EXPLANATORY NOTES

Introduction

This publication contains detailed statistics of the consumption of foodstuffs and nutrient intake in Australia for 1981-82 as well as comparative data for earlier years. Section I deals with the supply and utilisation of foodstuffs, while Section II deals primarily with the level of nutrient intake in Australia. These levels are compiled by officers of the Nutrition Section of the Commonwealth Department of Health to whom thanks are extended. Preliminary statistics for 1982-83 covering major food items will be published shortly in *Apparent Consumption of Selected Foodstuffs, Australia 1982-83 (Preliminary)* (4315.0) and will be available from any ABS office.

Revision of data

2. In 1980-81, officers of the Nutrition Section, Commonwealth Department of Health and of the Australian Bureau of Statistics commenced a major review of the adequacy and reliability of these statistics. The review concentrated on the supply and utilisation of foodstuffs and on the factors used for converting these to nutrients available per capita per day.

Changes in consumption of foodstuffs and nutrients

3. In the six years 1976-77 to 1981-82 total meat available for consumption has decreased by 15 per cent from 107.2kg to 91.2kg per capita per year. This is represented by decreases in beef (by 27 per cent), and veal (by 53 per cent). Lamb intake has fluctuated in this period. Mutton has increased by 6 per cent. The availability of pigmeat, bacon and ham has also been increasing. Relative to 1968-69, however, the total meat availability to 1981-82 has decreased by only 8 per cent from 98.8kg to 91.2kg per capita per year. In this period the availability of beef, veal, bacon and ham increased while that of other meats decreased. If poultry is included with the other meats, there has been a small increase in total meat and poultry availability in the last 13 years.

4. Apparent poultry intake in itself has increased by 22 per cent from 15.7kg to 19.1kg per capita per year from 1976-77 to 1981-82. The current availability of poultry represents an increase of 130 per cent since 1968-69.

5. Total fruit available for consumption over the past six years has increased by 12 per cent and since 1968-69 by 20 per cent. There have, however, been considerable fluctuations within the types of fruit available. Of specific interest is the decrease in jams, conserves, etc, which in 1981-82 represent just over half those available in 1968-69. The availability of processed fruit was reported as 10.8kg per capita in 1981-82, a decrease of 15 per cent since 1980-81.

6. While the total apparent consumption of butter and margarine has varied little, that of butter continues to decline from 9.8kg per capita in 1968-69 to 5.7kg in 1976-77 to 4.3kg per capita in 1981-82—a decrease of 56 per cent in thirteen years. Total margarine has increased by 94 per cent in this same period, and the ratio of table to

'other' margarine has been reversed. In 1968-69 the ratio was 0.4:1, in 1976-77, 1.4:1 and in 1981-82 it was 2.5:1. This represents an increase of over fourfold in consumption of table margarine since 1968 (from 1.5kg to 6.8kg per capita per year) and a 20 per cent decrease in 'other' margarine. Total fat content availability from this commodity group has fluctuated little in the past six years.

7. The apparent consumption of total milk and milk products has fluctuated little in the past 5 or 10 years, although availability of individual commodities has varied considerably. Fluid milk which had decreased from 128 litres in 1968-69 to 103 litres in 1981-82 has stabilised in the last 5 years. Cheese has increased steadily since 1968-69, from 3.5kg per capita per year to 7.0kg in 1981-82.

8. Total available vegetables increased by 12 per cent between 1976-77 and 1981-82 from 117kg to 131kg per capita per year. Component vegetable types have varied considerably in availability.

9. The shift from sugar available for home purchase to its use by manufacturers continues. There is now approximately three times more sugar used in manufactured foods than in home use.

10. Apparent consumption of beer has decreased in the past six years from 136.7 litres in 1976-77 to 128.9 litres in 1981-82. Wine, however, has been steadily increasing, with a rise of 41 per cent in the past 6 years (from 13.5 litres in 1976-77 to 19.1 litres per capita in 1981-82).

11. The apparent consumption of cereal products has fluctuated in the last 13 years. The total available has however been stable for the last three years.

12. Apparent consumption of protein has decreased by 2 per cent over the six year period. Most of this decrease is in animal protein and is due to the decrease in the meat group.

