MAIN FEATURES

Particular care should be taken in the interpretation of month-to-month movements from August to September 1987. A new sample is being introduced from September to December 1987, which will increase the standard error on these estimates and which would tend to increase, by a small amount, the estimate of the number of unemployed persons for September, compared with August. See paragraphs 15 to 18. In addition, it is possible that the seasonality of employment, unemployment and labour force participation has been affected by the changed pattern of school holidays in some States. The impact of any such effect cannot be assessed at this stage.

The September 1987 estimate (seasonally adjusted) of employed persons was 7,122,300. The levels of full-time and part-time employment remained relatively unchanged between August and September 1987. Over the past year the trend estimate of total employment has shown a pattern of steady employment growth, although at a reduced rate in recent months. Over the past three years, trend estimates of males employed full time have shown a much slower rate of growth than the corresponding estimates for females (see

graphs on page 2). The rate of growth in part-time employment has been similar for males and females and has been greater than the rate of growth in full-time employment over the past three years.

The total number of unemployed (seasonally adjusted) stood at 596,300, a decrease of 33,200 compared with August 1987. Trend estimates of unemployed persons show that since the beginning of this year the total number of unemployed persons has fallen each month. The fall has been mainly attributable to a reduction in the number of unemployed males looking for full-time work. Trend estimates show that the number of unemployed females either looking for full-time or part-time work has decreased marginally since the beginning of the year.

The September 1987 seasonally adjusted estimate of the unemployment rate was 7.7%, down 0.4 percentage points from August 1987. The trend estimates show that during the last 12 months the unemployment rate reached a peak (8.4%) in the period October 1986 to January 1987 and since then has steadily declined. The September trend estimate of the unemployment rate is the lowest since April 1986. Since the beginning of the year there have been marginal decreases in the unemployment rates, for both males and females looking for full-time or part-time work.

The State trend estimates of the unemployment rate show marginal decreases in the unemployment rate for all States over recent months. The unemployment rate for Victoria has decreased significantly since the beginning of the year and now stands at 5.9%. The trend estimates of the unemployment rate for September 1987 in the other States are Western Australia 7.4%, New South Wales 8.7%, South Australia 8.8%, Tasmania 9.4% and Queensland 9.7%.

The participation rate (seasonally adjusted) for September 1987 was 61.6%, a decrease of 0.5 percentage points from August. Reduced labour force participation in Victoria, Queensland and South Australia was the strongest contributor to this decrease. The trend estimates show that the participation rate for persons has remained relatively unchanged since April 1986. Trend estimates for male and female participation rates show varying patterns. The male participation rate has been steadily falling over recent years, while the female participation rate has been increasing. Since the beginning of this year however, the female participation rate has remained relatively unchanged.

