State seasonally adjusted series and trend series are included in this publication for the first time (see Tables 8 and 9).

Care should be taken in the interpretation of the trend series, as the most recent data are subject to revision when subsequent months' data become available. Care should also be taken in the interpretation of month-to-month movements in the original and seasonally adjusted data - see paragraphs 15 to 19.

MAIN FEATURES

The May 1987 estimate (seasonally adjusted) of employed persons was 7,077,900, which is 139,400 higher than in May 1986. The fall of 6,700 in employment between April 1987 and May 1987 is not statistically significant. The trend estimates show a pattern of continuing growth in employment between October 1986 and May 1987, following a levelling off in growth between April 1986 and September 1986.

They indicate that the growth in employment since September 1986 occurred for both males and females and for both full and part-time workers.

The number of unemployed persons was 633,400 in May 1987. While there was only a marginal fall (7,400) in unemployment (seasonally adjusted) between April and May 1987, there were more significant changes in some of the component series. Unemployed males looking for full-time work increased by 10,900, with the number looking for part-time work declining by 2,800 giving an overall rise in male unemployment of 8,000. Female unemployment decreased between April and May 1987 in both the number looking for full-time work (down 7,200) and part-time work (down 8,200), giving an overall fall in female unemployment of 15,400. The trend estimates of unemployed persons have remained stable at about 640,000 from November 1986, following a period of steady increases from November 1985 (583,400) to October 1986 (636,300).

The May 1987 unemployment rate for persons was 8.2% (seasonally adjusted). Since July 1986, successive monthly estimates of the unemployment rate have been in the range 8.2% to 8.4%. The rate for females dropped sharply from 9.1% to 8.6% reflecting a fall in unemployment, a slight rise in employment and a drop of 0.3 percentage points in the participation rate for females. Trend estimates show the unemployment rate has remained steady at either 8.3% or 8.4% since September 1986.

The State trend estimates show that the unemployment rate for all persons has remained very steady in recent months in each State except Victoria, where there has been a decline in the trend unemployment rate from 7.0% in November 1986 to 6.4% in May 1987. Victoria also has a lower unemployment rate than any other State.

The participation rate (seasonally adjusted) for May 1987 was 62.0% compared with 62.2% for both March and April. The trend estimates show that the participation rate for persons has been relatively unchanged since April 1986. The estimate has held steady at 62.1% for the last five months.

Indicates break in series - see paragraph 14.

UNEMPLOYMENT RATE: TREND SERIES

Indicates break in series - see paragraph 14.

EXPLANATORY NOTES

Introduction

This publication contains preliminary estimates of the civilian labour force derived from the labour force survey part of the monthly population survey. Estimates for the current month are preliminary and subject to revision. Revised estimates for the current month and more detailed estimates will be published in *The Labour Force, Australia* (6203.0).

The population survey

2. The population survey is based on a multi-stage area sample of private dwellings (about 35,000 houses, flats, etc.) and non-private dwellings (hotels, motels, etc.) and covers about two-thirds of one per cent of the population of Australia. The information is obtained from the occupants of selected dwellings by carefully chosen and specially trained interviewers. The interviews are generally conducted during the two weeks beginning on the Monday between the 6th and 12th of each month. The information obtained relates to the week before the interview (i.e. the survey week).

Scope

3. The labour force survey includes all persons aged 15 and over except: members of the permanent defence forces; certain diplomatic personnel of overseas governments, customarily excluded from census and estimated populations; overseas residents in Australia; and members of non-Australian defence forces (and their dependents) stationed in Australia.

Coverage

4. In the labour force survey, coverage rules are applied which aim to ensure that each person is associated with only one dwelling, and hence has only one chance of selection. The coverage rules are, necessarily, a balance between theoretical and operational considerations. Nevertheless, the chance of a person being enumerated at two separate dwellings in the survey is considered to be negligible.

Definitions

5. The labour force category to which a person is assigned depends on the *actual activity* undertaken during the survey week (i.e. whether working, looking for work, etc.). The following definitions, which conform closely to the international standard definitions specified by the International Labour Office (ILO), relate only to those persons within the scope of the survey.

6. *Employed persons* comprise all those aged 15 and over who, during the survey week:

- (a) worked for one hour or more for pay, profit, commission or payment in kind in a job or business, or on a farm (including employees, employers and self-employed persons); or
- (b) worked for one hour or more without pay in a family business or on a farm (i.e. unpaid family helpers); or

(c) were employees who had a job but were not at work and were: on paid leave; on leave without pay for less than four weeks up to the end of the survey week; stood down without pay because of bad weather or plant breakdown at their place of employment for less than four weeks up to the end of the survey week; on strike or locked out; on workers' compensation and expected to be returning to their job; or receiving wages or salary while undertaking full-time study; or

(d) were employers, self-employed persons or unpaid family helpers who had a job, business or farm, but were not at work.

7. *Full-time workers* are those who usually worked 35 hours or more a week and others who, although usually part-time workers, worked 35 hours or more during the survey week. *Part-time workers* are those who usually work less than 35 hours a week and who did so during the survey week. When recording hours of work, fractions of an hour are disregarded.