13. Total apparent energy consumption has shown a small but steady decrease in this period.

14. All nutrients available for consumption are considerably in excess of the estimated recommended dietary allowances for the population.

Acting Australian Statistician

I. SUPPLY AND UTILISATION OF FOODSTUFFS

In general, the method employed in this publication to estimate consumption in Australia of each of the various foodstuffs is as follows:

Apparent consumption = (Commercial production + Estimated home production + Imports + Opening stocks) minus (Exports + Usage for processed food + Non-food usage + Wastage + Closing stocks).

Per capita consumption = Apparent consumption divided by the mean population for that period.

2. The following mean population figures (year ended 30 June basis) have been used in this publication:

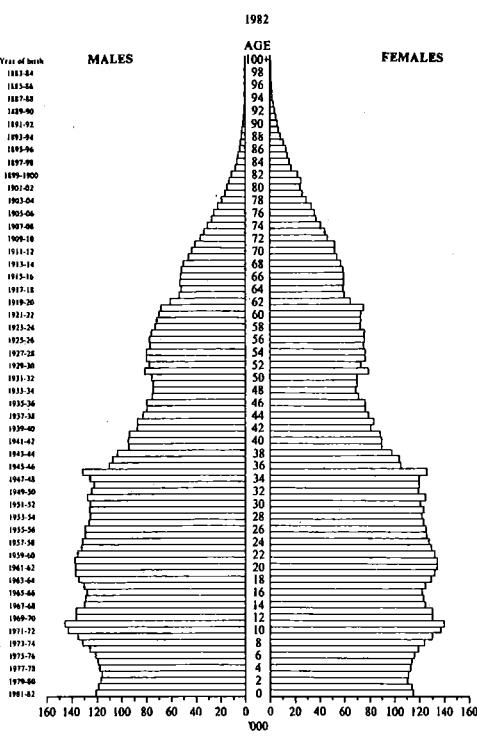

| Average 3 years ended— | Individual years— |
|------------------------|-------------------------|
| 1938-39 | 6,870,261 |
| 1948-49 | 7,651,558 |
| 1958-59 | 9,741,073 |
| 1968-69 | 11,919,046 |
| 1978-79 | 14,275,100 |
| | 1976-77 14,110,800 |
| | 1977-78 14,279,500 |
| | 1978-79 14,435,000 |
| | 1979-80 14,599,200 |
| | 1980-81 14,808,100 |
| | 1981-82 15,050,600 |

3. In interpreting the figures shown in this publication the following factors should be noted:

(a) Changes in the composition of the population have a bearing on trends in the patterns of consumption (particularly on estimates of consumption per capita). The most significant change since 1945, which has almost certainly had some effect on the consumption pattern, is the increasing proportion of the population born overseas and resident for only a comparatively short period in Australia (e.g. the proportion of the population born overseas was 9.8 per cent in 1947, 14.3 per cent in 1954, 16.9 per cent in 1961, 18.4 per cent in 1966, 20.2 per cent in 1971, 20.1 per cent in 1976 and 20.6 per cent in 1981).

(b) Another similar factor is the age distribution of the population which may also affect data relating to per capita consumption. For example, while per capita consumption of infants' and invalids' food has been calculated on the basis of the mean Australian population for the years concerned, these commodities are clearly consumed by a relatively small proportion of people. The effective per capita consumption by these consumers would therefore be considerably higher than the figures shown in the relevant table. The following diagram shows the age distribution of the Australian male and female population at 30 June 1982. The age distribution is based on the results of the Population Census of 30 June 1981 brought forward by reference to natural increase derived from records of births and recorded age at death, and details of overseas migration. Population and age distribution data

ESTIMATED POPULATION GRAPH

ESTIMATED RESIDENT POPULATION OF AUSTRALIA:
AGE LAST BIRTHDAY, BY SEX, 30 JUNE 1982

from 30 June 1981 onwards incorporates a conceptual change in the procedures of estimating Australia's population. Details of this change and its effect on preceding years are available in the publication *Australian Demographic Statistics Quarterly, September and December 1981* (3101.0) and in the information paper *Population Estimates: An Outline of the New Conceptual Basis of ABS Population Estimates* (3216.0) published on 29 March 1982.

