shiftworkers* were employees (excluding 'handicapped' persons) who in the four weeks prior to the date of the interview worked two or more different work shifts in their main job; for the purposes of this survey, work shifts were two or more distinct periods of work within a 24-hour day between which employees were regularly rotated. Typically the periods of time covered by the work shifts operating in any given establishment or workshop vary appreciably and often do not overlap with each other. Persons who worked fixed hours, i.e. those who did not work rotating shifts whether during the day or at night, were not classified as shiftworkers. Persons who, in establishments working several 'shifts', worked the 'night shift' only were, therefore, not classified as shiftworkers but were generally classified as nightworkers.

9. *Weekend workers* were persons who usually worked at some time on either Saturdays or Sundays (or both). This category included persons who also worked on one or more weekdays but excludes those who worked on a varying number of days each week. However, those persons for whom any regular working period ended early on Saturday morning or started late on Sunday night were generally not included as weekend workers. The category *other than weekend workers* excluded persons who worked on a varying number of days each week.

10. *Multiple jobholders* were persons who usually worked in two or more jobs each week and who were employed in at least one of their jobs as wage or salary earners.

11. *Type of ordinary time working pattern* was the type of arrangement worked during award, etc. agreed or standard hours of work.

12. A *rostered* employee was scheduled to start work at the same time on each working day but worked on varying days each week.

13. Employees working *flexible hours* were able, within limits, to choose to some extent the times at which they started and/or finished work each day, while still working the award or agreed hours on average over a longer period.

14. *Marital status.* Persons were classified as *married* or *not married*; the latter category included persons who, at the time of the survey, had never married or were widowed, divorced or separated.

Classification of family status

15. Families were classified as married-couple families or other families. Married-couple families comprised the married couple together with any children or other relatives present. Other families comprised one-parent families and families in which there was no parent, such as groups of related persons.

16. *Family status* was determined at the time of the survey and may have been affected by absences of members from the household (e.g. children at boarding schools).

17. *Dependent children* comprised all family members under 15 years of age and all family members aged 15 to 20 years who were full-time students. Dependent children were regarded as *present* and hence were included in the survey provided they were not living away from the household (for example, at boarding school) at the time of the survey.

18. A person was defined as *not a member of a family* if they were living alone or they were not related to any other member of a household in which they were living.

19. For further details of this classification see *Labour Force Status and Other Characteristics of Families, June 1981* (6224.0).

Classification of industry and occupation

20. Industry is classified according to the *Australian Standard Industrial Classification* (ASIC) 1978 and occupation according to the *Classification and Classified List of Occupations, Revised June 1981*.

Reliability of the estimates

21. Estimates in this publication are subject to two sources of error:

- (a) *sampling error*: since the estimates are based on information obtained from occupants of a sample of dwellings, they may differ from the figures that would have been produced if all dwellings had been included in the survey. More information on this topic is given in the Technical note.
- (b) *non-sampling error*: inaccuracies may occur because of imperfections in reporting by interviewers and respondents and errors made in the coding and processing of data. These inaccuracies may occur in any enumeration, whether it be a full count or only a sample. Every effort is made to reduce the non-sampling error to a minimum by careful design of questionnaires, intensive training and supervision of interviewers and efficient operating procedures.

Related publications

22. Other ABS publications which may be of interest include:

The Labour Force, Australia (6203.0)—issued monthly

Work Patterns of Employees, Australia, November 1976 (6328.0)

Evening and Night Work, Australia, November 1976 (6329.0)

Working Conditions, Australia, February to May 1979 (6335.0)

Australian Statistician

SUMMARY OF FINDINGS

'Day' workers

Of 5,683,000 'day' workers during February to May 1981, about 82 per cent were wage or salary earners (employees) in their main job, the others being employers or self-employed persons. About 97 per cent of all 'day' workers held one job only. Of employees in their main job, about 7 per cent of 'day' workers who were not shiftworkers worked rostered hours (males 5 per cent, females 9 per cent), about 26 per cent worked flexible hours (males 28 per cent, females 21 per cent) and about 68 per cent worked fixed or standard hours on the same days each week (males 66 per cent, females 69 per cent). For employees who usually worked on weekends the corresponding proportions (for persons) were 13 per cent rostered, 25 per cent flexible hours and 62 per cent fixed or standard hours. About 30 per cent of 'day' workers who were employees in their main job usually started work before 8.00 a.m. and 9 per cent usually finished work at 6.00 p.m. or later.

Nightworkers

About 7 per cent of all nightworkers held more than one job. Of employees who were nightworkers in their main job, 45,700 (11 per cent) also did unpaid-for work

and 77 per cent of these worked 10 or more hours without pay. About 95,600 (23 per cent) worked paid overtime, of whom about 42 per cent worked 10 hours or more of overtime.