EMPLOYED PERSONS: TREND SERIES

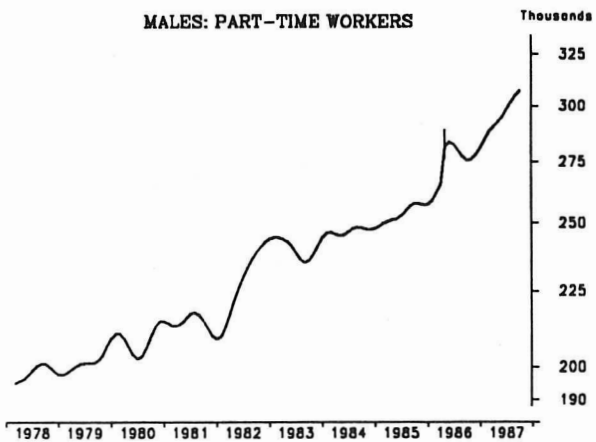

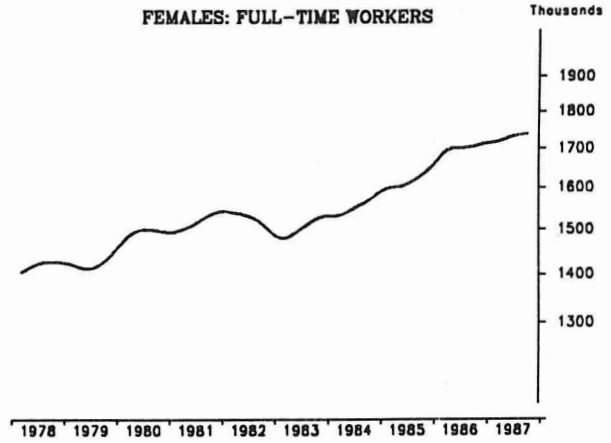

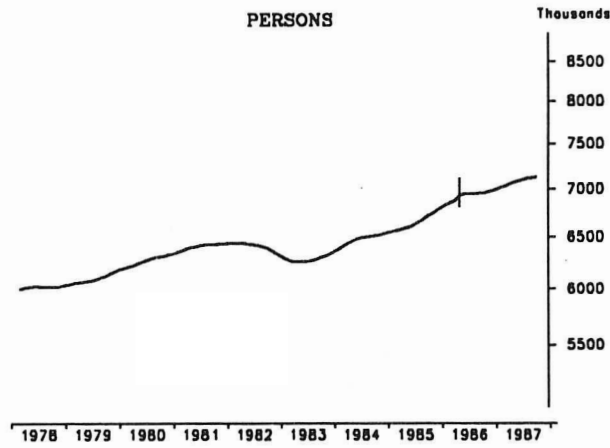

UNEMPLOYMENT RATE: TREND SERIES

Indicates break in series - see paragraph 14.

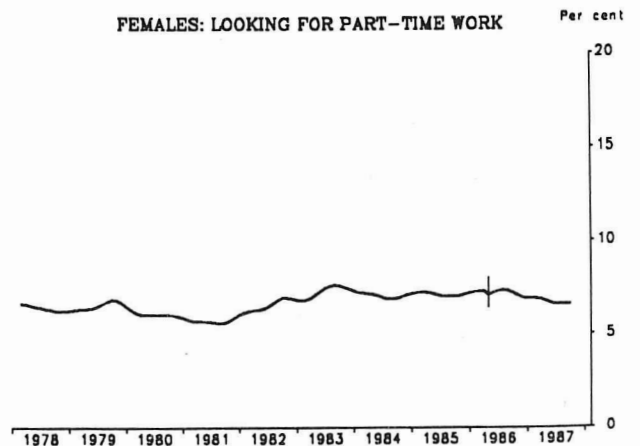

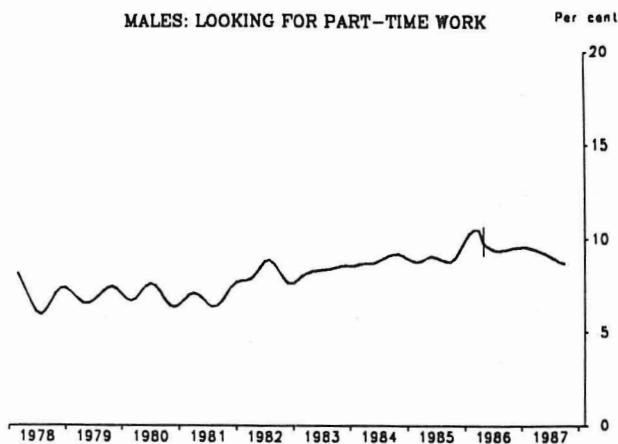

EMPLOYED PERSONS: TREND SERIES

Semi-logarithmic graphs (see paragraph 28)

Indicates break in series - see paragraph 14.

Indicates break in series - see paragraph 14.

EXPLANATORY NOTES

Introduction

1. This publication contains preliminary estimates of the civilian labour force derived from the labour force survey part of the monthly population survey. Estimates for the current month are preliminary and subject to revision. Revised estimates for the current month and more detailed estimates will be published in *The Labour Force, Australia* (6203.0).

The population survey

2. The population survey is based on a multi-stage area sample of private dwellings (about 35,000 houses, flats, etc.) and non-private dwellings (hotels, motels, etc.) and covers about two-thirds of one per cent of the population of Australia. The information is obtained from the occupants of selected dwellings by carefully chosen and specially trained interviewers. The interviews are generally conducted during the two weeks beginning on the Monday between the 6th and 12th of each month. The information obtained relates to the week before the interview (i.e. the reference week).

Scope

3. The labour force survey includes all persons aged 15 and over except: members of the permanent defence forces; certain diplomatic personnel of overseas governments, customarily excluded from census and estimated populations; overseas residents in Australia; and members of non-Australian defence forces (and their dependents) stationed in Australia.

Coverage

4. In the labour force survey, coverage rules are applied which aim to ensure that each person is associated with only one dwelling, and hence has only one chance of selection. The coverage rules are, necessarily, a balance between theoretical and operational considerations. Nevertheless, the chance of a person being enumerated at two separate dwellings in the survey is considered to be negligible.