(c) In general, the statistics in the publication are for financial years. However, where there is a marked seasonal pattern in the production or marketing of certain crops, the statistics in practice refer to crop years. For example, statistics relating to commercial production of citrus fruit are on the basis of the year ending 31 March.

4. In estimating apparent consumption, four significant components in the general equation should be noted.

(a) *Consumption.* Because of qualifications in respect of stocks and wastage (described below), the term 'consumption' is used in a specialised sense, since the quantities actually measured are broadly the quantities available for consumption at a particular level in the process of distribution, i.e. ex-market, ex-store or ex-factory, depending on the method of marketing and/or processing. It is considered that in most cases these foodstuffs will find their way to the ultimate individual consumers with a minimum time lag. The figures therefore represent fairly accurately total consumption, as defined above, in the year to which they relate.

The general consumption equation is not used in those instances where certain components of the equation are not available, or where a more appropriate technique for estimating consumption is available. In this publication the equation is not used for milk, rice, bread, butter, wine and spirits.

- (b) *Commercial production and estimated home production.* Available production statistics are confined mainly to commercial production and are deficient for the purposes of the calculation to the extent of production by householders for their own use. This applies particularly in the case of vegetables, fruit, eggs, poultry and fish. However, in all these cases estimates of non-commercial production have been included, based on somewhat inadequate information obtained from a household expenditure survey conducted in 1944 and other investigations conducted by government departments during the 1939-45 War. Production statistics are derived from sources such as the annual Agricultural Census and other annual or monthly collections for the year in question. Where these are unavailable, outside sources or reliable estimates have been used.
- (c) *Stocks.* Statistics of stocks refer to in-store (i.e. those held by marketing authorities) and factory stocks. With minor exceptions no details are available of wholesalers', retailers' or householders' stocks. For perishable commodities this point is of little importance since the very nature of the commodity precludes the accumulation of stocks. This is not the case, however, with non-perishable foods, and estimates derived for consumption of such foodstuffs for individual years may not state the position correctly with regard to consumption as ordinarily understood, i.e. foodstuffs consumed by the individual. This difficulty is apparent particularly in the case of canned foodstuffs, where in some years it has been necessary to initiate special enquiries from the trade and other informed sources in an endeavour to take better account of these deficiencies.
- (d) *Wastage.* In many cases, allowance is not made for wastage before the foodstuffs are consumed. The importance of this factor is difficult to estimate, but in some seasons gluts result in considerable destruction of perishable foodstuffs, and it should therefore be taken into account when using these statistics. The effect of ignoring wastage is ultimately to overstate the consumption figures. In recent years, however, it is likely that there has been less wastage of foodstuffs than previously, because of more efficient methods of distribution and storage (including refrigerated transport, air freight and household refrigeration).

Additional information

5. Additional information related to some of the individual food groups in Tables 1,2 and 3 are set out below:

Nuts. Formerly this section contained details on pulse and nuts. However, due to a lack of adequate information estimates on consumption of dried pulse and cocoa have not been calculated in recent years.

Vegetables. Vegetables are shown in terms of fresh or fresh equivalent, that is, the statistics in effect relate to the pre-processing stage. For example, the consumption of tomatoes includes fresh tomatoes consumed plus the fresh equivalent of tomatoes consumed as tomato products (canned tomatoes, tomato juice, etc.). Stocks, imports, and exports, of processed tomatoes are converted to fresh equivalent for this purpose. Data are also shown for some vegetables as product weight.

Fruit. Fruit is shown in terms of fresh or fresh equivalent and, as in the case of vegetables, relate to the pre-processing stage. Stocks, imports and exports are converted to fresh equivalent for this purpose. Data are also shown for some fruit as product weight. Melons and cantaloupes, included in vegetables in earlier issues of this publication, are now included in fruit.