Multiple jobholders

About 17 per cent of all multiple jobholders were nightworkers in either or both of their jobs of whom 51 per cent were nightworkers in their main job only. About 17 per cent usually worked in their second job on five or more days each week and 26 per cent usually worked less than 35 hours in their main job each week.

Family characteristics of various workers

Persons with family responsibilities are heavily represented amongst nightworkers and shiftworkers working double shifts. About 46 per cent of nightworkers had dependent children compared with 34 per cent for all employees. Shiftworkers with dependent children comprised about 37 per cent of all shiftworkers but about 46 per cent of those who worked double shifts. About 35 per cent of nightworkers with dependent children claimed that nightwork was a disadvantage because of health/ sleeping problems.

TECHNICAL NOTE

Estimation procedure

The estimates are derived from the population survey by use of a ratio estimation procedure which ensures that the estimates conform to an independently estimated distribution of the population for each capital city and remainder of State by age and sex, rather than to the corresponding distribution within the sample itself.

Reliability of the estimates

2. Since the estimates in this publication are based on information obtained from occupants of a sample of dwellings, they are subject to sampling variability; that is, they may differ from the figures that would have been produced if all dwellings had been included in the survey. One measure of the likely difference is given by the *standard error*, which indicates the extent to which an estimate might have varied by chance because only a sample of dwellings was included. There are about two chances in three that a sample estimate will differ by less than one standard error from the figure that would have been obtained if all dwellings had been included, and about nineteen chances in twenty that the difference will be less than two standard errors. Another measure of the likely difference is the *relative standard error*, which is obtained by expressing the standard error as a percentage of the estimate.

3. Space does not allow for the separate indication of the standard errors of all estimates in this publication. A table of standard errors for general application is given on the following page. Since they are averages based on calculations for a limited number of past surveys over a wide range of labour force characteristics, these figures will not give a precise measure of the standard error of a particular estimate but they will provide an indication of its magnitude.

4. An example of the calculation and the use of standard errors in relation to estimates of persons is as follows. Table 6 shows the estimated number of weekend workers was 726,400. Since this estimate is between 500,000 and 1,000,000 in the standard error table, the standard error for Australia will be between 7,200 and 9,100 and can be approximated as 8,100 (rounded to the nearest 100). Therefore there are about two chances in three that the value that would have been produced if all dwellings had been included in the survey will fall in the range 718,300 to 734,500 and about nineteen chances in twenty that the value will fall within the range 710,200 to 742,600. This example is illustrated in the following diagram.

5. As can be seen from the standard error table, *the smaller the estimate the higher is the relative standard error*. Very small estimates are thus subject to such high standard errors (relative to the size of the estimate) as to detract seriously from their value for most reasonable uses. In the tables in this publication, estimates less than the lowest levels shown in the standard error table have not been published. Although figures for these small components can in some cases be derived by subtraction, they should not be regarded as reliable.

6. Proportions and percentages formed from the ratio of two estimates are also subject to sampling error. The size of the error depends on the accuracy of both the numerator and the denominator. The formula for the relative standard error (RSE) of a proportion is given below:

$$RSE (x/y) = \sqrt{[RSE(x)]^2 - [RSE(y)]^2}$$

7. Considering the example from paragraph 4 above, the 726,400 weekend workers represent 16.7 per cent of the 4,349,300 employees who were not shiftworkers. The standard error of 4,349,300 is approximately 14,300 so the relative standard error is 0.3 per cent. The relative standard error for 726,400 is 1.2 per cent. Applying the above formula, the relative standard error of 16.7 per cent is $\sqrt{(1.2)^2 - (0.3)^2}$ or 1.2 per cent, giving a standard error of about 0.2 per cent. Therefore, there are about two chances in three that the proportion of employees who were not shiftworkers and who were weekend workers is between 16.5 per cent and 16.9 per cent and nineteen chances in twenty the proportion is within the range 16.3 per cent to 17.1 per cent.

8. Published figures may also be used to estimate the difference between two survey estimates (of numbers or percentages). Such a figure is itself an estimate and is therefore subject to sampling error. The sampling error of the difference between two estimates depends on their standard errors and the relationship (correlation) between them. An approximate standard error (SE) of the difference between two estimates (x-y) may be calculated by the following formula:

$$SE (x - y) = \sqrt{[SE(x)]^2 + [SE(y)]^2}$$

While this formula will only be exact for differences between separate and uncorrelated characteristics or subpopulations it is expected to provide a good approximation for all differences likely to be of interest in this publication.

9. The imprecision due to sampling variability, which is measured by the standard error, should not be confused with inaccuracies that may occur because of imperfections in reporting by interviewers and respondents and errors made in the coding and processing of data. Inaccuracies of this kind are referred to as the *non-sampling error*, and they may occur in any enumeration, whether it be a full count or only a sample.

STANDARD ERRORS OF ESTIMATES

Size of estimate	N.S.W.	Vic.	Qld	S.A.	W.A.	Tas.	N.T.	A.C.T.	Australia		
	—number—									Per cent of estimate	
700						210