8. *Unemployed persons* are those aged 15 and over who were not employed during the survey week, and:

(a) had actively looked for full-time or part-time work at any time in the four weeks up to the end of the survey week and:

(i) were available for work in the survey week, or would have been available except for temporary illness (i.e. lasting for less than four weeks to the end of the survey week); or

(ii) were waiting to start a new job within four weeks from the end of the survey week and would have started in the survey week if the job had been available then; or

(b) were waiting to be called back to a full-time or part-time job from which they had been stood down without pay for less than four weeks up to the end of the survey week (including the whole of the survey week) for reasons other than bad weather or plant break-down.

9. *Unemployed persons looking for their first full-time job* are those who had never worked full time for two weeks or more.

10. The *unemployment rate* for any group is the number unemployed expressed as a percentage of the labour force in the same group.

11. The *labour force* comprises all persons who, during the survey week, were employed or unemployed, as defined above.

12. The *labour force participation rate* for any group is the labour force expressed as a percentage of the civilian population aged 15 and over in the same group.

13. *Persons not in the labour force* are those who, during the survey week, were not in the categories employed or unemployed as defined above.

Revision of series

14. From April 1986, the definition of employed persons was changed to include persons who worked without pay between 1 and 14 hours per week in a family business or on a farm (i.e. unpaid family helpers). For further information, see paragraphs 37 and 38 of the Explanatory Notes to the February 1987 issue of *The Labour Force, Australia* (6203.0).

Reliability of the estimates

15. Two types of error are possible in an estimate based on a sample survey: sampling error and non-sampling error. The *sampling error* is a measure of the variability that occurs by chance because a sample, rather than the entire population, is surveyed. One measure of the likely difference resulting from not including all dwellings in the survey is given by the *standard error*. There are about two chances in three that a sample estimate will differ by less than one standard error from the figure that would have been obtained if all dwellings had been included in the survey, and about nineteen chances in twenty that the difference will be less than two standard errors.

16. Standard errors of estimates for the latest month and of estimates of movements since the previous month are shown in the tables. Standard errors of other estimates and other movements may be determined by using information in the Technical Note in *The Labour Force, Australia* (6203.0).

17. Very small estimates and percentages based on such estimates are not published but are indicated with a '*' because they are subject to high relative standard errors. Although estimates for these small components can in some cases be derived by subtraction, they should not be regarded as reliable.

18. Examples of the calculation and use of standard errors are given below:

(a) An estimate of 320,000 unemployed males looking for full-time work has a standard error of about 6,300. Therefore there are about two chances in three that the number that would have been produced if all dwellings had been included in the survey will be within the range 313,700 to 326,300 and about nineteen chances in twenty that the number will be within the range 307,400 to 332,600.

(b) An estimate of movement in the number of unemployed males looking for full-time work from one month to the next is an increase of 28,300. The standard error of this monthly movement is about 5,100. Therefore, there are about two chances in three that if all dwellings had been included in the surveys the movement would have been within the range +23,200 to +33,400, and about nineteen chances in twenty that it would have been within the range +18,100 to +38,500.

19. The imprecision due to sampling variability, which is measured by the standard error, should not be confused with inaccuracies that may occur because of imperfections in reporting by respondents, errors made in collection such as in recording and coding of data, and errors made in processing the data. Inaccuracies of this kind are referred to as the *non-sampling error*, and they may occur in any enumeration, whether it be a full count or a sample. Every effort is made to reduce the non-sampling error to a minimum by careful design of questionnaires, intensive training and supervision of interviewers and efficient operating procedures.

Seasonal adjustment and trend estimation

20. Seasonally adjusted series are published in Tables 2, 5 and 8. Seasonal adjustment is a means of removing the estimated effects of normal seasonal variation from the series so that the effects of other influences on the series can be more clearly recognised. Seasonal adjustment does not aim to remove the irregular or non-seasonal influences which may be present in any particular month. Influences that are volatile can still make it difficult to interpret the movement of the series even after adjustment for seasonal variation.

21. Smoothing seasonally adjusted series produces a measure of trend by reducing the impact of the irregular component of the series. The trend estimates have been derived by applying a 13-term Henderson-weighted moving average to the series. Trend series are used to analyse the underlying behaviour of the series over time. These are published in Tables 3, 6 and 9.

22. While this smoothing technique enables estimates to be produced for the latest month, it does result in revisions to the most recent months as additional observations become available. Generally, subsequent revisions become smaller, and after three months have a negligible impact on the series. There will also be revisions as a result of the annual review of seasonal factors.

23. Users may wish to refer to the ABS Information Papers *A Guide to Smoothing Time Series - Estimates of 'Trend'* (1316.0), and *Time Series Decomposition - an Overview* (1317.0) for more detailed information on smoothing of seasonally adjusted time series data.

Semi-logarithmic graphs

24. Graphs on page 2 have been drawn using a logarithmic vertical scale to facilitate comparisons of rates of growth in series of differing magnitude. Equal distances on the vertical scale (over equal time periods) indicate equal rates of growth.

Related publications

25. Users may also wish to refer to *The Labour Force, Australia* (6203.0). This publication contains a detailed list of related publications which are available on request.

26. Current publications produced by the ABS are listed in the *Catalogue of Publications, Australia* (1101.0). The ABS also issues, on Tuesdays and Fridays, a *Publications Advice* (1105.0) which lists publications to be released in the next few days. The Catalogue and Publications Advice are available from any ABS office.

Symbols and other usages

* subject to sampling variability too high for most practical uses. See the Technical Note in 6203.0 for more details.