Meat. Owing to diverse cutting practices by butchers in Australia and because of the difficulty of clearly defining the term 'retail weight of meat', it is considered impracticable to derive a satisfactory factor for the purpose of expressing estimated meat consumption in terms of retail weight. Depending on cutting practices employed and whether or not bones, etc., sold to customers are included in retail weight of meat, the retail weight as a proportion of carcass weight ranges from about 60 per cent to 75 per cent for beef, from 80 per cent to 95 per cent for mutton and lamb and from 90 per cent to 95 per cent for pork. For this reason apparent consumption of carcass meat is expressed in terms of carcass weight.

Eggs and egg products. The production of eggs shown in Table 3 is based on Egg Boards' records of output from areas under their control, plus estimates of production for uncontrolled areas and for 'back-yard' poultry keepers based on information obtained from other sources. Because of the inadequacy of data covering the volume of uncontrolled production, the figures should be used with some reserve.

Advances in poultry technology have resulted in a gradual increase in the average weight of eggs produced. For statistical purposes, the average weight of an egg was increased in 1960-61 from 49.6g to 56.7g. Although the increase in average weight actually occurred over a period of years, no adjustment has been made to 1959-60 and earlier years. No further adjustments are anticipated.

Fish. For the purpose of estimating supplies of fish available for consumption, in this publication, an allowance of 10 per cent of commercial production has been made for the non-commercial catch of fish. No such allowances have been made for crustacea or molluscs as it is considered that the non-commercial take is not significant.

Oils and fats (including butter). In assessing consumption of all oils and fats no allowance is made for fats consumed in association with carcass meat. The quantities of carcass meat shown in Table 3 include fats which remain in the carcass after slaughtering and which may or may not be subsequently removed for boiling down, etc., prior to retailing of the meat. No duplication occurs for fats removed from the carcass at the slaughtering stage.

(a) Comprises canned seafood only prior to 1972-73. Prepared seafood other than canned was included with 'Fresh and frozen' in this period. (b) Prior to 1978-79 known as Fluid Whole Milk. (c) Included ice-cream mix prior to 1972-73. (d) Combined product and natural equivalent weights prior to 1971-72. (e) Includes an allowance for estimated cream consumption. (f) Sweet potatoes included with 'other root and bulb vegetables' since 1968-69; formerly included with 'other vegetables'. (g) Includes flour used for breadmaking. (h) Per capita data on bread is now shown in kg per year. (i) Includes an estimate for vegetable oils and other fats. Prior to 1975-76 this was estimated at 2kg. From 1975-76 onwards estimated at 10kg. (j) Includes sugar content of syrups, honey and glucose. (k) Coffee and coffee products in terms of roasted coffee.