Definitions

5. The labour force category to which a person is assigned depends on the *actual activity* undertaken during the reference week (i.e. whether working, looking for work, etc.). The following definitions, which conform closely to the international standard definitions specified by the International Labour Office (ILO), relate only to those persons within the scope of the survey.

6. *Employed persons* comprise all those aged 15 and over who, during the reference week:

- (a) worked for one hour or more for pay, profit, commission or payment in kind in a job or business, or on a farm (including employees, employers and self-employed persons); or
- (b) worked for one hour or more without pay in a family business or on a farm (i.e. unpaid family helpers); or

(c) were employees who had a job but were not at work and were: on paid leave; on leave without pay for less than four weeks up to the end of the reference week; stood down without pay because of bad weather or plant breakdown at their place of employment for less than four weeks up to the end of the reference week; on strike or locked out; on workers' compensation and expected to be returning to their job; or receiving wages or salary while undertaking full-time study; or

(d) were employers, self-employed persons or unpaid family helpers who had a job, business or farm, but were not at work.

7. *Full-time workers* are those who usually worked 35 hours or more a week and others who, although usually part-time workers, worked 35 hours or more during the reference week. *Part-time workers* are those who usually work less than 35 hours a week and who did so during the reference week. When recording hours of work, fractions of an hour are disregarded.

8. *Unemployed persons* are those aged 15 and over who were not employed during the reference week, and:

(a) had actively looked for full-time or part-time work at any time in the four weeks up to the end of the reference week and:

(i) were available for work in the reference week, or would have been available except for temporary illness (i.e. lasting for less than four weeks to the end of the reference week); or

(ii) were waiting to start a new job within four weeks from the end of the reference week and would have started in the reference week if the job had been available then; or

(b) were waiting to be called back to a full-time or part-time job from which they had been stood down without pay for less than four weeks up to the end of the reference week (including the whole of the reference week) for reasons other than bad weather or plant break-down.

9. *Unemployed persons looking for their first full-time job* are those who had never worked full time for two weeks or more.

10. The *unemployment rate* for any group is the number unemployed expressed as a percentage of the labour force in the same group.

11. The *labour force* comprises all persons who, during the reference week, were employed or unemployed, as defined above.

12. The *labour force participation rate* for any group is the labour force expressed as a percentage of the civilian population aged 15 and over in the same group.

13. *Persons not in the labour force* are those who, during the reference week, were not in the categories employed or unemployed as defined above.

Revision of series

14. From April 1986, the definition of employed persons was changed to include persons who worked without pay between 1 and 14 hours per week in a family business or on a farm (i.e. unpaid family helpers). For further information, see paragraphs 37 and 38 of the Explanatory Notes to the February 1987 issue of *The Labour Force, Australia* (6203.0).

Survey sample redesign

15. Following each Population Census the ABS redesigns and reselects the LFS sample to take into account the new information which is obtained from the Census. The sample currently used in the LFS, designed and selected using data from the 1981 Census, is being updated and reselected using information collected in the 1986 Census. When a new sample is being introduced, the standard errors of the month-to-month movements are higher than usual during the changeover period. In order to reduce the impact of the higher standard errors on any individual monthly movement, the new sample is to be phased in over the period from September 1987 to December 1987.

16. One quarter of the new sample will be introduced each month so that, by December 1987, the entire new sample will be in place. Replacement will occur at the rotation group level with two rotation groups being substituted each month. Such a pattern of implementation means that any changes in labour force estimates due to differences between the two samples, or any other influences, will be spread over the four months rather than being concentrated in one inter-month period.

Potential effects on labour force survey estimates

17. The implementation of a new sample may affect estimates derived from the LFS. Implications for estimates produced from the LFS due to the sample redesign are as follows:

- (a) There will be higher standard errors for the estimates of month-to-month movements produced over the period September 1987 to December 1987 compared with those for the corresponding series produced prior to this period and from January 1988 onwards. *These are estimated to be up to 22 per cent higher than the normal standard errors on monthly movements.*
- (b) Analysis has shown that the unemployment rate is marginally higher (about 4 per cent) for those persons in sample for the first time. Normally, this will not affect the overall estimates of month-to-month movements because the number of persons in sample for the first time does not change significantly. However, during the transition period, there will be twice as many people as usual in sample for the first time. This may cause a small upward movement in the number of unemployed persons from August to September (about 3,500 persons) and a compensating decrease from December to January.