APPARENT PER CAPITA CONSUMPTION OF MEAT AND POULTRY

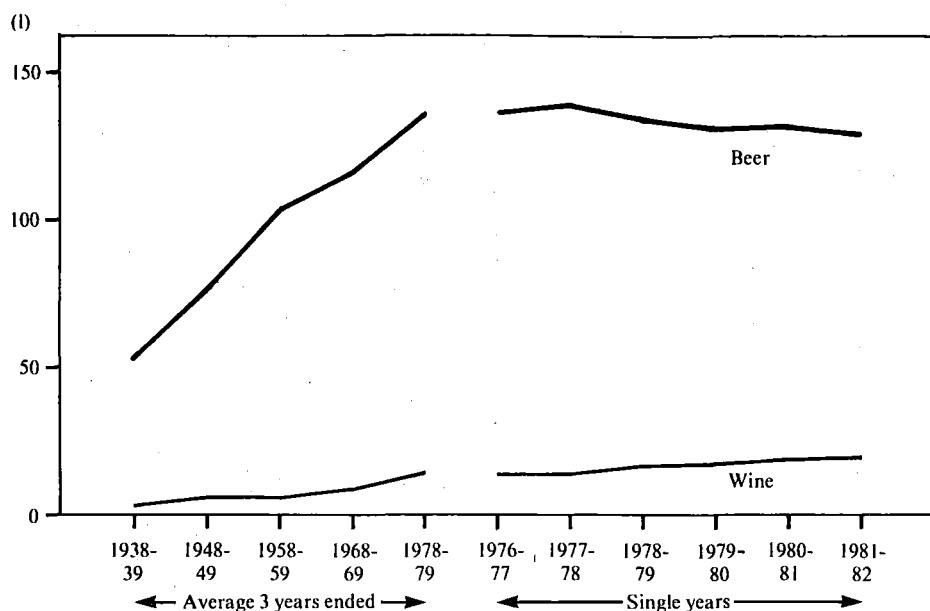

APPARENT PER CAPITA CONSUMPTION OF SUGAR

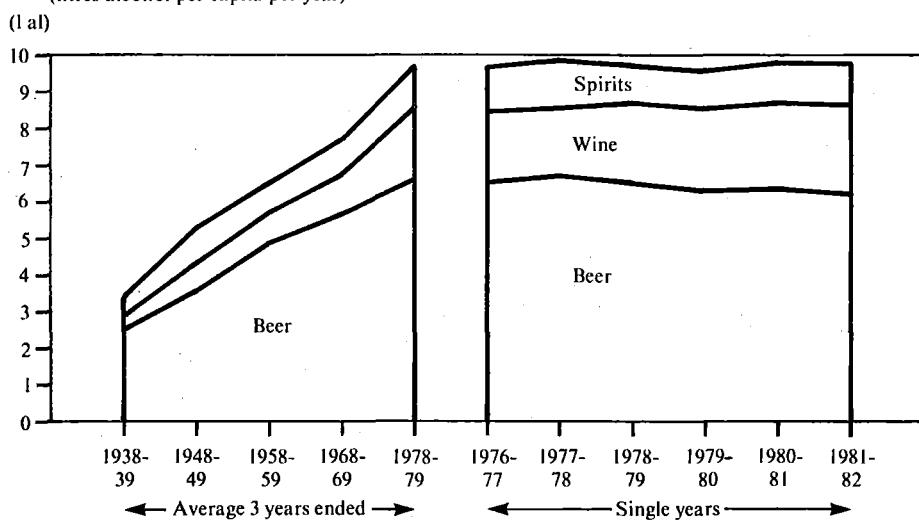

APPARENT CONSUMPTION OF BEVERAGES

Apparent per capita consumption of beer and wine
(litres per capita per year)

Apparent per capita consumption of alcohol
(litres alcohol per capita per year)

Apparent per capita consumption of non-alcoholic beverages
(litres, kilograms per capita per year)

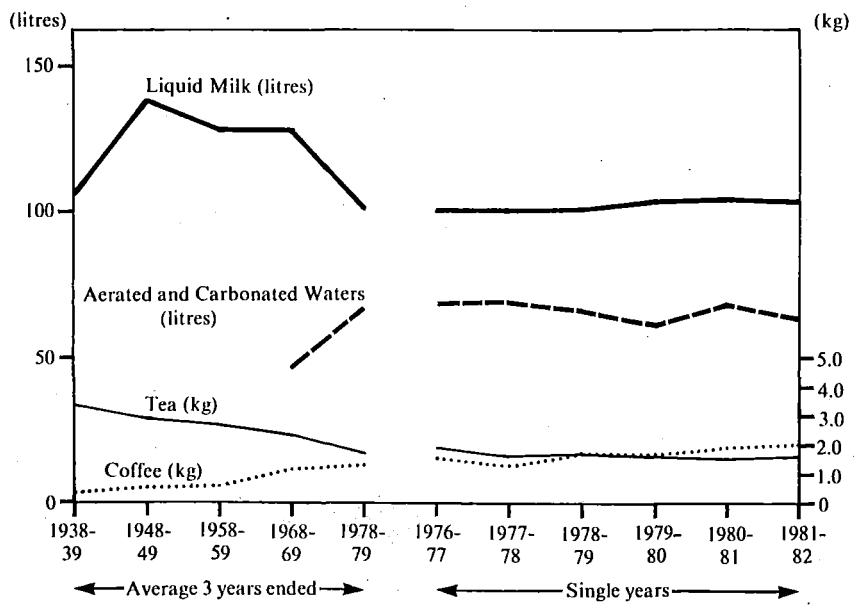

TABLE 2. TOTAL APPARENT CONSUMPTION OF SELECTED FOODSTUFFS, AUSTRALIA

| | Available for consumption— | | | | | | Apparent per capita consumption— | | | | | |

(a) Stocks supplied by the Australian Meat and Livestock Corporation. (b) Domestic sales by Australian Dairy Corporation.

(c) Cold store stocks of apples and pears.

(d) Deliveries year ended 30 June as recorded by the Australian Dried Fruits Association.

(e) Stocks and commercial production obtained from the Australian Dried Fruits Association.

(f) Includes fruit salad.

(g) Comprises deliveries for home consumption.

(h) Comprises deliveries for breadmaking.

(i) Stocks held by Queensland Peanut Marketing Board.

(j) Stocks collection discontinued under Review of Commonwealth Functions.

(k) Comprises quantity of beer produced in Australia and imports cleared for home consumption.

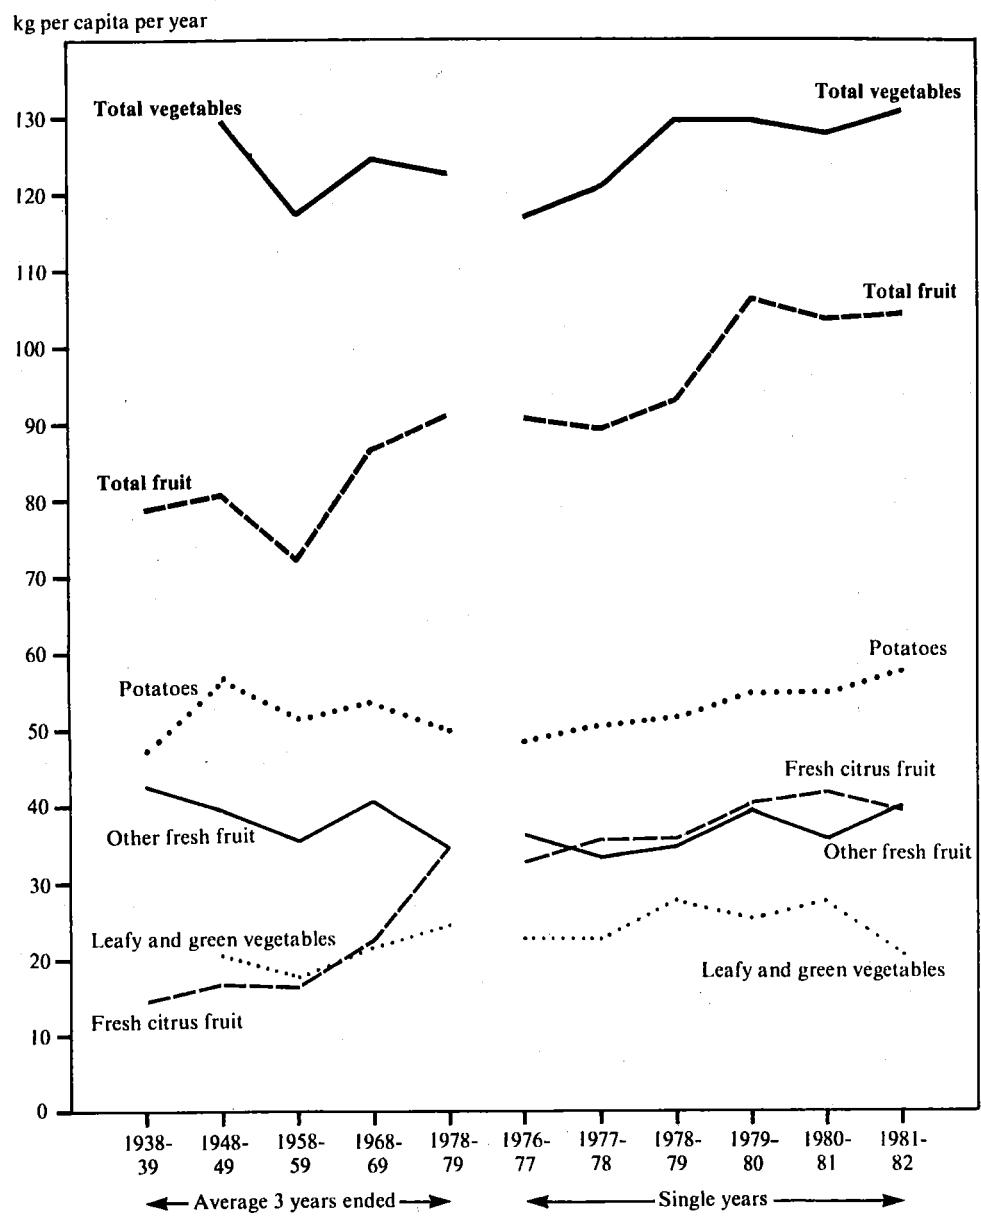

(l) Comprises quantity of potable spirits upon which excise duty was paid and imports cleared for home consumption.

(m) Comprises quantity of sales by winemakers and imports cleared for home consumption.

(n) Comprises quantity of sales by winemakers and imports cleared for home consumption.

(o) Comprises quantity of sales by winemakers and imports cleared for home consumption.

APPARENT PER CAPITA CONSUMPTION OF VEGETABLES AND FRUIT

II. LEVEL OF NUTRIENT INTAKE

The explanatory notes in this publication contain particulars of data revisions resulting from investigations into the adequacy and accuracy of statistics on foodstuffs and nutrient consumption.

2. In order to determine whether the quantities of the various foodstuffs available for consumption are likely to be sufficient for adequate nutrition, it is necessary to calculate the amount of nutrients the foods provide.

3. The analysis in this section is based on the statistics collected by the Australian Statistician as set out elsewhere in this publication and is therefore subject to the same qualifications. See notes to Section I for a statement of these qualifications.

4. The basis for the calculations of estimated supplies of nutrients available for consumption in Australia was changed after Bulletin No. 23 (1967-68) and is now dependent on conversion factors calculated from *Metric Tables of Composition of Australian Food* (Sucy Thomas and Margaret Corden, A.G.P.S. Canberra, 1977). The previously used Tables, compiled by Anita Osmond and Winifred Wilson, 1954, have been revised and considerably enlarged and nutrient values for almost all food items altered in the light of improved analytical techniques. While comparison with figures published for previous years is no longer entirely valid, the differences in conversion factors are not so great as to negate the value of all such comparisons.