18. For further information, see *Information Paper - Labour Force Survey - Sample Design* (6269.0)

Reliability of the estimates

19. Two types of error are possible in an estimate based on a sample survey: sampling error and non-sampling error. The *sampling error* is a measure of the variability that occurs by chance because a sample, rather than the entire population, is surveyed. One measure of the likely difference resulting from not including all dwellings in the survey is given by the *standard error*. There are about two chances in three that a sample estimate will differ by less than one standard error from the figure that would have been obtained if all dwellings had been included in the survey, and about nineteen chances in twenty that the difference will be less than two standard errors.

20. Standard errors of estimates for the latest month and of estimates of movements since the previous month are shown in the tables. Standard errors of other estimates and other movements may be determined by using information in the Technical Note in *The Labour Force, Australia* (6203.0).

21. Very small estimates and percentages based on such estimates are not published but are indicated with a '*' because they are subject to high relative standard errors. Although estimates for these small components can in some cases be derived by subtraction, they should not be regarded as reliable.

22. Examples of the calculation and use of standard errors are given below:

- (a) An estimate of 300,000 unemployed males looking for full-time work has a standard error of about 6,600. Therefore there are about two chances in three that the number that would have been produced if all dwellings had been included in the survey will be within the range 293,400 to 306,600 and about nineteen chances in twenty that the number will be within the range 286,800 to 313,200.
- (b) On an estimate of movement of +28,300 in the number of unemployed males looking for full-time work from one month to the next (with the highest of the two monthly level estimates being 325,000) the standard error is about 6,400. Therefore, there are about two chances in three that if all dwellings had been included in the surveys the movement would have been within the range +21,900 to +34,700, and about nineteen chances in twenty that it would have been within the range +15,500 to +41,100.

23. The imprecision due to sampling variability, which is measured by the standard error, should not be confused with inaccuracies that may occur because of imperfections in reporting by respondents, errors made in collection such as in recording and coding of data, and errors made in processing the data. Inaccuracies of this kind are referred to as the *non-sampling error*, and they may occur in any enumeration, whether it be a full count or a sample. Every effort is made to reduce the non-sampling error to a minimum by careful design of questionnaires, intensive training

and supervision of interviewers and efficient operating procedures.

Seasonal adjustment and trend estimation

24. Seasonally adjusted series are published in Tables 2, 5 and 8. Seasonal adjustment is a means of removing the estimated effects of normal seasonal variation from the series so that the effects of other influences on the series can be more clearly recognised. Seasonal adjustment does not aim to remove the irregular or non-seasonal influences which may be present in any particular month. Influences that are volatile can still make it difficult to interpret the movement of the series even after adjustment for seasonal variation.

25. Smoothing seasonally adjusted series produces a measure of trend by reducing the impact of the irregular component of the series. The trend estimates have been derived by applying a 13-term Henderson-weighted moving average to the series. Trend series are used to analyse the underlying behaviour of the series over time. These are published in Tables 3, 6 and 9.

26. While this smoothing technique enables estimates to be produced for the latest month, it does result in revisions to the most recent months as additional observations become available. Generally, subsequent revisions become smaller, and after three months have a negligible impact on the series. There will also be revisions as a result of the annual review of seasonal factors.

27. Users may wish to refer to the ABS Information Papers *A Guide to Smoothing Time Series - Estimates of 'Trend'* (1316.0), and *Time Series Decomposition - an Overview* (1317.0) for more detailed information on smoothing of seasonally adjusted time series data.

Semi-logarithmic graphs

28. Graphs on page 2 have been drawn using a logarithmic vertical scale to facilitate comparisons of rates of growth in series of differing magnitude. Equal distances on

the vertical scale (over equal time periods) indicate equal rates of growth for graphs on the same page.

Related publications

29. Users may also wish to refer to *The Labour Force, Australia* (6203.0). This publication contains a detailed list of related publications which are available on request.

30. Current publications produced by the ABS are listed in the *Catalogue of Publications, Australia* (1101.0). The ABS also issues, on Tuesdays and Fridays, a *Publications Advice* (1105.0) which lists publications to be released in the next few days. The Catalogue and Publications Advice are available from any ABS office.

Symbols and other usages

* subject to sampling variability too high for most practical uses. See the Technical Note in 6203.0 for more details.