5. Following a recommendation of the joint FAO—WHO Expert Group which reported on the *Requirements of Vitamin A, Thiamine, Riboflavin and Niacin* (FAO Rome, 1967) the total vitamin A of the diet is now stated as micrograms of vitamin A (retinol) activity. Strict comparisons between vitamin A activity values published since 1968-69 cannot be made with previous values, since the values given for individual food items vary considerably in the food composition tables (1954 and 1977).

6. *Nutrients available for consumption.* Details of the estimated supplies of nutrients passing into consumption in the years 1976-77 to 1981-82 are shown in Table 4. A

note on trends in consumption of nutrients is included in **Changes in Consumption of Foodstuffs and Nutrients** in the Explanatory notes. All nutrient determinations are based on the fresh equivalent weight of the foods with an allowance for natural wastage, i.e. from skins, seeds, bones, etc. The exceptions are foods such as cheese, powdered and canned milks, bacon, ham, dried fruit, canned fish and alcoholic beverages.

7. Losses in total food available for consumption due to processing have been allowed for by way of an adjustment to the conversion factors used for processed and preserved foods. No allowances have been made for losses of nutrients (other than vitamins) due to the effect of storage and cooking; losses of vitamins are referred to in the following paragraphs. The figures in Tables 7 and 8 are adjusted for losses of vitamins in cooking and for the additional niacin obtained from the metabolism of protein (see Table 5 for these adjustments).

8. *Loss of vitamins in cooking.* As a result of storage and cooking, certain foods, particularly fruit and vegetables, lose some of their nutritive value. Estimates of possible loss of vitamin C (ascorbic acid) and thiamin in cooking are set out in Table 5. Losses in cooking of other nutrients do occur but not in amounts likely to be significant. Losses due to storage have not been estimated.

9. Losses of vitamin C cover a wide range, from almost nil to 100 per cent. On average, 60 per cent of vitamin C in leafy green vegetables is lost through cooking, while losses for skinned potatoes, other vegetables and stewed fruit are approximately 50 per cent. There is also a significant loss of thiamin in the cooking of meat and vegetables, the amount of loss depending on the method and duration of cooking. In a normal mixed diet it is accurate enough for statistical purposes to allow 15 per cent deduction from the total thiamin available. The estimates in Table 5 are calculated assuming average conditions and methods of cooking. Losses could be reduced to less than these figures by careful cooking. Losses from uncooked fruits and vegetables are assumed to be negligible.

(a) Adjustments have not been made for the loss of nutrients in cooking, or the extra niacin obtained from the metabolism of protein. See Table 5 for adjustments for specific vitamin availabilities. (b) Expressed as the sum of retinol content and one sixth of the β carotene equivalent. (c) Includes canned and cured meat and edible offal. (d) Excludes butter, which is included in 'Oils and fats'. (e) Comprises beer, wine and spirits, the energy value of which includes the contribution made by alcohol.

SOURCES OF NUTRIENT FAT

grams per capita per year

**APPARENT PER CAPITA CONSUMPTION OF BUTTER, MARGARINE AND OTHER OILS AND FATS IN TERMS OF FAT CONTENT**

Average: 3 years ended 1938-39

1981-82

(a) Losses in cooking have been estimated for vitamin C and thiamin only; losses of other nutrients are not likely to be significant. (b) Little vitamin C would be retained in these foods. (c) The niacin equivalent of a diet is computed from dietary niacin plus 0.16 times the dietary protein in grams, expressed in milligrams.

Dietary allowances. The nutritive value of food available for consumption may be compared with an arbitrary standard such as the *Dietary Allowances for Use in Australia (1970 Revision, reprinted in metric version 1977)*, formulated by the Nutrition Committee of the National Health and Medical Research Council. This comparison has been made in Table 8, where the quantity of nutrients available for consumption in the Australian diet (as shown in Table 4), less estimated cooking loss, is compared with desirable quantities recommended by the Council. The allowances shown in Table 8 are averages weighted according to the various age groups in the population. The allowance data are based on information from the publication *Estimated Age Distribution of the Population* (3201.0). See the age-sex pyramid of the Australian population in the notes to Section I of this publication.

The comparisons in these tables are useful as an indication of trends in food consumption, although it

must be emphasised that the allowances do not necessarily represent nutrient requirement; rather they were devised for the planning of practical diets within the average Australian food pattern. Precise information concerning human requirements of certain nutrients is far from complete, and no conclusion regarding the nutritional status of the community should be drawn from comparison with these allowances. A deviation from the allowances of the order of 10-15 per cent is not regarded as a serious deficiency. Even if the nutrient intake is more than 15 per cent below the allowance, a nutritional deficiency cannot be assumed without clinical verification.

The calculated figures, being averages, give no information on the food consumption of individuals or of specific groups within the population. Also the figures represent food available for consumption, which is not the same as foods consumed. The Food and Agriculture Organisation of the United Nations estimates that in communities with a plentiful food supply, up to 15 per cent of the food available may be wasted.

(a) Not comparable with years prior to 1968-69. Figures are based on conversion factors calculated from the revised and enlarged edition of S. Thomas and M. Corden *Metric Tables of Composition of Australian Food A.G.P.S.*, Canberra 1977. See notes to Section II. Adjustments have been made for loss of nutrients in cooking and the extra niacin obtained from the metabolism of protein.

(a) Adjustments have been made for the loss of nutrients in cooking and the extra niacin obtained from the metabolism of protein. (b) Calculated on the lower level of the dietary allowance range given for each age group. (c) Source. S. Thomas and M. Corden, *Metric Tables of Composition of Australian Food* A.G.P.S., Canberra, 1977. Appendix I. The allowances are averages weighted according to various age groups in the population; the age distributions at the beginning of each period have been used.

**NUTRIENTS AVAILABLE FOR CONSUMPTION IN AUSTRALIA 1971-72 AND 1981-82
(Expressed as percentages in excess of dietary allowances)**
